Digital storytelling concentrates on a selected theme and maintains a certain point of view. It is a method that can be used to develop students' skills appropriate to the age we live in, to arouse their perceptions, to encourage them, and to increase their motivation to learn. The purpose of this study is to examine the effect of using digital stories while lecturing about subjects in the "Realized Dreams" unit of the Social Sciences course on students' motivation. The study group includes 72 fifth-grade students in two different classes of Makbule Suleyman Alkan Secondary School located in Izmir. In this study, an experimental model was used. Also to measure the motivation was used the Turkish version (Kutu & Sözbilir, 2011) of the ARCS motivation survey developed by Keller (1987). The results of the research will be included in the full text.

THE EFFECT OF EDUCATION THEMATIC FILMS ON CLASSROOM TEACHER CANDIDATES' MOTIVATION TO TEACH AND ATTITUDES TOWARDS TEACHING PROFESSION

ABSTRACT

It is thought that the use of education thematic films in teacher education and the teacher-student relations in films will be an example for teacher candidates, therefore it can affect the attitudes towards the profession and the motivation of teaching. In this context; the aim of the research is to examine the effect of education thematic films on classroom teacher candidates' motivation to teach and attitudes towards teaching profession. An explanatory design model has been used in the research that one of the mixed method designs. Explanatory design; requires qualitative data for the purpose of supporting, explaining and interpreting quantitative data (Patton, 2002). Research was conducted with 3rd year students; In the spring semester of the 2016-2017 academic year, Mersin University Faculty of Education Classroom Teacher Education Department. The "Motivation to Teach Scale" developed by Kauffman, Yilmaz-Soylu and Duke (2011) and adapted to Turkish by Ayık, Ataş Akdemir, Seçer (2015) and "Attitude Scale for Teaching Profession" developed by Üstüner (2006) were used for data collection tools in this research. As a result of the analysis, it is possible to say that the films watched during the implementation process have positive effects on teacher motivation and attitudes towards the teaching profession. In order to develop the teachers' motivation to teach and their attitudes towards the teaching profession, it is possible to make all students in the faculty watch the education thematic films on certain days and establish a qualified film archive within the faculty for reaching more teacher candidates.

Key words: Classroom teacher candidate, education thematic film, attitude, motivation.

INTRODUCTION

In today's world of rapidly improving knowledge and technology, information-generating societies are one step ahead of societies in the world that consume knowledge in order to create both economic development, wealth and prosperity. Therefore, the education of the individuals who will shape the future and produce information and technology gains more importance every day (Yavuz and Coşgun, 2008). Teachers are the first factor in ensuring that individuals get a good education. The fact that the teachers are qualified also ensures the qualified education of the individuals they train. In this respect, our primary goal should be to train qualified teachers. Teachers with such power to influence on the people are expected to have good motivations and attitudes towards this profession as well as cognitive field competences such as knowledge and skills. Because it is very important to make this profession fondly and willingly in order to be successful in the teaching profession, which requires patience, dedication and continuous work (Akşar and Erden, 1987).

Motivation is a concept that applies to all individuals and concerns the goals that enable individuals to act (Ayık, Ataş Akdemir, Seçer, 2015). It is about how the individuals are treated and what they feel about the work they do "(Keenan, 1996: 5). People need to be motivated to work towards the goals of society, groups or institutions. Because the motivated individual does his job with pleasure, which in turn affects the productivity of both himself and the institution positively. To explain the importance of motivation in education, Former American Education Secretary Terrell Bell said that "There are three basic dimensions in education. The first is motivation. The second is motivation. Third is also motivation "(Dede and Yaman, 2008). Teacher candidates' perspectives on the teaching profession in particular are very important to their motivation for teaching. If a contribution to the learning of

people is desired, one should be aware of what might be the motivating elements in this matter. The reactions that an individual develops against internal needs are called intrinsic motivation. The source of intrinsic motivation can be a sense of curiosity, interest, knowledge, understanding, sufficiency and development that spontaneous for the individual. Extrinsic motivation involves external influences. Extrinsic motivation is based on punishment and reward, contrary to intrinsic motivation. The individual acts with the aim of winning a good position or promotion based on a liaison, promotion. Motivation theories are examined in two parts: need-content theories and process theories. Need-content theories generally include Maslow's Hierarchy of Needs, Alderfer's VIG theory, Herzbergs' Two Factor Theory, and McClelland's need for achievement theory. Process theories are; Equality theory, expectation theories, reinforcement theory and purpose theory (Akbaba, 2006). According to the need - content theories, motivation is considered in terms of the internal needs of the individuals, and according to the process theories, it is considered that many external factors are effective on motivation (Süral-Özer, P. and Topaloğlu, 2012).

Another important determinant of an individual's success in a job is the attitude of the individual towards that occupation (Çakır, 2005). As in all professions, attitudes towards the profession in teaching also affect the efficiency of the teaching action significantly (Üstüner, 2006). The attitudes of teachers who constitute the most important stance of the education system that directly determines the future of a society are important factors affecting the quality of the education process (Nakip, 2015). One of the characteristics of attitudes is that every attitude has one direction. The individual has a positive or negative tendency towards any topic. If attitude is positive, positive feelings, evaluations and tendencies; If the attitude is negative, negative feelings, evaluations and tendencies are in question towards object, event or person. When the direction of the attitude is positive, individual gradually approaches the subject of the attitude, and when it is negative, they move away from the subject of attitude (İnceoğlu, 2004: 48). The education supplied to the teacher candidates should also provide positive attitudes towards their profession (Senemoğlu and Özçelik, 1989, Johnson and Howell, 2005).

When literature is examined, it has been found studies such as aiming to change teachers' attitudes towards teaching profession in a positive way, but education thematic films have not been used before (Erden, 1994, Zembat and Bilgin, 1996, Tanrıoğlu 1997, Argun and İkiz, 2003, Çeliköz and Çetin, 2004, Erkan and Akman, 2004, Üstün, 2005, Nakip, 2015). It has not been found studies which aims to increase teachers' motivation for teaching. In this sense, it is thought that the use of education thematic films in teacher education and the teacher-student relations in films will be an example for teacher candidates, therefore it can affect the attitudes towards the profession and the motivation of teaching. In this context; the aim of the research is to examine the effect of education thematic films on classroom teacher candidates' motivation to teach and attitudes towards teaching profession.

THE STUDY

Pretest-posttest semi-experimental design without control group was used in the research. An explanatory design model has been used in the research that one of the mixed method designs. Explanatory design; requires qualitative data for the purpose of supporting, explaining and interpreting quantitative data (Patton, 2002).

Research was conducted with 3rd year students; In the spring semester of the 2016-2017 academic year, Mersin University Faculty of Education Classroom Teacher Education Department. The "Motivation to Teach Scale" developed by Kauffman, Yilmaz-Soylu and Duke (2011) and adapted to Turkish by Ayık, Ataş Akdemir, Seçer (2015) and "Attitude Scale for Teaching Profession" developed by Üstüner (2006) were used for data collection tools in this research. The "Motivation to Teach Scale " is a measurement tool composed of 12 items and two sub-scales developed to measure the intrinsic and extrinsic motivation of teacher candidates. The reliability of the intrinsic motivation sub-scale is determined .86 and the reliability of the extrinsic motivation sub-scale is determined .76. "Attitude Scale Towards Teaching Profession" is a five-point Likert-type scale consisting of 34 items. The internal consistency coefficient of the scale (Cronbach Alpha) is .93.

Three different films were shown during the three weeks of the study. The films shown within the scope of the research were Dead Poets Society; Choir; Taare Zameen Par (Stars in the ground). After each film, teacher candidates were offered the opportunity to discuss the film and teaching profession. Every week after the film, the

teacher candidates were asked to write their journals about their thoughts and views both on the film and teaching profession. Written journals of students who participated in the research were used as a qualitative data collection tool. In the research, the statements contained in the journals of the teacher candidates were directly shared in the relevant places.

FINDINGS

As a result of the statistical analysis, the effects of education thematic films on teaching motivation and attitudes towards teaching profession were examined. Kolmogorov-Smirnov test was conducted to decide whether to use parametric or non-parametric tests in the analysis of the data obtained from the scales and it was seen that the scores of both scales were not distributed normally. For this reason, the Wilcoxon Signed Ranks Test was used for non-parametric tests to answer research questions.

Findings obtained from the Motivation to Teach Scale

Findings obtained from the Motivation to Teach Scale, Kolmogorov-Smirnov test was conducted to decide whether to use parametric or non-parametric tests in the analysis of the data obtained from the scales and it was seen that the scores of both scales were not distributed normally. For this reason, the Wilcoxon Signed Ranks Test was used for non-parametric tests to answer research questions.

Table1. Wilcoxon Signed Rank Test Results of Motivation to Teach Scale Pre-and Post-Implementation Scores

	pre-test/post-test	n	mean of rank	sum of ranks	z	p
Motivation to Teach	Negative rank	15	16,53	248,00	5,01*	,00
	Positive rank	46	35,72	1643,00		
	Ties	3				
1. sub-scale extrinsic motivation	Negative rank	26	31,90	829,50	0,63*	,53
	Positive rank	34	29,43	1000,50		
	Ties	4				
2. sub-scale intrinsic motivation	Negative rank	5	7,40	37,00	6,53*	,00
	Positive rank	56	33,11	1854,00		
	Ties	3				

* based on negative ranks

Wilcoxon Signed Rank Test Results of Motivation to Teach Scale showing whether the Pre-and Post-Implementation scores of the 64 teacher candidates who took part in the implementation differed significantly are given in table 1. The results of the analysis show that there is a statistically significant difference between the pre- and post- implementation scores of the teacher candidates participating in the implementation ($z = 5,01$, $p < ,05$). When the mean and sum of ranks of the difference scores are taken into account, it is seen that the difference is in favor of positive rankings, that is, the post-test scores. According to these results, it can be said that the films watched during the implementation process have a significant effect on teaching motivation of the teacher candidates.

When we look at the sub-scales of the scale, it is seen that there is no statistically significant difference in the extrinsic motivation scores ($z = 0,63$, $p > ,05$), which is the first sub-scale, and a significant difference in intrinsic motivation scores ($z = 0,63$, $p < ,05$), which is the second sub-scale, in favor of the post-test scores. These results can also be expressed as the fact that the films watched may have significant effect to the intrinsic motivations of the teacher candidates. Moreover, it can be said that the reason why the teaching motivation scores differ significantly in favor of the post-test is the change in the intrinsic motivation scores.

Teacher candidates were interviewed and opinions about their motivation for teaching were taken both after each film and in the journals, they wrote. It seems that they focus on the importance of intrinsic motivation rather than external motivation in fulfilling their profession properly. It can also be explained by the fact that there is no significant difference in the extrinsic motivation scores and the significant difference in the intrinsic motivation scores.

"There is no need to pecuniary resource for being teacher. Even resource is supportive something can be taught without it. Teacher can design materials with the bag of tricks and draw attention of the students to the lesson and make the students forget about financial or environmental deficiencies. "

" Although financial or environmental conditions support education, it does work, but these conditions for education can not be preliminary."

" Financial or environmental conditions are important. But I think that the teacher can close this gap by improving himself. The important thing is to improve ourselves on behalf of education and training".

"Financial and environmental reasons increase or decrease the efficiency of education. But what matters first is the will of the human being. "

Findings obtained from the Attitude Scale for Teaching Profession

Table 2. Wilcoxon Signed Rank Test Results of Attitude Scale for Teaching Profession Pre-and Post-Implementation Scores

pre-test/post-test	n	mean of rank	sum of ranks	z	p
Negative rank	21	23,45	492,50	3,53*	,00
Positive rank	42	36,27	1523,50		
Ties	1				

* based on negative ranks

Wilcoxon signed rank test results showing whether the attitudes of teacher candidates towards the teaching profession before and after the practice differed significantly are given in Table 2. According to the results of the analysis there is a statistically significant difference between the pre- and post- implementation attitude scores of the teacher candidates participating in the implementation ($z = 3.53$, $p < .00$). It is seen that the difference is in favor of positive rankings, that is, the post-test scores. According to these results, it can be said that the films watched during the implementation process have a significant effect on attitudes of the teacher candidates.

Attempts are made to ensure that the information, emotions and skills that will be provided to the students in the teacher training programs are more effective in their professional life. One of the conditions for the individuals who will practice the teaching profession to fulfill the requirements of this profession more effectively is the positive attitude towards the profession. The determination of the attitudes of the students who are studying in the teaching programs will inform them about what kind of attitudes should be given during the training process (Üstüner, 2006). In this sense, during the undergraduate education process, attitudes and perspectives of teacher candidates can be improved positively thanks to the films about the possible situations that they will come across when they start their profession. In this study, teacher candidates shared their views about each of the leading teachers and their approaches to teaching profession in the film as follows;

"If I were the teacher in the film, I would try to make the child realize her dream by encouraging. In the same way, her parents could not enjoy it, but I would try to change it. I would try to show that each person's talents and demands are different. "

"As a result of the film I watched, I understood better the characteristics that must be found in a teacher. I understand the importance of tolerance and patience. "

"I do not know if I could be a teacher who appeals so much students, but I will definitely want to be one of them. I cannot find much to tell if I will be different in my teaching profession. At the end of film, despite all the pressure of the students' yelling on the tables "captain, my captain" was a proof that the teacher can appeal to them.

"After the film I watched, I would try to do my best to meet both the social and psychological needs of the students. Treat with love and make them adopt me. Once I became acquainted with my students, I would teach them the appropriate level. "

"Differences. I think you have to try different ways to be a more creative teacher besides your uniformity. In this film, I was very impressed by the approach of our teacher to students with different perspectives."

"I had an idea about how I should become in terms of attitude and behavior towards the students in my professional teaching life. I learned that the difficulties of ensuring authority in the classroom environment as well as its conveniences are greatly influenced by our student approach. "

"I think that an approach that should be consider as an example is a teacher I would like to start in the future, and I have an approach that I would like to practice very much. The students are taught in a positive way to help them to be better individuals by telling their mistake or telling why their mistakes are wrong. ",

CONCLUSIONS

Teacher candidates' views on the teaching profession are very important in terms of attracting attention to the values that the candidates attach to teaching on the one hand and affecting their success in teaching (Gürses et al., 2005). In this study examine it was tried to investigate the effect of education thematic films especially on the attitudes of classroom teacher candidates towards teaching motivation and teaching profession. The result show that the films influenced teacher candidates' attitudes towards the teaching profession and their motivation to teach positively.

Kaşkaya, Ünlü, Akar and Sağrılı (2011) investigated the effects of school and teacher thematic films on professional attitudes and self-efficacy perceptions of teacher candidates. Similar results were obtained as a result of this research. As a result of this study using different film options, different attitudes towards teaching profession scale and self-efficacy scale, it is seen that education thematic films form a significant difference in teacher candidates' professional attitudes and self-efficacy perceptions.

In order to develop the teachers' motivation to teach and their attitudes towards the teaching profession, it is possible to make all students in the faculty watch the education thematic films on certain days and establish a qualified film archive within the faculty for reaching more teacher cadidates. Also collaborating with other academicians about the selection of qualified and appropriate films will be convenient. Similar studies can be conducted with prospective teachers in different branches of the main science. Similar studies can be conducted with other teacher candidates in different branches of the same department. Being informed about the professional attitudes of teacher candidates who will work in educational organizations in the future may lead to know what kind of education should be given in pre-service training. Research on larger groups in all teaching areas can be undertaken in order to determine the attitudes of teacher candidates towards motivation to teach and teaching profession and to take remedial measures in this regard.

ABSTRACT

The aim of this study is to determine the effect of the educational game training which will be given 2 days a week in addition to standart preschool education ,to preschool children aged 4 and 5, on creativity development.

Totally 141 children from two different kindergarten are included in this study. Children are randomly divided into two groups 37 girls, 38 boys in total 75 children to experimental group and 30 girls, 36 boys in total 66 children to control group. Before the study Thinking Creatively in Action and Movement (TCAM) Test developed by E. P. Torrance and adapted to Turkish by Karabulut (2012) were applied all of the 141 children. Educational game is played to the experimental group 2 days a week and an hour a day during 14 weeks in addition to their standart education. But the control group doesn't involve in any activities except for their standart education. At the end of the 14 weeks TCAM test is applied again both control and experimental group as a final test.

As a result of the statistical analysis of the obtained data significant differences has been determined in the fluency , originality, imagination and total creativity scores of the children in the experimental group compared to the children in the control group. In the light of the these datas , it can be said that under the guidance of the teacher, regular and well-planned educational game programmes make a significant contribute on children's creative thinking skills.

Key words: Movement Education, Creative Thinking, Educational Game

INTRODUCTION

The term of 'Creativity' which has some meanings such as to be able to think different from the others, to interpret events different from everyone, to create new things by using imagination is a really important subject that should be emphasized in children's World (Duch, 2007 & Dağhoğlu,2011). Because as adults we teach them what the objects are used for and their life styles as far as we know (Sungur, 1997). For instance; a carpet in the middle of a living room canbe a pool or a sea for their imagination, a sofa can be train, a table can be a hut for them. While teachers at school and parents at home are educating them they may try to stereotype them (Öztunç, 1999). That's why preschool period gains a lot more importance in terms of creativity education and development (Güven, 1999 & Konstantinidou, 2014).

Contribution of the pre-school education to children's multi-faceted development is indisputable (Pagona & Costas, 2008). Another crucial part for children in this period when the most free and original thoughts can be produced and the boundaries of imagination are challenged is movement and game(Cheung, 2010 & Çamlıyer and Çamlıyer 2009). Thinking Creatively in Action and Movement(TCAM) developed by E. P. Torrance came out because of the children's love of game and movement. Maybe children can express what they can not write, can not draw or can not tell with movement and game (Torrance, 1981).

METHOD

The study was planned to find out whether there is a contrubition or not playing educational games with the movement support under the teacher's guidance two days in a week, an hour a day during 14 weeks on children's creative thinking skills. In accordance with this purpose 141 children from two different kindergartens were included in this study. Children divided randomly 75 of them to the experimental group, 66 of them to the control group. Thinking Creatively in Action and Movement(TCAM) test developed by Torrance (1981) and adapted to Turkish by Karabulut (2012) was used as a scale for the study. The test includes 4 activities and has a format that provides to evaluate children's in terms of fluency, originality and imagination. 3 of these activities consist of open ended questions and some tests that allows children to answer by moving or orally. These 3 activities evaluate the number of the answers as fluency and individuality as originality. The other activity is designed to measure the children's imagination. The role given to children are asked to answer by movements (for ex; a rabbit running away from the hunter).

The test applied to the children at the beginning as pretest. While control group didn't participate in any planned activity except for standart education, experimental group 2 days a week ,an hour in a day under the guidance of

the teacher played educational games during 14 weeks. At the end of the period TCAM test applied as a final test and statistical analysis of all obtained data were done.

FINDINGS

Table 1: Distrubition of the participants according to the ages

	Hakki Kabaklarlı Kindergarten	Yunus Emre Kindergarten	N (total)
N (4 years old experiment)	19	12	31
N (5 years old experiment)	15	29	44
N (total)	34	41	75
N (4 years old control)	11	12	23
N (5 years old control)	21	22	43
N (total)	32	34	66

Totally 141 children aged 4 and 5 from two different kindergarten are included in the study. From Hakki Kabaklarlı Kindergarten, 34 children (19 children aged 4 and 15 children aged 5) are in the experimental group and 32 children (11 children aged 4 and 21 children aged 5) are in the control group. Likewise from Yunus Emre Kindergarten 41 children (12 children aged 4 and 29 children aged 5) are in the experimental group and 34 children (12 children aged 4 and 22 children aged 5) are in the control group. In general distrubition 75 children are in the experimental group and 66 children are in the control group.

Table 2: Comparison of the pretest datas between groups

FLUENCY					
Groups	N	Average	Sd	Average Difference	p
Experimental Group	75	10,67	2,38	,333	,203
Control Group	66	11,00	2,04		
ORIGINALITY					
Groups	N	Average	Sd	Average Difference	p
Experimental Group	75	6,19	3,87	1,065	,070
Control Group	66	5,12	2,90		
IMAGINATION					
Groups	N	Average	sd	Average Difference	p
Experimental Group	75	19,71	4,99	,263	,344
Control Group	66	19,97	4,37		

When the datas obtained from pretest are examined it is seen that average fluency score of the children from experimental group is 10,67 while the score of the children from control group is 11,00. When the originality scores are examined the average of the experimental group is 6,19 while control group average is 5,12. And when we look at the imagination scores we can see that the average of the experimental group 19,71 while the average of the control group is 19,97.

Accordingly, it can be understood from the table it can be said that before starting to the study there is not statistically difference at a level of $p < 0,05$ between two groups depending on obtained datas.

Table 3: Experimental group pretest - final test datas comparison

FLUENCY EXPERIMENTAL GROUP					
Groups	N	Average	Sd	Average Difference	p
Fluency Pretest	75	10,67	2,38	7,21	,000
Fluency Final Test	75	17,88	3,25		
ORIGINALITY EXPERIMENTAL GROUP					
Groups	N	Average	Sd	Average Difference	p
Originality Pretest	75	6,19	3,87	9,34	,000
Originality Final Test	75	15,53	4,92		

IMAGINATION EXPERIMENTAL GROUP					
Groups	N	Average	sd	Average Difference	p
Imagination Pretest	75	19,71	4,99	5,70	,000
Imagination Final Test	75	25,41	3,23		

When Table3 is examined the fluency pretest scores of the children in the experimental group were 10,67, while the final test scores increased to 17,88. When the originality values were examined, the pre-test averages increased from 6,19 to 15,53 in the final test. And finally imagination scores were examined score averages were 19,71 in the pretest results but at the end of the study the score increased 25,41. In the light of these datas it can be said that both observable and statistically significant developments were obtained in terms of each three sub-dimensions.

Table 4: Control group pretest - final test datas comparison

FLUENCY CONTROL GROUP					
Groups	N	Average	ss	Average Difference	p
Fluency Pretest	66	11,00	2,04	6,30	,000
Fluency Final Test	66	17,30	2,29		
ORIGINALITY CONTROL GROUP					
Groups	N	Average	ss	Average Difference	p
Originality Pretest	66	5,12	2,90	7,64	,000
Originality Final Test	66	12,76	3,76		
IMAGINATION CONTROL GROUP					
Groups	N	Average	ss	Average Difference	p
Imagination Pretest	66	19,97	4,37	1,86	,000
Imagination Final Test	66	21,83	3,79		

In the Table 4 there are datas obtained from the comparison of pretest and final test datas of control group in which children didn't involve in well planned, teacher guided educational games during 14 weeks they just kept standart kindergarten education. When these datas are examined it can be said that the children develop completely in fluency, originality and imagination sub-dimensions and this development is statistically significant.

Table 5: Comparison of the final test datas between groups

FLUENCY					
Groups	N	Average	sd	Average Difference	p
Experimental Group	75	17,88	3,25	,58	,003
Control Group	66	17,30	2,29		
ORINGINALITY					
Groups	N	Average	sd	Average Difference	p
Experimental Group	75	15,53	4,92	2,77	,013
Control Group	66	12,76	3,76		
IMAGINATION					
Groups	N	Average	sd	Average Difference	p
Experimental Group	75	25,41	3,23	3,58	,980
Control Group	66	21,83	3,79		

Datas obtained from the study show that children from both control and experimental group showed a statistically significant improvement in all three sub-dimensions of creativity during the 14 weeks. When the final test datas are examined development levels between groups are compared at Table5. Accordingly, based on the statistical datas it can be said that children in the experimental group developed more than the children in control group in terms of fluency and originality sub-dimensions. Although there is observable difference in terms of imaginary sub-dimension it can be said that statistically there is no significant development.

DISCUSSION AND CONCLUSION

In the light of the datas obtained from the study when table 2 is examined it is seen that at the beginning there is any significant difference between control and experimental groups in terms of fluency, originality and imagination. In other words it can be said that there is a balance in the distrubition of the children participated in the study.

When the results are examined at Table 3 datas of experimental group and at Table 4 datas of control group it has been determined that both group showed development in terms of all fluency, originality and imagination dimensions. This development has been found statistically significant. Because of the improvements in both groups, the developmental differences were compared to find out whether the additional 14 weeks game training programme contributed to the experimental group or not. When Table 5 is examined it can be said that experimental group showed more observably development than the control group in terms of the all three sub-dimensions. But statistically the result is different. While there is a significant difference in terms of fluency and originality, a significant difference cannot be determined in terms of imagination. It can be said that 14 weeks educational game programme has no significant effect on imagination. Activity game education has already takes place in the preschool education programme so it may cause these results.

There are few examples of TCAM test that is less preferred than the other creativity-related scales because of the length and difficulties in implementation. In the Zachopoulou's (2006) study ,included 251 pre school children aged 4 and 5, children were practiced movement trainig programme to develop creativity 2 days a week 35-40 minutes a day during 10 weeks and got similar results with this study (Zachopoulou & et al., 2006).

Educational programs should be arranged to allow children to think sophisticatedly and especially in preschool and elementary school period education should include more games (Razon, 1990 & Poyraz, 2003). If the children's imagination is directed positively in these years, the foundation of a enterpreneur generation who can produce creative ideas is laid (Fenc1, 2014 & Torrance, 1981).

THE EFFECT OF IN-SERVICE TRAINING ON THE TEACHER DEVELOPMENT: THE EVALUATION OF THE TEACHER PROFESSIONAL DEVELOPMENT PROGRAM

Memet KARAKUŞ
Çukurova University
Faculty of Education
Turkey
memkar@cu.edu.tr

ABSTRACT

The teacher has very important roles and responsibilities in reaching the aims of education, which is an important organ in the development of societies. Therefore, it is very important to train teachers who will introduce the desired knowledge, skills, attitudes, and values to individuals in the society and to provide them with the content knowledge, professional formation, and general culture they need. Providing the pre-service and in-service development of teachers is a very important issue. Subjects such as the need-based nature of in-service training, the suitability of the training time for employees, the functionality of the methods and techniques used in teaching, and the teaching period are the key elements that determine the effectiveness of this training, although its importance in the professional development is acknowledged by everybody. The aim of this study is to evaluate the secondary school teachers' perceptions of a professional development program. In this study, an evaluation of the in-service training program consisting of 8 modules of 3 hours for secondary school teachers was performed. The study group of the research, in which the qualitative method was used, consisted of 67 teachers participating in the in-service training. An interview form consisting of 11 questions was used as the assessment tool. As a result of the study, the teachers stated that the in-service training they received contributed to their professional development. Furthermore, the teachers expressed that they had difficulty with the problems related to the time of the in-service training and the room in which the training was provided. The teachers believe that the practical professional training integrating the theory with practice will be more beneficial. Teachers need in-service training in subjects such as the behavioural management, creativity, and problem-solving, educational technologies, and material development. Therefore, it may be more functional to provide the need-based in-service training to small groups rather than providing in-service training to very large and crowded groups. It is beneficial to develop continuous in-service training programs that will provide the participation of all teachers, although they contribute more to teachers who participate in the in-service training voluntarily.

Keywords: Teacher training, in-service training, curriculum development, adult education.

INTRODUCTION

Education, which generally refers to the behavioural changes in the individual, is one of the important means facilitating the adaptation to the rapid change and development in the present day. How to provide a quality education has always been one of the important questions that educators have been seeking an answer for. Throughout the history of education, debates about improving the quality of education have focused more on the teacher education. Teachers have a central role in the development of schools. The efficiency of the school is largely associated with the qualifications of teachers working at the school, the quality of their teaching, and the access of students to a quality education. According to Hoban (2002), this situation that teachers play a central role in the whole school system means that their competence and experiences generally have a great impact on the quality of schools. Therefore, professional qualifications and competence of teachers are important indicators in terms of the quality of education. In terms of providing the continuity and professional efficiency in the professional development, in-service training is also as important as pre-service training (Guskey, 2000; Craft, 2000; Huber, 2011). The development of the qualifications and the acquisition of a professional teacher identity by teachers can be achieved through the integration of pre-service and in-service training processes.

In-service training is a type of training that draws attention in terms of increasing the continuity and quality of education. In-service training is a set of knowledge and skill activities to increase the employee performance and

meet the professional needs (Guskey, 2000; Elmore, 2002; Huber, 2011). In today's world, in which the pace of change is very high, educators need continuous training to provide an effective education.

Although teachers work intensively, they have to constantly update their professional knowledge and skills in order to be able to perform their job effectively. When this intensity is taken into account, the necessity for teachers to use their time effectively and efficiently is also clear. Therefore, it is of great importance that in-service training programs are of good quality and need-based. It is necessary for teachers to follow both the technology and developments in different fields and continue their personal and professional development and transfer the knowledge they have acquired to students. For this reason, the in-service training activities for teachers are very important in terms of ensuring the continuity of the training for the personal and professional development of teachers. Through these programs, teachers will develop their knowledge of the lessons they teach and continue their general professional development.

In-service training programs performed within traditional patterns are nothing but a waste of time. It is not possible for the in-service teacher training, which is imposed on teachers, not need-based, out of context, and not implemented in the classroom, to be efficient. In-service training should support and to be considered as the continuation of the pre-service training. There is a need for scientific and functional training based on needs and practice in order to increase the effectiveness of in-service training. The scientific evaluation of the in-service training applied will also provide important contributions to the professional development in terms of offering an insight into future in-service training.

Teacher training programs can be examined and evaluated in different dimensions, such as investigating the effects of the program on teachers, content, skill development, and investigating teachers' perceptions of the program. In addition to providing information about the teachers' perceptions of the in-service training programs and the effectiveness of their components, this study could also give an idea to the program designers designing in-service training programs. Therefore, it is important to evaluate an in-service training program for teachers.

In parallel to the above explanations, in this study, it was aimed to "evaluate the secondary school teachers' perceptions of a professional development program". For this purpose, answers to the following questions were sought:

1. What are the opinions of teachers on the efficiency level of the in-service training program they have participated in, its contribution to their professional development, and on the application environment?
2. According to the teachers, what are the strong and weak aspects of the in-service training program they have received?
3. What are the most challenging and enjoyable dimensions of the in-service training of the teachers?
4. What are the recommendations of the teachers for in-service training programs to be performed?

METHOD

In the study carried out as a qualitative study, interview method was utilized. In qualitative studies, perceptions and incidents are tried to be put forward in a natural setting through a realistic and holistic manner (Yıldırım & Şimşek, 2011). Within the study, the perceptions of teachers regarding the teacher professional development program were tried to be described in an objective and holistic way. The information about the teachers constituting the study group is presented in Table 1 and Table 2 below.

Table 1. The distribution of the teachers constituting the study group by number, branch, and gender

Order	Branch	Gender		Total
		Female	Male	
1	Science	9	2	11
2	Turkish	9	1	10

3	English	8	2	10
4	Mathematics	5	3	8
5	Social Sciences	4	1	5
6	Visual Arts	3	2	5
7	Psychological Counseling and Guidance	4	-	4
8	Religious culture and Moral Knowledge	3	1	4
9	Technology and Design	2	1	3
10	Information Technologies	1	1	2
11	Music	1	1	2
12	Special Education	1	1	2
13	Physical Education	1	-	1
Total		51	16	67

As seen in Table 1, the study group of the research consists of 67 teachers from 13 different branches, 51 of which are female and 16 are male.

Table 2. The distribution of the teachers in the study group by the professional seniority

Professional Seniority	f	%
1-5 years	4	6
6-10 years	16	24
11-15 years	16	24
16-20 years	24	36
21 years and above	7	10
Total	67	100

As seen in Table 2, the study group consists of teachers with a professional experience at different levels. More than half of the participants have a seniority of 10 years and above. Therefore, it can be said that the professional experiences of the teachers participating in the study are high.

The Scope and Implementation of the In-service Training Program

The in-service training program, which is prepared in a modular way for the teachers working in four different secondary schools, consists of 8 modules of three hours each. The training for one module each week in the morning/noon for two groups lasted for 8 weeks in total. The training was provided in a room for 50 people of a private school in March and April 2017. The subject headings of the modules included in the in-service training are as follows:

- Effective Communication in Class
- Drawing Attention and Motivation in Class
- School Culture and Values Education
- Education of Critical Thinking in Class
- Teaching Methods and Techniques for Active and Meaningful Learning
- Integration of Education and Teaching: The Planning and Evaluation of Extracurricular Educational Process
- Teaching of Concepts and Generalizations
- Applications of Brain-Compatible Teaching in Class

Data Collection and Analysis

An Interview Form consisting of 11 open-ended and closed-ended questions was used as a measurement tool in the study. The interview form was presented to the experts in the educational sciences department and was applied after performing the necessary corrections in line with the feedbacks. The first four questions in the form are closed-ended and scored between 1-5. The other seven questions are open-ended. The graded items in the interview form were interpreted according to frequencies and percentages. The open-ended items were qualitatively described in terms of the sub-aims of the study. The participant teachers were coded as T1 and T2. In the relevant parts of the study, references were made from the teachers' opinions through these codes. In order to provide validity and reliability in the study, the study data were analysed according to the dimensions of Credibility, Transferability, Consistency, and Verifiability proposed by Mills (2003) for qualitative studies. In order to provide credibility, the results obtained from the study data were confirmed by one faculty member and two teachers who participated in the in-service training. In order to provide transferability, the data were described in detail, and the participants were directly quoted, and the quotations were tried to be presented in a way that the reader could understand. In order to increase the consistency of the study results, all of the findings obtained in the study were presented directly to the reader without making any comment and generalization. For verifiability, the raw data of the study are being kept by the researcher so that they could be examined by those concerned.

FINDINGS AND DISCUSSION

In this part, the findings obtained are discussed under 4 sub-headings in parallel with the questions an answer to which is sought in the direction of the aims of the study.

1. Opinions of the teachers on the productivity level, contribution to their professional development, and the application environment of the in-service training program they participated in

Opinions of the teachers on the motivation levels for the participation in the in-service training are presented in Table 3.

Table 3. The motivation levels of the teachers to receive the in-service training

Question: At what level would you like to participate in in-service training to be performed in this way in the future?		
Level	f	%
Never	2	3
Low	1	2
Moderate	11	16
High	31	46
Very High	22	33
Total	67	100

As seen in Table 3, a large majority of the teachers want to participate in in-service trainings at a high level. Some teachers interviewed in this regard expressed the following: *We, educators, received really good information (T25). It was very good to take private lessons from expert educators and to apply them (T54). Educators from universities transferred their experiences personally in the training (T47).* This can be interpreted as the fact that teachers are satisfied with the training they have received and that their motivation for participating in the new in-service training to be performed is high. In this respect, in a study conducted by Yurttaş (2014), seven of the ten teachers interviewed stated that the in-service training met their needs at certain rates. On the other hand, studies on teachers in our country show that teachers approach in-service trainings positively and they need courses covering new approaches (Akkuş & Kadayıfçı, 2007).

Opinions of the teachers on the contribution level of the in-service training to their professional development are presented in Table 4.

Table 4. The contribution level of the in-service training to the professional development of teachers according to their opinions

Question: At what level did the in-service training contribute to your professional development?		
Level	f	%
Never	-	-
Low	3	5
Moderate	15	22
High	39	58
Very high	10	15
Total	67	100

As seen in Table 4, a large majority of the teachers believe that the in-service training they have participated in makes contribution to their professional development at a high level. Some teachers interviewed in this regard expressed the following: *It gave me the opportunity to think about assessing myself professionally and about the student-centered education (T1). My motivation increased (T2). It reminded me of many applications I forgot... I realized better the importance of empathy in education (T5). I saw my weaknesses (T7). I revised and updated my professional knowledge (T10). My awareness of individual differences increased (T15). My ideas about what I can do as a teacher became clearer (T20). I learned what I can do to increase student motivation (T23). It enabled me to question education (T29).*

When the findings obtained from the opinions of the teachers are examined, it can be observed that “Remembering the previous professional knowledge”, “Updating the professional knowledge”, “Evaluating the self professionally and making self-criticism”, “Understanding the importance of student-centered education and methods”, “The fact that education increases the teaching motivation”, and “Contributing to critical thinking on education” are the points that teachers have emphasized at most for the level of contribution of the in-service training to their professional development. In the study conducted by Yurttas (2014), the teachers interviewed stated that the in-service training they participated in made positive contributions to them in terms of effective teaching techniques, participant-centered teaching, material development, and collaborative work. Similarly, in the study conducted by Önen, Mertoğlu, Saka and Gürdal (2009) on the effect of in-service training, it was determined that there were significant increases in the knowledge of teachers about teaching methods and techniques and constructivist approach following the in-service training.

The opinions of the teachers on the level of suitability of the environment in which the in-service training was provided are presented in Table 5.

Table 5. The level of suitability of the environment in which the in-service training was provided according to the opinions of the teachers

Question: At what level would you evaluate the suitability of the physical environment in which the in-service training was provided?		
Level	f	%
Not suitable	6	9
A little suitable	10	15
Moderate	20	30
High	26	39
Very High	5	7
Total	67	100

As seen in Table 5, there are 3 different opinions on the level of suitability of the environment in which the in-service training was provided. These are as follows; not suitable or a little suitable (24%), moderately suitable

(30%), and highly suitable (46%). Some teachers interviewed in this regard stated the following: *The room was small and the ventilation was inadequate (T14, T19, T46). The physical space was not suitable (T52, T53). Both the team and the environment were quite good (T59). The training environment and offerings were very good (T53).*

Teachers emphasized 2 points at the most in terms of the level of suitability of the environment in which the training was provided. These are not suitability of the room in which the lessons were given and the good quality of the offerings such as “food, tea, coffee, etc.” and services. The quality of the environment in which training is provided is very important. The quality of the education service affects many things about learning and teaching. If the environment is not very suitable for education, both the teacher and students may have problems in concentrating on the lesson, and their motivation may decrease. The fact that one-quarter of the participants have found the classroom in which the training was provided to be physically inadequate, although the majority of teachers participating in the study have found it suitable, is an indication that there are problems in this subject and that measures should be taken. In the study conducted by Karaçalı (2006), it was stated that the number of students, the seating plan of students, temperature, light, and ventilation of the classroom are the most important physical variables in the classroom management in achieving the aims of educational activities. Furthermore, it was emphasized that these variables have a great effect on communication in the classroom environment.

2. Opinions of the teachers on the strong and weak aspects of the in-service training they received

Opinions of the teachers on the strong and weak aspects of the in-service training they received are presented in Table 6.

Table 6. Opinions of the teachers on the strong and weak aspects of the in-service training program

Strong Aspects	Weak Aspects
<ul style="list-style-type: none"> • The effective training of experts, all of which are experienced academicians • Current, scientific, and functional nature of the subjects and presentations • Interactive training • Critical thinking-based education 	<ul style="list-style-type: none"> • The physical inadequacy of the teaching environment (small and unventilated classroom) • The inadequacy of course hours for the provision of the detailed information about the subject • The inability of the program to take into account sufficiently the needs of the schools of their own

As seen in Table 6, the facts that the teachers who provide in-service training are experienced and motivated, the topics presented are current and functional, and that the training is interactive and develops critical thinking were expressed by the teachers as the strong aspects of the in-service training. The physical inadequacy of the teaching environment, the short duration of the teaching period, and the inability of the training to take into account sufficiently the needs of the schools of the participating teachers were expressed by the teachers as the weak aspects of the in-service training.

With regard to the strong aspects of the training program, some teachers stated the following: *The fact that the teachers have given lessons willingly and their good communication with us have made this training effective. This training is really different from the unequipped formators in the seminars we have participated so far (T27). The compatibility of the training with the present conditions was very important for us to apply it (T43).* Regarding the weak aspects of the training program, the teachers also stated the following: *The use of traditional methods in some presentations (T1), the fact that the topics remain mostly in theory, the lack of applications (T5, T17, T19, T24, T25, T30, T31), the smallness of the room in which the training was provided (T14), some topics' remaining superficial due to time constraints (T7, T27, T32) are the weaknesses of the training program. The training with a large number of participants in a small and unventilated environment prevented the use of active methods such as drama (T12, T36, T37, T41, T46, T61).* In the study in which Yurttaş (2014) examined the strong and weak aspects of in-service training practices for teachers, it was determined that the classrooms were suitable in terms of technology and hardware and that the organizational dimension was the strongest aspect of the program. It was observed that the teachers were successful at the point of determining needs in general, but inadequate to identify some needs.

3. Opinions of the teachers on the dimensions they had difficulties in and enjoyed the most within the in-service training process

Opinions of the teachers on the dimensions they had difficulties in and enjoyed the most within the in-service training process are presented in Table 7.

Table 7. Opinions of the teachers on the dimensions they had difficulties in and enjoyed the most within the in-service training process

Challenging dimensions	Enjoyable dimensions
<ul style="list-style-type: none"> The difficulty of the transportation to the school where the training was provided Both receiving training and teaching on the same day Providing education in the midterm Difficulty in concentrating on lessons due to fatigue 	<ul style="list-style-type: none"> Actively participating in the lessons Having the opportunity to have a conversation with the teaching and experienced academicians Being a student again Participating in activities in the class Examples of the teachers from their lives The friendly and democratic nature of the training environment

When Table 7 is examined, the “transportation” and “fatigue” are the dimensions teachers find challenging and the “effective and efficient communication environment” attracts attention as the dimension teachers enjoy in the in-service training process. Some teacher opinions in this regard are as follows: *The distant location of the school where the training is provided and transportation are important problems (T1, T3, T6, T14, T16, T17, T19, T22, T28, T47). It was very difficult to go to school in the morning and participate wearily in the training after school (T4). It was a little difficult for me to come to training after school because it coincided with my lesson (T12). On Wednesdays, it was a problem for me to find a place to leave my child (T13). School in the morning and training in the afternoon interrupted our other responsibilities (T22). I did not have a car, so I had a lot of trouble coming to and going from the training (T40). I enjoyed the democratic atmosphere of the educational environment, lectures, and conversations with our teachers, the content of the lessons and the lessons we practised (T2, T3, T1, T10, T13, T16, T21, T30). It was good to have an interactive education, to meet and work with teachers working in different schools, and to feel like a student again (T8, T9, T11, T20 T31), (T20). I liked the examples from the experiences the teachers had, it felt familiar to me. I remembered being a student, I saw my obsessions and weaknesses, it was a very friendly environment (T26, T54).*

One of the planning processes that reduce the effectiveness of in-service training is the timing and duration of the seminar. The results of the study conducted by Şahin (2012) show that providing education in the midterm, the need for teachers to delay the current personal plans and the concern of not being able to catch their own program at school are evaluated as problems and that teachers have a problem with focusing in long sessions. Thus, in-service training provided for a longer period of time during September or June, and in shorter course hours during the day may increase the effectiveness of training.

4. Recommendation of the teachers for the in-service training programs to be performed

When the recommendations for the in-service training practices are examined together, the teachers recommend “the development of an in-service training approach, which is school-based and needs analysis-based, in which teachers participate voluntarily and also their duties and responsibilities outside the training are taken into account”. The opinions of some teachers in this regard are as follows: *The in-service training would be better if it was provided in our own school, according to our needs, and for voluntary teachers (T10, T30, T31, T33, T62). I would like the training to be in the form of workshops specific to the branches (T11, T12, T22, T26, T44, T46). Trainings centred on the problems we experience at school should be provided (T13). It would be better if the seminar was given during the term. It would be very useful to take teacher opinions when the seminars are determined (T31). I would like the practices we have made to be exhibited (T40). It would be good if we were considered to be on-duty and permitted on the days of the in-service training (T49).* It is observed that the emphasis of the teachers on the in-service training recommendations is on the school centeredness, needs analysis, voluntary participation, and functionality. This shows that while in-service training programs are being developed, they must conduct a thorough and detailed need analysis in the first step. The first step of the program development is performing the need analysis (Cekada, 2011). Thanks to this analysis, learning

objectives can be determined, and the program is designed and evaluated in the light of the data obtained. Other recommendations of the teachers are “*providing branch-based and workshop-based IST in each teacher’s own school*” and “*providing IST in periods when there are no lessons of teachers such as seminar periods*”.

The subjects that the participating teachers want to be included in the in-service training programs are the education on intervention in unwanted student behaviours (T1), science education through games and time management in education (T5), trainings related to innovation and creativity (T8, T59). The structure of the education systems of countries advanced in education, the Finnish education system (T12, T39), methods of increasing student motivation and problem-solving education (T13), drama, the use of technology in education, and positive examples in education (T22), classroom management and communication (T24), education for increasing the permanence in learning (T37), special education (T43), educational technologies and material development (T54), motivation and personal development (T57), and how a teacher becomes happy (T64). It is observed that the subjects that the teachers recommended to include in the in-service training are parallel to the individual and professional development and the contemporary developments in education. In the study conducted by Yurttaş (2014), it was determined that teachers had similar expectations regarding the subject headings of in-service training. These subjects can be taken into consideration when forming the content of in-service training programs to be planned in the future. On the other hand, providing school-centered in-service trainings draws attention as an important recommendation. The study conducted by Saban (2000) focuses on school-centered in-service training models and the principle that teachers should be responsible for their own education.

CONCLUSIONS

Teachers who have participated in the in-service training are satisfied with the training they have received. Teachers tend to participate in new in-service trainings to be performed at a high rate. Teachers think that the in-service training they have participated in has contributed to their professional development at a high level and is particularly useful in updating their professional knowledge, making self-assessment, and understanding better the student-centered education. There are teachers who find the in-service training environment adequate and inadequate. The strong aspects of the in-service training program according to teachers are the teachers’ providing the training being experienced, and having good professional knowledge and formations, the program content’s being current and functional, and the use of active teaching methods. The weak aspects of the program are regarded to be the physical inadequacy of the teaching environment, the short duration of teaching, and the inability of schools to address their own problems.

In the in-service training process, problems such as transportation to school where training is provided and situations such as the lack of preparation and fatigue arising from the teachers’ obligation to catch up with their own lessons in their schools in addition to the in-service training are the most challenging problems for teachers. The points that teachers enjoy at most are the comfort of the communication environment, meeting new friends who share the same branch and being a student again. The teachers want subjects such as the physical layout of the classroom, planning, communication, behavioural regulation, learning and teaching, educational technologies, critical and creative thinking, and brain-based learning to be included in the in-service training.

In parallel with the results mentioned above, it can be said that in-service trainings, which are school-centered, based on scientific need analyses, planned in the form of workshops with small groups on the basis of branches, are required. Coşkun and Daloğlu (2010) stated that teacher training programs should be in harmony with both theoretical and practical aspects. If in-service trainings are planned as trainings teachers need and voluntarily participate in, rather than a task they have to attend to, they will be more effective. In-service trainings should be provided at the beginning or end of the education period. There will be many problems such as fatigue and insufficient time in trainings to be provided at other times.

ABSTRACT

In this study, it was tried to investigate the effect of the augmented reality cards on teaching. For this purpose, the effect of the reality cards designed for astronomy subjects on students' attitudes towards astronomy, the effect on academic achievement and the opinions of students about reality cards were evaluated. Mixed method was used as research method in the study which quantitative and qualitative data were collected together. The study group consisted of 53 students studying in the seventh grade of a state school located in Erdemli district of Mersin province. Within this scope, a branch in the school was defined as experimental group including 26 students, and another branch as control group including 27 students. During the "Solar System and Beyond" unit, the subject was taught with augmented reality cards in the experimental group, while the control group was not intervened. The implementation continued throughout the unit. Attitudes towards astronomy scale and achievement test were applied as pre-test and post-test before and after implementation. In addition, open-ended interviews were held with two lower, middle and upper level students in the experimental group in terms of academic achievement. As a result of the analyzes, it was seen that both groups showed a positive change in their attitudes towards astronomy and an increase in the academic achievement on astronomy when the groups were examined within themselves. When the groups were compared, statistically significant difference was found in favor of the experimental group in both attitude and academic achievement. As a result of the interviews conducted with the students, the results revealed that they liked the augmented reality cards very much, could not really distinguish the images from the real objects, as if the planets were indeed in their classes and they learned much more easily.

Key words: Augmented Reality, Astronomy, Science Teaching, Attitude

INTRODUCTION

Today, technology is manifested in every aspect of our life. The technology that started in the early ages has been constantly changed and developed with imparting and fund of knowledge (Rıza, 2003). In recent years, information technologies have rapidly developed, service production has increased and globalization has accelerated. These developments have also affected the perception of education. Therefore, educational tools and equipment required to be changed in order to respond to today's needs. Societies that cannot catch up with the technology that develops in the field of education are behind in the educational standards (Karasar, 2002).

The increase in information resources, desire to reach and share information quickly and the 21st century skills to be technology-oriented has made it necessary for technology to be used in education, and it has also directed the studies carried out in the field of education in recent years (Wang and Hannafin, 2005; Sonyürek, 2014). As a result of these developments, the organizations that determine the qualifications to be reached in education set out serious policies in order to ensure the integration of information technologies into the teaching process and implement comprehensive projects in this direction (European Parliament and the Council, 2006; UNESCO, 2008; FATİH, 2012). Moreover, the integration of the technology into existing curriculum has become a necessity in responding to the diverse expectations of today's youth, nowadays known as Digital generation or Z generation. It is quite normal to need technology in this kind of learning environment that is intertwined with technology at every moment of their lives (Prensky, 2001; Oblinger and Oblinger, 2005; Kennedy et al., 2008; Sonyürek, 2014). For this reason, it is thought that traditional learning methods and environments are not enough to attract their attention as they were in previous generations. On the one hand, different technological developments have to be transferred to the educational environment in order to attract Z generation's attention and provide an efficient training (Bennett, Maton and Kervin, 2008; Somyürek and Karabulut-Koskun, 2013). A real learning experience is always necessary. Involving more senses into learning makes it easier, effective, stronger and permanent. In this context, augmented reality emerges as a developing technology for education (Walczak, Wojciechowski and Cellary, 2006;

Lai and Hsu, 2011; Luckin and Fraser, 2011). Augmented reality (AR), which can be defined as a computer enrichment of the real world, has the potential to be more accessible in recent years with the development of technology. AR is defined as a blended technology of real world and virtual images, and provided a real-time interaction with the virtual environment (Azuma, 1997). Technology of Augmented reality emerged in the 1970s after Ivan Sutherland and his students began working on computer graphics at Harvard and Utah universities in the 1960s. Officially, the US Air Force and NASA have been able to use this technology for the first time since 1990 (Feiner, 2002).

This technology can easily interact the user with events and objects in natural ways using with a variety of tools such as desktop computers, laptop computers, portable devices, and smartphones (Kirner, Reis and Kirner, 2012; Wojciechowski and Cellary, 2013). The new opportunities for learning and teaching provided by augmented reality have been recognized by the educators over time and coexistence of virtual objects and real environments have been found to help students to understand the complex and abstract concepts (Arvanitis et al., 2007; Wojciechowski and Cellary, 2013). In addition, AR combines learning environments with the real world in which students live, allowing the seamless implementation of knowledge and skill (Lave and Wenger, 1991).

Communication between users and both real and virtual objects allows them to learn through experience and increase their motivation (Singhal, et al., 2012). While AR technology embodies abstract objects and makes invisible events visible, it also removes potentially dangerous situations. For these reasons, it is emphasized that the use of AR technology in education will increase the effect of education on the student (Walczak, Wojciechowski and Cellary, 2006). Moreover, AR applications attract children's interest because they can move and intervene, and make learning fun and permanent (Billinghurst, Kato and Poupyrev, 2001; Bujak et al., 2013; Oh and Woo, 2008; Wojciechowski and Cellary, 2013; Zhou, Cheok and Pan, 2004).

As implied in the literature, it is seen that AR applications provide an important contribution to the education process, but new application examples are also needed (Martin et al., 2011; Wu et al., 2013). In addition, the internal decision-making mechanism, ie, the reaction of learners, is very important in the process of integrating new technologies into the educational process (Venkatesh, et al, 2003). For this reason, students' attitudes towards the topics they learn with the help of AR will give clues about the effectiveness of AR. However, the impact of AR on the success of students needs to be examined (Clark, Nguyen and Sweller, 2005), since it is thought that it is an important variable in determining the effectiveness of the learning of change in students' achievement.

From all these, the study tried to investigate the impact of the AR on the attitudes and success of the students. In this context, the astronomy was chosen as the topic and the "Solar System and Beyond" unit of the seventh classes was chosen as the base. The fact that the subject which is being tried to teach at various stages contains extremely large objects, the concepts that planned to impart cannot be experimented by touching or feeling make it difficult for the students to learn the astronomy. In addition, observes and images remain in 2D, makes difficult to shape concepts in mind for students (Şener, Demirhan and Kalyoncu, 2005). The issue of astronomy has been chosen since AR thought to overcome these difficulties.

METHOD

In the study, the mixed method sequential explanatory research design was used. In sequential explanatory patterns, the researcher first collects and analyzes quantitative data, then collects and analyzes qualitative data to better explain quantitative data (Creswell, 2003).

According to Sönmez (2005); universe and sample should not be selected in the experimental research. For this reason, generalization of the universe was ignored and the study group was chosen. The study group consisted of 53 students studying in the seventh grade of a state school located in Erdemli district of Mersin province. Within this scope, a branch in the school was defined as experimental group including 26 students, and another branch as control group including 27 students. During the "Solar System and Beyond" unit, the subject was taught with augmented reality cards in the experimental group, while the control group was not intervened.

The "Astronomy Attitude Scale" developed by Zeilik et al. (1999) and adapted to Turkish by Canbazoğlu-Bilici et al. (2012) was used in the study to determine the astronomical attitudes and the effect of AR on the astronomy attitudes of the students. As a result of the analyzes, data revealed that original scale was different from the adapted scale which had two subscales and consist of 15 items. The Cronbach alpha internal consistency coefficient of the scale was .80. The Cronbach alpha internal consistency coefficient of the two factors of the scale is .71 and .77.

The "Astronomy Achievement Test" developed by Arıcı (2013) was also used to determine the students'

astronomic success levels and the effect of AR on astronomical achievements. In the first phase, after the test consisting of 50 questions with 4 options in multiple choice and 20 questions were given and the reliability coefficient was found .76 .

In addition, open-ended interviews were held with two lower, middle and upper level students in the experimental group in terms of academic achievement. In the interviews, questions were asked to the students about how they found the practice and what the application made them feel.

The AR cards used in the study are; developed by ATF studios. On one side there is the object or the visual of the concept, on the other side there are the texts that are voiced when it is opened by the program. The sample images that are opened with the program are as follows:

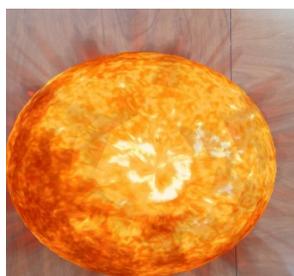

Galaxy

Black Hole

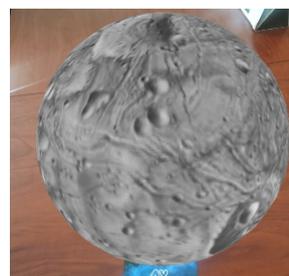

Solar system

Sun

Earth

Moon

FINDINGS

The findings of this study which aims to examine the effects of augmented reality cards on student attitudes and academic achievements are presented and interpreted below. In this context, it was examined whether the scores obtained from the scales were homogeneous and assumptions of normal distribution were checked. The F-test for homogeneity and the Shapiro-Wilk test for normality were used since the groups were smaller than 50. As a result of the analyzes, it was determined that the scores of the groups were homogeneous but not normal. Therefore, non-parametric tests were used for other analyzes.

The analysis of the students' Astronomy Achievement Test scores are given in Table 1 and Table 2:

Table 1. U test Results of the Groups on Astronomical Achievement pre-test

Group	N	mean rank	sum of ranks	U	p
experimental	26	23,87	620,50	269,50	,141
Control	27	30,02	810,50		

The Mann Whitney U-test results of the pre-intervention experimental and control group students' scores on the astronomy achievement test are given in table 1. Accordingly, before the "Solar System and Beyond" unit, there was no statistically significant difference between the astronomical achievement scores of the experimental and control group students, $U = 269,50$, $p > ,05$.

Table 2. U test Results of the Groups on Astronomical Achievement post-test

Group	N	mean rank	sum of ranks	U	p
experimental	26	38,54	1002,00	51,00	,000
Control	27	15,89	429,00		

Mann Whitney U-test results on the astronomical achievement scores of the groups were given in Table 2 after the "Solar System and Beyond" unit was lectured in experimental and control groups. Accordingly, there appears to be a statistical difference between the scores of the experimental and control groups after the astronomical achievement test was given, $U = 51.00$, $p < .05$. The difference in favor of the experimental group can be interpreted as the use of the augmented reality cards become more effective when the "Solar System and Beyond" unit is being processed. It is also believed that seeing the concepts in three dimensions rather than two dimensions make it easier for students to learn.

The analysis of the students' scores on the Astronomy Attitude Scale is given in Table 3 and Table 4:

Table 3. U test Results of the Groups on Astronomy Attitude Scale pre-test

Group	N	mean rank	sum of ranks	U	p
experimental	26	26,12	679,00	328,00	,680
Control	27	27,85	752,00		

Mann Whitney U-test results on the astronomy attitude scale pre-test scores of the students in experimental and control groups were given in Table 3. According to this, before the "Solar System and Beyond" unit, there was no statistically significant difference between astronomical attitude levels of experimental and control group students, $U = 328.00$, $p > .05$.

Table 4. Grupların Astronomi Tutum Ölçeği Son-testlerinden Aldıkları Puanlarının U-Testi Sonuçları

Group	N	mean rank	sum of ranks	U	p
experimental	26	36,02	936,50	116,50	,000
Control	27	18,31	494,50		

Mann Whitney U-test results on the astronomy attitude scale scores of the groups were given in Table 2 after the "Solar System and Beyond" unit was lectured in experimental and control groups. Accordingly, there appears to be a statistical difference between the scores of the experimental and control groups after the astronomical achievement test was given, $U=116,50$, $p<.05$. The difference in favor of the experimental group can be interpreted as the use of the augmented reality cards increase the positive attitude towards astronomy when the "Solar System and Beyond" unit is being processed. It is also believed that seeing the concepts in three dimensions rather than two dimensions make an positive effect on attitudes towards astronomy.,

As a result of the open-ended interviews made with the students; in general, the results revealed that they liked the augmented reality cards very much, could not really distinguish the images from the real objects, as if the planets were indeed in their classes and they learned much more easily. They also stated that the information they learn is more permanent, appealing to more senses, much fun and very advantageous. Some of the views of the students about the AR are as follows:

"I love it. It was very fun listening to the lesson. I also did not have any interest in these subjects, but after the lessons I made searches about the planets from the web and read new things. "

"Very beautiful lessons. Let's work always this way. I learned very easily and got a high score on the exam. It was so beautiful both telling the subject and showing as if it was real and made me understand easy "

"In this way, our class was a lot of fun. I like these cards very much. Because they were as good as real, we are able to intervene like we want, and we can examine the part we want more easily. "

"These cards were very beautiful. I wish there were more for other lessons too. It was very easy to learn by seeing the planets. It was also very nice to talk about the planet while watching the planet. "

"It seems as if the planets were in our class. They were like real. At first, I was tough, but then I started to enjoy it as I learned. While our teacher was talking about it, I learned quickly because we saw it all the time. "

"The fact that it was three-dimensional affected me very much. I guess it was real. If I were a teacher, I would always use them in my classes. It makes easy to teach and give my lecture. I liked the lesson because it was explained in this way. "

"Everything we see visually provides more permanent instruction. So, this course was very good. It was also very good to use tablets in lessons "

"When our teacher first showed us, I was very interested. I think should be used in every lesson. I would use them if I were a teacher. Because technology is remarkable, which is unusual. "

"We both heard and intervened. That's why it appealed many of our senses. Since it was three-dimensional, we have seen and understood better. And everyone participated in the class. I think these issues were difficult but we understood it easily. "

CONCLUSIONS

Experts who focus on how advanced technologies can be used to add value in teaching today are treating technology of augmented reality as an effective environment / method (Dunleavy, Dede and Mitchell, 2009; Clarkeand Dede, 2007; Kozmaandanderson, 2002). Augmented reality technology, which enables the real world to be supported and enriched with information created in the virtual environment, provides opportunities for digital generation who was surrounded by computers, video cameras, smart devices in order to supply entertaining and participatory learning experiences (Somyürek, 2014).

In this study, the impact of the AR on the attitudes and academic achievements of the students was examined. In this context, AR cards developed by ATF studios were used. The implementation lasted for one month during the process of unit. At the end of the research, the changes in attitude and achievement levels of AR cards were examined.

When the attitudes of the students were examined, it was seen that there was a statistically significant difference between the students' pre-test and post-test attitude scores. In other words, the attitudes of the students were positively affected by AR. In addition, results indicate that, students who used AR cards were very happy to use these applications, wanted to use even in other lessons, and had fun while using AR. This can be expressed as an attentive learning environment for the students, and a positive attitude of the students. In addition, the students' first encounter with the application and their interaction with the application also positively affected their attitudes. This situation is also supported by some other researches in the literature (Klopfer and Squire, 2008; WeilandElias; 2011; Vate-U-Lan, 2012; MahadzirandPhung 2013; Wu, et al., 2013).

When the success levels of the students are examined, they show similar results with attitude levels. It has been found that the students' academic achievement levels increases more with the education provided by AR cards. The fact that the students have more fun, the interaction with the application in the teaching process, the visualization with the three dimensions and intervention, providing the individual learning have positively affected the success of the students. Since the AR cards attractive lead to an increase in the motivation of the students. This result is similar to some other studies in the literature (Bradford, 2011, Wojciechowski and Cellary, 2013, Bujak et al., 2013, Küçük, Yılmaz and Göktaş, 2014).

As a result; It was noticed that secondary school students were satisfied with AR cards and they had a lot of fun while learning astronomy. Also, students stated that AR cards should be used in other subjects and lessons. The students' progress in fun, easy learning, interactively participating in lessons and enabling individual learning have improved positive attitudes, which has reduced the anxiety level of the students, and increased their success. From all these, it is thought that AR is an effective material in teaching and should be used.

ABSTRACT

The interpretation at a historical museum is an educational activity that explains the contents and meaning of the resources possessed by the museum. It is important to understand the relationship between the contents of the interpretation, the personality of the visitors, and the effect of the interpretation, because the interpretation can enhance the visitors' awareness of history and enhance the interest and support of the museum. However, it is difficult to find a systematic analysis of the relationship between three variables so far. The purpose of this study is to analyze the effects of message types of interpretation on visitors' willingness to support at a historical museum focusing on the moderating effects of visitors' personality.

One of the major tasks of interpretation research is to understand the roles of rational and emotional ways as appealing methods. The role of the appeal depends on audience and the subject of the interpretation. The previous researches show that delivery and the persuasive effects of the interpretation differ as the appeal types and visitors' personality work. Based on the results of literature reviews, Hypothesis 1 is formulated that rational appeal type and emotional appeal type of interpretation have different effects on visitors' willingness to support; and Hypothesis 2 is formulated that the relationship between two message appeal types of interpretation and willingness to support changes depending on visitors' personality.

Experiment methods are planned and experiments are underway to test the hypothesis. Two classes, which consist of 45 homogenous college students, will be presented with a description of the same theme and amount of rational appeal and emotional appeal explaining the history of Seodaemun Prison Museum, which contains the sad history of Korea. As a result of data obtained through the experiment, the hypothesis test will be performed. On the other hand, theoretical and practical implications of the hypothesis test results will be discussed. (The experiment will be completed in mid-June, and the experimental results will be included in the final paper and will be presented at the conference).

Keywords: *Interpretation Appeal Type, Willingness to Support, Visitors' Personality, Historical Museum*

THE EFFECT OF LEARNING LEADERSHIP ON PROFESSIONAL LEARNING COMMUNITY IN THAI SECONDARY SCHOOLS

ABSTRACT

This study aimed to examine the learning leadership and professional learning community and the impacts of the two variables in Thailand Secondary Schools. A total of 600 samples were selected using stratified random sampling. This study employed quantitative survey design using questionnaire as an instrument and analyzed by structural equation modeling. Results indicated that the relationship model between learning leadership and professional learning community was consistent with empirical data, with $X^2 = 38.811$, $df = 31$, $p = .158$, $X^2/df = 1.625$, $RMSEA = .020$, $SRMR = .007$, $CFI = .999$ and $TLI = .997$. Finally, the overall effect of learning leadership towards professional learning community was 88.30 percent.

INTRODUCTION

Learning leadership is defined as a strong determinant of directive outcomes at the micro and macro level of school operation (Kouzes & Posner, 2016). As it is prominent, and because of the fundamental importance of education, the nature and formation of leadership instinctively is also essential for anyone concerned with shaping practice and policy (CERI Board Report, 2013). Since learning is the core business of education, this represents the dominant form of disseminated associated activities and relationships. Therefore, learning leadership is able to prepare school principals and others for continuous success and provides school principals with a 'play and win' approach to respire new life into the team performance. Learning leadership boosts school principals' understandings of their individual leadership strengths and weaknesses (Somprach, Tang & Popoonsak (2017). Subsequently, school principals will master new ways of approaching challenges and overcoming obstacles. This improves interactions with their team members by building strong bonds. In addition, they manage conflicts through successful leadership transactions and coach their team members to develop their potential. Learning leaders develop resilience in the face of adversity (Kohlreiser, 2013). In short, learning leadership is focused on creating and sustaining environment that are conducive to good learning. Innovation is an essential part of the exercise of learning leadership in setting new directions and designing learning environment (Somprach & Tang, 2016).

Professional learning communities can produce resources such as lesson plans, worksheet, and other teaching aids for furthering pedagogical innovation, yet the dynamics and level of success differ among teachers because of the varying support provided by school principals. Based on the report from Office of National Education Commission (2002), Thailand's basic education depends on a growing number of effective school principals to promote professional learning community practice as one of the shared responsibilities and collaborative actions for both teachers and students. The findings of Somprach et al. (2017) showed that knowledge representations that guide the practice of professional learning communities are rich and openly accessible to all teachers under the facilitative guidance of school principals who exhibit learning leadership. Their finding breaks the new ground in suggesting that school principals should focus on learning leadership style as the most significant predictor to promote participation of teachers in professional learning communities. On this line of reasoning, professional learning communities which was associated with learning leadership and the performance of the school principals, it is critical for school principals to consider and enhance learning leadership behavior appropriately in the workplace.

LITERATURE REVIEWS

Somprach and Tang (2016) employed grounded theory as a systematic methodology to construct the learning leadership theory. A total of six outstanding principals from two different levels of primary and secondary education were selected as informants. Their findings revealed that learning leadership of school principals are comprised of 10 dimensions. These 10 dimensions are creativity and courage, powerful environment for learning, flexibility, integration, technologies application, team learning, self-directed learning, transformation process and tailor made, sufficiency economy philosophy, and research. Their findings implied that learning leadership of principals would improve the efficiency of management as well as teaching and learning of school

community thus developing a learning community. Hence, the implication of their study is congruent with the National Education Plan of Thailand (2009-2016).

Learning leadership as a term is not regularly used but it give emphasis to how important leading and designing for learning is, yet to make a distinction from related concepts such as team learning, technology, innovative learning, environment, evaluation, collaboration, research, creativity, and vision (Tubin, 2013). The basic concept of learning leadership had further supported by Salavert (2013). Salavert studied on learning leadership behaviors which are comprised of shared learning, team learning, innovative learning, and instructional development that are directly connected to improved student outcomes underscore the importance of promoting, supporting, and participating in professional learning by setting strategies for instruction and designing learning models. Subsequently, Halbert and Kaser (2013) included a complete description of this learning leadership approach with examples British Columbia schools, made conclusion of key characteristics on 21st century learning leaders is the relentless focus on the experiences of the learners to frame and inform the process.

According to Somprach, Ariratana, and Tang (2013), professional learning community practice has been widely promoted in most of the high schools in Thailand. The professional learning community model included development, use, and discussion of common formative assessment processes as a core activity. Besides, the works of in-building mentors have to integrate in professional learning community practice to provide job-embedded professional development to teachers (Borman, 2012). As a result, the continuing adoption and natural discrepancy across schools and teachers offer the potential to observe variation in schools' and teachers' adoption of the professional learning community practice in Thailand.

RESEARCH OBJECTIVES

The main objective was to study the linear structural relationship model of the learning leadership and professional learning community practice in secondary schools. Specifically, researchers identified the learning leadership implemented school principals before examining the factors of learning leadership that affecting the professional learning community practice.

METHOD

A survey questionnaire was employ as a method to collect quantitative data. Sample size was determined based on Hair, Black, Anderson, and Tatham's (2016) rules of thumb. Hair et al. proposed that the ratio between the samplings and the parameters or variables in a factor analysis should be at a minimum of 50 but not less than 100 in proportion with the variables. Since there were 60 parameters and the ratio was 10 to 1, the sample size was identified as 600. Stratified random sampling was employed to select the samples according to school size after considering the secondary school consortiums in proportion with the total population of school principals and teachers who affiliated to the schools under the Office of Secondary Educational Service Area 25. The unit of analysis was school and a five-point Likert scale questionnaire was used as a mode of data collection.

Structural Equation Modeling (SEM) was utilized in order to fit the model with empirical data. SEM is a combination of factor analysis and regression or path analysis. SEM is a comprehensive statistical modeling tool for analyzing multivariate data involving complex relationships between and among variables (Hoyle, 1995). In addition, SEM is a powerful technique that can combine complex path models with latent variables (factors). Using SEM can specify the relationships between variables using two main sets of equations namely measurement equations and structural equations. Measurement equations are used to examine the accuracy of proposed measurement by considering relationships between latent variables and their respective indicators. The structural equations are used to drive the assessment of the hypothesized relationships between the latent variables, which permit testing the statistical hypotheses of the study (Byrne, 2010). In addition, SEM considers the modeling of interactions, nonlinearities, correlated independents, measurement error, correlated error terms, and multiple latent independents each measured by multiple indicators. On this line of reasoning, the interest in SEM is often on the theoretical constructs are represented by the latent factor.

The relationships between the theoretical construct are represented by regression or path coefficients between the factors. The structural equation model implies a structure for the covariance between the observed variables. Nowadays structural equation models need not be linear, and possibilities of SEM extend well beyond the original LISREL program or Mplus program. SEM provides a very general and convenient framework for statistical analysis that encompasses several traditional multivariate procedures, for example factor analysis, regression analysis, discriminate analysis, and canonical correlation, as special case. Structural equation models are often visualized by graphical path diagram. The statistical model is usually represented in a set of matrix equation. Mplus utilized in this study allows the model to be specified in a graphical way, by allowing the user draw the path diagram directly in an interactive command window.

The Chi-Square value (χ^2) is the traditional measure used for evaluating overall model fit and, assesses the magnitude of discrepancy between the sample and fitted co-variances matrices' (Hu and Bentler, 1999: 2). According to Kenny and McCoach (2003), the Chi-Square statistic would lack of power when small samples are used. Thus Chi-square values may not discriminate between good and poor fitting models. Owing to the restrictiveness of the Model Chi-Square, Wheaton, Muthen, Alwin and Summers (1977) suggested the other alternative statistic that can minimize the impact of sample size will be relative/normed chi-square (χ^2/df)

Confirmatory factor analysis (CFA) is part of SEM and plays an important role in measurement model validation in path or structural analysis. Therefore, CFA tests a prior hypothesis about relations between observed variables and latent variables or factors. Hence, CFA is a powerful statistical tool to examine the nature and relations among latent construct (Brown, 2006; MacCallum & Austin, 2000). CFA was used to evaluate the initial measurement model whether the measured variables accurately reflecting the desired constructs or factors before assessing the structural model. As a result, in this study SEM not only used to obtain estimates of the parameters of the model such as the factor loading, the variances and covariance of the factor, and residual error variances of the observed variables but also used to assess the fit of model, for example to assess whether the model itself provides a good fit to the data.

The RMSEA tells us how well the model, with unknown but optimally chosen parameter estimates would fit the population covariance matrix (Byrne, 1998). Recommendations for RMSEA cut-off points have been reduced considerably in the last fifteen years. Up until the early nineties, an RMSEA in the range of 0.05 to 0.10 was considered an indication of fair fit and values above 0.10 indicated poor fit (MacCallum, Browne, & Sugawara, 1996). It was then thought that a RMSEA of between 0.08 to 0.10 provides a mediocre fit and below 0.08 shows a good fit (MacCallum et al, 1996). However, more recently, a cut-off value close to 0.06 (Hu and Bentler, 1999) or a stringent upper limit of 0.07 (Steiger, 2007) seems to be the general consensus amongst authorities in this area. One of the greatest advantages of the RMSEA is its ability for a confidence interval to be calculated around its value (MacCallum et al, 1996). This is possible due to the known distribution values of the statistic and subsequently allows for the null hypothesis (poor fit) to be tested more precisely (McQuitty, 2004). It is generally reported in conjunction with the RMSEA and in a well-fitting model the lower limit is close to 0 while the upper limit should be less than 0.08.

The Goodness-of-Fit statistic (GFI) was created by Jöreskog and Sorbom (1993) as an alternative to the Chi-Square test and calculates the proportion of variance that is accounted for by the estimated population covariance (Tabachnick & Fidell, 2007). This statistic ranges from 0 to 1 with larger samples increasing its value. When there are a large number of degrees of freedom in comparison to sample size, the GFI has a downward bias (Sharma, Mukherjee, Kumar, & Dillon, 2005). Related to the GFI is the Adjust Goodness-of-Fit statistic (AGFI) which adjusts the GFI based upon degrees of freedom, with more saturated models reducing fit (Tabachnick & Fidell, 2007). In addition to this, AGFI tends to increase with sample size. As with the GFI, values for the AGFI also range between 0 and 1 and it is generally accepted that values of 0.90 or greater indicate well-fitting models. Given the often detrimental effect of sample size on these two fit indices they are not relied upon as a stand-alone index, however given their historical importance they are often reported in covariance structure analyses.

The Root Mean square Residual (RMR) and the Standardized root mean square residual (SRMR) are the square root of the difference between the residuals of the sample covariance matrix and the hypothesized covariance model. The range of the RMR is calculated based upon the scales of each indicator. The standardized RMR (SRMR) resolves this problem and is therefore much more meaningful to interpret. Values for the SRMR range from zero to 1.0 with well-fitting models obtaining values less than 0.05 (Byrne, 1998; Diamantopoulos & Siguaw, 2000), however values as high as 0.08 are deemed acceptable (Hu & Bentler, 1999). The Comparative Fit Index (CFI: Bentler, 1990) is introduced by Bentler (1992) and subsequently included as part of the fit indices in his EQS program (Kline, 2005). This statistic assumes that all latent variables are uncorrelated (null/independence model) and compares the sample covariance matrix with this null model. A cut-off criterion of $CFI \geq 0.90$ was initially advanced however, recent studies have shown that a value greater than 0.90 is needed in order to ensure that miss-specified models are not accepted (Hu & Bentler, 1999). From this, a value of $CFI \geq 0.95$ is presently recognized as indicative of good fit (Hu & Bentler, 1999).

RESULTS

The identification on the levels of variables in this study are indicated in Table 1 as proposed by Glass and Hopkin (1984).

Table 1. Interpretation of variable level based on mean score

Mean score range	Interpretation
4.50 – 5.00	Highest
3.50 – 4.49	High
2.50 – 3.49	Medium
1.50 – 2.49	Low
1.00 – 1.49	Lowest

Learning leadership and its dimensions implemented by school principals

Table 2 shows the mean scores and standard deviations of learning leadership dimensions namely sufficiency philosophy, transformational process and tailor making, ICT for learning and management, creativity, integration, team learning, self-directed learning, flexibility, and powerful environment for learning and innovation. As indicated in Table 2, the mean score for all the nine learning leadership dimensions from school principals' practices ranged from 4.12 to 4.24. Average mean score of learning leadership from school principals' practices was 4.17. Generally, respondents' perceptions on their school principals' overall learning leadership practice were high.

The result of the study revealed that all the learning leadership dimensions from school principals' practices were at high level. Considering the first three orders, found that the highest level was in the sufficiency philosophy dimension ($\bar{x} = 4.24$, $SD = .57$). The second order was ICT for learning and management dimension ($\bar{x} = 4.21$, $SD = .51$). The third order was transformational process and tailor making dimension ($\bar{x} = 4.19$, $SD = .54$). This is followed by creativity dimension ($\bar{x} = 4.17$, $SD = .56$). There were three learning leadership dimensions included integration, team learning, and self-directed learning dimensions at the same level of practices ($\bar{x} = 4.15$) with the different standard deviation values as 0.58, 0.53, and 0.50 respectively. Next was flexibility dimension ($\bar{x} = 4.13$, $SD = .52$). The learning leadership dimension with the lowest level of average value was the powerful environment for learning and innovation ($\bar{x} = 4.12$, $SD = .58$).

Table 2. Learning leadership and its dimensions practiced by school principals

Learning leadership dimensions	\bar{x}	SD	Interpretation
Sufficiency philosophy	4.24	0.57	High
ICT for learning and management	4.21	0.51	High
Transformational process and tailor making	4.19	0.54	High
Creativity	4.17	0.56	High
Integration	4.15	0.58	High
Team learning	4.15	0.53	High
Self-directed learning	4.15	0.50	High
Flexibility	4.13	0.52	High
Power environment for learning and innovation	4.12	0.58	High
Total	4.17	0.46	High

Professional learning community practice and its attributes

Table 3 shows the mean scores and standard deviations of professional learning community practice and its attributes namely supportive and shared leadership, supportive conditions, collective learning and application of learning, shared values and vision, and shared personnel practice from respondents' perceptions. As indicated in Table 3, the mean scores for all the five professional learning community attributes ranged from 4.07 to 4.21. Average mean score of professional learning community practice from respondents' perceptions was 4.17.

Table 3. Professional learning community practice and its attributes

Professional learning community practice	\bar{x}	SD	Interpretation
Supportive and shared leadership	4.21	0.49	High
Supportive conditions	4.20	0.46	High
Collective learning and application of learning	4.19	0.48	High
Shared values and vision	4.17	0.53	High
Shared personnel practice	4.07	0.64	High
Total	4.17	0.42	High

The results of the study revealed that all the professional learning community attributes from respondents' perceptions were at high level. Considering the first three orders, found that the highest level was in the supportive and shared leadership attribute ($\bar{x} = 4.21$, $SD = .49$). The second order was supportive conditions attribute ($\bar{x} = 4.20$, $SD = .46$). The third order was collective learning and application of learning attribute ($\bar{x} = 4.19$, $SD = .48$). This is followed by shared values and vision attribute ($\bar{x} = 4.17$, $SD = .53$). The attribute with the lowest level of average value was shared personnel practice ($\bar{x} = 4.07$, $SD = .64$). The overall mean score for professional learning community practice from respondents' perception was at high level ($\bar{x} = 4.17$, $SD = .42$).

Factor loading and validity of observable variables in the relationship model

As indicated in Table 4 below, factor loading values of all the learning leadership dimensions ranged from 0.761 to 0.909 are statistically significant at 0.01. Factor loading is the importance of standard factors of each dimension or attribute in the relationship model of learning leadership and professional learning community practice of the school principals that have been taken into consideration. The co-variance with learning leadership was from 57.90 to 82.50 percent. The dimension with the highest factor loading was self-directed learning. This is followed by flexibility, powerful environment, technology for management and learning, integration, team learning, transformational process and tailor making, and sufficient philosophy dimensions respectively. The dimension that had the lowest factor loading was creativity. As a result, all the dimensions are found to be important construct of learning leadership.

On the other hand, as for construct of professional learning community practice showed the factor loading values from 0.490 to 0.795 are statistically significant at 0.01. The co-variance with professional learning community was from 24.00 to 63.20 percent. The attribute with the highest factor loading was supportive conditions, followed by supportive and shared leadership, and collective learning and application of learning respectively. The attribute receiving the lowest factor loading was the shared personnel practice. All constructs were important as the attributes of professional learning community practice.

Table 4. Factor loading and validity of observable variables in the measurement model

Factors	Matrix of Factor loading			
	β	SE	t	R ²
Learning leadership dimensions				
Self-directed learning	0.909	0.011	0.000	0.825
Flexibility	0.832	0.016	0.000	0.693
Power environment for learning and innovation	0.831	0.017	0.000	0.691
ICT for learning and management	0.826	0.017	0.000	0.682
Integration	0.821	0.015	0.000	0.674
Team learning	0.820	0.018	0.000	0.673
Transformational process and tailor making	0.818	0.016	0.000	0.670
Sufficiency philosophy	0.769	0.029	0.000	0.591
Creativity	0.761	0.019	0.000	0.579
Professional learning community attributes				
Supportive conditions	0.795	0.021	0.000	0.632
Supportive and shared leadership	0.774	0.021	0.000	0.599
Shared values and vision	0.759	0.027	0.000	0.576
Collective learning and application of learning	0.715	0.025	0.000	0.511
Shared personnel practice	0.490	0.038	0.000	0.240

Findings from Table 4 reveals that the correlation between the factors of professional learning community could be assessed in the standard component score (β) which indicated significantly high and positive correlations at 0.01. Besides, it was found that the measurement model of professional learning community factors has goodness fit with evident data, with $X^2 = 38.811$, $df = 31$, $p = .158$, $X^2/df = 1.625$, $RMSEA = .020$, $SRMR = .007$, $CFI = .999$ and $TLI = .997$. Result shows that not only the degree of correlation between the professional learning community factors was statistically high at significant level of 0.01 but also the relationship model of professional learning community factors were consistent with empirical data.

The effect of linear structural relationship model

CFA was used to validate at the preliminary stage to identify the causal relationships among the latent variables. Referring to causal relationship as shown in Table 5, result show that latent variables of learning leadership was affecting professional learning community practice with a factor loading as 0.883. In conclusion, learning

leadership of school principals had an influence on school's professional learning community practice, accounted for 88.30 percent.

Table 5. The effect of linear structural relationship model

Professional learning community	Matrix of Factor loading		
	β	SE	t
Learning leadership	0.883	0.018	0.000

Results of assessing of model fit

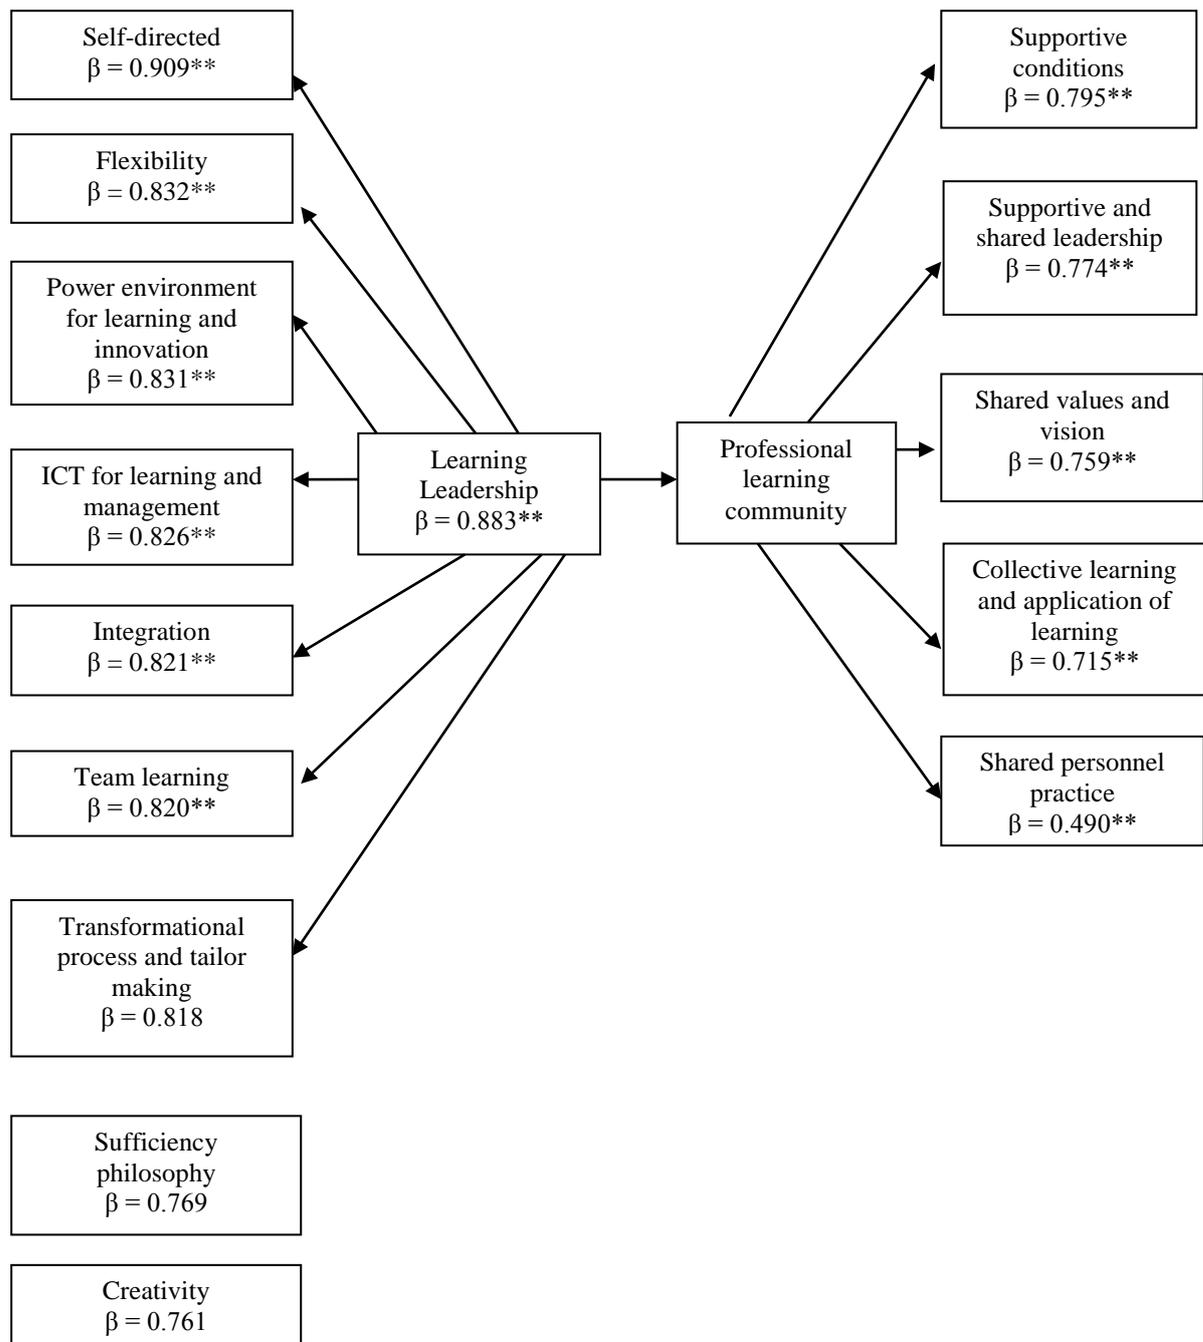

Figure 1. A Linear Structural Relationship Model of Learning Leadership and Professional Learning Community

Results of assessment of model fit indexes would be used to explain the relationship between the latent variables which were the defined variables from the measurement models as correlations, means, and standard deviations

among the latent variables. Subsequently, predicted correlations or co-variances were compared to the observed correlations or co-variances and if fit statistics are poor the model should be re-specified and modification indices should be followed. The final modified model with acceptable model fit statistics should be used for testing the hypotheses related to the statistical significance of the structure coefficient or path in the model. A careful assessment of the structure coefficient, standard error, t-value, and p-value will indicate if the null hypotheses should be rejected or not (Carvalho & Chima, 2014). It is concluded the null hypotheses should be significantly rejected at significant level as 0.01. Figure 1 above shows the results of the linear structural relationship model has goodness of fit with evident data.

DISCUSSION

The main focus of this study was looking into the importance of standard factor loading of each variable in the relationship model of learning leadership and professional learning community practice of the school principals under the Secondary Educational Service Area 25. Results of the study revealed that all the synthesized factors of learning leadership correlate well with the empirical data with statistical significance (Tuksino, 2009). Hence results also implied that all the six dimensions of learning leadership namely sufficiency philosophy, transformational process and tailor making, ICT for learning and management, creativity, integration, team learning, self-directed learning, flexibility, and powerful environment for learning and innovation are important for school principals if they would like to implement learning leadership style. As a result, overall result seems to be in accordance with the theory (Somprach et al., 2013) and also previous research findings such as Somprach and Tang (2016) and Somprach et al. (2017).

In addition, the key finding indicated that the degree of correlation between learning leadership and professional learning community practice was indicated by the standard factor loading as $\beta = 0.883$, which was high and positive with statistical significance at 0.01. Moreover, it was found that the relationship model of learning leadership and professional learning community practice correlated very well with the empirical data with statistical significance. This implies that the more school principals implemented learning leadership the professional learning community practice in their schools will be higher. Nevertheless final result revealed that this model of relationship between learning leadership and professional learning community practice was found to be consistent with empirical data with $\beta = 0.883$, $X^2 = 38.811$, $df = 31$, $p = .158$, $X^2/df = 1.625$, $RMSEA = .020$, $SRMR = .007$, $CFI = .999$ and $TLI = .997$ as what has been suggested by researchers. In conclusion, this means that learning leadership and professional learning community practice relationship model can explain well the two observed variables.

CONCLUSION

This study initiated the above mentioned dimensions of learning leadership supported the proposition that learning leadership associated with professional learning community practice. Learning leadership dimensions emerged as supporting the process of professional learning community practice in the context of this study. The general results of this study are useful for the policy maker, educational administrators, educators, and practitioners. Empirical development in the secondary schools largely neglects to recognize learning leader as an element of professional learning community practice. This study has successfully provided empirical justification that learning leadership is crucial in the construction of professional learning community practice. Such results establish school organization as a social process rather than as cost-effective judgment. The richness and justification of data reveals its valuable contribution of knowledge from an academic perspective. On top of that, this study also contributes to school principals' work in several ways. The results highlighted the important of learning, thus acknowledge the managerial implications of incorporating learning process based professional development into the Thailand educational administration system.

ABSTRACT

The purposes of this research were to assess the learning effectiveness of programming language by using games in class, and evaluate the satisfaction of the students learning the programming language with games. The sample included 40 students in high school 1 at School in Prachin Buri Province. The samples were 40 high school students selected by cluster random sampling. Experimental results showed that the efficiency of programming language learning using games in class for was higher than the standard of 70/70 and the students were satisfied with programming language learning using games, at a high level, the highest percentage was that they understand and enjoyed learning programming language better. The results suggest that programming language by using games can be exploited as effective and motivational learning environments.

INTRODUCTION

Currently, when technology is a part of life and more active, the question of how children use and learn technology wisely and intelligently is more importance. Children are growing up using a variety of digital devices (Penn State, 2014). A programming language is a language for describing instructions of computer to solve a problem and learning programming language is considered to be a difficult subject to learn. There are many students experienced with fail to understand the significant concept of programming.

Much of previous research reveals that students face with the problems of coding and designing a computer language program (R. Lister et al, 2004, A. R. Mohamad Gobil et al, 2009). The McCracken group presented the problem of the student's performance in problem solving ability (R. Lister, 2011). Student learned the concept of object-oriented programming using the static visualization in the first stages of learning (Ragonis and Ben-Ari, 2005).

Game is one of the significant innovations in education and teacher acknowledges that game can motivate students for learning activities. Learning through play a game is one of the important principles of education for children and teacher acknowledges that gaming activity can use for learning activities and act as a significant medium that makes fun as a skill tool. According to Sébastien et al (2016), the gamification process increases in motivation and engagement of the learners and the design process in game-based learning was presented feedback, goals, and interaction (Z. Alaswad and L. Nadolny, 2015). A game model was created including three parts as input, process and outcomes in order to evaluate educational computer games (Ak O., 2012). Also, game based learning has been used for a number of studies; for example, Kambouri and colleagues (2006) assessed basic literacy skills and Kiili (2005) engaged players by using direct experiences with the game world.

Therefore, learning programming language is considered difficult subject to learn for students and to achieve the learning effectiveness of programming language, this project studies and conduct research by using game based learning to engage and motivate student to learn programming language.

OBJECTIVES

The research aims to assess the learning effectiveness of programming language by using games in class, and evaluate the satisfaction of the student's learning in the programming language with games.

RESEARCH METHODOLOGIES

In the preliminary stage, the literature of this subject was examined and a deductive approach was applied with a quantitative method. The research aims to assess the learning effectiveness of programming language by using games in class, and evaluate the satisfaction of the students learning the programming language with games. The research consists of six steps:

1. Design and development of teaching materials. Instructors designed and developed the content from the curriculum for analysis as a learning unit, each consisting of behavioral objectives, content, tests and summaries.
2. Assessment the appropriateness of the instructional media and the media is used to understand concept and develop learning activities including introduction, variables, statement and condition concept.
3. Test the lesson divided into 2 parts; the pretest and posttest.

4. Experiment with the sample.
5. Collect data by trial with students.
6. Summary and conclusions

The samples of the research were 30 students in high school 1 at School in Prachin Buri Province. The samples were 30 high school students by purposive sampling. The in-depth interviews were conducted after the training session and the samples were required to give the explanation and describe the learning situation. The collected data were analyzed by the statistical means, and standard deviation (S.D.). The level of the significance was $p = 0.05$ that formed the basis for or rejecting or not rejecting each of the hypotheses. To evaluate the effectiveness of learning material collected data from test and post-test was analyzed and measured by using E1/E2 effectiveness with 80/80 condition.

$$E_1 = \frac{\sum x}{N} \times 100 \quad (1)$$

$$E_2 = \frac{\sum F}{N} \times 100 \quad (2)$$

When

- E1 = the efficiency of the developed material
- E2 = the efficiency of performance result
- $\sum X$ = total score from lesson testing
- $\sum F$ = total score from post-test
- A = Total score of lesson testing
- B = Total score of post-test
- N = total number of students

Moreover, this research took questionnaires to test and evaluate the satisfaction of the student's learning in the programming language with games and a 5-point Likert scale was utilized to range from "strongly satisfaction" to "strongly dissatisfaction".

EMPIRICAL STUDY AND RESULTS

The results of this study are presented to 2 sections: assessing students' learning achievements; and evaluating the satisfaction of the student's learning.

Table 1 the results of assessing students' learning achievements

	Group	Score		E1/E2
		\bar{x}	S.D.	
Pre-test	30	16.13	1.44	80.67
Post-test	30	17.36	2.41	86.12

Testing during class, the mean score was 16.13 from the 20-point scale and the standard deviation of 1.44 was 80.67 and the average score of posttest was 17.36 from the 20-point scale and the standard deviation of 2.41 was 86.12. Also, the performance of the game, the efficiency of E1 / E2 is 80.67 /86.12, indicating that the game lessons effective 80/80 criteria.

A questionnaire adapted was applied to evaluate the satisfaction of the student's learning. The sample consisted of 30 students (number of boys =19 and number of girls =11). Data are presented in terms of descriptive statistics.

Table 2 the results of the satisfaction of the student's learning

	\bar{x}	S.D.	Level
Teaching technique	4.39	0.55	High
The personality of the instructor	4.50	0.49	Very high
Teaching material	4.29	0.53	High
Quiz and evaluation	4.25	0.50	High
Total	4.36	0.52	High

Table 2 was shown the level of student satisfaction toward teaching and learning management and the overall is high (Mean = 4.36). When considering each aspect, it was found that the highest mean was the personality of the instructor and followed by teaching technique, teaching material, and measurement and evaluation respectively. In teaching technique aspect, the level of student satisfaction toward teaching and learning management in the course presented that teacher used techniques to teach students to understand them more easily, including the use of questions, debates, presentations, and etc.

Table 3 the results of the satisfaction of the student's learning in teaching technique

	\bar{x}	S.D.	Level
Teacher uses a variety of teaching methods appropriate to the subject matter.	4.55	0.49	Very high
Teacher uses techniques to teach students to understand them more easily	4.28	0.56	High
Students have the opportunity to ask questions, express opinions, discuss, give advice and listen to their ideas.	4.38	0.59	High
Teachers use language to teach that students can understand. It's easy and appropriate for content.	4.33	0.55	High

Table 4 was shown the results of the satisfaction of the student's learning in the personality of the instructor and

Table 4 the results of the satisfaction of the student's learning in the personality of the instructor

	\bar{x}	S.D.	Level
Teacher teaches students by applying moral / ethical / professional ethics.	4.42	0.49	High
Teacher uses a polite language to teach students.	4.70	0.45	Very high
Teachers can control emotions while teaching.	4.39	0.54	High

Also table 5 and 6 were described the results of the satisfaction of the student's learning in teaching material and quiz and evaluation sections.

Table 5 the results of the satisfaction of the student's learning in teaching material

	\bar{x}	S.D.	Level
Teacher uses modern technology media.	4.27	0.56	High
The media is easily to understand and learn.	4.48	0.50	High
Teacher uses e-learning to help in class effectively.	4.13	0.53	High

The media easily to understand and learn was the highest score of the satisfaction of the student's learning in teaching material and teacher informing the test results after the exam finished was the highest score of the satisfaction of the student's learning quiz and evaluation.

Table 6 the results of the satisfaction of the student's learning in quiz and evaluation

	\bar{x}	S.D.	Level
Teacher sets the assessment criteria to meet the behavioral objectives	4.04	0.42	Very high
Teacher informs the test results after the exam finished	4.47	0.55	High
Teacher reviews the content after teaching.	4.23	0.52	High

CONCLUSIONS AND FUTURE WORKS

The experimental group had significantly better performance in learning achievements. This learning activity can be beneficial to use in different courses so that students can enhance and improve their ability and also this system supports teachers in handle and manage their course. However, in term of the future experiments, we are looking forward to advanced technologies to support in learning preferences and interest of learners based on social networks and to create adaptive learning for learners.

ABSTRACT

Anatomy is one of the basic lessons at the schools of medicine. It takes an important place on the first and the second term syllabi. Because of its terms are latin, heavy schedule of theoretical lessons, despite anatomy lecturers have many images on their slides, experiencing difficulties on three dimensional thinking and imagining; learning anatomy is evaluated as difficult by the students.

To overcome these difficulties, anatomy laboratory lessons that are paralelly to the theoretical lessons are performed. In these laboratory lessons, the better learning is targeted by making use of models and cadavers. The aim of our study is measuring how much effect of the videos on anatomy laboratory exam scores.

For this aim, anatomy laboratory exam scores of the second term students of the school of medicine this year whom we shared the laboratory videos that were started to record in 2016 (Group 2) and that of the second term students of the school of medicine last year whom we didn't share the laboratory videos(Group 1) are compared. Group 1 students consist of 294 students(146 male, 148 female) and group 2 students are made up of 330 students(171 male, 159 female). Mean of these two groups' anatomy laboratory exam scores in Circulation and Respiration, Digestion and Metabolism, Urogenital and Endocrine committees are compared. The students in group 2 were also filled in a questionnaire that is related with feedback of their pleasures from the laboratory videos. The mean of Group 1 students' anatomy laboratory exam scores in Circulation and Respiration Committee is 51.04 ± 25.911 and that of group 2 is 57.82 ± 22.739 . The mean of Group 1 students' anatomy laboratory exam scores

in Digestion and Metabolism Committee is 56.51 ± 24.737 and that of group 2 is 62.50 ± 23.055 . The mean of Group 1 students' anatomy laboratory exam scores in Urogenital and Endocrine Committee is 72.73 ± 25.485 and that of group 2 is 78.71 ± 18.313 . When the means are compared statistically, there are significant differences in Circulation and Respiration ($p < 0.001$), Digestion and Metabolism ($p = 0.001$), Urogenital and Endocrine Committees ($p < 0.05$). In conclusion, it is found that these laboratory videos contribute to the scores of anatomy laboratory exams of the school of medicine students. Our opinion is that these laboratory videos will be useful for better anatomy knowledge which is in order to be a good doctor.

Keywords: school of medicine, anatomy, videos, laboratory, exam scores

INTRODUCTION

Human anatomy is a basic lesson in health field. To be successful and good doctor, human anatomy should be learned truly and permanently. Anatomy is a lecture that is difficult to learn and remember, because Anatomy is a science that is based on Latin. Theoretical knowledge must be combined with imagery. Because of this, Anatomy laboratory courses must be applied in addition to the theoretical lectures.

With the opening of the new schools of medicine, number of cadavers is not enough for the laboratory courses. Therefore, Anatomy laboratory courses are learned on mock-ups (Sabancıoğulları et al. 2016). The crowd of the classes, insufficient number of mock-ups and cadavers, the environmental problems of laboratory (sound system, air conditioning etc.) reduce the efficiency of the course.

Applying of new information technologies on university teaching has made a breakthrough on traditional education methods (Paalman, 2000. Greenhalgh, 2001). In the recent days, to cope with these problems, varied educational methods like on-line content, social media, tablet and mobile phone applications, virtual reality, video education, e-book with multimedia content etc. has come to the fore.

Chen et al. made a study on 1181 students of University of Central Florida. In this study 95 percent of the students have a smart phone and 57 percent of them have a tablet. The majority of the students can access to mobile phone and tablet applications, e-books with multimedia content easily. However, in these methods, the level of the information detail and information reliability may be lower than the wanted level. On the other hand, there are studies declaring as innovative methods, these methods are helpful for the education with the traditional education methods (Lewis et al. 2014, Stirling & Birth 2014, Briz-Ponce et al. 2016). From this, we considered that students use technological devices frequently. After recording the Anatomy laboratory videos, we shared the videos with students. With this, we wanted to combine innovative education method with the traditional one.

Recently, video education is used not merely in Anatomy, but also in other science fields as a supporting method. It is used especially in seminars. Because of the insufficiency of the education materials and crowd of the classes, they are used instead of the practical courses. There are many studies stating video education has effects on the success of the students. (Saxena et al. 2008, Topping 2014, Saberski et al. 2015)

Considering the benefits of Anatomy laboratory videos, first of all, students can clearly see the mockup or organs of the cadaver and focus on the subject. After the first watching, if the student thinks his/her knowledge isn't enough, he/she may replay the video. The video isn't affected by the crowd or negative environmental laboratory conditions. They can be watched with a smart phone, a tablet or a computer everywhere, every time. They also can contribute to studying theoretical subjects.

In 2016-2017 educational year, as Anatomy Department Kocaeli University School of Medicine we started to record videos of Anatomy laboratory courses. The videos include not solely mock-ups but also organs of the cadaver. If any error is determined, lecturers check videos and then videos are fixed. The aim of this study is exploring the effect of video education on Anatomy laboratory exams and level of the students' pleasure.

MATERIAL-METHOD

The scores of two student groups in Kocaeli University School of Medicine are examined. One of these groups who didn't watch Anatomy Laboratory Videos compose of 2015-2016 second term students. (n:294) The other group who watched these videos consisted of 2016-2017 second term students (n:330).

Anatomy Laboratory scores of Respiratory and Circulatory System, Gastrointestinal System and Metabolism, Urogenital System and Metabolism committees of the two groups are taken from Registrar's Office

of Kocaeli University School of Medicine. Taken scores are not comparable because of the difference of Anatomy Laboratory exam percentage of the committees between the two years. Therefore, these scores calculated again from 0 to 100. The SPSS package (SPSS for Windows, version 20.0, SPSS, Chicago, IL, USA) for personal computers is used for the statistical analyses. The means, standard deviations and normality tests are performed. The data that are not fit with the normal distribution are analyzed with Mann-Whitney U test.

Furthermore, we have taken feedback surveys from the 2016-2017 second term students (n:255). Percentage of watched videos to all of the videos, how many times they watched the videos, how much effect on their theoretical and practical exams, if the videos are beneficial for understanding the related subject, if they re-watched the videos after the committee exam are the questions of this survey. From these surveys, descriptive statistics are done with SPSS package program.

FINDINGS

The Anatomy laboratory scores of Kocaeli University School of Medicine Second Term Students in 2015-2016 (n:294) and 2016-2017 (n:330) educational years are examined. Furthermore, some of the students in 2016-2017 educational year (n:255) filled out feedback surveys willingly. Although, the students of the 2016-2017 educational year could access the Anatomy laboratory videos that comprised mock-ups and cadaver organs, the students of the 2015-2016 educational year didn't access the videos. Because these videos were started to record in 2016-2017 educational year. When the Anatomy Laboratory exam scores of these two groups are compared, 2016-2017 group that had access to the videos, statistically had higher scores than the 2015-2016 group that didn't have access to the videos. Respectively, p values of Respiratory and Circulatory System Committee, Gastrointestinal System and Metabolism, Urogenital System and Metabolism are $p < 0,001$, $p = 0,001$, $p < 0,05$.

Committees	2015-2016	2016-2017	p value
Respiratory and Circulatory	51,04 ± 25,911 (n:294)	57,82 ± 22,739 (n:330)	$p < 0,001$
Gastrointestinal and Metabolism	56,51 ± 24,737 (n:294)	62,5 ± 23,055 (n:327)	$p = 0,001$
Urogenital and Metabolism	72,73 ± 25,485 (n:288)	78,71 ± 18,313 (n:328)	$p < 0,05$

Table – 1 Means ± Standard Deviations of the Anatomy laboratory scores of the two groups to the committees are shown in the table. P values in 5 percent significance level calculated with Mann Whitney U test.

When the willingly filled out surveys are examined, (n:255 114 boys and 131 girls and 10 of them didn't state their genders. Mean of ages: 20,13 ± 1,26) 78,8 percent of the students stated that they had watched all of the videos. 16,9 percent of the students watched more than half. %39,6 of the students answered as 2 times, %27,5 of them answered as 3 times, %16,9 of them answered as 5 or more times to "How many times did you watch the videos" question. 60,8 percent of the students marked 9-10 points, 26,3 percent of them marked 7-8 points, 9 percent of them marked 5-6 points for the beneficial effect of the videos on understanding the related subject. %31,4 of the students pointed 9-10 points, %27,5 of them pointed 7-8 points, %19,2 of them pointed 5-6 points for influences of the videos on theoretical exams. Furthermore, %65,1 of the students replied as 9-10 points, %22,4 of them replied as 7-8 points, %5,5 of them replied as 5-6 points for the impact of the videos on Anatomy practical exam. Additionally, only 19,2 percent of the students stated that they had watched the videos of past committees and 79,6 percent of them stated that they hadn't watched.

	The beneficial degree of the videos on understanding the related subject	The beneficial degree of the videos on theoretical exam	The beneficial degree of the videos on laboratory exam
No, the videos aren't beneficial.	n:4 (%1,6)	n:1 (%0,4)	n:3 (%1,2)
1-2 points	n:1 (%0,4)	n:17 (%6,7)	n:2 (%0,8)
3-4 points	n:5 (%2)	n:38 (%14,9)	n:13 (%5,1)
5-6 points	n:23 (%9)	n:49 (%19,2)	n:14 (%5,5)
7-8 points	n:67 (%26,3)	n:70 (%27,5)	n:57 (%22,4)
9-10 points	n:155 (%60,8)	n:80 (%31,4)	n:166 (%65,1)
Total	n:255	n:255	n:255

Table – 2 The data in this table are taken from the feedback surveys. The beneficial degrees of the videos on understanding the related subject, theoretical exam and laboratory exam classified to points.

When considering the effectuality of the videos with comparing the scores and feedback surveys, it's clearly found out that the videos are beneficial. Furthermore, students stated that these benefits are more on the practical exams than the theoretical exams.

Students also indicated that they had replayed the videos majorly two or more times. Replaying the videos is effective for that students can comprehend the subjects that haven't been understood after first watching.

The students answered mostly "No, I didn't watch" to the question of watching the videos of past committees. It is also a notable issue. This point expresses that exams have positive contribution to learning of students. However, after the exam, students lose motivation for learning of the subjects of past committees.

Moreover, the other information from the surveys is that the contribution is not only to practical exams, but also to theoretical exams. However, this contribution is less than to the practical exams.

DISCUSSION

Each lecturer has a special educational style and method. Anatomy has an important role in medical education (Sabancıoğulları et al. 2016; Erbay et al. 2015; Tuygar et al 2015). Not merely for Anatomy, but also for the other medical sciences, there are a lot of media such as figures, animations, videos, three dimensional visuals on the internet. However, these materials are beneficial only if they're used with the traditional educational method. The place of the subjects of the lecturers who manage the students' educational steps to the assessment and evaluation cannot be replaced with the information from the internet.

Anatomy laboratory education has a crucial role in Anatomy education as well (Green & Whitburn 2016; Dinsmore, Daugherty & Zeitz, 1999). When preparing these laboratory videos, it is considered that these videos are prepared in parallel with both Anatomy laboratory courses and theoretical lectures. After preparing, our lecturers control them and their acceptability is provided. This reason why the level of reliability of the information in these videos are higher than the free internet sources.

Green & Whitburn (2016) did a study with 461 physiotherapy students in second term for Gross Anatomy lecture. They investigated the differences of success levels between mixed education and face to face education. For this aim, they classified these students as three groups that consisted of 150 students (year 2013), 160 students (year 2014), and 151 students (year 2015). The year 2013 group had only face to face education. The year 2014 group had face to face education that was supported with some online videos. The year 2015 group had online video once a week and face to face education. In the results, the success levels of year 2014 and year 2015 groups (mixed education) were higher than the classic face-to-face education. Also, in our study video education with classical education ends with more success.

Mahmud et al. (2011) performed a study on 287 first term students in school of medicine about whether the dissection videos were beneficial. There wasn't any significant difference between the group that watched the dissection videos and the other group that didn't watch them. We think that learning isn't possible only watching the videos of dissection of cadavers or mock-ups. Students must have sufficient knowledge on the related subject. Touching has a role on learning as well.

Peeler et al. (2016) made up an exploration on 93 medical students. 54 of them had pro-section based and 39 of them had dissection based practical courses. The two groups also had the same the theoretical lectures. There wasn't any significant difference between the scores of the two groups. Besides this, students filled out surveys about which educational method was the best. Majority of the students answered this question with case based and medical imaging. Therefore, students are eager to learn the subjects with innovative methods. If the traditional education method is supported with the innovative methods, students will remember easily the information which is supported with more than one method. In the long process, this will turn into the success.

Topping (2014) managed an investigation about the effect of gross anatomy educational videos on the first term medical students' success. 40 participants watched the videos, the other 40 participants that consisted of a year before the first group didn't watch. The first group who watched the videos had the higher scores. The increasing is 4 percent. In our study the increasing percentage is %6 approximately for all committees.

Saberski et al. (2015) did a research about effectuality of using laparoscopic videos on gross anatomy education. In this research, 75 percent of the students found beneficial these videos. There was an increase on understanding the abdominopelvic anatomy in 62 percent of them statistically ($p < 0,01$). Although %10 of them

didn't have an eager to the surgical branches, after the videos, they considered a surgical career as well. The results also resemble with outcomes of our study.

RESULT

In this research, we want to show how much effect of the video education on the Anatomy exam scores when it's used with traditional education. Independent two groups are investigated. Anatomy laboratory scores of these two groups in the same three committees are analyzed. The group who watched the videos have higher scores statistically in all three committees. The information from feedback surveys show the pleasures of the students. They stated in the surveys that videos are beneficial for not only practical exams, but also theoretical exams.

For the reason that attentions and interests of the students are on mobile devices and both learning and understanding Anatomy is a difficult lecture because of it is Latin, diverting to new educational methods is a requirement. Consequently, in this study video education is beneficial for Anatomy practical courses. However, for determining whether the video education is absolutely beneficial and whether it is the best, more researches should be done.

ABSTRACT

Theories of the nature of science and epistemological belief approaches allow the individual to distinguish between scientific and non-scientific knowledge. Despite the accumulation of knowledge which is the product of scientific studies, many false beliefs still exist. One of the basic dimensions of scientific literacy, the nature of science, is a broad field that includes the beliefs and values inherent in scientific knowledge and considers human efforts in their development. It also tries to find answers to questions such as "What is science?", "How does it work?", "How do scientists work as a social group?", "How does society guide science and how does society react to scientific works?" (McComas and Olson, 2000).

These false beliefs that are believed to be true, which are also named as pseudo-science, consist of beliefs that are not supported by scientific research and only based on hypotheses, that doesn't go through the phases of scientific methods, that are made up of personal explanations and examples or based on religious beliefs, and practices based on these beliefs (Çetinkaya, 2013).

In this research, we tried to determine the epistemological beliefs and beliefs towards the nature of the science of teacher candidates studying in different programs of the education faculty. And it was investigated that how much of an effect these beliefs of the teacher candidates have on their pseudo-science beliefs. Thus, in this study we have worked with 202 teachers in total studying at the Education Faculty of Pamukkale University. 46 of the teachers were Science Teachers, 51 of them were Elementary Mathematics Teachers, 49 of them were Computer and Instructional Technologies Teachers and 56 of them were Primary School Teachers. Combined method design based on the principle of combining the quantitative and qualitative studies and the data regarding them is used in this study. "Scientific Epistemological Beliefs Scale", "Nature of Science Beliefs Scale" and "Science, Pseudo-Science Differentiation Scale" were applied to the teacher candidates. In addition, a semi-structured interview was conducted with a total of 12 prospective teachers, three teacher candidates from each area, to examine the mentioned effect more deeply.

As a result of the research, it is seen that there are certain differences and similarities in the beliefs of the prospective teachers towards epistemological and scientific nature and that these differences and similarities are reflected in the pseudo-science beliefs of the teacher candidates in a similar way. The findings are also discussed in the light of the literature of the area.

1. INTRODUCTION

As it's in their nature, mankind has always tried to understand the world they live in and the universe. And they tried to solve their mysteries. The struggles they had to overcome their fears, to discover what they don't know or just to have a better life has turned into a more systematic and regular fashion and thus, the concept what we call science today has appeared. Questions such as what science is, what is its functions and what methods should science include have always been topics that are highly discussed among the scientists. Yet considering the constantly changing dynamic structure of the science, this comes as no surprise.

Even though there are many different perspectives regarding the nature of science, that the scientific knowledge should be experimental and subjective, based on human inference, imagination and creativity and that it should come out by means of getting affected by social and cultural elements have always been the factors embraced by many scientists (Lederman, 1999). Accordingly, the nature of science includes the characteristics of scientific knowledge, the views of scientific committees and the conceptual inventions, values and assumptions in science (Aikenhead, Ryan, 1992).

All these determinations and definitions are important in order that the efforts to reach knowledge can be carried out on a more accurate and productive ground, in other words, to distinguish non-scientific ones. It was otherwise observed that some findings suggested as scientific lead to confusion, infollution and conceptual fallacies. Thus, they prevent people from finding the facts. The concept of pseudoscience, which has been frequently encountered in recent years, is an example of this.

Pseudo-science is generally means "so-called" or fake science in a negative sense. Despite of the fact that the concept of pseudo-science has been in use since the eighteenth century, Karl Popper was the one who revived the use of the term in contemporary philosophy of science Popper (1962) defines the term of pseudo-science as disciplines or systems which asserted to be scientific and to explain facts in other words and which pretend to be based on the scientific methods or to have the epistemic status the scientific facts have, but in fact are extremely against falsifying and testing. Tutar (2014) has generally expressed pseudo-science as ethically problematic mental struggles that doesn't conform to the scientific criteria even though they look as if they were in accordance with the scientific norms. Pseudo-scientific theories are usually described using fictitious, rhetorical and mythical words rather than using verifiable, valid and grounded systems that are case based and objective (Tutar, 2014). In other words, even though the owners of the pseudo-scientific claims say that their claims are scientific, these claims often do not conform to scientific standards and do not have the chance to be verified either experimentally or theoretically (Jahoda, 1969; Preece and Baxter, 2000; Finn, Bothe and Bramlett, 2005). In order to distinguish pseudo-science elements from scientific phenomena, it is of great importance to know the nature of science well. In this context, the importance of science education emerges once again. In general terms, science is defined as examining the creatures and entities in nature and making an effort to foresee the events in the future by generalizing or founding principles (YÖK/World Bank, 1997). Hodson (1993) stated that teaching the nature of science is one of the main aims of science education and training. Lederman (2004), however, stated that in order for students to be able to make conscious personal and social decisions using scientific knowledge, it is necessary to first understand how scientific information is structured and, accordingly, to deeply understand the source and boundaries of this information.

Not only the beliefs of the individuals towards the nature of science but their epistemological beliefs affect their approach to information as well. Epistemological beliefs are expressed as the individual's subjective beliefs regarding the acquisition of knowledge, the nature of science and knowledge. Mentioned beliefs consist of individual's core beliefs about how one identifies knowledge, what are the boundaries of knowledge, how it is obtained and stored (Hofer and Pintrich, 1997; Schommer, 1994). In the same vein, it was emphasized over and over that the epistemic profiles of the science teachers are highly influential on both learning a new subject and distinguishing scientific and pseudo-scientific concepts (Hashweh, 1996; Abd-el-Khalick, 2003; Olafson and Scraw, 2006; Yılmaz-Tuzun and Topçu, 2008, Liu et al., 2011).

Starting from this facts and points of view, the study was aimed at determining the epistemological beliefs and beliefs towards the nature of science of the teacher candidates studying in different departments of Pamukkale University, Faculty of Education. After the determination process, it was examined that how much effect these beliefs have on the teacher candidates' pseudo-science beliefs.

2.METHOD

In the study, one of the combined method designs, sequential explanatory design, was used. Predominantly, qualitative data is gathered after the quantitative data is collected and analyzed in this study. Priority is usually the quantitative data. Qualitative data fundamentally is collected to enhance the quantitative data. Data analyses are related to each other and they come together in the discussion chapters (Creswell, 2003). One of the reasons why the approach of using the qualitative and quantitative data collection tools together in this study is because it enables examining the complicated structure which emerges as a result of investigating the pseudo-science beliefs of the participants as well as their epistemological beliefs and beliefs towards the nature of science profoundly.

In the quantitative dimension of the study, the scientific epistemological and pseudo-scientific beliefs of the participants and their beliefs towards the nature of science are revealed using "Scientific Epistemological Beliefs Scale", "Beliefs towards Nature of Science Scale" and "Science, Pseudo-Science Separation" scales. In qualitative dimension, however, semi-structured interviews were conducted with the participants to be able to examine the mentioned effect profoundly.

In table 1, information about the participants worked with in the quantitative dimension are shown.

Table 1. Participant Information for Quantitative Work

Program	Class	f	&
Science Teachers	1	8	22.78
	2	12	
	3	11	
	4	15

	4	18	
	Total	49	
Primary School Teaching	1	12	27.72
	2	11	
	3	16	
	4	17	
	Total	56	
	Grand Total	202	100.00

The choice of the teacher candidates to participate the semi-structured interview conducted in the qualitative dimension of the study were based on their score average in the scales of "Scientific Epistemological Beliefs Scale" and "Beliefs towards Nature of Science Scale" which were applied beforehand. Depending on the scores in those scales, 3 voluntary participants were chosen from highest, middle and lowest score groups in each department. In the semi-structured interviews conducted with a total of 12 teacher candidates, five questions regarding the separation of science and pseudo-science and prepared by researchers were directed to participants.

"Scientific Epistemological Beliefs Scale" used in the study is a scale consisting of 5 Likert choices changing between "Strongly Agree" and "Strongly Disagree" and it includes 50 items. It was developed by Pomeroy (1993). In the factor analysis adjusted to Turkish by Deryakulu and Bıkmaz (2003) and conducted to determine its validity and reliability, it was observed that the scale is in a single factor structure and consists of 30 items. And Chronback Alpha factor is calculated as 0,91.

50-item original version of the scale in English consisted of three sub-dimensions:

- a) Traditional science understanding,
- b) Traditional science education understanding,
- c) Non-traditional understanding of science.

Developed by Özcan and Turgut (2014) to determine the beliefs of teacher candidates regarding the nature of science, "Beliefs regarding the Nature of Science Scale" consist of 37 items developed in a 5-point Likert type ranging between "Strongly Agree" and "Strongly Disagree". The sub-dimensions of the scale are as follows:

- a. Change in Scientific Knowledge
- b. Difference between Observation-Deduction
- c. Scientific Method/Methods
- d. Creativity and Imagination
- e. Socio-Cultural Impact
- f. Scientific Laws and Theories
- g. Scientific Acceptance and Limits

"Science Pseudo-Science Scale" developed by Oothoudt (2008) was localized for Turkish by Çetinkaya et al. (2003). As a result of explanatory and confirmatory factor analysis of the scale, linguistic equivalence of which was achieved, it was found appropriate to reduce the original scale of 32 items to 23 items and the items were found to be collected in four sub-dimensions:

- a. Pseudo-Science
- b. Scientific Method
- c. Science, Pseudo-Science Separation
- d. Pseudo-Scientific Beliefs

Items seen in the Science, Pseudo-Science scale are actualized using the high grading of the scientific beliefs and low grading of the pseudo-scientific beliefs.

The study conducted in the 2017-2018 academic year was completed in two months. Primarily the scales regarding the respective subjects were applied to the teacher candidates participated in the study. The responses the participants provided for these scales in the quantitative dimension of the study were coded using the SPSS 22.0 package software. While descriptive statistics were used in the general evaluation of the participants' opinions, Unilateral Variance Analysis statistics were used in the comparisons as the research data has shown a normal distribution according to the Kolmogorov Smirnov test. In interpreting regression analyzes, standardized Beta (β) coefficients and t-test results on their significance were taken into account. Significance level of .05 was considered as the basis in the data analysis. As an absolute value, the correlation coefficient between 0.70–1.00

was considered as a high; between 0.69–0.30 was considered as a medium; and between 0.29–0.00 was considered as a low relation (Büyüköztürk, 2009).

After analyzing the scales, semi-structured interviews were conducted. The responses of the participants were interpreted and transformed into codes, and the themes were formed considering the relations between these codes. The aim was to reveal the participant opinions more clearly with this process. This process was performed manually by the researchers. Then interpreted considering the quantitative and qualitative data together.

3. FINDINGS

3.1. Findings Related to the Quantitative Data

In this part of the research, teacher candidates' opinions regarding the Scientific Epistemological Beliefs, Nature of Science and Science, Pseudo-Science beliefs were determined and compared accordingly with the variable of the program they are studying to begin with. Afterwards, the relation between these candidates' Scientific Epistemological Beliefs, Nature of Science and Science, Pseudo-Science beliefs included. The descriptive statistics on teachers' Scientific Epistemological Beliefs, Beliefs Regarding the Nature of Science and Science Pseudo-Science Beliefs depending on the program variable they have are shown in Table 2.

Table 2. Descriptive Statistics Regarding the Scientific Epistemological Belief, Nature of Science and Science,

Chapter	Scientific Epistemological Beliefs			Beliefs Regarding the Nature of Science			Pseudo-Science Beliefs		
	n	X	Ss	n	X	Ss	n	X	Ss
1. Science Teachers	46	106.13	17.40	46	143.83	15.441	46	90.74	7.698
2. Elementary Mathematics Teachers	51	98.61	7.416	51	138.59	14.286	51	84.78	7.072
3. Computer and Instructional Technologies Teachers	49	89.41	6.000	49	127.51	13.635	49	79.31	7.015
4. Primary School Teachers	56	87.23	8.023	56	124.54	12.850	56	75.04	8.321
Total	202	94.94	12.79	202	133.20	15.992	202	82.11	9.546

Pseudo-Science Beliefs

At the end of the unilateral variance analysis, a statistically significant difference at the meaningful level of 0.05 was found in the Scientific Epistemological Beliefs of the teacher candidates studying in different programs ($F=34,36$; $p<0.05$). The acquired findings are shown in the following Table 3.

Scientific Epistemological Belief	Sum of Squares	Degree of Freedom (DF)	Sum of Squares	F	p	Difference
Between groups	11272.97	3	3757.65	34.36	0.00	1-2, 1-3,1-4, 2-3,2-4
In Groups	21653.19	198	109.360			
Total	32926.16	201				

Table 3. Results of Unilateral Analysis of Variance According to Program Variable of Scientific Epistemological Belief

When the POST HOC process, recommended by Tukey to determine which program this difference is in favor of, it was concluded that scores of Scientific Epistemological Belief of the Science Teacher candidates ($X_f=106,13$) and teacher candidates studying in the elementary mathematics teaching department ($X_m=98,61$) are higher than the scores of the teacher candidates studying in Computer and Instructional Technologies department ($X_b=89,41$) and teacher candidates studying in Primary School Teaching department ($X_s=87,23$).

At the end of the unilateral variance analysis, a statistically significant difference at the meaningful level of 0.05 was found in the Nature of Science beliefs of the teacher candidates studying in different programs ($F=21.127$; $p<0.05$). The acquired findings are shown in the following Table 4.

Table 4. Results of One-Way Analysis of Variance According to Program Variability of Belief regarding the Nature of Science

Belief Regarding the Nature of Science	Sum of Squares	of Degree of Freedom (DF)	Sum of Squares	F	p	Difference
Between groups	12464.944	3	4154.981	21.127	0.00	1-3,1-4, 2-3,2-4
In Groups	38939.135	198	196.662			
Total	51404.079	201				

When the POST HOC process, recommended by Tukey to determine which program this difference is in favor of, it was concluded that scores of Scientific Epistemological Belief of the Science Teacher candidates ($X_f=143,83$) and teacher candidates studying in the elementary mathematics teaching department ($X_m=138,59$) are higher than the scores of the teacher candidates studying in Computer and Instructional Technologies department ($X_b=127,51$) and teacher candidates studying in Primary School Teaching department ($X_s=124,54$).

At the end of the unilateral variance analysis, a statistically significant difference at the meaningful level of 0.05 was found in the Nature of Science beliefs of the teacher candidates studying in different programs ($F=6.294$; $p<0.05$). The acquired findings are shown in Table 5.

Science Pseudo-Science	Sum of Squares	of Degree of Freedom (DF)	Sum of Squares	F	p	Difference
Between groups	6977.770	3	2325.923	40.619	0.00	1-2, 1-3,1-4, 2-3, 2-4, 3-4
In Groups	11337.834	198	57.262			
Total	18315.604	201				

Table 5. Results of One-Way Analysis of Variance According to Program Variability of Pseudo-Science - Science Belief

When the POST HOC process, recommended by Tukey to determine which program this difference is in favor of, it was concluded that scores of Science - Pseudo-Science Belief of the Science Teacher candidates ($X_f=90,74$), teacher candidates studying in the elementary mathematics teaching department ($X_m=84,78$) and the teacher candidates studying in Computer and Instructional Technologies department ($X_b=79,31$) are higher than the scores of teacher candidates studying in Primary School Teaching department ($X_s=124,54$).

Table 6. Regression analysis results on the predictions of Scientific Epistemological belief

Variable	B	Sh	β	T	p	Binar y r	Partia l r
Constant	,483	,235	-	2.062	.03	-	-
Science Pseudo-Science	0.561	,060	,483	9,380	.00*	,482	,482

$p<.01$, $R=,48$, R^2P $P=,231$

As seen in Table 6, there is a moderately significant and meaningful relationship between the teacher candidates' Science-Pseudo-Science Beliefs and Scientific Epistemological Beliefs ($R=,48$, $p<.01$). It is observed that the Science-Pseudo-Science Beliefs of the teacher candidates' can explain 23% of the total variance in the Scientific epistemological beliefs of the candidates'. Science-Pseudo-Science ($\beta=,483$, $p<.01$) is seen to predict the Scientific epistemological beliefs of the teacher candidates on a positive and meaningful level. When the bilateral and partial correlations between Science-Pseudo-Science beliefs and Scientific Epistemological Beliefs are examined, it is observed that there is a positive and moderate relationship ($r =,48$) between these two variables. When the results of the t-test on the meaningfulness of the regression coefficients are examined, it can be said that the Scientific Epistemological Beliefs of the teacher candidates predict the variable of Science-Pseudo-Science Beliefs on a meaningful level.

Table 7. Regression analysis results on the predictions of belief regarding the nature of science

$p<.01$, $R=,612$, R^2P $P=,376$

<i>Variabl e</i>	<i>B</i>	<i>Sh</i>	β	<i>T</i>	<i>p</i>	<i>Binar y r</i>	<i>Partia l r</i>
Constant	0,34 7	,19 9	-	1.774	.06	-	-
Science Pseudo- Science	0.66 4	,05 0	,61 2	13.16 2	.00 *	,612	,612

As seen in Table 7, there is a moderately significant and meaningful relationship between the teacher candidates' Science - Pseudo-Science Beliefs and Nature of Science Beliefs ($R=.61$, $p<.01$). The Science Pseudo-Science Beliefs of the teacher candidates' can explain approximately 37% of the total variance in their Nature of Science Beliefs. Science Pseudo-Science ($\beta=.612$, $p<.01$) is seen to predict the Nature of Science beliefs of the teacher candidates' in a meaningfully positive way. When the bilateral and partial correlations between Science Pseudo-Science beliefs and Nature of Science Beliefs are examined, it is observed that there is a positive and moderate relationship ($r=.61$) between these two variables. When the results of the t-test on the meaningfulness of the regression coefficients are examined, it can be said that the Nature of Science Beliefs of the teacher candidates predict the variable of Science-Pseudo-Science Beliefs on a meaningful level.

3.2. Findings Related to the Qualitative Data

In semi-structured interviews conducted at the qualitative dimension of the study, the participants were addressed a total of six questions, including the sub-dimensions of the Science, Pseudo-Science Separation Scale, in various scenarios. The answers provided by the participants were examined separately by the researchers along with the literature analysis in the regarding field. Firstly, the codes were created and then themes were discovered by determining the relations between these mentioned codes. Then the required rectifications were made upon examining the analyses conducted separately.

3.2.1. Findings Related to the First Question

In the scenario presented with the first question of the semi-structured interview, the dilemma of an individual who has seen a large number of doctors because of their chronic illness but never was able to find a solution was referred. Should this person continue to remain within the borders of the medical sciences despite of their negative case and go on seeking a cure with the doctors or should they try alternative solutions? Participants were asked to step themselves into this person's shoes and explain how they would act in such a situation. Using leading and deepening questions, the participants were led to explain various solutions using examples and to share anything themselves or anyone they knew experienced should they ever went through something similar. Findings related to these responses are presented in Table 8.

Table 8. Findings regarding the first interview

Themes	Science (f)	Percent %	Prim. Scho. Math. (f)	Percent %	BÖTE (f)	Percent %	Class (f)	Percent %
Never trying to find an alternative	8	38.09	7	36.84	5	18.52	5	19.23
Experimenting with alternative medicine (homeopathy, acupuncture, magnetic field therapy ...)	6	28.58	6	31.59	8	29.63	8	30.77
Searching for solutions by means of spiritual methods (prayer, amulet, sacrifice...)	5	23.80	4	21.05	7	25.93	6	23.07
Trying folk remedies or what they hear from other people	2	9.53	2	10.52	6	22.22	6	23.08
Asking for help from supernatural beings (djinn, angel, ghost ...)	0	0	0	0	1	3.70	1	3.85
Total	21	100	19	100	27	100	26	100

When Table 8 is examined, it was seen that the science programs and elementary mathematics programs were dominant in the group saying that "they'd never be in pursuit of alternative methods" with respectively 38.09% and 36.84%. The rates of the ones who share this idea in BÖTE and primary school teaching programs are, however, seen to be low with 18.52% and 19.23% respectively. After examining the opinions of the teacher candidates studying in BÖTE and primary school teaching programs, it was observed that the themes of "alternative medicine" and "spiritual solutions" are the most common ones.

3.2.2. Findings Related to the Second Question

In the scenario included in the second question of the semi-structured interview, the participants were asked to interpret an event, where something happens to an individual who was so eager to visit a fortune teller. In the case study, participants were expected to answer how they would explain the things that happens this individual after the fortune teller told them that they would happen. While emphasizing this, they were also expected to explain their ideas using their own experiences in similar cases if any. Findings related to these responses are presented in Table 9.

Table 9. Findings regarding the second interview

Themes	Science (f)	Percent %	Prim. Scho. Math. (f)	Percent %	BÖTE (f)	Percent %	Class (f)	Percent %
Probability of accidentally making the correct guess	12	52.17	14	63.64	10	40.00	8	36.36
Due to assumptions based on psychological or social experience	8	34.78	6	27.28	9	36.00	7	31.82
Being able to foresee the future with the help of supernatural entities	2	8.70	1	4.54	3	12.00	4	18.18
The ability to foresee the future due to special powers of the individual	1	4.35	1	4.54	3	12.00	3	13.64
Total	23	100	22	100	25	100	22	100

When the answers to the second question are examined, it is observed that the most common idea is the one that the things happening after the fortune teller in the scenario told they would be completely a coincidence and that they are connected to psychological and social experiences. Also, the number of participants with thoughts relating the event with the non-scientific elements is observed to be higher in BÖTE and primary school teaching programs. While 9.08% of the ones in elementary mathematics teaching program and 13.05% of the ones in the science teaching program tried to explain the event using non-scientific solutions, this rate goes up to 24% in BÖTE teaching program and 31.82% in primary school teaching program.

3.2.3. Findings Related to the Third Question

In the scenario presented in the third question, the participants were expected to be included in the efforts of a couple who experienced a mysterious event. In the mentioned event, the participants try to explain how objects mysteriously disappears or found in different places. Using the ideas they propose trying to explain this case, the aim was to determine their approach to the science and scientific methods. Findings related to these responses are presented in Table 10.

Table 10. Findings regarding the third interview question

Themes	Science (f)	Percent %	Prim. Scho. Math. (f)	Percent %	BÖTE (f)	Percent %	Class (f)	Percent %
Observing the event by experimenting in different ways	12	28.58	10	24.40	7	16.28	6	15
Trying the probable solutions one by one	11	26.20	12	29.27	11	25.59	6	15
Observing with the assistance from different observers	8	19.05	9	21.95	6	13.95	4	10.00
Thinking that there's a supernatural explanation	3	7.14	2	4.88	3	6.98	4	10.00
Even though knowing that there's a scientific solution, still fearing or feeling anxious	6	14.29	7	17.07	13	30.23	15	37.50

Fear and anxiety arising from the failure to explain the events	2	4.77	1	2.44	3	6.98	5	12.50
Total	42	100	41	100	43	100	40	100

It was observed that the participants from science and elementary education fields were relatively more successful in coming up with methods that might be considered within the boundaries of scientific methods than the ones in other programs. The significant point here is that while the participants from BÖTE and primary school teaching programs mostly guess that "there is a scientific explanation" to the event, they still express the themes of "fear and anxiety" (30.23% and 37.50% respectively).

3.2.4. Findings Related to the Fourth Question

In the fourth question, participants were asked to share their views on a scenario where the probability of extraterrestrial life was discussed. Upon elaborating what an individual who reads news about aliens on a web page feels like or how they behave, the participants were asked to put themselves into this individual's shoes. What they would feel upon reading such news or how they would act are discussed and the responses are shown in Table 11.

Table 11. Findings regarding the fourth interview question

Themes	Science (f)	Percent %	Prim. Scho. Math. (f)	Percent %	BÖTE (f)	Percent %	Class (f)	Percent %
Curiosity, interest	12	33.33	11	28.20	12	36.36	8	25.80
Joy, hope	8	22.22	10	25.64	10	30.30	7	22.59
Concern, unrest	4	11.11	6	15.39	4	12.12	6	19.35
Fear, panic	3	8.33	4	10.26	2	6.06	3	9.68
Not believing, not caring	9	25.00	8	20.51	5	15.15	7	22.59
Total	36	100	39	100	33	100	31	100

When Table 11 is examined, it is seen that the themes of "Curiosity, interest" and "Joy, hope" are prominent among all the teacher candidates from all fields when it comes to the probability of extraterrestrial life. It was observed that the most commonly encountered "Curiosity, interest" theme was highest in BÖTE program (36.36%) and this is followed by science teaching programs (33.33%). the themes of "Anxiety, feeling restless" and "Fear, panic" were proportionately scored less in all programs.

3.2.5. Findings Related to the Fifth Question

In the fifth question of the semi-structured interview, a scenario was created in order to reveal the participants' ideas on astrology. In this scenario, the behavior of someone who reads an extremely negative interpretation of the astrological sign they belong to in the morning is mentioned. The finding consisting of the answer given when the participants were asked how they would feel or how they would act if they were going through the same event are suggested in Table 12.

Table 12. Findings regarding the fifth interview

Themes	Science (f)	Percent %	Prim. Scho. Math. (f)	Percent %	BÖTE (f)	Percent %	Class (f)	Percent %
Moving on without caring for it	12	41.38	11	39.28	9	30.00	10	32.26
Finding it ridiculous, making fun of it, doing the opposite of recommendations	6	20.69	8	28.58	7	23.33	6	19.35
Even if feeling restless, still not taking any precautions	7	24.14	6	21.43	8	26.67	8	25.80
Fearing and being uneasy about it and trying to take precautions	4	13.80	3	10.71	6	20.00	7	22.58
Total	29	100	28	100	30	100	31	100

When the findings regarding the last interview question were examined, it was observed that the participants opining about the astrology, one of the pseudo-science elements, have the tendency to "moving on with their lives without caring" when it comes to the zodiac signs or horoscopes mentioned in the provided scenario. Besides this, it is seen that there are remarkable rates in both "even if feeling restless, still not taking precautions" and "fearing and being uneasy about it and trying to take precautions" themes. It was observed that especially the candidates studying in primary school teaching program have presented opinions regarding these two themes at the rate of 48.38% in total. The rate of the opinions of the ones studying in BÖTE programs regarding these two themes was 46.67% in total. It is seen that this rate is 32.14% in elementary mathematics program and 37.94% in science teaching program.

4. CONCLUSION AND DISCUSSION

The effect of teacher candidates' epistemological beliefs or beliefs regarding the nature of science on the pseudo-scientific beliefs were investigated in this study. When the quantitative data of the study was examined primarily, it was seen that the epistemological beliefs and nature of science beliefs rates of the participants in science teaching and elementary mathematics teaching programs are higher than the rates of the candidates studying in primary school teaching programs. When the average scores of science and pseudo-science separation scale are examined, it is seen that science teacher candidates have the highest average (90.74). It is observed that the elementary mathematics teacher candidates have the second highest average score with 84.78 and they are followed by BÖTE with 79.31. While the primary school teaching candidates have the lowest average score of 75.04.

The quantitative dimension of the research explicitly suggest that scientific epistemological beliefs and nature of science beliefs have a direct relationship with science, pseudo-scientific beliefs. This relation was profoundly examined in the qualitative dimension of the study and supportive data for the quantitative findings were acquired.

Participants in science and elementary mathematics programs were found to be more successful than participants in BÖTE and primary school teaching programs when it comes to separating the science and pseudo-science. It was also observed that the science and elementary mathematics teacher candidates are more successful in trying to solve various events they came across in the provided scenarios by adhering to the scientific methods and producing a scientific way of thinking than the candidates studying in other programs.

It can be said that the courses the candidates took when they were undergraduates may have an impact on the fact that the epistemological, nature of science and science, pseudo-science separation beliefs of the candidates are consistent in both quantitative and qualitative data and they provide mutual support for each other within these data sets. To exemplify, while science teacher candidates take "Scientific Research Methods" course in the fifth semester of their education as an undergraduate and "Nature of Science and History of Science" in the sixth semester; elementary mathematics teacher candidates take "History of Mathematics" course in their third semester, "History of Science" in fifth semester, "Scientific Research Methods" in seventh semester and "Philosophy of Mathematics" course in their eighth semester. On the other hand, the candidate teachers in BÖTE program take "History of Science" course in the fifth semester and "Scientific Research Methods" in the seventh semester; yet the primary school teacher candidates take only "Scientific Research Methods" in their fourth semester.

In these courses they take, teacher candidates both get the chance of working with some fundamental philosophical problems and questions regarding not only the knowledge but the knowledge generation as well (Matthews, 1998) and they have the opportunity to attend discussions regarding how the scientific knowledge is produced and created (Bartholomew, Osborne and Ratcliff, 2004). The fact that the participants in an environment where there is a philosophy of science lecture with boundaries created using the concepts from the nature of science are determined to be able to develop a more coherent nature of science beliefs support the mentioned claim as well (Abd-El Khalick, 2005).

It was also observed that the candidates in primary school teaching programs with no courses regarding the nature, history or philosophy of science are the least successful in areas related to these concepts.

Similarly, the presence of a great deal of practices in the physics, chemistry, biology and laboratory classes in science teaching programs may also be pointed out as the reason why science teacher candidates are successful in the mentioned fields.

The study conducted by Turgut et al. (2010) is remarkable as it shows similarity with this study. A context structured upon science and pseudo-science separation was provided in the study. And during the process based on astrology case study and conducted through an academic year, a form consisting of open ended questions was used as both pre-test and proof positive. Finally, the data gathered using this form was analyzed qualitatively. The results of the research show that the planned context is influential as the candidates could improve their beliefs in sub-dimensions such as science as an endeavor and the role of experiment, observation, theories, laws, models, scientific method and sociocultural values in science.

ABSTRACT

This study was aimed to examine the effects of constructionism, metacognition and neurocognitive-based (CMEN) through working memory training and traditional (TM) teaching models on veterinary medicine students' behavioral, electrophysiological and achievement change in a Thailand public university. A total of 40 students equally distributed into experimental and control groups and attended to the two different teaching models respectively. An experimental research pretest and posttest control group design was employed and analyzed using 2X2 multivariate analysis of variance. Results indicated that the effect of CMEN model used in the working memory training was greater than TM model and proved to be an innovative teaching model to enhance working memory.

Keywords: Constructionism, metacognition and neurocognitive-based teaching model; working memory

INTRODUCTION

Working memory is defined as our ability to process and remember information which is interconnected to a range of cognitive activities from cerebral tasks to verbal communication (Kane & Engle, 2002). Cowan (2012) defined working memory as the small amount of information kept in mind at any time as it is needed for various types of learning such as comprehension, problem solving, and goal-directed thinking. In addition, working memory has a central role in learning and thinking and is conceptualized as the main cognitive system stores and processes information (Dahlin, 2013). Dahlin further emphasized that working memory upkeeps learning through the abilities to concentrate on the task in hand, hinder irrelevant information and assimilate information from several sources, including long-term memory. Therefore, it is an important cortical construct acts as the translator between sensory input and long-term memory (Dehn, 2008). As a result, the information must first be processed in working memory in order to remember the information (Cowan, 2005). In short, working memory is an active system of storing information and information processing, and is essential for correct functioning of other complex cognitive functions (Sanchez-Torres, Elosua, Lorente-Omenaca, Moreno-Izco & Cuesta, 2015). Past researchers had proved that there is growing evidence for the relationship between working memory and academic attainment (Alloway & Alloway, 2010; Engel de Abreu, Conway, & Gathercole, 2010).

The n-back is a chronological letter memory task commonly used in neuroimaging research (Perlstein, Dixit, Carter, Noll, & Cohen, 2003; Ragland et al., 2002). According to Miller, Price, Okun, and Bowers (2009), n-back is a working memory training which parametrically fluctuates working memory load and task difficulty as well, while keeping whole task procedures persistent across conditions. Miller et al. further stated that the promising aspect of the n-back is there appear to be distinct neural substrates associated with task performance. Neuroimaging studies have exhibited that increased working memory load on the n-back is associated with poorer performance in healthy participants and increased activation of the dorsolateral and inferior frontal regions of the prefrontal cortex (Ragland et al., 2002). Miller et al. suggest that n-back performance may be profound to the integrity of the frontal lobes, with grander working memory loads retaining greater demand upon frontally mediated cognitive functions. As a result, Miller et al. concluded that the n-back is a useful task for assessment of working memory ability within the context of clinical neuropsychological evaluation.

The behavioral performance is measured according to the n-back tasks accuracy and reaction time. The behavioral measures will be taken toward the participants during two separate testing sessions that is pretest versus posttest. The behavioral measures are part of a larger test battery because they assess working memory or processing speed as the two constructs thought namely accuracy and reaction time to underlie n-back

performance. In short, those participants who can perform in a higher level of accuracy and react with lower reaction time will be considered as positive behavioral change.

Event-related potentials (ERPs) have been used to examine the maintenance of information in working memory in human (Drew, McCollough & Voge, 2006). According to Drew et al., visual working memory has a limited capacity system to maintain the information about objects in the immediate visual environment. Psychophysical experiments have showed that majority of people are able to actively maintain 3 or 4 items in visual working memory at any point of time. Drew et al. further emphasized that an ERP component known as the negative slow wave has been used to measure the maintenance of information in working memory 'online' during a given trial. The P300 event related potential is considered as a positive potential that occurs approximately 300 milliseconds (ms) after presentation of any stimulus that requiring detection, counting or cognitive processing by participant. This represents a higher cognitive function of information processing, working memory or stimulus categorization (Thakur, Koushik Ray, Anand & UshaPanjwani, 2011).

In addition, P300 wave is an ERP component stimulated in the human's decision making process and considered as an endogenous potential. ERP's occurrence links not only shown as the physical attributes of a stimulus but also indicated as human's reaction on it. More precisely, the P300 wave is thought to reflect processes involved in stimulus evaluation using P300 amplitude and P300 latency. P300 amplitude refers as the voltage difference between a pre-stimulus baseline and the largest positive-going peak of the ERP waveform within a latency range such as 250-400 ms, although the range can differ depending on subject characteristics, stimulus modality, task conditions, etc (Polich et al., 1997). Therefore, P300 amplitude is the thought to brain activity index that is required in the maintenance of working memory when the context is updated (Polich & Hersbt, 2000).

On the other hand, P300 latency is defined as the time from stimulus onset to the point of maximum positive amplitude within the latency window (Polich et al., 1997). P300 latency is the thought to classification speed index, which is proportional to the time required to detect and evaluate a target stimulus (Polich, 2007). On this line of reasoning, the ERPs will provide an idea about the time course of information processing which encompasses expectancy, attention, cognition search, decision making and memorization. A distributed anterior-posterior cerebral network is used specifically for updating, involving prefrontal cortex (e.g., BA 10 and BA 9/46) and parietal cortex as core regions in updating (Jonides et al., 1997; Salmon et al., 1996).

Achievement performance of veterinary medicine students is measured by their abilities in learning medical terminology and anatomical knowledge. This is because an effective teaching in learning medical terminology in health sciences would assist those veterinary medicine students to understand the origin of words, rules of creating words from etymology, memorization, radical, and finally connected words to ease the troubles and complication of their learning (Uopasai & Bunterm, 2012; Uopasai, 2015). This is further supported by Veach and Holtsberry (2009) and Anderson (2009). Furthermore, medical terminology and anatomical knowledge can assist students to understand the relationships between the terms with anatomy, physiology and clinical significance (Veach and Holtsberry, 2009). Consequently, Anderson (2009) stated that a process of reorganization of current knowledge has to be adequate in line with the dissemination of new experience to give students an idea on the arising of terminology association. In conclusion, the medical terminology and anatomical knowledge achievement has to be vigorously generated through interface with sensory and to be relatively exceptional to the cultural and educational memorable events of the veterinary medicine students.

Uopasai (2015) had developed this constructionism, metacognition and neurocognitive-based teaching model (CMEN) utilizing three emergent fields, namely the constructivist philosophy of science teaching and learning, neurocognitive learning theory and metacognitive knowledge. This CMEN is composed of six phases: i) perception and attention, ii) objective planning and monitoring, iii) multisensory integration, iv) linking, v) rehearsal and practice, and vi) summary and evaluation. Furthermore, the CMEN had been proved by Sripongwiwat, Bunterm, Srisawat and Tang (2016) to be an effective teaching model that promotes secondary school students' science learning outcomes, including nanotechnology content knowledge, science process skills, scientific attitudes and also creative thinking. In addition, Srikoon, Bunterm, Nethanomsak, and Tang (in press) had successfully explored how a neurocognitive-based teaching model to accelerate the mechanisms of learning and development relate to group differences in educational attainment thus educational intervention could be optimized. Srikoon et al. found that the neurocognitive-based contextualization had more effect on attention, working memory, and mood of Grade 9 students than conventional model 5E consisted of five phases namely engage, explore, explain, elaborate, and evaluate.

The traditional model (TM) is the teaching model recommended by Thailand Quality Framework manual of veterinary medicine in this research public university. The TM model composed of three phases namely introduction, instruction, and summary. The TM teaching model was used to the control group. Working memory training is intended to improve an individual's working memory capacity. Working memory training has been claimed to be effective to improve intelligence and to enhance cognitive functioning in typically developing children and healthy adults (Melby-Lervag & Hulme, May 2012). Besides, there are many possible transfer effects from working memory training. Klingberg et al. (2005) emphasized that working memory training can make individuals to be more likely to take on tasks that have a higher working memory load, such as mathematics and other challenging academic. Additionally, Holmes, Gathercole, and Dunning (2009) reported that an improvement occurred in mathematical reasoning even six months after the working memory training was completed.

AIM OF THE STUDY

The aim of this study is to investigate whether working memory training with constructionism, metacognition and neurocognitive-based (CMEN) teaching model will influence veterinary medicine students' achievement in canine anatomy, their accuracy and reaction time while working on n-back tasks as well as their peak amplitude and latency of ERP.

METHOD

A total of 40 healthy, right-handed second year undergraduate students age ranged within 19 to 20 years old with corrected-to-normal vision and no history of neurological or psychiatric conditions from Faculty of Veterinary Medicine, a public university located at Khon Kaen province, Thailand were selected as participants. These 40 participants were recruited via announcements on the notice board at Department of Anatomy. The 40 participants equally distributed into experimental and control groups respectively. Each group consisted of 10 males and 10 females. A 2 (CMEN vs traditional teaching model) x2 (time of measure: pretest vs posttest) design was utilized in this study. On top of that, the experiment group was assigned to attend to working memory training while the control group was not.

At the initial stage, all the participants attended to two sets of pretest namely n-back tasks and anatomical test. The students in the experimental group followed working memory training every day for four weeks. They attended the CMEN teaching model including 15 minutes of daily working memory training which related to the topic of 'dog bone'. However, students in the control group received the traditional teaching model which is the teaching model recommended by Thailand Quality Framework were not attending the working memory training. After four weeks of intervention period, a posttest was then conducted. The reason for this working memory training was to investigate whether it would have any significant impact on the results at the posttest for the 20 participants who completing this CMEN teaching model coupled with the working memory training compared to the rest. The control group received regular TM teaching model and underwent the same basic content knowledge measures within the same time intervals as the experimental group, but they did not complete measures in neuropsychological tasks.

Participants were administered the n-back task and anatomical test during the two separate testing sessions namely pretest and posttest. Task and stimulation procedures working memory was assessed using an visual N-back task, in which subjects were presented a sequence of the pattern pictures which had different number of dots and the position in the grid 2x2, and had to determine whether the currently displayed stimulus at any given time had been already displayed in the previous presentation (1-back condition, low working memory load); or in the second-to-previous presentation (2-back condition, high working memory load) in a 21" CRT monitor and press the keyboard number (1-4) corresponding to the answer on the screen.

The anatomical test was used to measure students' ability in medical terminology and anatomical knowledge of dog skeletal system which was comprised of 60 multiple-choice items. The reliability (KR20) of this medical terminology test was 0.91 and the discrimination index was ranged from 0.27 to 0.61, and the difficulty index was ranged from 0.27 to 0.79. On the other hand, the anatomical knowledge test was used to measure the understanding about the canine skeletal anatomy. The reliability (KR20) was 0.86; discrimination index was 0.22 to 0.46, and difficulty index was 0.26 to 0.79. Specifically, both tests mentioned above consisted of 30 multiple choice items of each and was selected from the Department of Anatomy, Faculty of Medicine, Khon Kaen University, Thailand.

Besides, researchers collected the electrophysical data by specifically recorded the electroencephalogram (EEG) with DC-amplifiers (Neuroscan® EEG Nuamps device) from 32 positions referenced to linked mastoids using an Quik Cap system (Neuroscan® Inc) that placed according to the 10-20 international system. Impedance

values were kept at 5 K Ω for all electrodes. Researchers used three external flat electrodes to monitor eye movements (two above and below the left eye and the other one was 3 centimeters next to the outer canthus of the right eye). Data were recorded continuously and stored for off-line analysis with SCAN 4.3 - Vol. I (Compumedics-Neuroscan®) software. Next, researchers segmented continuous EEG into 500 ms. and the baseline used for the ERP analysis was 100 ms prior to the previous appearance as the target stimulus. Regarding the accuracy of ERP, researchers eliminated the undesired eye movements and eye blink artifacts waveform by using a semiautomatic and manual block rejection procedure. This can be included only corrected or match stimuli in our analysis. We then quantified ERP components, at each recording site for each participant and probe type, by selecting the amplitude and latency of the largest deflection within a specified latency range around the peak. EEG and electrooculographic (EOG) were peached off-line into periods of 500 ms, starting 100 ms prior to stimulus onset. To investigate the influence of serial position on recognition, researchers examined the accuracy and reaction time of participants' responses to probe items followed by the amplitude, latency, and topographic scalp amplitude distribution of the P300 at Pz electrode site

At the initial stage, all the variables were analyzed using descriptive statistic mean score and standard deviation. This is followed by utilizing repeated measures multivariate analysis of variance (Repeated MANOVA) to analyze the effects of the intervention in terms of three aspects (i) behavioral change including the accuracy and reaction time of participants' responses toward the probe items; (ii) electrophysiological that is the ERP components encompassing the amplitude and topographic scalp amplitude distribution of the P300 at Pz electrode site, and (iii) achievement in their ability in medical terminology and anatomical knowledge. Wilks' lambda, a direct measure of the proportion of variance in the combination of dependent variables that is unaccounted for the group variable (Everitt & Dunn, 1991), is used to test whether there are differences between the means of identified groups of students on a combination of dependent variables.

RESULTS

Results are presented according to the aim as mentioned above. The results demonstrate in two parts as descriptive and inferential results. The initial results highlight the mean score and standard deviation of each category of change (behavioral, electrophysical, and achievement) from different student groups (experimental group versus control group). This is followed by evaluating the differences between these two groups on each of category of change.

Results of Behavioral Change

Behavioral change was measured based on the accuracy and reaction time of the students toward the working memory tasks. The mean score and standard deviation of accuracy and reaction time measured by each working memory task between experimental group and control as indicated in Table 1 below.

Table 1. Mean score and standard deviation of students' behavior before and after intervention

		Before intervention				After intervention			
		Experimental Group		Control Group		Experimental Group		Control Group	
		Mean	SD	Mean	SD	Mean	SD	Mean	SD
Accuracy	1 back	65.50	9.99	66.00	11.42	77.50	19.55	61.50	12.26
	2 back	38.50	13.48	43.50	14.61	63.00	15.59	44.50	17.61
Reaction time	1 back	510.70	97.21	503.46	106.46	420.46	61.06	522.38	87.02
	2 back	608.66	107.86	592.01	110.70	473.70	108.05	616.43	99.61

The effects of CMEN teaching model and working memory training on the students' behavioral change was measured using 2x2 multivariate analysis of variance (MANOVA). Results revealed that pretest versus posttest of their behavioral change in term of accuracy and reaction time in 1-back and 2-back tasks were found to be improved. In other words, students in experimental group showed a better accuracy behavior and using shorter time while performing the working memory tasks such as 1-back and 2-back tasks. The behavioral change of both experimental and control groups as shown in Table 1 above indicate that the posttest results show the improvement compared to the pretest results after intervention only happened to experimental group.

Furthermore, repeated-measures MANOVA analysis indicated that there was a significant multivariate effect between-subjects factor and load (1-back and 2-back tasks) across the groups (regardless their reaction time): Wilks' $\lambda = .804$, $F(2, 37) = 4.511$, $p < .05$, partial $\eta^2 = .196$. Besides, result shows that there was also a significant multivariate effect within-subject factor and load (regardless student group): Wilks' $\lambda = .690$, $F(2, 37) = 8.294$, $p < .01$, partial $\eta^2 = .310$. On top of that, result further shows that there was a significant multivariate effect across

the interaction between student group and reaction time: Wilks' $\lambda = .575$, $F(2, 37) = 13.688$, $p < .01$, partial $\eta^2 = .425$. This is followed by performing the univariate test. Result of the univariate test shows that experimental group performed more accurately in 1-back task compared to the control group regardless their reaction time: $F(2,37) = 7.611$, $p < .01$, $\eta^2 = 0.167$ at 0.01 significant level. However, there was no significant difference between the two groups ($F(2, 37) = 2.128$, $p > .05$, $\eta^2 = .053$) while they performed the 2-back task in regard to accuracy.

Another behavioral change variable that researchers considered was participants' reaction time. Repeated-measures MANOVA analysis indicated that there was a significant multivariate effect between-subjects factor and load (reaction time on 1-back and 2-back tasks) across the groups: Wilks' $\lambda = .900$, $F(2, 37) = 2.065$, $p = .041$, partial $\eta^2 = .100$. Besides, result shows that there was also a significant multivariate effect within-subject factor and load (regardless student group): Wilks' $\lambda = .846$, $F(2, 37) = 3.372$, $p < .05$, partial $\eta^2 = .154$. On top of that, result further shows that there was a significant multivariate effect across the interaction between student group and their reaction time: Wilks' $\lambda = .773$, $F(2, 37) = 5.441$, $p < .01$, partial $\eta^2 = .227$. This is followed by performing the univariate test. Results of the univariate test show that experimental group only performed faster in performing 1-back with the result as $F(2,37) = 4.185$, $p = .048$, $\eta^2 = .100$ at .05 significant level. However, there was no significant difference between the two groups ($F(2, 37) = .050$, $p = .824$, $\eta^2 = .001$) while they performed the 2-back task in regard to their reaction time..

Results of Electrophysical Change

The electrophysical change was measured based on the P300 peak amplitude and P300 latency Pz of the students toward the working memory tasks. P300 peak amplitude was largest at parietal, decreasing through central and frontal electrode sites and decreased progressively from 1-back to 2-back task. Means and standard deviation of P300 peak amplitude and P300 latency Pz were measured by each working memory task by experimental and control group are shown in Table 2 and Table 3 as well as Figure 1

Table 2. Mean score and standard deviation of P300 peak amplitude (microvolts) while implementing tasks

n-back		Pretest				Posttest			
		Experimental Group		Control Group		Experimental Group		Control Group	
		Mean	SD	Mean	SD	Mean	SD	Mean	SD
1-back	Fz	11.63	1.13	11.83	1.34	15.06	1.52	12.04	1.21
	Cz	12.01	1.17	12.36	1.35	15.39	1.48	12.51	1.18
	Pz	12.46	1.26	12.52	1.37	15.66	1.47	12.77	1.07
2-back	Fz	9.68	1.04	9.84	1.25	12.07	1.21	9.96	1.27
	Cz	10.22	1.06	10.31	1.23	12.68	1.06	10.44	1.24
	Pz	10.55	1.08	10.78	1.16	12.96	1.05	10.88	1.21

Table 3. Mean score and standard deviation of P300 latency Pz (ms) while implementing tasks

n-back	Pretest				Posttest			
	Experimental Group		Control Group		Experimental Group		Control Group	
	Mean	SD	Mean	SD	Mean	SD	Mean	SD
1-back	357.48	8.99	360.39	9.30	349.56	5.85	361.08	7.49
2-back	376.89	7.29	378.03	9.54	363.56	7.53	374.77	6.67

By analyzing the P300 latency Pz, repeated-measures MANOVA analysis indicated that there was a significant multivariate effect between-subjects factor and load Pz latency while participants were implementing 1-back and 2-back tasks across the groups (regardless their reaction time): Wilks' $\lambda = .753$, $F(2, 37) = 6.072$, $p = .005$, partial $\eta^2 = .247$. Besides, result shows that there was also a significant multivariate effect within-subject factor and load (regardless student group): Wilks' $\lambda = .370$, $F(2, 37) = 31.470$, $p < .001$, partial $\eta^2 = .630$. On top of that, result further shows that there was a significant multivariate effect across the interaction between student group and reaction time: Wilks' $\lambda = .499$, $F(2, 37) = 18.607$, $p < .001$, partial $\eta^2 = .501$. This is followed by performing the univariate test. Result of the univariate test shows that experimental group performed PZ latency shorter than control group in 1-back task regardless their reaction time: $F(2,37) = 9.014$, $p = .005$, $\eta^2 = .192$ at 0.01 significant level as well in 2-back task regardless their reaction time as $F(2, 37) = 7.630$, $p = .009$, $\eta^2 = .167$.

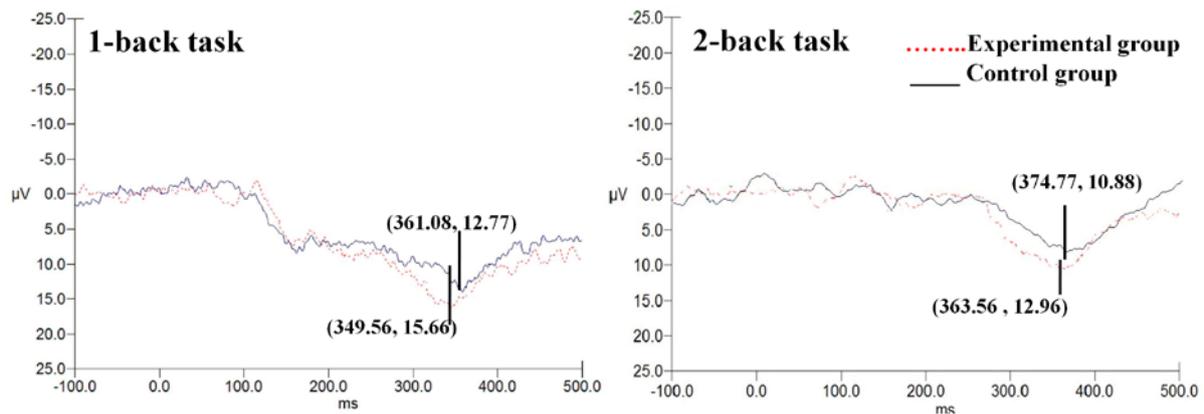

Figure 1. Grand average ERP for correct trials for 1-back and 2-back tasks at midline parietal Pz sites after working memory training

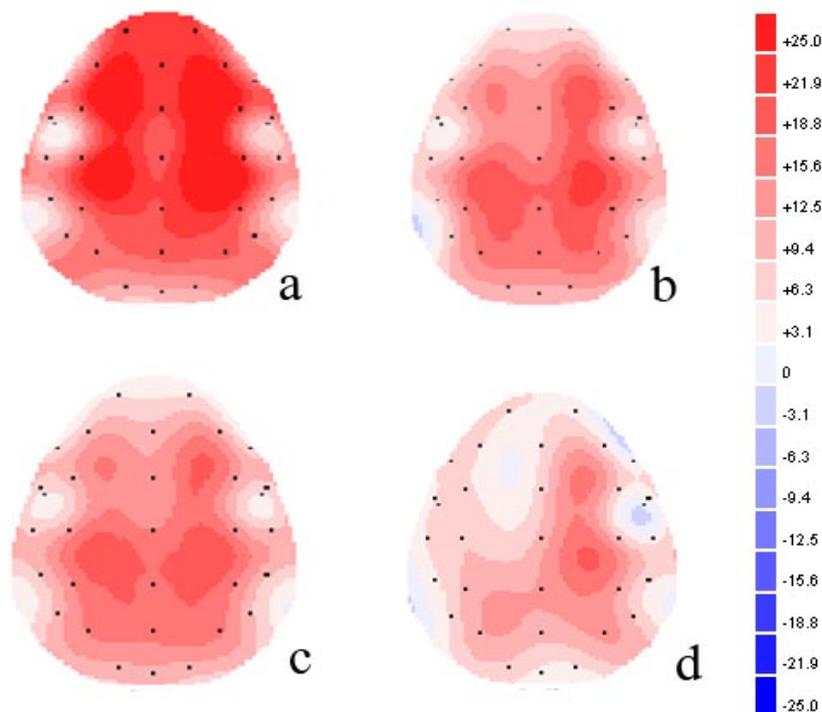

Figure 2. Two dimensional topographical distribution of the evoked P300 potentials at midline parietal Pz sites of experiment group elicited by 1-back task (a) 2- back task of (c) and 1-back task (b) 2-back task (d) after working memory training.

Repeated-measures MANOVA analysis once again confirmed that there was a significant multivariate effect between-subjects factor and load P300 peak amplitude (FZ_1_back, CZ_1_back, CZ_2_back, PZ_1_back, and PZ_2_back) while students were implementing 1-back and 2-back tasks across the groups (regardless their reaction time): Wilks' $\lambda = .358$, $F(2, 37) = 9.865$, $p < .001$, partial $\eta^2 = .642$. Besides, result shows that there was also a significant multivariate effect within-subject factor and load (regardless student group): Wilks' $\lambda = .192$, $F(2, 37) = 23.152$, $p < .001$, partial $\eta^2 = .808$. On top of that, result further shows that there was a significant multivariate effect across the interaction between student group and reaction time: Wilks' $\lambda = .205$, $F(2, 37) = 21.365$, $p < .01$, partial $\eta^2 = .795$. When univariate were performed on the dependent variables, results indicate that the amplitude of all electrode when performing n back tasks were higher than control group (regardless their reaction time) as shown in Table 4.

While students were implementing the 1-back task, results show that the experimental group had larger positive amplitudes over the para median parietal, central, and occipital especially frontal sites compared to the control group who had lower voltage especially frontal site. While participants were implementing 2-back task, results show that they had lower voltage compared to the 1-back task. However, the experimental group exhibited a

larger positive voltage compared to the control group. Subsequently, both groups of participants either in experimental or control groups were at higher voltage in the right hemisphere compared to the left hemisphere. Figure 2 above shows the two dimensional topographical distribution of the evoked P300 potentials at midline parietal Pz sites of experimental group elicited by 1-back task (diagram a), 2-back task (diagram c), and control group in 1-back task (diagram b), and 2-back task (diagram d) after the working memory training.

Table 4. Univariate test of midline P300 peak amplitude when implementing 1-back and 2-back tasks

Dependent variables	SS	df	MS	F	p	η^2
FZ_1_back_amp	39.847	1	39.847	15.444	.0008*	.289
FZ_2_back_amp	19.120	1	19.120	8.729	.005**	.187

**p<.01

Results of Achievement Change

Participants' achievement were measured from two aspects namely their ability in medical terminology and anatomical knowledge. A 2x2 multivariate analysis of variance (MANOVA) was used to examine whether the working memory training was able to enhance students' achievement particularly to understand the medical terminology and anatomical knowledge about the skeletal system of canine anatomy. The Box's M test for equality of variance-covariance matrices was not significant indicating that the assumption of homogeneity across the groups was met ($p>.05$). MANOVA analysis shows that there was a significant multivariate effect across the interaction between student group and their reaction time: Wilks' $\lambda = .031$, $F(2, 37) = 40.61$, $p<.01$, partial $\eta^2 = .69$. Besides, result shows that there was also a significant multivariate effect of between-subjects (medical terminology and anatomical knowledge achievement) across student groups regardless their reaction time: Wilks' $\lambda = 0.82$, $F(2, 37) = 4.11$, $p<.05$, partial $\eta^2 = .18$. In addition, we also found that there was a significant multivariate effect within-subjects regardless of student group: Wilks' $\lambda = .99$, $F(2, 37) = 1,212.26$, $p<.01$, partial $\eta^2 = 0.98$. Finally, result shows that there was a significant difference in their anatomical knowledge achievement between the experimental and control groups but there was no significant difference between the two groups in term of their achievement in medical terminology. Nevertheless, the experimental group possessed higher scores compared to the control group as shown in Table 5.

Table 5. Mean score and standard deviation of students' achievement before and after intervention

	Before intervention				t	After intervention				
	Experimental		Control			Experimental		Control		
	Group	Group	Group	Group		Group	Group	Group	Group	
	Mean	SD	Mean	SD		Mean	SD	Mean	SD	t
Medical terminology	5.50	2.48	7.25	2.92	2.01	23.15	1.98	20.70	1.78	4.11**
Anatomical knowledge	5.80	1.64	7.65	2.78	2.56*	23.65	2.56	18.10	4.01	5.22**

DISCUSSION

This study has hypothesized that the four weeks working memory training coupled with the CMEN teaching model would make significant change among the veterinary medicine students while implementing working memory tasks and achievement in medical terminology and anatomical knowledge. The results have been successfully proved that students in the experimental group had better performance compared to the control group. It seems that the working memory training may yield the impacts that related to the specific teaching model that is CMEN model and not to the traditional teaching model. A conclusion is working memory capacity is improved and working memory training has positive effect, as shown in the three dependent variables measures. This is in line with the hypothesis, suggesting that memory capacity is flexible (Eriksen, 2010) and that working memory training seems to affect students' behavior and achievement (Caviola, Mammarella, Cornoldi, & Lucangeli, 2009; Holmes et al., 2009).

P300 wave is recognized as neurophysiological measure to examine human brain process (Drew et al., 2006; Thakur et al., 2009) underlining working memory operations. The current results provide new evidence that experiment group performed higher amplitude P300 and shorter latency P300 compared to control group in operating working memory tasks. This implies that the information processing of the cortical networks in the brain of the experiment group have improved in correspond to encoding, retention, and retrieval of information held in working memory. The brain area that involving working memory was found around midline frontal, central, posterior parietal cortices (Figure 2) is in accordance to the past researchers (Drew et al., 2006; Gaspar et al., 2011; George & Coch, 2011). Moreover, result of higher voltage on right than left hemisphere implies that the lateralization on right hemisphere especially parietal area appeared to be strongest with an intermediate retention interval and early in the working memory process that affected by more general processes like spatial working memory, spatial attention, and the temporal dynamics of the task at hand (van der Ham, 2010). The two categories of P300 wave as P3a reflecting frontal lobe activity related to the hippocampus that associated with stimulus novelty processing (Friedman et al., 2001) stimulated by an infrequent distracter stimulus inserted randomly into the target/standard sequence (Polich, 2007) while P3b relating to allocation of attentional resources for updating of working memory contents (Polich, 2007) activity of parietal lobe related to context updating operations and subsequent memory storage. Only two dimensional topographical distributions of the evoked P300 potentials at midline parietal sites were used in order to illustrate the updating of working memory contents (Friedman et al., 2001; Polich, 2007). In the 2-back task, result showed that the latency P300 increased while the amplitude decreased when compared to 1-back task, reflecting the reallocation of attention and processing capacity of working memory activity. In 2-back task, an increase in difficulty transforms the structure or actual content of the flow of information in the processing systems, thereby interfering with the very processes that underlie P3 generation (Evans & Pollak, 2011).

In summary, we find that working memory in higher education can be a more powerful predictor of subsequent academic success thus represents a dissociable cognitive skill with unique links to their learning outcomes. In fact, results of this study are successfully reinforced the uniqueness of neurophysiological measures as P300 component whereby the information of working memory that widely accepted to examine the human brain processes that underline the operations of working memory (Drew et al., 2006; Thakur et al., 2009). On this line of reasoning, results imply that the information processing of the cortical networks in the brain of the experimental group had improved in encoding, retention, and retrieval of information held in their working memory. The practical implications suggest that the CMEN teaching model should be integrated into working memory training in order to upgrade the working memory capacity and transfer effect in academic achievement.

THE EFFECTIVENESS OF M-LEARNING IN HOSPITALITY EDUCATION: AN EXPLORATION WITH REVISED TECHNOLOGY ACCEPTANCE MODEL (TAM2)

Liwei Hsu

liweihsu@mail.nkuht.edu.tw

The emerging development of information communication technologies (ICTs) enables students learn without limits of time and location, particularly the expeditious advancement in mobile devices which have the functionality and affordance to deliver various modals of materials enrich students' learning. Even so, the empirical evidence on effectiveness of such application in hospitality education is still in paucity. This present study aimed to explore this issue through the adoption of Revised Technology Acceptance Model (TAM2) to shed lights on the comprehensive relationship between proposed variables; namely, perceived ease of use (POE), perceived usefulness (PU), usage intention (UI) and self learning effectiveness (SLE).

The present study employed purposive sampling techniques and collected 437 valid questionnaires (n = 437) for statistical analyses. The following findings were elicited out of the administration of this study:

1. Generally, hospitality students are keen to M-Learning in both practical and academic classes.
2. Participants reported a higher level of POE and PU for practical skills learning than academic knowledge learning.
3. A significant correlation was unveiled between POE and PU when they learn practical skills as well as academic knowledge through M-Learning and both POE and PU were significantly correlated to UI.
4. Participants' UI was able to predict their self learning effectiveness-- the greater UI, the better SLE.

Based on the findings of this present study, suggestions were provided accordingly to school administrators, practitioners of hospitality education, mobile device APP programmers and future researchers.

THE EFFECTIVENESS OF THE 3D ANIMATION FOR TRANSFERRING KNOWLEDGE TO THE JUNIOR HIGH SCHOOL KIDS: THE WATER RESERVOIR FOR SMALL ISLAND IN INDONESIA

ABSTRACT

3D animation becomes a media of choice for the technology information dissemination to people in rural. Previous researches showed that people in rural prefer to the information conveyed orally. 3D animation, which consist of text, sound and picture make adult people more understanding the content. Moreover, the media might encourage them to read the written version. However, the number of research about the 3D animation usage for transferring knowledge to the teens is still a few. The aim of this study was to evaluate the effectiveness of 3D animation to convey knowledge for the junior high school students. 3D animation about a water reservoir was made by collaboration between animation developer and researchers in the field of water technology and information science. The number of participants are 46 consisted of 8th and 9th grade junior high-school students living in the sub-district of Sedanau, the district of Natuna, Indonesia. Data are collected using open-ended questionnaire and analyzed with the content analysis. The result showed that 30 students understand the information conveyed by the animation, however 20 of them did not write down the explanation about the information. Most students also said that reservoir is necessary to be built in Sedanau. The significance of this research is that an appropriate media is required to transfer knowledge to the people including teens in the remote area.

Keywords: 3D animation, reservoir, knowledge transfer, school student, Natuna, Indonesia,

INTRODUCTION

People in rural especially in developing countries prefers oral rather than in written information. They choose village head, colleagues and friends as their sources of information (Daudu & Mohammed, 2014). For a certain field of information they are comfortable using media, which produce sound such as radio (Daudu & Mohammed, 2014; Rodriguez et al., 2015; Yoganingrum, 2016). Even in developed country such as US, oral tradition on science education is still maintained in rural. It takes into account the fact that the oral traditions are embedded in place, people, memory and culture (Avery & Hains, 2017). Likewise, (Stapleton, 2017) argued that oral traditions in science education give positive impacts such as connecting between youth and older generations in the families and the family traditions.

3D animation is one of media to convey information. Texts, images and sounds in an animation help people to understand the information content. Yoganingrum et al., (2016) showed that 3D animation could be a prospective media for transferring appropriate technology such as a manufacture of a dryer cabinet for people in Indonesian rural. Furthermore, 3D animation was helpful to improve the understanding of people aged 60 to 75 years old to the nutrition information (Ali, Norizan, & Shahr, 2013). Meanwhile (Zahra, 2016)(Chiou, Tien, & Lee, 2015) proved that multimedia learning animation has the finest and positive impact to understand a concept easily and memorable.

Likewise, 3D animation, which consists of sound, picture and text, makes students more understanding the content of the information. Sinthamrongruk et al. (2013) employed the media of 3D animation to evaluate the knowledge of students grade 8th, 9th, and 10th on the definition and importance of biogas. The result showed that their score is on the level of 3.5 out of 5. The score means that 3D animation is a media, which could give a good knowledge about biogas to junior high school students. It has been reported by Guo et al., (2014) that the 3D animation in a multimedia environment improve grade 12th students' mathematical spatial ability. Additionally, Yeh et al. (2012) showed that the animation-based instruction was effective to teach the 'Principles of Earthquakes' of 10th grade high-school students. Others study also provided evidence that animation effectively conveyed the obesity risk to young African American Girls (Thompson et al., 2013) and about the microcosmic particle conceptions to develop the Junior High School Students' Cognitive (Chang et al., 2008).

The aim of this study was to evaluate the effectiveness of the 3D animation-based knowledge for the junior high school students living in a small island (a remote area). The knowledge conveyed is about the water reservoir for the small island in Indonesia. Some small islands in Indonesia suffer fresh water lacking during the long dry season. Therefore the technology to keep fresh water as a stock for long dry season should be introduced to the dwellers. The significance of this research is that information service providers need an effective media for transferring knowledge to communities including teenagers, who living in remote areas. The Indonesian people live scattered in many small islands. Therefore, the media, which can overcome the obstacles of the distance, cost and time in conveying information is required.

LITERATURE REVIEW

There 4 aspects should be considered for the success of the information dissemination in rural, namely the inclusiveness of the provider, the availability of the information media and communication channel, the accuracy of the information content, and the characteristic of the user (Ambar Yoganingrum, 2016). This review would be focus on the development of the media for disseminating information to the people in rural, especially in the developing countries like in Indonesia. In the area of Library and Information Science, the development of the media for disseminating information is also called the information repackaging.

Repackaging of information is a kind of the library services. Initially the service was providing the abstracts collection of a specific disciplines (Frome and Caponio, 1963). This service was triggered by the dispersing of the literatures in the various form of publications, therefore the researchers need plenty of time to acquire, search and evaluate. This kind of service eased the reserachers in collecting the appropriate literatures. Currently, information repackaging is developed for the various needs and problems. Among others were for disseminating information to the people with the low level of the information literacy skills (Maryati and Yoganingrum, 2015) or for improving their literacy skills (Gathoni, 2012), for increasing civic information awareness in the remote areas (Nwofor and Ilorah, 2015), for promoting user characteristic, such as the true democracy (Kargbo, 2014), and for knowledge sharing (Namdev Dhamdhere, 2015). Following are the kinds of media for disseminating information in rural, namely liquid-crystal display (LCD) (Salim, 2013), model of a technology in the actual size (Yoganingrum et al. 2015), pictures (Miss & Njoku, 2013), posters (Yoganingrum et al. 2015), movie (Ravallion et al., 2015), and animation (Sinthamrongruk et al., 2013; Yeh et al., 2012; Yoganingrum et al., 2016).

Catts & Lau (2008) said that people in rural may prefer to the information conveyed orally and other kinds of non-written sources. It was likewise with Indonesian people, who live in rural (Yoganingrum & Hantoro, 2015). There were several media that fit those characteristics, those are movie and animation. The both media have been used for disseminating information to increase awareness, mitigation and adaption of people to the climate change impacts (Ballantyne et al., 2016; Lieske et al., 2014; Roberts & Nicol, 2011). Mayer & Moreno (2002) argued that animation can be used to improve deeper understanding in a learning process. Meanwhile, (Rosen, 2009) conveyed that the usage of animation for on-line learning can improve the ability to construct, adaptation with the scientific and technological knowledge and motivation to learn science and technology. Moreover, Yoganingrum et al. (2016) assumed that 3D animations containing detailed and focus information, according to the information needed and using the local terms can be a tool for transferring appropriate technology to the rural communities.

Some researchers developed the animation as a tool to convey the scientific information to the children school and for learning process of them. In Thailand Sinthamrongruk et al. (2013) combined between media of animation and game to disseminate the knowledge of energy conservation in student grade 8th, 9th, and 10th. They designed the picture with the round-shape characters and pastel-color technique to attract the attention of the children. The authors did not mention the reasons in choosing the media of 3D animation and games for disseminating knowledge to the children school. The result showed that the students were more satisfaction in using the game than that of the 3D animation. The author employed questionnaire to collect the data. However, the authors did not describe the shape of the questionnaire and the technique to analysed it. Moreover, Guo et al., (2014) used some types of the 3D animation namely Virtual Environment, Interface, and Static Illustrations Interface. The animation was completed by the narration and text in the multimedia applications. The research aimed to measure, which kind of 3D animations provides higher contribution in improving the mathematical spatial ability of the grade 12th students. The authors employed questionnaire, which is analysed by non-parametric test. The result showed that 3D virtual environment was the most effective animation for the learning process. On the other hand, Yeh et al. (2012) used animation-based instruction to convey knowledge about the 'Principles of Earthquakes' to 10th grade students. They divided respondent to two groups. The first group received an assessment of their prior knowledge before getting appropriate feedback mechanism. The students,

who join group one can reduce perceived cognitive loads making them easier to reconstruct their cognitive structure in subsequent learning using the correct information. Based on the results of an open question, animation-based instruction is an effective tool for reducing perceived cognitive burden and improving learning.

METHODOLOGY

3D animation about the building of a water reservoir was made by the collaboration among the animation developer and the researchers, who have expertise on water technology and information science. The number of participants are 46 consisted of 8th and 9th grade junior high-school students living in the village of Sedanau, the district of Natuna, Indonesia.

Data collecting and analyzing

Data were collected using open-ended questionnaire. This technique was used by (Yeh et al., 2012) to evaluate the learning outcomes and feedback provision of the animation-based earthquakes instruction for 10th grade high-school students. Then we analyzed the data with the content analysis. The questions are following:

- Can you understand the information? Is the information concise and clear? Please explain
- Does reservoir need to be built in your village? Please explain

The students could interact one to another while answer the questions. The steps of data collecting are following:

- We collected the student of grade 7 and 8 on a room
- We showed the 3D animation for 2 times
- The students wrote and answered the questions

FINDINGS

Can you understand the information? Please explain about the information

The Table 1 showed the various answers of the students.

Table 1: The answer of the students to the question number 1

No	Answer	Explanation	Amount
1.	Yes	None	20
2.	A little	None	4
3.	No	None	2
4.	Yes	<ol style="list-style-type: none"> 1. 'But the detail information is not clear' 2. 'About the usage and building of a reservoir appropriately' 3. 'The water in Sedanau will be available on any season' 4. 'To overcome the problem in lacking of water in Sedanau' 5. 'But the need of reservoir is depend on the awareness of the dwellers' 6. 'About closed reservoir for storing water' 7. 'I can imagine the building of a reservoir' 8. 'But the detail information is not clear' 9. 'The dwellers will not be hard to get water if a reservoir is built in Sedanau' 10. 'Although the animation tempo is too fast' 	10
5.	A little	<ol style="list-style-type: none"> 1. 'The animation is too fast. It will be good if the animation is repeated until 3 times' 2. The explanation about the reservoir is too fast and not clear' 3. 'I cannot write down the summary of the story' 4. The explanation is too fast 5. The explanation is too fast 6. We cannot find the tools for building the reservoir in Sedanau. However the information is useful for the region, which is lacking of water'. 7. 'The animation is too fast' 8. 'The explanation is too fast' 	9

		9. 'The explanation is too fast'	
6.	No	'Because the kind of reservoir in the animation is different with the one in Sedanau'	1
Total			46

Does reservoir need to be built in your village? Please explain

The Table 2 showed the various answers of the students.

Table 2: The answer of the students to the question number 2

No	Answer	Explanation	Amount
1.	None	<ol style="list-style-type: none"> 1. 'It is better to be built at Kurak' 2. 'Can be built at Kurak' 3. There is already reservoir in Sedanau. But the reservoir is not similar to the reservoir on the animation. The water on reservoir in Sedanau is very cloudy and lots of garbage. So, we must manage it, or we made again with the location in front of the high school and maintenance it therefore it cleaner and healthier. 4. 'At the highland, like at Gayam' 5. 'It is better built at Kurak' 6. 'In front of the high school' 7. 'At Semarus' 	7
8.	Very necessary	None	1
9.	Very necessary	<ol style="list-style-type: none"> 1. 'Because there is a dry season in Sedanau and Sedanau is tropical area' 2. 'At Pering' 3. 'Because here lack of clean water. I propose on the plateau like in front of the second high school in Natuna' 4. Sedanau is categorized as a place that lack of water, and we can build in the location of the shortage of water like in Penyong' 	4
10.	Necessary	<ol style="list-style-type: none"> 1. 'At Chinese cemetery' 2. 'Built at Pering' 3. 'In a humid place like Kurak' 4. 'On the plateau, that is in Kurak' 5. 'At Pering. Also at Samarus' 6. 'At Penyong' 7. 'So, we do not lack of water. It is suitable at Pering or in front of the high school, because there is very wide land there'. 8. 'On the open area, in the highlands like in front of the high school' 9. 'On the open area and do not disturb the community' 10. 'Built at a bit far from the residential area, so the reservoir is clean and not polluted, for example in the coastal area, at Samarus' 11. 'At Kurak' 12. In a place away from the homes of the residents, so that the residents do not contaminate the reservoir or water....On a highland in the Kurak area' 13. 'At Kurak, an open area so do not disturb the residents' 	32

		14. 'An open area so do not disturb the residents' 15. 'Built in lowland and upland areas' 16. 'Built in the main island' 17. 'In front of the high school' 18. 'During the dry season, Sedanau experiences water drought, and it is necessary to have a reservoir, so that poor families get water easily in the dry season' 19. 'In the areas where there is a rotting soil to make a perfect embung' 20. 'Sedanau experiences water drought during the dry season. The appropriate place is at Pering. There is already reservoir there' 21. 'At Penyong or in front of the high school' 22. 'Sedanau experiences water drought during the dry season' 23. 'At Peqeng' 24. 'At Peqeng' 25. 'At the open area, under the plateau' 26. 'At Kuraq' 27. 'At the highland' 28. 'in front of the high school' 29. 'At Pering/Apak' 30. 'At Pering' 31. 'At Pering' 32. 'Sedanau is area of water shortage'	
11.	Not necessary	1. There is already reservoir in Sedanau. However, it is not similar to the information on the animation. The water is very cloudy. 2. There is already reservoir in Sedanau, the location is beside the Futsal field'	2
Total			46

The result on the table 1 showed that most students understand the information conveyed by the animation. However, most respondents did not explain the content of the information. Meanwhile, Table 2 showed that most students have opinion reservoir is necessary to be built in Sedanau. But only a few respondents answer the reasons why their village needs reservoir. The result in table 2 showed that most of them imitate the answer of other. We assumed that those results are affected by the technique applied for the data collecting in this research.

Table 1 shows that 30 students answer 'yes' but 20 (twenty) students did not give the explanation. There is only 10 (ten) students give explanation on their answer sheet. Seven students said that the tempo of animation is too fast. It is similar to table 2. Most students only mention the name of the area for building the reservoir. It seems that the students have difficulty in describing and writing down their opinion. The form of answer on the class promotion test in Indonesia is generally the multiple choices or filling the blank. Probably this cause the students are not familiar with the form of the open-ended question, which they should write down the answer.

Animation-based learning improved the abstract conception of the student effectively (Yeh et al., 2012). However, the technique chosen to measure the abstractive concept of school students is critical. This research decided to use open-ended questions since one of the results of Yeh et al.(2012) showed that the result of open-ended question performed better than those of multiple choice result. (Araya & Aljovin, 2018) argued that the word of "explain" had a significant effect on the response of the students on written responses to open-ended questions of science, technology, engineering and mathematics (STEM) platform. For future research it may take a simpler phrase that encourages students to write down their opinion. Furthermore use of a motivation text and the small of answer boxes on the answer sheet affected the answering of open-ended questions in a web survey (Zuell at al., 2015). This research used a blank sheet for respondents to answer the questions. Although the technique of data collecting is different, in the future it could be considered to provide a question sheet with a motivation text written on it and use a small answer boxes to increase the willingness of respondent to write down the explanation.

It is necessary to build student's prior knowledge and learning environment before improving the cognitive structure of school kids regarding a particular topic (Yeh et al., 2012). Those processes will make the students easier to recreate cognitive structure in subsequent learning using the correct information. The steps of this research did not conduct those processes. Therefore, it is possibly the students finding difficulties when they are trying to understand and construct the concept about the building of the reservoir. One of students at Table 1 answered that he/she cannot write down the summary of the information from the animation. It is probably he/she is failure to reconstruct the cognitive structure. It is also happened to the 20 students on Table 1, who are only able to write yes, but difficult to write down the explanation.

CONCLUSIONS

This research result indicated that animation could be an effective media to convey the information regarding reservoir to the school kids of grade 7th and 8th. However most students showed the difficulties to write down the explanation, which is indicated the low level of the cognitive structure regarding the topic. It caused by the tempo of animation is too fast, also caused by they are not familiar with writing answer on open-ended question. In the future, we will compare to the form of multiple choice question, and open ended question using answer sheet completed by motivation text and small answer box, as well as building student's prior knowledge and learning environment before testing.

ACKNOWLEDGMENT

Many thanks to Mr. Syamsuddin, head of *Madrasah Tsanawiyah Negeri 1* (MTs Negeri 1) in *Sedanau*, the district of Natuna, Indonesia. Indonesian Institute of Sciences under the Program of Riset Unggulan 2017 sponsors this work.

THE EFFECTS OF MOBILE INQUIRY-BASED LEARNING: A META-ANALYSIS

Yao-Ting Sung

sungtc@ntnu.edu.tw

Je-Ming Yang

skfalong@gmail.com

One of the trends in inquiry-based learning is using mobile devices for supporting the process and products of learning activities, which has been forming the field of mobile inquiry-based learning (m-IBL). Although mobile devices have become valuable inquiry-based learning tools, evaluative evidence for their substantial contributions to inquiry-based learning is still scarce. The present meta-analysis, which included 45 peer-reviewed journal articles written over a 16-year period (2001–2016), revealed that m-IBL has produced meaningful improvements for inquiry-based learning, with an overall mean effect size of 0.774. The current analyses also revealed that some moderators, such as learning outcomes, inquiry types, and domain subjects related to different effect sizes.

ABSTRACT

This paper discusses the empowerment of teaching Arabic Language in National Schools of Malaysia. It focuses on 3 elements in a teacher of Arabic Language Model, namely, i) knowledge, ii) personality and iii) motivation. In Malaysia, not all teachers of the Arabic Language Model are given specialized training to teach it. Thus, it is important to identify or determine the teacher's readiness or preparedness in teaching the language. This paper only reports results of quantitative research which involves distribution of questionnaires to teachers of the Arabic Language Model. Data are analyzed by using descriptive statistical method and displayed as frequency, percentage, mean and deviation. Research is conducted on 344 teachers aged between 25 – 45 years and with teaching experience of between 1-12 years. Each question has a 5-point Likert scale, namely, "strongly agree (SA)", "agree (A)", "slightly disagree (SDA)", "disagree (DA)" and "strongly disagree (STDA)". There are 8 questions on the elements of knowledge and personality, and 5 questions on motivation. Research finds that: i) teachers' knowledge is at a good level with mean average of 4.00, ii) personality is also good at mean average of 4.15, and iii) motivation is also good with an overall mean of 4.12. Overall, research finds that teachers' readiness, in terms of the elements in teaching Arabic Language, is good except for some matters which need improvement by the administration, and the need for specialized training to teach Arabic Language in order to empower and produce trained teachers in this field.

Key Words: Personality, Motivation, Language Learning

INTRODUCTION

Arabic language education in National Schools in Malaysia is one of the Models introduced through the j-QAF Program. Historically, formal teaching of Arabic language was clearly visible in the Malay society, particularly with the emergence of Islamic learning centres in the form of *pondok (Traditional Religious Boarding School)* in the 18th Century CE (Abdullah Jusuh, 1989). The j-QAF Program is an effort to empower Islamic teaching through specific emphasis on teaching Jawi (Malay Arabic script), al-Quran, Bahasa Arabic language and *fardu ain (personal religious obligations)* implemented at primary school level. The implementation of the j-QAF Program in primary schools in Malaysia is based on the Ministry of Education circular, *Surat Pekeliling Ikhtisas: Bil.13/2004: Pelaksanaan Program j-QAF Di Sekolah Rendah (Professional Circular: Num.31/2004: Implementation of j-QAF Programme in Primary Schools)*. The j-QAF Program was first implemented in the year 2005, involving all first year pupils of selected primary schools. Its implementation was later adopted by the rest of the schools in the following years according to stages (Kementerian Pendidikan Malaysia, 2004;

Kementerian Pendidikan Malaysia, 2006). Its implementation was done through development of curriculum, model and module. In efforts to make the program a success, teachers are given specialized training by teacher training institutes to implement programs of student improvement, guidance, enrichment and appreciation (Ibrahim Hashim et al., 2009). The objective of Arabic Language Education in using the Expansion Model of Communicative Arabic Language (Pekeliling j-QAF, Bahagian Pendidikan Islam Malaysia) is to produce National School Students aged between 7 to 12 years who have ‘a good mastery of basic Communicative Arabic Language’. Six years after its implementation, a comprehensive study was conducted to identify the strengths and weaknesses of the program, and to suggest more thorough improvements, particularly in Arabic Language education. Several studies on its implementation have been conducted, however, these were on a smallscale and not comprehensive. Among these were studies by Ghazali Darussalam (2007) Ridhuan Jusoh (2008), Ibrahim Hashim et. al. (2009), Misnan Jemali et. al. (2009), Siti Fatimah Ahmad (2010) and Noor Azimah Surip (2012). Generally, the studies conducted found that teaching of j-QAF, as planned in the Islamic education curriculum, has given a positive effect on student development, spiritually and emotionally (Ibrahim et al., 2009). Arabic Language education is very important as Arabic is currently one of the major world languages, comparable to other major languages. One of the factors which contributes to world acceptance of its usage is its extensive coverage of many countries and great number of native speakers (Fakulti Pendidikan, Universiti Kebangsaan Malaysia, 2014).

THE STUDY

This paper only reports results of quantitative research which involved distribution of questionnaires to teachers of the Arabic Language Model. Data were analyzed by using descriptive statistical method and displayed as frequency, percentage, mean and deviation. Research was conducted on 344 teachers aged between 25 – 45 years and with teaching experience of between 1-12 years. Each question has a 5-point Likert scale, namely, namely, “strongly agree (SA)”, “agree (A)”, “slightly disagree (SDA)”, “disagree (DA)” and “strongly disagree (STDA)”. There were 8 questions on the elements of knowledge and personality, and 5 questions on motivation. The questionnaire served as a research instrument for works in data acquisition through randomly selected sample which represents a population chosen from among primary school Arabic Language teachers. This method was used to ensure that every member has an equal chance of being selected as sample representative of research population (Ary et. al. 1990). The sample units were randomly selected from sample areas based on a zone system, namely; a) North Zone (Kedah, Penang Island and Perlis); b) South Zone (Johore, Malacca and Negeri Sembilan); c) East Zone (Kelantan, Terengganu and Pahang); d) Central Zone Tengah (Perak, Selangor and Federal Territory); and e) Zon Sabah and Sarawak Zone. Such sampling was based on sample size as suggested by Krejcie and Morgan (1970) and Sekaran (2003).

FINDINGS

Discussion in this paper is limited to three elements, namely, knowledge, personality and motivation of Arabic Language education teachers of National Schools in Malaysia. The three elements are important to be studied because they form the foundation for success or otherwise of the objective desired to be achieved through the j-QAF Program Arabic Language Model.

First, discussion is focused on the knowledge element of teachers which generally indicates a teacher’s readiness in teaching the language. Generally, the teachers’ readiness in terms of knowledge is good with a mean average of 4.00 as the mean levels are at 2.5 and above. Nevertheless, teachers still require courses in Arabic language enhancement and training in methods of teaching Arabic. This finding corresponds with the main problem that not all Arabic language teachers received specialized training to teach this language. This finding is shown in Table 1 as follows:

Table 1. Analysis of Teachers’ Knowledge of Arabic Language Model

Frequency & Percentage(N=344)									
In implementing teaching of Arabic Language Expansion Model, ...									
No.	Item	STDA	DA	SDA	A	SA	Mean	SP	INT
EB1	I am able to read Arabic text passage without vowel marks	3 (0.7%)	14 (3.3%)	50 (11.8%)	201 (47.6%)	76 (18.0%)	3.96	0.779	ST
EB2	I am able to explain meaning of Arabic text passage	2 (0.5%)	11 (2.6%)	38 (9.0%)	209 (49.5%)	84 (19.9%)	4.05	0.730	T
EB3	I am able to write a brief essay in Arabic	1 (0.2%)	10 (2.4%)	52 (12.3%)	206 (48.8%)	75 (17.8%)	4.00	0.716	ST

EB4	I am unable to verify Arabic grammatical errors	16 (3.8%)	68 (16.1%)	136 (32.2%)	84 (19.9%)	40 (9.5%)	3.18	1.030	ST
EB5	I am able to communicate in official Arabic language (<i>fusha</i>)	2 (0.5%)	21 (5.0%)	79 (18.7%)	186 (44.1%)	56 (13.3%)	3.79	0.805	ST
EB6	I am able to use Arabic dictionary to search for word meaning.	1 (0.2%)	4 (0.9%)	16 (3.8%)	208 (49.3%)	115 (27.3%)	4.25	0.623	T
EB7	I require Arabic enhancement course.	1 (0.2%)	2 (0.5%)	12 (2.8%)	180 (42.7%)	149 (35.3%)	4.37	0.612	T
EB8	I require course on methods of teaching Arabic Language.	1 (0.2%)	1 (0.2%)	8 (1.9%)	187 (44.3%)	147 (34.8%)	4.38	0.581	T
Overall Mean for Teachers' knowledge of Arabic Language Model							4.00	0.459	T

Secondly, identifying the personality of the teacher, teaching Arabic Language Model is also the main focus of this study. Research finds that Arabic Language teachers have a good teacher's personality while implementing teaching of the language with an overall mean of 4.15. Among the highest are 57.8% (N244) for ability "to motivate pupils to learn Arabic language", 56.4% (N238) for ability "to attract students' attention in Arabic P&P" and 55.9% (N236) "agree" (A) on "attempt to create a conducive atmosphere in the Arabic language class", as shown in Table 2 as follows:

Table 2. Analysis of Teachers' Personality for Teaching Arabic Language Model

Frequency & Percentage(N=344)									
In implementing teaching of Arabic Language Model, ...									
No	Item	STDA	DA	SDA	A	SA	Mean	SP	INT
EB39	I am able to attract pupils' attention in Teaching and Learning (P&P) of Arabic language.	-	1 (0.2%)	19 (4.5%)	238 (56.4%)	86 (20.4%)	4.18	0.531	T
EB40	I am able to motivate pupils to learn Arabic language.	-	1 (0.2%)	11 (2.6%)	244 (57.8%)	88 (20.9%)	4.21	0.502	T
EB41	I constantly greet students in Arabic language in and out of the classroom .	1 (0.2%)	4 (0.9%)	33 (7.8%)	234 (55.5%)	72 (17.1%)	4.08	0.610	T
EB42	I give guidance to pupils who succeed in mastering only one word.	15 (3.6%)	32 (7.6%)	68 (16.1%)	174 (41.2%)	55 (13.0%)	3.64	0.999	ST
EB43	I give chance to pupils to ask questions about a word not understood in Teaching & Learning (P&P) of Arabic language.	-	-	7 (1.7%)	225 (53.3%)	112 (26.5%)	4.30	0.503	T
EB44	I refer to other teachers if he cannot understand some matter.	-	-	8 (1.9%)	218 (51.7%)	118 (28.0%)	4.31	0.514	ST

EB45	I refer to various sources to improve Arabic language skills	-	-	6 (1.4%)	205 (48.6%)	133 (31.5%)	4.36	0.518	T
EB46	I make it a daily practice to communicate with teachers/ pupils in Arabic language.	-	6 (1.4%)	53 (12.6%)	221 (52.4%)	64 (15.2%)	3.99	0.641	ST
EB47	I attempt to create a conducive atmosphere in Arabic language class.	-	-	9 (2.1%)	236 (55.9%)	99 (23.5%)	4.26	0.496	T
Overall Mean of Teacher's Personality for Arabic Language Model							4.15	0.405	T

And thirdly, as a teacher, the element of pupil/student motivation is very important. The teacher has a role to shape and strengthen the personality of pupils. It is very essential to implement motivation towards holistic excellence, physical and intellectual, during teaching. This element is the focus of this study. Overall, motivation of pupils by the Arabic Language Model teachers is good with an average mean of 4.12 as shown in Table 3 as follows:

Table 3. Analysis of Pupil Motivation by Teachers of Arabic Language Model

Frequency & Percentage(N=344)									
In implementing teaching of Arabic Language Model, ...									
No	Item	STDA	DA	SDA	A	SA	Mean	SP	INT
EB48	I am able to establish an Arabic language environment in class	-	-	36 (8.5%)	220 (4.7%)	88 (20.9%)	4.15	0.581	T
EB49	I am confident every time I teach Arabic language.	-	-	20 (4.7%)	224 (53.1%)	100 (23.7%)	4.23	0.543	T
EB50	I raise pupils' awareness of importance of Arabic language.	4 (0.9%)	1 (0.2%)	9 (2.1%)	217 (51.4%)	113 (26.8%)	4.26	0.635	T
EB51	I advise pupils to be diligent in learning Arabic language.	16 (3.8%)	38 (9.0%)	88 (20.9%)	98 (23.2%)	104 (24.6%)	3.68	1.150	ST
EB52	I am deeply interested in teaching Arabic language.	1 (0.2%)	2 (0.5%)	12 (2.8%)	210 (49.8am %)	119 (28.2%)	4.29	0.588	T
Overall Mean of Implementing Student Motivation by Teachers of Arabic Language Model							4.12	0.475	T

CONCLUSION

Arabic language is currently regarded as a major world language along with other major world languages such as English, French and Spanish. Arabic language is also a language for trade, international relations, politics and knowledge for the present world community (Fakulti Pendidikan, Universiti Kebangsaan Malaysia, 2014). Its teaching in Primary Schools in Malaysia currently becomes more important and relevant. In today's current of modern life developments, Arabic Language is growing as a communicative language. Therefore, it is felt that Arabic Language in Malaysia needs to be learnt from the early stage to a high level, beginning from primary school level until tertiary level. It is presently perceived that even other races are interested to learn the Arabic

language as an additional language. This clearly shows that Arabic language is not merely for in-depth study of the Islamic religion, but is also a communicative language (Fakulti Pendidikan Universiti Kebangsaan Malaysia, 2014). The j-QAF Program which specifically emphasizes on teaching Jawi, al-Quran, Arabic Language and *Fardu Ain* is an implementation strategy in the Malaysia Education Development Blueprint (Ministry of Education, Malaysia, 2006). Findings shown in this paper, on the whole, show that efforts and strategies of this Blueprint have yielded encouraging results. These findings may assist the education authorities in Malaysia to achieve their main objective of the Communicative Arabic language subject in the j-QAF Program which may be summarized as “teaching pupils to read, understand and speak Arabic language” through “learning basic Arabic grammar”. Our thanks and great appreciation for researchers of the related research project entitled “*Pemeriksaan Program j-QAF dalam Transformasi Sistem Pendidikan Islam Malaysia: Pelaksanaan, Pengurusan dan Keberkesanan*” (Empowerment of j-QAF Program in the Transformation of the Malaysian Islamic Education System: Implementation, Management and Effectiveness), code: AP-2012-005, Universiti Kebangsaan Malaysia.

ABSTRACT

The rapid emergence of new media has shifted the way to convey the idea and disseminate information as it could reach the potential target group across boundaries. Indeed, Shia has utilised this medium to convey their theological thought to public especially the heavy users of the Internet and young people. This study gives an overview of the emergence of Shia in Malaysian Cyberspace. Specifically, it examines the extent of Shia ideas are highlighted in the posting of Pro-Shiites' Facebook in Malaysia. A total of 10 Facebook accounts of Pro-Shiites are chosen as sample in this study to examine the frequent theme posted on their Facebook. The qualitative study has been used to analyse these Facebook accounts and the data were taken from April - July 2016. Nine themes of discourse have been examined in these Facebooks' account. The study found that the most frequent theme highlighted is "news and information related to Shia". Then, it follows by "the beautiful words and the good advices"; and "Prayer, rituals and dzikir of Shia". The rest six last themes are similarly captured in the posting.

INTRODUCTION

The social media has been developed at a great development in our time and it has changes many facets of our way of life especially in communication process and in dissemination of ideas. This medium has many advantages especially in its ability in integrating all graphic elements, including audio and video that can adopt and adapt all media tools in communication. For example, Facebook has all elements of interactions and it is completed with text, audio and video, both synchronously and asynchronously. All these advantages have empowered the ability of Facebook to influence public perception particularly when the public uses it widely. Therefore, Facebook becomes a medium for a small group of people or business to be seen as a big group.

Shiites in Malaysia have found themselves marginalized in the Malaysian society and depressed by the laws. Actually, they are allowed to practice their belief but only they are prohibited to disseminate Shia theological thoughts to public. Thus their movement and activities are closely monitored and observed by the authorities. As an alternative, they use the Facebook intensively to voice up their rights and to struggle for their position. This medium has a less constraint from legal perspective and it is a cost efficient because Malaysia has an open sky policy. This medium could help them to convey the idea of Shia indirectly because the direct conveyance is prohibited. This article attempts to explain the issues often raised by pro-Shiites in Malaysia through their Facebook.

THE STRUGGLE OF SHIA IN MALAYSIA

The dissemination of the Shia theological thought in Malaysia has caused a small discomfort among Muslim Sunnites in this country. It can be viewed from four perspectives. Firstly, the ideology of Shia is in contrast to the majority Muslim Sunnite community in this country who are holding *Ahl al-Sunnah wa al-Jamaah* (ASWJ) school of thought. The dissemination of new religious thought that is different to the current practice in terms of belief and ritual can lead to misunderstanding about Islam and it can break the unity of Muslims in Malaysia. Secondly, the Shia is not merely a sect in Islam, but it is a movement associated with the expansion of political influence, which can cause problems of national security, such as the demonstration in Saudi Arabia (Matthiesen, 2012) and in Bahrain (Gengler, 2012). Thirdly, the bloody crisis in Syria since 2014 that comprises inhumane actions has given a bad impression toward Shia in the eye of Malaysian. There are news about this crisis disseminated in the new media and WhatsApp that aroused a public concern. Fourthly, the public statement of Shia activist in Malaysia that the Shiite community in Malaysia is totalled over 200 thousand people (Kamil Zuhairi, 2011) has surprised many sides. Although the truth of this statement is disputed by some, it could be classified was a "psywar" in attracting the attention of certain parties especially authorities toward Shiites in Malaysia. Based on the at least four above scenario, Shia theological thoughts are difficult to penetrate the Malaysian Muslim community.

The Shiites have a difficulty to setup their movement in public because of the legal standpoint and the difference type of the practices and beliefs from the majority population of Malaysia. The interpretation of the Federal

Constitution and Laws that limits Islam is only to Sunni, makes Shiites movement a bit cramped. In other words, the laws do not favour them for propagation purposes, but the constitution grants for private practice. Based on legal constraints and the public cynicism toward Shiite groups in Malaysia, they have submitted a memorandum to The Human Rights Commission of Malaysia (SUHAKAM) and also the Yang di-Pertuan Agong. They try to get the attention for not ignoring their right as the minority group, but until now no any visible positive development from that memorandum.

Even though the idea of Shia has been infiltrated to Malaysia since late 70s, Shiites remain struggling to be recognized a sect in Islam and as a part in Muslim community (Chandra Muzafar, 1987). Malaysia only recognizes Sunnites school of thought, not Shia. They had tried many ways including meeting physically with many high authority people and distributing printed material to convince the public, but they receive more pressures from the authority and protest from public to stop the movement. Therefore, since 1990 the movement of Shi'ism has been slowed down especially with the legal constraints and social barriers.

However, with the emergence of the new media Shiites have opportunity to approach public especially young people known as “Y” generation and middle class of society. They are heavy users of the Internet and they may have no or little information about Shi'ism, thus they could be easily approached via this medium. The mission is at least to get recognition as a part in Muslim community. Taking into account all the above scenarios, the effort to expand the influence of Shiite through the new media became a new alternative way for Shiite propagation. To date, Shiites are struggling to appear as a sect, which is legally recognized and accepted within the framework of the legal system in Malaysia.

The advent of the new media especially Facebook have provided an alternative medium for them to achieve their goals. A study conducted by Mohd Naim (2013) showed an increasing interaction among Facebookers who are perceived as Shiites. This finding cannot be underestimated, as Facebook could be the potential and an effective communication medium for Shia propagation. The Facebook can adapt all methods of propagating Shia that can provide social and psychological impact of Facebook users.

SHIA ACTIVITIES IN MALAYSIA CYBERSPACE

Shia appears in Malaysian cyberspace through two main mediums; blogs and Facebook. Prior to Facebook, blogs have been widely used to share information about Shia and convey their messages. There is a number of Shia Malay-language blog such as <http://www.shia-explained.com/my>, which promotes activities and conveys information and news related to Shia. On top of that, blog and website are the medium used to help Shiite struggling to establish as a recognized group in Malaysia. By the coming of social media especially Facebook last decade, it extensively used in Malaysia by 2010. It has drowned the popularity of blogs because most users are more interested to interactive communication as in Facebook rather than blog.

Actually, Facebook has two types of accounts; “personal Facebook” and “Facebook Page”. The first is normally interactive but the number of the friend shall not more than five thousands. The second can have unlimited followers but slightly directive communication because only the owner can write on the main wall. Through personal Facebook account type, there are a few Shiites disclose their real identity in the Facebook, Meanwhile, there are some users who deliberately hide their identity for some reasons; By anonymous status, they could convey the idea of Shia to others without disclosing their original identity, thus the Shiites can be propagated Shi'ism to others unconsciously. It can be said that the Facebook presence has given a new impetus to the Shia because the medium is so open and they are free to interact with each other, including seeking new followers without having to meet physically. The feedback from this online interaction could indicate the extent of Shia accepted by the local community. According to Muhamad Faisal et.al (2013), since the target group in cyberspace is too wide, and at the same time, they still receive many responses it means that the idea of Shia is accepted. However, to examine the extent of this group needs another further research.

However, the advent of Shia in Malaysian cyberspace has received a negative response from local community. In turn, those who are not uncomfortable with Shia developed some blogs against Shiites; either using a hard approach like <http://gerakanantisyaiahmalaysia.blogspot.com/> or soft approaches such <http://duniasyiah.blogspot.com/>. Therefore, since 2013, these blogs have been slowly disappeared due to the pressure from the local community against Shiite community in Malaysia. Besides of the pressure, people more likely to use Facebook.

METHODOLOGY

Ten Facebook accounts have been selected purposively as the sample in this study. There are nine themes of discourse that can convey the idea of Shia namely, the beautiful words and the good advices; Prayer, rituals and dzikir; articulating the victory of the members of al-Bait and 12 Imamates of Shia; the local and international news and information of Shia; the traitor to members al-Bait; the signs of al-Mahdi; Wahhabism as opponent to Shia; reducing gap between Shia and Sunni; and the jurisprudence of Shia. All these items are pertinent issues in Shia school of thought that would attract people to Shia or at least could lead to sympathy and compassion to “the members of al-Bait” and Shia respectively.

Table 1: Nine Themes of Discourse Related to Shia

No.	Types of Theme	Details
1	The beautiful words and the good advices	Articulated by “members of al-bait” and Imamates Shia
2	Prayer, rituals and dzikir	Perform by the members of al-bait and Imamates Shia
3	The members of al-Bait and 12 Imamates	Mentions the origin of al-Bait decent and the victory
4	News and information of current situation of Shia	Local and international news
5	The traitor to “Ahli al-Bait”	The history of Shia
6	The signs of emergence of al-Mahdi	The story of al-Mahdi in Shia’s version
7	Wahhabi /opponent of Shia	
8	Reducing gap	To reduce the gap between Sunnites and Shia
9	Islamic jurisprudence of Shia	Islamic laws from Shia legal point of view

These accounts belong to the active supporters of Shia in Malaysia, in which four of them are “page”, while the rest are personal Facebook. This article presents an analysis of the qualitative content analysis of 20 posts from these Facebook from April 2016 to July 2016. The list of Pro Shiite Facebook selected in this study as follows.

Table 2: List of the Selected Facebook Account of Pro Shia

No	Facebook	Date founded	Type	Total like/ friend
1	Muhammad Mahdi Abdulrahman	20-Nov-09	Profile	1 214
2	Encik Hyde @ Encik Jekyll	13-Nov-14	Profile	3 389
3	Mas Alan @ Akmar Shamsul	10-Mar-14	Profile	3 218
4	John Ramond	15-Jul-09	Profile	4 461
5	Mohd Kamilzuhairi Abdul Aziz	15-Feb-13	Fanpage	52 092
6	Assajjad Movement	19-Mar-13	Fanpage	1 201
7	Halimi Al Muntazar	24-Sep-12	Profile	4 543
8	Misbah Misykat	28-Nov-10	Profile	2 203
9	Zainal Abidin Salleh	9-Mar-11	Profile	4 414
10	Zainal Ali	16-Nov-09	Profile	1 830

Table 2 above lists down Pro-Shiite Facebooks chosen as samples for this study. All of them have friends or likers below than 5000 except Facebook belongs to Mohd Kamilzuhairi who has 52,092 likers. Nevertheless, these friends or likers are not necessarily pro-Shiites because there are many possibilities including stalkers and haters to Shia. Most of them are perceived holding the teaching of Imamiyyah except Muhammad Mahdi Abdulrahman who claim as a “supporter to Imam Mahdi” who is the follower for Ahmad al-Hassan whom is considered as heretic by Imamiyyah. All of them use nickname except Mohd Kamilzuhairi Abdul Aziz and Assajjad Movement. Mohd

Kamilzuhairi is an activist of Shia who is critically voice up issues related to Shia in Malaysia. He is a chairman for Muslim Shia Community in Malaysia. While, Assajjad Movement is a Shia organization chaired by M. S. Hussain who uses Facebook to voice up the rights of minority group in Malaysia. This group plays a crucial role as a pressure group for Shia community in Malaysia. According to Abdul Hamid (2014) they get support from COMANGO (Coalition of Malaysian Human Rights NGOs) and one of its reports is demanding the Malaysian government to give the freedom to disseminate Shia among Muslims in Malaysia.

Table 3: The frequency of posting according to category

No.	Facebook	Type of theme								
		1	2	3	4	5	6	7	8	9
1	Muhammad Mahdi Abdulrahman	4		2		5	9			
2	Encik Hyde	9	4	3	1			3		
3	Mas Alan @ Akmar Shamsul	3			7		1		4	5
4	John Ramond	2	2	2	12			1		1
5	Mohd Kamilzuhairi Abdul Aziz	2	1	1	9	1	1	2	1	2
6	Assajjad Movement	1	1		12	1		3	2	
7	Halimi Al Muntazar	5	2	1	2	5	1	1	3	
8	Misbah Misykat	1	2	1	7			6	1	2
9	Zainal Abidin Salleh	4	2	1	2	3	1	1	3	3
10	Zainal Ali	6	7	3	1	1				2
	Jumlah	37	21	14	53	16	13	17	14	15

Table 3 above reveals the distribution and frequency of the issues raised by each account of Facebook. Two of them, KamilZuhairi and Zainal Abidin, touch all themes while the rest only touch the selected theme. They may focus on the selected theme because the online communication needs the focus in communication. People know the niche of the Facebook.

THE THEME OF DISCOURSE THAT CONVEY THE IDEA OF SHIA

Generally, not all themes received the similar attention from the selected Facebookers. That may have different focus because to cater to the themes need not a little efforts as shown in Table 4.

Table 4: Types of Theme and Times Mentioned

No.	Types of Theme	Times mentioned
1	The beautiful words and the good advices	37
2	Prayer, rituals and dzikir	21
3	The members of al-Bait and 12 Imamates	14
4	News and information of current situation of Shia	53
5	The traitor to "Ahli al-Bait"	16
6	The signs of emergence of al-Mahdi	13
7	Wahhabi /opponent of Shia	17
8	Reducing gap	14
9	Islamic jurisprudence of Shia	15

Table 4 above shows nine themes mentioned in the pro-Shiites Facebook to approach the new "Y" and "Z" generation. Only three themes got the pertinent attention from the Facebookers namely news and information, the beautiful words; and Prayer, rituals and dzikir. While others get the moderate attention from them. Below is discussion on each theme.

1. The beautiful words and the good advices

It is word from the Shia Clerics consisting of “members of al-Bait” and the infallible Imams. The words include advices, speeches, wills, teaching and wisdom that can raise awareness and consciousness toward Islam, which are found in their books such as “Bihar Al-Anwar” and “Nahj al-Balagha”. The ultimate aim of these words is to promote the beauty of the teachings in Shia. Besides, it also shows their admiration for their clerics and “members of al-Bait” and their descendants. These words sent in Facebook as a tool to touch the emotions and feelings of the Internet users and attract them to approach Shia. Generally, people are more interested to the beautiful words and appreciate precious phrases or sentence. According to Muhamad Faisal and Nur Adwa (2014), using the beautiful words in the Facebook’s posting is a marketing technique to attract people’s attention especially when the words articulated by the respected Imam or Sheikh. On top of that, people are more interested to the beautiful image portrayed in attractive image. They always like, give comment and share it.

People have no any subtle reason to refute these words because it consists of noble idea and good value for all human being. It does not highlight the theological part of Shia and does not call to embrace Shia directly. Only these words are belong to personalities of Shia cleric that may attract people to Shia. People may believe that these beautiful words describe the good personalities of the owner of these words. Without any prejudice, they do not only accept these personalities, but simultaneously they may accept their ideology.

The analysis found that this item is the second most popular category of theme in the selected Facebooks. Both Encik Hyde and Zainal Ali send 9 and 6 posting throughout the period of the study. It indicates the beautiful word is a subtle approach to propagate the idea of Shia. Both are active in promoting the ideology of Shia compared to other Facebook account. Although this is most suitable method of online persuasion, not all Facebooks use this method because the quotation of Imam’s words should be in line with other postings. The contradiction should be avoided. For example, in one hand, the posting is about the patience and the good advices, but in other hand, the posting is regarding political issues, voicing rights and sometimes using the hard word. Therefore, only the certain Facebook always share the beautiful words in posting, while others only use this method selectively when suitable.

2. Prayer, rituals and dzikir

This item composes of prayers, practices and rituals performed by the Shia clerics consisting of the members of al-Bait and Shiite Imams. It includes pray for “Imam last day”, remembrance, practices for identifying Imam Mahdi and so on. It also comprises tips such as health care tips by Imam Ja’far al-Sadiq like eating quince fruit to strengthen memory and consuming pomegranates to accelerate the maturity of the child. There are also post items relating to *selawat* and *syahadah* according to the teachings of the Shia that would normally be responded by Shiite with the greeting “solawat!”. This is the third highest item among all themes of posting. It means that showing the ritual of Shia and the practice could attract the attention of people to Shia. This item only reveals the selected prayer and dzikir from clerics of Shia. These rituals do not involve the discussion related to the thought that may receive many questions.

3. “The members of al-Bait” and 12 Shiite Imams

Loving “the members of al-Bait” is among the teachings in Islam because they are the family of the Prophet. This is accepted by Sunnites. However, Shiite uses this practice as a tool for disseminating idea of Shia by articulating the privileges and advantages of “the members of al-Bait”. It can activate feelings of loving The Prophet and his families. The verses of al-Quran and Hadith about these advantages are regularly repeated to lure the attention in one hand, and to stress the need to love the Prophet’s family members on the other hand.

This is followed by a sad story happened to the kids’ Ali to capture people’s emotion. For example, the persecution of “the members of the al-Bait”, poetry praising the members of al-Bait and 12 Shia Imam, Hadith regarding the virtues of the members of al-Bait, born the members of al-Bait and the infallible Imams, song for the members of al-Bait, and so on. Therefore, to attract attention and to arouse the curiosity of the public, the members of al-Bait issue often raised, where there are Hadith from Sunnite sources and the verses of the Qur’an that describe the privileges of The members of al-Bait. They explained that the verse in Surah al-Ahzab verse 33 that reveals the words “The members of al-Bait” means Ali, Hassan, Hussein and Fatima and does not include spouses and other relatives of the Prophet. This verse is the important argument for the Shia that indicates the infallible (preserved from sin) to Ali, Hassan, Hussein and Fatima in turn connected to the Imam Mahdi. This theme receive a moderate attention from the Facebookers.

4. News and information of current situation of Shia

The current issue can be categorised into local and international issues. Supporters of Shia in Facebook mostly raised the international issues because during the period of the study, the war in Syria was just exploded and involved three Shia related countries; namely Iran, Lebanon and Syria. The Shiites were seen as giving support to the Syrian government and called rebels or *da'ish* as terrorist. They also called Free Syrian Army (FSA) as Wahabi and Israeli stooge because between Shia and Wahabi has a long story of quarrel. As for local issue, it is like the suggestion from the former Malaysian Prime Minister, Mahathir Mohamad and the former Iranian President, Seyyed Mohammad Khatami to parties involve in Syrian War to ceasefire. The war involves the death of many innocent people and simultaneously it could tarnish the image of Islam and Muslims. However, this statement was interpreted as the call for the unification of Sunni-Shiite. Actually, the suggestion is not aimed at uniting Shia and Sunni sect but the aim is at halting the bloodshed that happened in the world and strife. This is the highest theme written in the selected Facebookers namely 53 times.

5. The trait to “the members of al-Bait”

Another theme raised in the posting is about the story of the traits against the members of al-Bait. It refers to events that restrain the appointment of the Caliphate Ali, the murder of Imam Ali by Khariijite and murder of some members of the al-Bait especially in Karbala'. It includes the attitudes of some Companions of the Prophet who did not recognize the Caliphate Ali, especially in the cursed descendants of Abu Sufyan especially The Caliphate Yazid. They also raised doubts on trustworthy friends by the allegations and stories that are not as good as said that Abu Bakr al-Siddiq has issued a fatwa that condemned him when he ordered the Muslims who do not pay zakat killed. Similarly, the title of al-Siddiq claimed a title that should be given to 'Ali. They also claim that Umar Al-Khattab changed pronouncement Azan from *Hayya ala solah* to "العمل حي على خير" which is actually is an original command of the Prophet. Besides, they also denounce the descendants of Abu Sufyan, highlight Mu'awiah crimes and deny the leadership of Abu Bakr al-Siddiq and his followers. This theme receive a moderate attention from the Facebookers.

6. al-Mahdi and its signs

Shia also has a belief of the emergence of Imam al-Mahdi at the end time as in Sunnite. It includes the story of the emergence of Imam Ahmad al-Yamani, the allegiance on the army of Black Flag from Khurasan, the emergence of *qo'im al-hujjah* (enforcement Hujjah), *sahib al-amr* (the leader) and an executor of the Mahdi. The idea of al-Mahdi is significant for Shia is due to this Imam will lead the world with justice and peace; to empower justice and defeat the cruelty. He also has a special position in Shia as the “saviour of mankind” to defeat the opponents who are considered as Dajjal.

According to Shia, al-Mahdi is the twelfth Imam of “the members of al-bayt” and he is the son of Hasan al-Askari. They argue that al-Askari has a son but he disappears and will come back as al-Mahdi at the end time. Shia also believes that the Islamic laws will only complete with the leadership of this Imam. Meanwhile, Sunnites also have a different version of the emergence of al-Mahdi, in which they do not put all the solution of troubles in this world to this imam. Nevertheless, both Sunni Muslims and Shia are awaiting a person whose is referred to as Imam al-Mahdi. However, both the identity and characteristics of the Mahdi of the Sunnis are significantly different from the identity and characteristics of Shia's Imam Mahdi. This theme receives a moderate attention from the Facebookers.

7. Wahhabism is opponent to Shia

Wahhabism is the biggest opponents to Shia because both hold different ways of understanding Islam in its nature. Wahhabism is a school of thought that applies the literal approach in understanding the al-Quran and the Tradition. Meanwhile, Shia holds the emotional approach because this school of thought always concern with the early history of members of al-Bait who were depressed and murdered. Both approaches are contradicted thus is not surprising if each demonizes between each other. According to Wahhabism point of view, the emergence of Shia brings a wrong way of understanding Islam and this should be avoided in Muslims society. This theme receives a moderate attention from the Facebookers. In line to shift from traditional Shia quietism (non-radicalism) to revolutionary Khomeinism, ASWJ attacks on Shia also caused a shift from small-scale Shiite apologetics intended for internal usage to large scale Shiite proselytization.

8. Reducing gap between Sunnites and Shiites

It is a deliberate attempt to highlight similarities between Sunnites and Shiites to demonstrate that Shia is a recognized sect in Islam. They always be highlighted the difference is in some practices, not in the fundamental aspect of belief. On top of that, a few of Sunnite Imam such as Imam Hanafi studied with Imam Ja'far al-Sadiq (the sixth Imam of the Shia sect). Therefore, there is a sect of Shia called as Ja'fariah, the sect pledged to Imam Ja'fari. Shiite also argued if Shia is not from Islam, why they are still allowed to perform the pilgrimage in Mecca, while unbelievers cannot be allowed enter the Holy Land. Besides, they also spread the Amman Message (Amman Message), a Memorandum of Understanding signed by a large number of Ulama and Muslim leaders from around the world where the leaflet explaining the Shiite as one of the legitimate sect in Islam. This brochure was made by supporters of the Shia as an argument to persuade Sunnites to unite in forming a consensus. In short, Shiites give the effort in calling people to recognize Shia as an accepted sect in Islam and consistently attempts to eliminate the gap between Sunni and Shia. This theme receives a moderate attention from the Facebookers.

9. The Islamic jurisprudence of Shia

It explains aspects of the practice of the Shiite perspective such as prayer, charity, pilgrimage and marriage. The practice should be brought to the public to inform them with religious practices from Shia perspective. This theme receives a moderate attention from the selected Facebookers. Indeed this item should be given an attention because the intention is to disseminate the idea of Shia. However, this has received a low attention may because the priority is given to the theological aspect rather than jurisdictional aspect. The main interesting part in Shia version of Islamic laws is the temporary marriage contract (*al-mut'ah*). A man can marry with women even in three hours and then that woman is divorced. It seems for sexual purpose only. However, this item is never posted in the Facebook may because this item is not accepted as a noble value among Muslims in Malaysia.

CONCLUSION

In Malaysia, Shiite cannot arbitrarily disseminate the idea of Shia because it is not lawful here. Basically, Malaysia permits other religions to be practiced even in the public such as Buddhism, Hinduism and Christianity including Shia. This prohibition also includes the Malaysian cyberspace because the cyberspace is a reflection to the real world especially, when the Facebook is used for the sake of propagation. Therefore, Shiites use indirect call to Shia because it is cost efficient and this space also is really promising as it has many technical constraints to be found guilty. This study found three themes that received many postings from pro-Shia Facebookers, while the rest theme received a moderate posting. No generalization can be made from this finding, because this is a qualitative study. However, the three items are significant to be explored in the qualitative studies, as it is in line with the technique of online da'wah. Generally, the supporters of Shia use Facebook not only for friendship purpose, but also for propagation. They have truly given a full effort to disseminate Shia thought even though they realized that not all people could accept.

THE END OF DEMOCRACY AND THE MODES OF RESISTANCE IN EDUCATION

agd@usal.es

Our scope is to show how democracy has been trivialized as a concept and, more worryingly, as a mystified practice of consented servitude, which supposedly would bring to its very end. In fact, for the emblematic occidental societies, democracy has, at the best, been reduced to a consumerist way of life, under the capitalist liberal order, and the façade of a “spectacularized” electoral process. Overall, the word “democracy” is currently used to mask different forms of authoritarianism, from which nor even western societies escape from. In such context, as to the promises of democracy for schools’ systems, we see nothing but a bureaucratic centralization, allowing no more than an instrumental autonomy of power of execution through which the players only enjoy a “voluntary servitude” to the neoliberal naturalized ideology of efficiency, competitiveness and pseudo meritocracy. We thus conclude by suggesting possibilities of resistance and the empowerment of the subject.

THE EVALUATION OF ATTITUDES OF NURSING STUDENTS ABOUT CADAVER AND ORGAN DONATION

ABSTRACT

Topics related to cadaver and organ donation are very important for the education of health sciences and treatment of chronic diseases. Many countries encounter various problems in maintaining health science education and satisfying organ demand. People's approach is influenced by many factors both organ donation and cadaver donation. These factors include age, living environment, level of education, and many others. In this questionnaire, conducted among nursing students who will become future healthcare professionals, it is aimed to examine the knowledge, attitude and behavior of nursing students about organs and cadavers donation. Our work was carried out among Semester-2 Nursing students during 2016-2017 academic year, in Kocaeli University Health Sciences Faculty. A total of 72 students (Female: 51, Male: 21) participated in the questionnaire study. The students who participated in the study were asked 12 questions answers of which were including "Yes", "No" and "Undecided" choices. There was a significant difference in the questions 3, 6, 7 and 9 when the answers of the male and female students were compared statistically ($p < 0,05$). The questions in the questionnaire are designed to assess students' views on cadaver and organ donation, their awareness and attitude towards their / their relatives' needs. Among the questions students participating in the study were asked: "Do you want to donate your organs when brain death takes place?" 54,2% of respondent nursing students, n: 39 replied as yes; 20,8%, n: 15 students said "Undecided". In another question they were asked "Do you want to donate the organs of anybody from the family?" 31,9%, n: 23 people said yes; 31,9%, n: 23 people said "Undecided". In the same questionnaire, 83,3% n: 60 people answered yes, 13,9%, n: 10 people gave the answer "Undecided", when they were asked "Are you accepting organ transfer from another person in case of need?" When the questions were asked about cadaver donations for medical education usage; 86,1% n: 62 people did not want to donate themselves as cadavers, 8,3% n: 6 people stayed

tentative. Students responded as "interesting" with 38.9% n: 28 when they were asked about their feelings while working with cadavers in the anatomy laboratory. After evaluating obtained results, the awareness of nursing students concerning donation of organs and cadavers was not recorded as expected. In consideration of responsibilities and duties of health workers in this regard, the improvement of their awareness is critical to increase the quality of community health and health education.

Keywords: cadaver donation, organ donation, anatomy, nursing students

INTRODUCTION

Cadaver and organ donation issues are very important in terms of health sciences education and treatment of chronic diseases. Topics related to organ and cadaver donation is a social subject that interests many people, their families, governments and medical staff. The health policies implemented by all countries around the world are unable to meet the required and desired organ requirements. A similar situation is also observed in the provision of cadavers which are necessary for medical and anatomical education.

Despite the contribution of technological developments to the training of anatomy, cadaver dissection still forms the basis of anatomy courses (Şehirli et al., 2004). The only benefit of dissection applications for the students who have studied anatomy is not about learning the structure of human body by visual experience. At the same time, students learn how to be respectful and cautious towards the cadaver and approach their future patients (Ögenler et al., 2014). Throughout the history of the anatomy, the cadaveric procurement has been a major problem. In many European countries bodies of criminals had been used as cadavers but after some social reactions unclaimed bodies started to be used. As for last 50 years, cadaver needs have being met largely by donors (Şehirli et al., 2004). However, due to the fact that cadaveric donations are not at sufficient level in our country and number of medical faculties and students increase, many universities have lack of desired number of cadavers.

Organ transplantation is of great importance in the treatment of the problems that arise due to organ failure and loss of function of the organs (Sungur and Mayda, 2014). In our country, organ donation is done by people who are over 18 years old and examinant. In this process, the persons have to sign a document with two witnesses that comprises their organ donation approval. Organ donation can also be with relatives of persons' approvals after the determination of the medical deaths of the related persons. Organ donation is a humanitarian behavior which is done entirely voluntarily (Baykan et al., 2009). Studies have shown that education, socioeconomic status, culture and religion are important factors in organ donation. However, organ donation is not at the desired level both in our country and in the world (Horton, 1990).

Many countries encounter various problems in maintaining health science education and satisfying organ demand. People's approach is influenced by many factors both organ donation and cadaver donation. These factors include age, living environment, level of education, culture and religion (Gürbüz et al., 2004). The biggest responsibility belongs healthcare professionals in order to raise awareness about cadaver and organ donation. Nursing students who will serve in the health sector need to be informed about cadaver and organ donation and prepared for future. In this questionnaire, conducted among nursing students who will become future healthcare professionals, it is aimed to examine the knowledge, attitude and behavior of nursing students about organs and cadavers donation.

MATERIAL-METHOD

Our work was carried out among Semester-2 Nursing students during 2016-2017 academic year, in Kocaeli University Health Sciences Faculty. A total of 72 students (Female: 51, Male: 21) participated in the study questionnaire. The students who participated in the study were asked 12 questions answers of which were including "Yes", "No" and "Undecided" choices. The questions in the questionnaire are designed to assess students' views on cadaver and organ donation, their awareness and attitude towards their / their relatives' needs. In an anatomy course day, survey forms were distributed to students who were present in the class and accepted to participate in the study. They were informed about the objective of study and survey forms were collected from students after properly filled. Obtained data from study was transferred to the digital environment and statistical analysis was performed with SPSS for Windows 20 package program.

FINDINGS

The average age of the 72 students who participated in the study is 19.86 ± 1.72 . 51 (70.8%) students who participated in the study were female and 21 (29.2%) were male. Demographic features of the students participating in the survey are shown in Table 1.

Table 1: Distribution of demographic features of students participating in the research.

Demographic Features		N	%
Gender (n=72)	Female	51	70,8
	Male	21	29,2
Geographical regions (n=72)	Mediterranean Region	3	4,2
	Eastern Anatolia Region	4	5,5
	Aegean Region	2	2,8
	Southeastern Anatolia Region	3	4,2
	Central Anatolia Region	4	5,5
	Black Sea Region	19	26,4
	Marmara Region	37	51,4

DISCUSSION

Anatomy is one of the basic subjects in not only in school of medicine but also in departments that give education related with health sciences. Studying with touching and looking on cadavers is also as important as given theoretical lectures in Anatomy education. Many studies stated that cadaver dissection is a need for Anatomy education (Quiroga-Garza et al., 2017; Gunderman & Wilson, 2005; Arràez-Aybar et al., 2014). In our country, cadaver donation isn't known well, therefore universities are still having trouble to procure sufficient cadavers.

Similarly, although demand of organ donation increases, level of organ donation is not as expected level. When looking through the outcomes of this study, it is seen that attitudes and thoughts of healthcare staffs of the future are negative for especially cadaver donation.

Şehirli et al. (2004) sent e-mails to Turkish anatomists that includes surveys of cadaver donation. %15,7 of anatomists thought donations of their bodies as cadavers. %63,9 of anatomists didn't think of donating. In addition, %39,8 of anatomists replied the question of being dissected as cadaver as "unacceptable". As the result of the study, it is stated that the anatomists that encourage people for cadaver donation were not aspired enough to donate their bodies as cadaver and this conflict was underlined. Likewise, it is observed that cadaver donation awareness of nursing students who will be healthcare professionals of the future, is not at expected level. When the healthcare professionals' responsibilities and duties were considered, raising these level is important for the increase of community healthcare and quality of health education.

A statistically significant difference was found between male and female students in our study when compared to the given answers for the following question: "Would you give your kidney to any relatives or beloved ones if it is necessary (while you are alive)?" ($p < 0,05$). 88.2% of the females and 71.4% of the males answered "yes" to this question. There are studies in the literature showing that differences between genders may occur in terms of fear of death and approaching to dead (Madnawat and Kachhawa, 2007; Abdel-Khalek, 2005). It was seen that female students respond as "no" with a higher statistically significance comparing to male students when following survey questions are under consideration: "I believe that organ donation after death has disturbed the peace of the dead" and "I believe that organ donation after death is not appropriate in my religion" ($p < 0,05$). These results have shown that men and women emotionally have a very different perspective in terms of their / their relatives' fear of death / loss.

When students were asked as "Do you want to donate your organs when brain death takes place?" and "Do you want to donate the organs of anybody from your family when brain death takes place?", %20,8 and %31,9 of them replied as "undecided" respectively. The number of undecided students should not be underestimated when these rates are considered. Informing undecided people accurately and sufficiently can turn their attitudes about donation into positive direction. Therefore it is necessary to ensure that public, including healthcare professionals, should be informed and encouraged to donate.

Sungur and Mayda (2014) performed a study on term I and term VI students in school of medicine about knowledge and attitudes towards organ donation. They found higher significant difference at term VI students comparing to term I students about their positive approach to organ donation. In our study, 54.2% of students answered "yes", 20.8% of students answered "undecided" when they were asked as "Do you want to donate your organs when brain death takes place?".

CONCLUSION

As a result of our study, nursing students' attitude and approach towards organ donation is more positive comparing to cadaver donation. However, we think that cadaver and organ donation knowledge levels of staff who will be responsible at healthcare services in future can be increased afterwards.

It is not a pleasant feeling to donate the body as a cadaver to be used in medical education because it reminds people of death and dissecting own/relatives dead body make people feel uneasy. Likewise, people who do not want to donate own/relatives organs think that organ donation is not convenient to his/her religion and disturbs peace of dead. However, it must be explained very well that these donations will give life to one who needs it and they will be used for the sake of science and in the end advantage of humanity again. At this point, greatest duty and responsibility belong to health professionals.

THE EXAMINATION OF 8TH GRADE STUDENTS' PERCEPTIONS ABOUT GENETICALLY MODIFIED FOODS THROUGH METAPHORS

Bülent Aydođdu

baydogdu@aku.edu.tr

İlkay Ersöz

ilkayersoz1995@gmail.com

The purpose of the current study is to investigate of 8th grade students' perceptions about genetically modified foods through metaphors. In this study, the sample of the study consist of 200 8th grade students from a province in west of the Turkey. The participants are selected through stratified sampling. Research data of this study which is qualitative research method were collected through metaphors. Content analysis was used for the analysis of qualitative data. 8th grade students were asked to fill the blanks in a form such as "genetically modified foods is like....., because of" The participants were asked to fill the first blank with a metaphor about the concept of genetically modified foods and explain the reason of this metaphor in the second blank. In this context, the process of analyzing and interpreting the metaphors developed in three stages by the students; (1) identification of metaphors (2) classification of metaphors (3) category development.

THE EXAMINATION OF MEASUREMENT INVARIANCE OF BELIEFS ABOUT THE NATURE OF MATHEMATICS SCALE IN TERMS OF GENDER

Serhat AYDIN

aydins@kmu.edu.tr

Murat İbrahim YAZAR

myazar@kmu.edu.tr

Measurement instruments used in psychology or education are expected to work similarly in different groups in order to make meaningful comparisons and assessments across these groups. Usually only a single parameter is addressed in measurement invariance (MI) studies and one of the most frequently examined parameter is gender (Başusta and Gelbal, 2015). In Turkey, measurement invariance studies are still limited in number and they concentrate also on the gender variable. In this study, factor structure of Turkish adaptation of the 9-items TEDS-M Beliefs about The Nature of Mathematics Scale (Tatto et al., 2008) and measurement invariance of these factors in terms of gender were examined. For this aim, the 5-stage method recommended by Vandenberg ve Lance (1998) was used. This method is based on the progressive application of different models from the least restricted through the most restricted one. The study sample consisted of 1639 preservice teachers from four different departments from 16 different universities randomly selected in Turkey. The data was analyzed using structural equation modeling (SEM) in Lisrel 8.80 software. In order to determine invariance several fit indices were used together. According to 5-stage analysis outputs it was concluded that the scale had two factors such as "mathematics as rules" and "mathematics as a process of inquiry", these factors had measurement invariance across genders, and Turkish adaptation of the 9-items TEDS-M Beliefs about The Nature of Mathematics Scale can be used to compare different sexes.

THE EXAMINATION OF THE CONTENT DIMENSION OF THE 9TH GRADE BIOLOGY CURRICULUM BASED ON THE KNOWLEDGE DIMENSION OF THE BLOOM REVISED TAXONOMY

ABSTRACT

The main purpose of this study is to examine the content dimension of the 9th Grade Biology Curriculum which has been used since 2013 by Ministry of National Education based on the revised Bloom Taxonomy developed by Bloom and his friends in 1950s and later revised and published by Anderson and Krathwol. In the study, the content in the 9th grade Level Biology Curriculum were examined and evaluated by the observers based on the revised Bloom taxonomy independently. The study was design as qualitative research model and the data were collected through the document analysis method. The data were analyzed to calculate the reliability of the study. The reliability coefficient of the study was calculated as 92%. It has been concluded that the content of curriculum is mostly under the conceptual knowledge dimension while other knowledge dimensions are relatively few.

INTRODUCTION

Discussions at a meeting of the American Psychological Association in 1948 lead to a group of educators under the leadership of Bloom to conduct a study of the classification of educational goals and objectives. This resulted in the birth of a classification scale called 'Educational Objectives Taxonomy' for classifying the behaviors that students are expected to gain as educational outputs (Forehands, 2010). With this taxonomy, researchers aimed to established a pool of test substances, each of which assesses the same educational objective and to establish a standard for assessment by mutual utilization of these substances among the teaching institutions. In accordance with this purpose, a taxonomy consisting of three parts as (1) cognitive, (2) affective and (3) psycho-motor was formed. Bloom saw this taxonomy beyond an assessment and evaluation instrument and listed the possible areas of usage of the taxonomy as: (1) creating a common language for learning objectives that will aid the communication at the individual, subject area and class level, (2) specifying general education objectives at national and local level more specifically for a subject area, (3) ensuring that the objectives of a curriculum, course or unit are consistent with the learning activities and evaluation, (4) establishing a general framework for education (Krathwohl, 2002). An example of the first created taxonomy is given in table 1:

Table 1: Bloom's original taxonomy

The first taxonomy consists of a single dimension and the cognitive domain categories are listed from simple to complex. The revised Bloom Taxonomy has become a two-dimensional structure by adding the knowledge dimension to the taxonomy. The cognitive dimension categories were used in verb forms, the names of the three categories were changed the two categories were replaced. The knowledge dimension of the Revised Bloom Taxonomy is given in Table 2.

Table 2: The knowledge dimension of the revised Bloom taxonomy

1. Factual Knowledge	The basic knowledge which a person must know to be acquainted with a discipline or solve problems in it
	1a) Knowledge of terminology 1b) Knowledge of specific details and elements
2. Conceptual Knowledge	The interrelationships among the basic elements within a larger structure that enable them to function together
	2a) Knowledge of classifications and categories 2b) Knowledge of principles and generalizations 2c) Knowledge of theories, models, and structures
3. Procedural Knowledge	Knowledge about how to do something, methods of inquiry, and criteria for using skills, algorithms, techniques, and methods
	3a) Knowledge of subject-specific skills and algorithms 3b) Knowledge of subject-specific techniques and methods 3c) Knowledge of criteria for determining when to use appropriate procedures
4. Metacognitive Knowledge	Knowledge of cognition in general as well as a awareness and knowledge of one's own cognition
	4a) Strategic knowledge 4b) Knowledge about cognitive tasks, including appropriate contextual and conditional knowledge 4c) Self-knowledge

(Anderson and Krathwohl,2014)

When the knowledge dimension of the revised Bloom taxonomy have been revised, meta-cognitive knowledge has been added to the taxonomy as the fourth knowledge dimension, unlike the original taxonomy. The reasons for going such a revision on taxonomy can be listed as follows (Anderson and Krathwohl, 2014):

- 1) 'It is important that the educators reorient their attention on the value of the taxonomy and look it as resource in the future in many ways as well as a historical document'
- 2) 'Since the first development of Bloom Taxonomy in 1956, there have been many changes in community life, which have also changed the thinking and practice of education. Having more information about how children develop and learn, how teachers plan, teach and assess their students.'

The 'Dimensionalized Progressive Classification Chart' presented by the working group of Anderson and Krathwohl (2001) is shown on a two-dimensional matrix/table. The rows in the vertical dimension of the table contain the knowledge dimension and the columns in the horizontal dimension contain the cognitive process dimension. The knowledge dimension of this classification answers 'What do students know?' and its cognitive dimension answers 'How do students think?' (Demirel, 2014). This two-dimensional new taxonomy provides educators with the opportunity to create objectives not only in the way they are taught but also by taking into account of their intended cognitive strategies (Ornstein and Hunkins, 2014). The revised two-dimensional chart is given in table 3 (Anderson and Krathwol, 2014).

Table 3: The dimensions of the revised taxonomy of cognitive domain

When the literature is reviewed, it has been seen that the examination questions of the objectives of the different curriculum (Arı, 2012) are analyzed according to the both original and revised Bloom taxonomy (Ozdemir, Altıok ve Baki, 2015; Eke,2015; Eroğlu ve Sarar, 2014; Kuzu, 2013; Sünkür ve Gezer, 2013; Arı ve Gökler, 2012; Ayyacı, Türkdoğan, 2010). When the studies related to the 9th grade biology course have been reviewed, it has been encountered a study which examine the objectives dimension of the 9th grade biology course according to the

revised Bloom taxonomy (Yurttaş, Göktaş, Gökmen and Ekici, 2012). This study is unique as it has examined the content dimension of the curriculum based on the knowledge dimension of the revised Bloom taxonomy.

THE STUDY

Despite the fact that the objectives of the 9th grade biology course have been examined according to the revised Bloom taxonomy, there are no studies of the content dimension. In this respect, the purpose of the study is to examine the content of the 9th grade biology course according to the revised Bloom taxonomy. For this purpose, answers to the following research problems have been searched:

Research problems and sub-problems

- 1) What is the level of appropriateness of the content dimension of 'Yaşam Bilimi Biyolojisi' unit to Bloom's revised taxonomy?
- 2) What is the level of appropriateness of the content dimension of 'Canlılar Dünyası' unit to Bloom's revised taxonomy?
- 3) What is the level of appropriateness of the content dimension of 'Güncel Çevre Sorunları' unit to Bloom's revised taxonomy?

The Method

This study is a research design that uses qualitative data collection methods to reveal facts and events in a realistic and holistic way (Yıldırım and Şimşek, 2013). In this study which is designed as a qualitative research, document analysis, one of the qualitative research methods, is used. Document analysis enables the analysis of a research problem based on documents produced within a specific time frame or on a wide range of documents produced by different sources and in different time periods (Yıldırım and Şimşek, 2013). In this context, the content in the 9th grade of the Secondary Biology Curriculum, which has been used since 2013, has been examined by using the document analysis method according to the taxonomy revised by Anderson and Krathwohl. In the first phase of the research, the curriculum to be examined by the researcher has been determined. Researchers and co-observers have examined new and old taxonomy to understand Bloom's revised taxonomy in the best way. As a pilot practice prior to the start of the study, the content in the first unit of the 9th grade biology curriculum has been examined according to the revised taxonomy by the researchers. After this stage of the study, the observation forms created by the researchers were evaluated by 2 co-observers. After the evaluation, researchers determined the consensus and dissent on the items. The dissenting items were re-submitted to co-observers with a new blank form, and it was checked whether there would be any change of opinion. After the final forms from the co-observers were combined, the researchers identified the dissenting and consonant items on content by marking them in a new form and conducted a reliability analysis on these findings. After determining the dissenting and consonant items, the reliability coefficient of the study was calculated by using the formula suggested by Huberman (1994). The reliability coefficients of the units were calculated as 100%, 86%, 94%, respectively and the total reliability of the study was calculated as 92%. Miles and Huberman (1994) indicate that the reliability of the calculation of 70% and above indicates that the research is reliable.

FINDINGS

The content dimension of the 9th grade biology curriculum was analyzed by the intercoders according to the knowledge dimension of the revised Bloom taxonomy and the analyzed content was placed in the revised Bloom taxonomy matrix. The findings have been presented in the form of table under this section.

Findings of the content dimension of the 'Yaşam Bilimi Biyolojisi' unit has been given in table 4.

Table 4: Findings of the content dimension of the 'Yaşam Bilimi Biyolojisi' unit

UNIT	NAME OF THE UNIT	CONTENT	KNOWLEDGE DIMENSION			
			Factual	Conceptual	Procedural	Metacognitive
1 Unit	Life Science Biology	1. The nature of science and scientific knowledge attributed to evidence, the diversity of directions used in science, the changeable structure of scientific knowledge and the causes that are effective in change, subjects such as subjectivity and objectivity in science and science-society relation are discussed through examples from current and biologic history.		*		
		2. Scientific work processes used in biology can not be memorized and these processes can be discovered by students in the context of neysel activity design.		*		
		3.The information obtained about the biology is investigated and discussed in the historical process depending on the developments in other sciences and especially in the technology.		*		
		4. The contribution of biology to the solution of life-threatening problems (food shortage, global climate change, health problems, etc.) is questioned.		*		
		5. The profession and career areas related to biology are explored so that students can make informed choices in their prospective career choices.			*	
		6. Examples of living and non-living beings selected nearby on the basis of each other general structure, physical properties, etc..		*		
		7. By taking the way from the nearby living things, it is possible for the students to reach common characteristics of the living things.		*		
		8. As common characteristics of living things; Cellular structure, nutrition, respiration, excretion, movement, stimulus response, adaptation, reproduction, growth and development characteristics are given.		*		
		9. The concept of metabolism is discussed with examples.		*		
		10. Some concepts arising from the association of the concept of motion with life alone are discussed with the examples that are not enough to explain the movement's vitality in order to avoid the misconceptions		*		
		11. Experiments on carbon, hydrogen, oxygen, nitrogen, phosphorus, and sulfur are common to all living things, and animations are made available to students through simulations.		*		

UNIT	NAME OF THE UNIT	CONTENT	KNOWLEDGE DIMENSION			
			Factual	Conceptual	Procedural	Metacognitive
1 Unit	Life Science Biology	12. As water, minerals, acids, bases and salts are processed in detail in chemistry, the importance of these substances for the living is only questioned.	*			
		13. The importance of carbon compounds for living things is discussed.		*		
		14. Without the chemical formulas of molecules such as ATP, enzymes and hormones, the importance of living things is questioned.		*		
		15. The structure and functions of nucleic acids are processed at the basic level by animation-simulations or models. Mathematical calculations are not allowed.		*		
		16. Carbohydrates, fats, proteins, vitamins are associated with the food they are experimenting with. However, detailed chemical formulas of carbohydrate, fat, protein and vitamins are not used.		*		
		17. Carbohydrates and oil varieties are investigated and exemplified.		*		
		18. Vitamins are only classified as oil and water soluble; Health problems arising from deficiency or excess of vitamins are investigated and discussed.		*		
		19. Important minerals such as calcium, potassium, iron, iodine, fluorine are examined for their importance for health.		*		
		20. The importance of regular and balanced nutrition associates with obesity, insulin resistance and diabetes.		*		

When the content dimension of the 1st unit has been examined, it has been concluded that the content is mostly under the conceptual knowledge. The factual and procedural knowledge dimensions are also available but the meta-cognitive one has not been determined. The reliability coefficient has been calculated as 100% for this unit.

Table 5 shows the findings of the content dimension of the 'Canlılar Dünyası', the second unit of the 9th grade biology curriculum.

Table 5: Findings of the content dimension of the 'Canlılar Dünyası' unit

UNIT	NAME OF THE UNIT	CONTENT	KNOWLEDGE DIMENSION			
			Factual	Conceptual	Procedural	Metacognitive
2 Unit	Bio-World	1.It is examined on different samples that the cell's viability is the basic unit of its ability to survive and reproduce, that the properties expressed in one cell are common to all living things, and that cells divide themselves into cells.		*		
		2.R. Hook and A. Von Leewenhoek's work on the microscope and the cell are investigated.		*		
		3.In the context of the contributions of M. Schleiden, T. Schwann and R. Virchow made to the formation of cell theory, the process of structuring scientific knowledge is analyzed		*		
		4.The development of knowledge about cell and microscope in the historical process and the developments in the advanced imaging technology are evaluated on the basis of science-technology relation.		*		
		5.Only the parts of the prokaryotic cells are shown through the samples are not detailed		*		
		6.The structure of a eukaryotic cell and the constituent elements of it are examined.		*		
		7.When cell membranes are studied, experimental activities related to matter passage, active transport, osmosis and diffusion are utilized and associated with daily life.		*	*	
		8.Organelles are taken up in the organism as a result of their tasks in the cell and therefore in the organism.		*		*
		9.Different cell samples are examined using a microscope and / or visual samples (picture, video, animation etc.) and compared			*	
		10.Proportional comparisons are made regarding the sizes of various cell and cellular structures.		*		
		11.Cell-tissue-organ-system relation is examined, structure and functions of tissues and systems are not entered.		*		

UNIT	NAME OF THE UNIT	CONTENT	KNOWLEDGE DIMENSION			
			Factual	Conceptual	Procedural	Metacognitive
2 Unit	Bio-World					
		12.Cellular, colony forming and multicellular organisms are examined with examples of cellular organization and privatization.	*			
		13.The concept of stem cell and the use of stem cell technology in the field of health are investigated.		*		
		14.Establishing relationship between cell culture, tissue culture, artificial organ and artificial tissue and cell technologies		*		
		15.The importance of classifying in terms of understanding diversity is discussed		*		
		16. The reasons why thinkers and scientists have used different criteria and approaches in the classification of living things since antiquity are discussed.		*		
		17.From the example of the classification of living things, it is questioned that the models produced in science have limitations in some issues besides the contributions they make in making meaning to nature.		*		
		18.The general characteristics of species, genus, family, team, class, branch and world are examined.	*			
		19.Considering the hierarchical categories, examples of "binary naming" are given regarding the living species to be selected in the vicinity. In addition, applications related to the identification of the selected living specimens are carried out.		*		
		20.The importance of classification is discussed by focusing on the classification logic rather than memorizing Latin names.		*		
		21.Since more animals are associated with life, students are given examples, especially from animals living outside animals.		*	*	
		22.The main subgroups of plants and animals are examined. The general characteristics of the bacterium world, the archebacteria world, the protista world and the fungus world are explained, several examples are given,	*			
		23.The concept of seeds related to plants is dealt with, and no classification is made according to the number of seeds in seeded plants.		*		

UNIT	NAME OF THE UNIT	CONTENT	KNOWLEDGE DIMENSION			
			Factual	Conceptual	Procedural	Metacognitive
2 Unit	Bio-World	24. Seedless plants are confined to mosses and ferns		*		
		25. Vertebrate animals are processed with close-up samples of fish, two life, reptiles, birds and mammals.		*		
		26. Invertebrates are restricted to insects and worms.	*	*		
		27. The living worlds, taking into consideration their biological and economic importance; - Use of bacterias in yoghurt production and industrial fermentation, - Use of archebacteria in the fertilizer industry, - Protista members take part in preventing the environmental pollution by disrupting the matter and disposing of wastes, - Use of fungi in dough fermentation and antibiotic production, - Oxygen - They are studied in the context of examples such as the use of animals as nutrients and their importance in the matter cycle.		*		
		28. The characteristics of viruses are discussed on the basis of the effects of virus-borne diseases on human life.		*		
		29. The transmission of diseases such as herpes caused by viruses, AIDS, rabies, hepatitis, flu and so on and ways of protection from these diseases are examined.		*		

When the content dimension of the 2nd unit has been examined, it has been concluded that the content is mostly under the conceptual knowledge as in the previous unit. The other dimensions are also available. The intercoders have mostly agreed on the content but they haven't on four of it. The reliability coefficient has been calculated as 86%.

Table 6 shows the findings of the content dimension of the 'Güncel Çevre Sorunları', the third unit of the 9th grade biology curriculum.

Table 6: Findings of the content dimension of the ‘Güncel Çevre Sorunları’ unit

UNIT	NAME OF THE UNIT	CONTENT	KNOWLEDGE DIMENSION			
			Factual	Conceptual	Procedural	Metacognitive
3 Unit	Current Environmental Issues	1.Current environmental problems; Air pollution, water pollution, soil pollution, food pollution, radioactive pollution, noise pollution, acid rain, global climate change, erosion, destruction of natural habitats, forest fires etc., are discussed.		*		
		2.Global climate change and the potential impacts of biological diversity on everyday life are questioned.		*		
		3.Practices related to ecological footprint and carbon footprint are made.		*		*
		4.Diseases caused by environmental problems are investigated.		*		
		5.Natural resources are classified as soil, water, food, meral, forests, etc.	*			
		6.The concept of sustainability is analyzed on the basis that countries continue their development without losing the natural richness they have		*		
		7.Turkey is exemplified as a successful local and global practices.		*		
		8.The impact of biodiversity at the local level is discussed.		*		
		9.It is emphasized that every living thing is important in nature. In particular, it is emphasized that human nature is not part of the dominance and user but part of the existing system		*		
		10.The reasons why Turkey is rich in biodiversity (geographical location etc.) are discussed		*		
		11.Examples to be given include; It should be taken care to find endemic species and species used by the local people for different purposes (food, health, etc.)		*		
		12.Examples of studies on the protection of endemic species and living species under threat of extinction in Turkey		*		
		13.ncouragement of student participation in work carried out by non-governmental organizations to protect biodiversity and endemic species is encouraged.		*		
		14.The genetic varieties that are important for the region and the country's economy and the gene banks belonging to my country's species are searched.		*		

When the content dimension of the 3rd unit has been examined, it has been concluded that the content is mostly under the conceptual knowledge as in the previous two units. One of the item has been agreed under the factual

knowledge and intercoders couldn't agree on one of the items and classify it under both conceptual and metacognitive knowledge dimension. The reliability coefficient of this unit has been calculated as 92%.

CONCLUSIONS

When the findings obtained from the research are examined, it is seen that the content dimension of the 9th grade biology curriculum of secondary education is mainly concentrated under the conceptual knowledge. The content of the curriculum are listed in a 63 items form. And intercoders have agreed on 68 items and disagreed on just 5 items. According to this finding, the overall reliability coefficient of the study has been calculated as 92%.

The first unit of the curriculum is Life Science Biology consisting of 20 items under its content. The Intercoders have investigated all the content and have agreed on all the items. They agreed that 18 of the items are under the conceptual knowledge dimension. They have agreed that one of them is under procedural knowledge and the other is under factual knowledge dimension. Intercoders of the study decided that 'The profession and career areas related to biology are explored so that students can make informed choices in their prospective career choices' is under the procedural knowledge dimension and 'As water, minerals, acids, bases and salts are studied in detail in chemistry, the importance of these substances for the living is only questioned' is under the factual knowledge dimension. The reliability coefficient has been calculated as 100%

The second unit of the curriculum is Bio-World consisting of 29 items under its content. 24 items under its content have been agreed on and 5 of them have been put under different knowledge dimension. 21 items are decided to be under conceptual knowledge, 3 items are under factual knowledge and 1 is under procedural knowledge dimension. The intercoders have not agreed on 4 items. They put 'When cell membranes are studied, experimental activities related to matter passage, active transport, osmosis and diffusion are utilized and associated with daily life' under both conceptual and procedural knowledge dimension; 'Organelles are taken up in the organism as a result of their tasks in the cell and therefore in the organism' under both conceptual and metacognitive knowledge dimension; 'Since more animals are associated with life, students are given examples, especially from animals living outside animals' is under both conceptual and procedural knowledge dimension.; 'Invertebrates are restricted to insects and worms' is both under factual and conceptual knowledge dimension. The reliability coefficient has been calculated as 86%.

The Current Environmental Issues, the third unit of the curriculum, consists of 14 items under its content 12 of which are under conceptual knowledge, 1 of which is under factual knowledge dimension. The intercoders have not agreed on just one item, 'Practices related to ecological footprint and carbon footprint are made', is put under both conceptual and metacognitive knowledge dimension. The reliability coefficient has been calculated as 92%.

Conceptual knowledge represents a systematic way of relating and integrating different knowledge, and how this knowledge work together (Anderson and Krathwohl, 2014). If we make an interpretation from this definition of the conceptual knowledge, it can be said that the curriculum aims that student can establish the relation between knowledge and make use of separate pieces of knowledge and knowledge into one whole. As biology consists of many sub-branches and constitutes a discipline of biology as a whole, the curriculum is rich enough in terms of conceptual knowledge to encourage students to reach the whole. The fact that most of the content is in the conceptual knowledge dimension makes it necessary for the students to convey the learned knowledge.

It has been concluded that the knowledge dimension of curriculum content takes less space than the conceptual knowledge in other knowledge dimension. This shows that the curriculum is structured from simple to complex, from abstract to concrete. It is aimed to transfer the information based on the biology course that students first met in the first stage of secondary education to the students by this curriculum. In this context, the content included in the biology program was determined in the light of the basic theories and concepts in biology, with the subject of daily life related to the student (MEB, 2013)

THE EXAMINATION OF VOCATIONAL SCHOOL STUDENTS' ONLINE INFORMATION SEARCH STRATEGIES: SAKARYA SAMPLE

Asst. Prof. Dr. Hakkı BAĞCI, Sakarya University, Kaynarca Seyfettin Selim Vocational School, Department of Computer Technology, hbagci@sakarya.edu.tr

Lecturer Özlem ASLAN BAĞCI, Sakarya University, Health Services Vocational School, Child Development Program, obagci@sakarya.edu.tr

ABSTRACT

Information and communication technologies, internet and also online environments are increasingly being used in education nowadays. One of the things students who use online environments should be aware of is that they need to know how to reach the information provided to them and how to search for the information available on these online environments. In this study, it is aimed to examine the online search strategies used by vocational school students to search for information on the internet in terms of different variables. Survey model was used to collect the research data. The participants are students in Sakarya University Kaynarca Seyfettin Selim Vocational School and Health Services Vocational School in 2016-2017 semester. "Online Search Strategies Inventory" which was developed by Tsai (2009) and adapted to Turkish by Aşkar and Mazman (2013) was used as data collection tool. Descriptive statistics, independent sample t-test and variance analysis were used for data analysis. According to the results, it is seen that vocational school students have low level of disappearance strategies, medium level of evaluation, purposeful thinking, discrimination of basic ideas and problem solving strategies and they have high level of trial-error and control strategies. There is a significant difference between trial-error and discrimination of basic ideas in terms of gender. There is a significant difference between only problem solving strategies in terms of the grade level of students. There is a significant difference between only evaluation strategies in terms of the departments of students. There is no significant difference between students' strategy levels in terms of their high school graduation types. It is suggested to conduct different studies with collecting data from students who are using online learning environments studying in different departments in vocational schools.

Keywords: online environment, online information searching, vocational school

INTRODUCTION

Today, science and technology are developing rapidly and everyone is using these facilities which are offered by developing technology very often. The internet and online environments are undoubtedly the most used environments in this evolving technology. The internet enables new information to be acquired not only through learning in a rich learning environment but also through research, exploration and implementation (Demir Kaymak & Horzum, 2013). Information acquisition and search on the internet and in the online environments have become as important as information acquisition in our daily lives. Nowadays, people and especially students use online environments first when they need any information. In short, individuals who need information use online environments that provide continuous, flexible and uninterrupted opportunities to meet these needs. In other words, all kinds of information can be accessed via internet and online environment, especially students use the internet for information search (Sarıkaya & Çakır, 2014).

As the sources of information on the online environments increase day by day, it becomes difficult to understand the nature and correctness of the information on these environments (Nazim, 2008). For this reason, it is necessary to be able to decide on the nature of the information being accessed, not accessing the information, in order to access the right information and to perform successful search in the online environments. It is important to determine how the students who perform information searches using the internet and online environments do their search. There are different studies in the literature (Sarıkaya & Çakır, 2014; Çaka, Doğan & Şahin, 2015; Turan, Reisoğlu, Özçelik & Göktaş, 2015;

Kuiper, Volman & Terwell, 2005) within this framework. However, it has been seen that no study has been conducted on the examination of the information search strategies of the students in the vocational school on the internet and in the online environments. This is why it is important for vocational school students to examine what is the information search strategy in the online environments.

The purpose of this research is to examine the information search strategies of vocational school students in online environments. For this purpose, following research questions were determined.

1. How the information search strategies of vocational school students in online environments?
2. Is there a difference between online information search strategies of students in terms of their;
 - a. Gender
 - b. Grade level
 - c. Departments
 - d. High school type.

METHOD

The purpose of this study is to determine the information search strategies of online students in vocational school. Survey method was employed to collect the data. Survey method is an approach that aims to describe a situation that exists in the past or in present. It is attempted to describe the individual or object that is being investigated as if it was within its own circumstances (Karasar, 2005). In addition, related survey methods have been utilized in the direction of sub-questions.

Participants

The participants are students in Sakarya University Kaynarca Seyfettin Selim Vocational School and Health Services Vocational School in 2016-2017 semester. Table 1 represents the departments of students who have been accessed and included in the analyses.

Table 1. Information of Participants

	Değişkenler	f	%
Gender	Male	104	47,3
	Female	116	52,7
Grade Level	1. Grade	149	67,7
	2. Grade	71	32,3
Department	Business Administration	40	18,2
	Computer Programming	98	44,5
	First Aid	46	20,9
	Child Development	36	16,4
High School Type	High School	33	15,0
	Vocational High School	152	69,1
	Anatolian High School	35	15,9
Total		220	100

There is not a specific sample, totally 220 students have been participated to this study. 104 (47,3%) of the participants are male and 116 (52,7%) of them are female. In addition, 149 (67.7%) of the students participated in the study are in the first grade and 71 (32.3%) of them are in the second grade. 40 of the students (18.2%) study in Business Administration, 98 (44.5%) of them study in Computer Programming, 46 (20.9%) of them study in the First Aid and 26 (16.4%) of them study in the Child Development departments.

Data Collection Tool

"Online Search Strategies Inventory" which was developed by Tsai (2009) and translated and adapted to Turkish by Aşkar and Mazman (2013) and also personal information form which was developed by researchers were used as data collection tools. Online Search Strategies scale consists of 7 factors and 25 items. These factors are; "Disappearance" has 4 items, "Evaluation" has 8 items, "Purposeful Thinking" has 4 items, "Trial-Error" has 3 items, "Discrimination of Basic Ideas" has 3 items, "Control" has 4 items and "Problem Solving" has 3 items. Cronbach Alpha value of the scale is 0.91. The lowest score that can be taken from this 6 point likert scale is 25 and the highest score is 150. The internal consistency coefficient of the scale applied to the students of computer programming was calculated as .893 in this study.

Data Analysis

Data collection tools were applied by the researcher to the students as hard copies. The highest score that can be taken for each item on the applied scale is 6 and the lowest score is 1. In order to evaluate and interpret information search strategies of the vocational school students in the online environment, three evaluation range and criteria are set out on the average value (Table 2).

Table 2. Evaluation Criteria of Online Information Search Strategies

Evaluation Criterion	Evaluation Interval
Low	1,00 – 2,66
Medium	2,67 – 4,33
High	4,34 – 6,00

In the analysis of the data, the arithmetic average, percentage and frequency of the descriptive statistics were used. On the other hand, independent samples t-test and variance analysis were used to determine whether information search strategies differed in terms of gender, departments, grade levels and high school graduates students graduated. The significance level of the data in the analyses was taken as .05. In statistical analysis, SPSS 16.0 (Statistical Package for the Social Sciences) package software was used.

FINDINGS AND INTERPRETATION

Findings toward Online Information Search Strategies Used by Students

Strategic levels of vocational school students have been determined according to the average scores of the sub-factors of disappearance, evaluation, purposeful thinking, trial-error, discrimination of basic ideas, control and problem solving. Average scores of sub-factors are given in Table 3.

Table 3. Descriptive Findings on Online Information Search Strategies in Terms of Sub-Dimensions

Sub Dimentions	\bar{X}	ss	Level
1 Disappearance	1.93	1.20	Düşük
2 Evaluation	4.05	1.28	Orta
3 Purposeful Thinking	4.08	1.27	Orta
4 Average of Trial-Error	4.47	1.39	Yüksek
5 Discrimination of Basic Ideas	4.30	1.37	Orta
6 Control	4.47	1.34	Yüksek
7 Problem Solving	3.93	1.17	Orta
GENERAL	3.85	1.21	Orta

According to Table 3, it is seen that the average of trial-error and control strategies of the vocational school students is high, and the averages of evaluation, purposeful thinking, discrimination of basic ideas and problem solving strategies are medium and the average of disappearance strategy is low.

The Examination of Online Information Search Strategies by Gender

The results of the independent sample t-test analysis conducted to determine whether the vocational school students differ in terms of gender according to all the sub-factors of the scale within the scope of the study are given in Table 4.

Table 4. Independent Sample t-test Results of Online Information Search Strategies by Gender

Sub Dimentions	Groups	n	\bar{X}	Sd	df	t	p
Disappearance	Male	104	1.90	1.18	218	-.369	.712
	Female	116	1.96	1.23			
Evaluation	Male	104	3.91	1.42	218	-1.623	.106
	Female	116	4.19	1.15			
Purposeful Thinking	Male	104	3.92	1.31	218	-1.812	.071
	Female	116	4.22	1.22			
Average of Trial-Error	Male	104	4.15	1.41	218	-3.357	.001
	Female	116	4.76	1.30			
Discrimination of Basic Ideas	Male	104	4.08	1.47	218	-2.276	.024
	Female	116	4.49	1.24			
Control	Male	104	4.53	1.38	218	.625	.533
	Female	116	4.42	1.30			
Problem Solving	Male	104	4.03	1.13	218	1.087	.278
	Female	116	3.85	1.21			

According to the findings, there is no significant difference in the factors of disappearance [$t(218)=-.369$, $p>.05$], evaluation [$t(218)=1.623$, $p>.05$], purposeful thinking [$t(218)=1.812$, $p>.05$], control [$t(218)=.625$, $p>.05$] and problem solving [$t(218)=1.087$, $p>.05$] in online information search strategies by gender. There are significant difference in the factors of trial-error [$t(218)=3.357$, $p<.05$] and discrimination of basic ideas [$t(218)=-2.276$, $p<.05$] in online information search strategies by gender. In terms of both trial-error and discrimination of ideas, male students have more developed online information strategies than girls.

The Examination of Online Information Search Strategies by Grade Level

Table 5 shows the findings of the independent sample t-test conducted to determine whether the vocational school students differ in terms of their grade levels according to all the sub-factors of the scale.

Table 5. Findings of Independent Sample t-test of Online Information Search Strategies by Grade Level

Alt Boyutlar	Gruplar	n	\bar{X}	Sd	df	t	p
Disappearance	1. Grade	149	1.93	1.22	218	-.010	.992
	2. Grade	71	1.93	1.18			
Evaluation	1. Grade	149	3.96	1.32	218	-1.644	.102
	2. Grade	71	4.26	1.20			
Purposeful Thinking	1. Grade	149	3.98	1.26	218	-1.708	.089
	2. Grade	71	4.29	1.26			

Average of Trial-Error	1. Grade	149	4.42	1.35	218	-.797	.426
	2. Grade	71	4.58	1.46			
Discrimination of Basic Ideas	1. Grade	149	4.19	1.38	218	-1.610	.109
	2. Grade	71	4.51	1.33			
Control	1. Grade	149	4.44	1.32	218	-.423	.672
	2. Grade	71	4.52	1.37			
Problem Solving	1. Grade	149	3.79	1.16	218	-2.695	.008
	2. Grade	71	4.24	1.16			

According to the findings, there is no significant difference in the factors of disappearance [$t(218)=-.010$, $p>.05$], evaluation [$t(218)=1.644$, $p>.05$], purposeful thinking [$t(218)=-1.708$, $p>.05$], control [$t(218)=.423$, $p>.05$], trial-error [$t(218)=-.797$, $p>.05$] and discrimination of basic ideas [$t(218)=-1.610$, $p>.05$] in online information search strategies by grade level. There is significant difference only in the factor of problem solving [$t(218)=-2.695$, $p<.05$] in online information search strategies by grade level. In the problem solving factor, the students in the second grade have more advanced online information strategies than the students in the first grade.

The Examination of Online Information Search Strategies by Department

Table 6 shows the ANOVA analysis results to determine whether vocational school students differ according to all the subscales of the scale in terms of the department they have studied.

Table 6. ANOVA Results of Online Information Search Strategies by Department

	Source of Variance	S.S	sd	M. S	F	p	Significant Difference
Disappearance	Between Groups	11.707	3	3.902	2.742	.044	No
	Within Groups	307.353	216	1.423			
	Total	319.060	219				
Evaluation	Between Groups	25.304	3	8.435	5.391	.001	3-1 3-2 3-4
	Within Groups	337.917	216	1.564			
	Total	363.220	219				
Purposeful Thinking	Between Groups	1.403	3	.468	.289	.833	No
	Within Groups	349.931	216	1.620			
	Total	351.335	219				
Average of Trial-Error	Between Groups	16.898	3	5.633	3.017	.031	No
	Within Groups	403.290	216	1.867			
	Total	420.187	219				
Discrimination of Basic Ideas	Between Groups	14.710	3	4.903	2.669	.049	No
	Within Groups	396.777	216	1.837			
	Total	411.487	219				
Control	Between Groups	12.548	3	4.183	2.390	.070	No
	Within Groups	378.057	216	1.750			
	Total	390.605	219				
Problem Solving	Between Groups	5.963	3	1.988	1.452	.229	No
	Within Groups	295.658	216	1.369			
	Total	301.622	219				

(1: Business Administration, 2: Computer Programming, 3: First Aid, 4: Child Development)

According to the findings, there is no significant difference in the factors of disappearance [$F(3-216)=2.742$, $p>.05$], purposeful thinking [$F(3-216)=.289$, $p>.05$], trial-error [$F(3-216)=3.017$, $p>.05$], control [$F(3-216)=2.390$, $p>.05$], discrimination of basic ideas [$F(3-216)=2.669$, $p>.05$] and problem

solving [$F(3-216)=1.452$, $p>.05$] in online information search strategies by department. There is significant difference only in the factor of evaluation [$F(3-216)=5.391$, $p<.05$] in online information search strategies by department. Scheffe analysis was conducted in Post Hoc analyzes to find the source of this difference. The evaluation strategy was lower for the First Aid department students than for the other departments.

The Examination of Online Information Search Strategies by High School Graduations

Table 7 shows the results of ANOVA analysis conducted to determine whether vocational school students differ in terms of high school graduation types according to all the subscales of the scale.

Table 7. ANOVA Results of Online Information Search Strategies for High School Graduation Types

	Source of Variance	S.S	sd	M. S	F	p	Significant Difference
Disappearance	Between Groups	.510	2	.255	.174	.841	Yok
	Within Groups	318.550	217	1.468			
	Total	319.060	219				
Evaluation	Between Groups	5.903	2	2.951	1.792	.169	Yok
	Within Groups	357.318	217	1.647			
	Total	363.220	219				
Purposeful Thinking	Between Groups	7.301	2	3.650	2.302	.102	Yok
	Within Groups	344.034	217	1.585			
	Total	351.335	219				
Average of Trial-Error	Between Groups	1.417	2	.709	.367	.693	Yok
	Within Groups	418.770	217	1.930			
	Total	420.187	219				
Discrimination of Basic Ideas	Between Groups	7.046	2	3.523	1.890	.154	Yok
	Within Groups	404.441	217	1.864			
	Total	411.487	219				
Control	Between Groups	3.967	2	1.983	1.113	.330	Yok
	Within Groups	386.639	217	1.782			
	Total	390.605	219				
Problem Solving	Between Groups	3.220	2	1.610	1.171	.312	Yok
	Within Groups	298.402	217	1.375			
	Total	301.622	219				

(1: Business Administration, 2: Computer Programming, 3: First Aid, 4: Child Development)

According to the findings of the analysis, it is seen that the students do not differ significantly in terms of disappearance, evaluation, purposeful thinking, trial-error, discrimination of basic ideas, control and problem solving strategies compared to high school graduation types.

RESULTS AND DISCUSSION

In this study, in which the vocational school students' information search strategies were determined in online environment, it was seen that the average of the students' trial-error and control strategies

are at a high level, the average of the students' evaluation, purposeful thinking, discrimination of basic ideas and problem solving strategies are at a medium level and the average of the strategies of disappearance are at a low level.

While there is no significant difference in the factors of disappearance, evaluation, purposeful thinking, control and problem solving, there is significant difference in the factors of trial-error and discrimination of basic ideas of online information search strategies by gender. In terms of both trial-error and discrimination of basic ideas, male students have more developed online information strategies than girls.

While there is no significant difference in the factors of disappearance, evaluation, purposeful thinking, trial-error, discrimination of basic ideas and control, there is significant difference in the problem solving factor in online information search strategies by grade level. In the problem solving factor, the students in the second grade have more advanced online information strategies than the students in the first grade.

While there is no significant difference in the factors of disappearance, purposeful thinking, trial-error, discrimination of basic ideas, control and problem solving, there is significant difference in the evaluation factor in online information search strategies by departments which student have studied.

There is no significant difference in the factors of disappearance, evaluation, purposeful thinking, trial-error, discrimination of basic ideas, control and problem solving in online information search strategies by high school graduation types of the students.

It is suggested to conduct different studies with students who use online learning environments from different departments in vocational schools.

ÖZET:

Toplumların karakteristik özelliklerinin belirlenmesinde 4. kuvvet medyanın büyük rolü olduğu düşünülmektedir. Türk toplumunun da gelişmekte olan ülkeler kategorisinde yer aldığı gözönünde tutulduğunda, bu etkileşimin daha büyük olacağı varsayılabilir. Bireyin toplum oluşumunda örnek aldığı rol modellerin, en yakın çevre ve medyanın sunduğu kabule hazır kahramanlardan oluştuğu düşünüldüğünde, kimi genç izleyicinin gerçeklik algısının diziler üzerinden şekillendiği gözlenmektedir.

Dizilerin, sosyal medyada gerçekliğe ilişkin yansımalarını, dizi yayınlarının hemen ardından dizilerin resmi sitelerinde, sosyal medya hesaplarında vs. ve günlük hayatlarında objeler, takılar ve karakter yansımaları, giyim tarzları ve konuşma biçimleri ile reel hayata ne denli yansıttıklarını görülmektedir. Buradan hareketle, bireyin gerçeklik algılarının etkileşiminde büyük rol oynayan 4. kuvvet olan medya, sorumluluklarını gözardı etmemelidir. Dizi sektörünün karakter yaratmada, örnekler oluşturmada, toplum gerçekliklerinin ve gerçek hayatın dışına çıkmadan, toplumun geneliyle uyumlu, özdeş ve ideal yaşam biçimi ve karakterler oluşturması gerektiği düşünülmektedir.

Yerli dizilerin içerik ve konseptlerinin belirlenmesinde, izleyici algısının sosyal medya (yeni medya) üzerinden şekillenmesini konu alan bu çalışmada, Nitel Araştırma Yöntemleri'nden olan "Doküman İncelenmesi" metodu kullanılmıştır. Doküman türü olarak yerli dizilerin incelendiği çalışmada, analiz birimi saptanırken, dizilerdeki tema, karakter veya kişi, içerik ve kullanılan dil ve toplumsal okumalar üzerinden genel bir bakış açısı oluşturulmaya çalışılmıştır.

Anahtar Sözcükler: Yerli dizi, yeni medya, gerçeklik algısı,

ABSTRACT:

The 4th force media is believed to have a great role in determining the characteristics of societies. Considering that the Turkish society falls into the category of developing countries, it could be assumed that such interaction will be greater. Thinking that the role models the individual looks up to in formation of the society consist of the readily acceptable heroes offered by the closest environment and the media, it is observed that the perception of reality of some young audience is shaped through TV shows.

It is seen through objects, jewelry, character reflections, clothing styles and manner of speaking of the heroes on the official sites of TV shows, their social media accounts, etc. right after the TV shows are aired and the daily lives that how much the reality of the TV shows reflect on the real life. From this point of view, the 4th force that is the media, which plays a great role in interaction of the perceptions of reality of the individual, should not ignore its responsibilities. It is believed that the TV shows sector should create characters and produce role models that are identical and in harmony with and ideal for the overall society and within the boundaries of the realities of the society and the real life.

This research that studies the formation of the audience's perception through the social media (the new media) when determining the contents and concepts of local TV shows uses the "Document Review" method from among Qualitative Research Methods. In the research, which examines local TV shows as a document, the analysis unit was determined while trying to form an overall viewpoint on the themes, characters or persons, contents, the languages used and social readings in TV shows.

Key Words: Local TV shows, social media, perception of reality,

INTRODUCTION

Television broadcasts started in Turkey during the TRT period. The first television broadcast started on January 30, 1968 in Ankara. The audience of the telecasts was rather limited. The telecasting that was in black and white until the year 18984 started to be offered in color after that year. TRT, which was the single channel for long years, started broadcasting from 2 channels in 1985, 18 years after starting broadcasting. In 1989, a new channel called TV3 started broadcasting. In the same year, cablecasting began in Turkey. Audience of the cablecasts, who watched monophonic TV broadcasts first through a single channel and then through two and three channels for years, had the opportunity to watch 20-30 foreign TV channels at the same time. An important turning point in the Turkish electronic broadcasting started in 1990. People started watching foreign broadcasts through satellite dishes. Magic Box, a company that started satellite broadcasting in June of 1990, eliminated the broadcasting monopoly of TRT by offering Turkish televisions broadcasts. After that, channels such as Tele-On, Show TV, Kanal 6, HBB TV, Flash TV and TGRT joined the broadcasting sector starting from 1992(Aziz, 2013).

From those years on, it is observed that the number of broadcasts and contents increased through numerous law amendments and categorizations so that particularly radio and television broadcasts could be included in the legal process. Today in Turkey, there is a combined or dual broadcasting system that co-maintains public service broadcasting and commercial broadcasting as a system of radio and television broadcasting. Local TV shows, which started at the time when TRT was the monopoly, mushroomed when private channels became popular. The local TV shows aired by certain TV channels, which represent about 80% of 15 national channels, resulted in an increase in the number of such productions. Those TV shows that became popular among others continued for a long time. Love, violence and mafia relations were among the themes that were found in abundance so that the TV shows attracted attention (Aziz, 2013).

** Assoc. Prof. Dr., Near East University, e-mail: mustaufuk.celik@neu.edu.tr

RELATIONSHIP BETWEEN LOCAL TV SHOWS AND THE SOCIETY

Cultural lives of societies are not uniform in terms of characteristics. Every large society may incorporate different religions, languages, races, ethnicities, educational levels, genders, income levels, lifestyles, elements of primary importance, wishes and habits. Considering that mass media advances dramatically based on technological improvements, it could be said that, with its fast rise, the media affects societies in different ways, result in changing of societies and completely surround individuals (Hobbs, 1998).

Keeping the ratings high seems to be inevitable in order that the local TV shows sector in Turkey is not affected by the fierce competition between the television channels and ensures its sustainability. For this reason, it is true that the entire purpose is the rating that is elaborately calculated from the scenario to editing, selection of characters to clothes, setting to selection of colors and images. It is challenging that such productions, which channel the whole motivation into almost only the ratings, do not pay relative regard to other concerns.

Increasing the ratings requires serving the imaginary world of each individual that makes up the society. TV shows reinforcing the lives that individuals desire to have in the future and manipulating their perception of reality is considered to be another issue that requires TV shows to self-criticize. Screenwriters that serve the imaginary worlds and dreams of individuals influence audiences of different demographical backgrounds through references to their cultural characteristics.

The effort to internalize and impose exaggerated life styles that mostly do not agree with the real life in an attempt to increase particularly the ratings of the local TV shows (the effect of sponsorship connections) can be linked with economic concerns. Attempts to target and have the audience like and adopt the luxurious and ostentatious lives led in TV shows, encourage the impulse to buy are associated with the revenues from TV show materials and sponsors, advertisement agreements and rating concerns.

While the television viewers or the audience try to experience and make sense of the contradiction between their real lives and the imaginary world suggested by the TV shows, they experience distortions in their perception of reality accompanied by the conflicts between the two separate worlds. Addressing this issue in his column, Journalist KursatBasar says: *“All girls walk around in clothes that come straight out of fashion magazines. All boys have beards like that of Hacivat and follow the latest fashion. Even though majority of the girls feel like a princess, it is as if they will get into a fight any time with the first person they see. They fly off the handle when you tell them a single world they do not like. They lose that daintiness and become Chucky. Purses, shoes, clothes, telephones, cars are all the most luxurious ones... They get off the yacht and get on an SUV, get off it and get on a Ferrari. Even in the TV shows that are set in the South East, not a single soul is poor! Everyone has lots of aids at their command. Does anyone think what is happening there right now? Or are Mardin and Urfa not the ones we have seen but their versions recreated in cartoons? The actors that play the businessmen have a single job, which is to sign a couple of documents for their secretaries in miniskirtsin*

their cool skyscraper offices... If I had known that there was such a business world, I would not have become a writer. I mean it.”

THE EFFECT OF NARRATIVE STRUCTURES IN TV SHOWS ON INDIVIDUALS

Studies show that children are not able to see a difference between the real world and the fictional media world until they are 12 years old (Hawkins, 1977; Livingstone, 2006; Potter, 2005). One could not expect the huge difference between the future dreams of particularly that age group and the realities experienced to have positive reflections. Young individuals making sense of the TV shows they watch, their future life conditions and the characters over themselves could be construed as the beginning of disappointments in the real world. The lives of TV show heroes filled with enviable, beautiful and handsome figures and wealth lead the individual to shape his or her future perceptions in the same parallel. The people who identify themselves with the TV show heroes that have nearly impeccable physical features but unable identify with their own physical appearances may pose yet another issue.

In this context, the evidence of particularly looking like TV show characters and the orientation toward the perfect come to the fore as an issue pointed out by experts. Indicating that the age of undergoing plastic surgery has recently lowered down to 15, experts say that this is caused by television shows and the pop star culture (<http://www.dunya.com/saglik/estetik-ameliyat-yasi-15e-dustu-255944h.htm>). Prof. Dr. Necmettin Kutlu, Aesthetic, Plastic and Reconstructive Surgeon, comments on the issue: *“There are increasing number of TV shows, pop star, song star or similar contests on every channel. One of them even appealed to the smaller age group. The makeup, clothes, jewelry, enactments and, most importantly, the dreams evoked in such programs are important. Also, the colorful adolescent magazines and photography techniques have an influence. However, considering our fair share in this as the plastic surgeons, our new techniques have rendered the surgery more convenient, shorter and more reliable. The early problem-free results and their coverage in the press have also made a significant contribution in the rising demands”*. Pointing out that the primary objectives of esthetic operations are malformations, deformities, taking into account the level of physical maturity and to what extent the parents support the operation, Kutlu says that young girls look like each other after they go through the aesthetic operations (<http://www.dunya.com/saglik/estetik-ameliyat-yasi-15e-dustu-255944h.htm>).

It could be said that another important effect of the narrative structure in TV shows on individuals is that they increase the unnecessary and/or unneeded consumption. Another factor that contributes in the increasing consumption is that the clothes, jewelries, accessories of TV show characters and the phones and devices they use agree with the role model. The individuals that are unable to reach the world of the dominant characters of TV shows still attempt to identify with the personal effects, clothes and accessories, etc. of the TV show characters. The jewelry of the main character of a seasonal series that aired in the last years significantly raised the sales of necklaces, rings and accessories not only in Turkey but also some other countries where the TV show was watched. The press gave coverage to this topic as follows:

“Hurremring is selling like hot cakes” Use of large, natural stone rings in the TV show “*MuhtesemYuzyil*”, inspired from the lives of Suleiman the Magnificent and Roxelana has reportedly led to a return to rings that bear Ottoman motives (<http://www.haberortak.com/Haber/Ekonomi/11022011/Hurrem-yuzugu-yok-satiyor.html>).

“Roxelanaring imitations sold 2 million” Jeweler Boybeyi has come to the fore thanks to the TV show *MuhtesemYuzyil*. The ‘Hurrem’ ring designed by Mete Boybeyi, the fourth generation representative of Boybeyi Family has attracted so much attention that 2 million imitations have been sold. One of their customer in Monaco has reportedly had a seating group manufactured matching with the ring designed by Boybeyi. Mete Boybeyi says that they have customers that purchase 1.5 million dollars’ worth of jewelry in Turkey, which corresponds to the price of a mansion” (<http://www.gazetevatan.com/elif-ergu-440380-yazar-yazisi-yali-dairesi-fiyatina-mucevher-alan-var--hurrem-yuzugunun-taklitleri-2-milyon-tane-satti/>).

It is seen that the press, which notices the effect of TV shows on the consumption habits of the society, gives coverage to this issue from time to time. The press, which reported in the same news the effect of different TV shows on the consumption habits, told about the reflection of the series sector on the economy as follows.

MuhtesemYuzyil: “*MuhtesemYuzyil crowns: Hurrem ring is not the single product put on the market with MuhtesemYuzyil being aired. Today, the crowns worn by the female characters in MuhtesemYuzyil are available at many online shopping websites*”.

Fatmagul’unSucu Ne?: “*Fatmagul slippers: The likes of the slippers that Fatmagul wears in the TV show are sold at 5 liras. Fatmagul boots are also sold at 35 liras*”.

Ask-iMemnu: “Bihter: Another legendary character played by BerenSaat was Bihter from Ask-iMemnu. The belongings of Bihter in the series attracted great interest. Bihter Necklace: The imitations of the Bihter Necklace, which is sold at high prices in jeweler’s shops could be sold at 3-5 liras in the bazaar. Bihter armchair: Ask-iMemnu also affected the designs in the furniture sector”.

Gonulcelen: “*Hasretring: The ring of Hasret character played by Tuba Buyukustun in the TV show Gonulcelen are also among those that attract the interest. This ring is sold at 2.5 liras*”.

KurtlarVadisi: “*PolatAlemdar: PolatAlemdar, the legendary character of KurtlarVadisi, led to the production of products that inspired the men’s fashion at a time. The shoes, wristwatch and scarf of PolatAlemdar character played by NecatiSasmaz in “KurtlarVadisi” are still on demand by citizens*”. THE EFFECTS OF INDIVIDUALS' AND SOCIETY'S HABITS ON THE FORMATION OF TV SHOWS AND CREATION OF CHARACTERS THROUGH THE SOCIAL MEDIA

According to Altunay, the new media provides an interactive communication media to its users compared to the traditional media. In fact, this brings the source and the receiver to the same position during the communication process. The lacking communication process that we are used to in the traditional media acquires a new ground and functionality with the increasing feedbacks in the new media. The communication process in the traditional media almost leads to the ending of the process from the moment the messages are delivered to the audience. In other words, it is thought that the process of conveying the feelings, ideas, wishes and demands of the audience to the source almost does not exist. Nevertheless, the new media habits and the increasing new processes have enriched such insufficient cycle in terms of information and the messages of the source and the audience have sometimes been reciprocal and simultaneous.

Each receiver has also the means to become a potential source. Unlike the one-way communication processes of the traditional media, the interactive communication opportunity of the new media allows each user to have equal rights on the medium and also allows them to have the same rights when coding their messages by using the medium (Dagtas, 2007:119)

As suggested by Dagtas, one of the most significant differences between the understanding of the traditional media and that of the new media is that the ideas or views of the individual in each audience are equal to and have the same weight with that of the other individuals. From this point of view, the comments and critiques of the people seen in the traditional media such as critics, commentators, journalists, columnists and reporters, etc. were limited whereas the weight of them seemed to be disproportionately more powerful.

Nevertheless, with the new media understanding, each social media user that has access to the source can be viewed also as a critic, columnists, etc. The opinions of each individual on the social media and the manners of expression being shaped on a common ground can closely influence the source, and they can be revised in line with the opinions of the audience. The information relationship between the traditional media and the new media is evaluated by Altunay as follows: "When stressing out the interactivity on the internet, it is pointed out that internet users are not passive and merely receiving users but active when compared to the audience of the traditional media. Altunay also refers to the four different definitions of interactivity by Massey and Levy, which are: 1) The user being able to access different and complex choices, 2) The new media being able to respond to its user, 3) Allows for interpersonal communication, 4) The user being able to actively add information on top of the existing information. (Cited,Deuze, 2003:213-214)

The relation of four definitions determined by Massey and Levy regarding the new media understanding with the TV shows in Turkey can be analyzed as follows: Whereas, in the traditional media, the credibility of the message in the eye of the public or its perception can be measured with circulation and rating, which are from among traditional media tools, hashtags, trend topics, and the number of viewing on video channels (YouTube), the number of comments on social media sites (Facebook, Twitter, Instagram, etc.) have become important in the new media understanding; moreover, such importance had reflections on the general progress of TV shows, determination of the characters, increasing the weight of roles, removing the characters from or adding new characters to the cast. Such general structure destroyed the passivity of the

audience and directed them towards becoming active; the endings of the characters in TV show scenarios of the evolution of the story can be directed in this way.

METHOD

Official social media accounts of TV shows, the fan pages opened by the TV show fans under the name of the TV shows, the personal accounts of TV show stars, the accounts opened by the audience for TV show stars, Instagram accounts and social networks such as Facebook and Twitter were examined for this research, which studies the formation of audience perception through social media with determination of contents and concepts of TV shows and the perception of reality. "Document Review" method from among Qualitative Research Methods was used. In the research, which examines local TV shows as a document, the analysis unit was determined while trying to form an overall viewpoint on the themes, characters or persons, contents, the languages used and social readings in TV shows.

FINDINGS AND CONCLUSION

In this research, where official social media accounts of TV shows, the fan pages opened by the TV show fans under the name of the TV shows, the personal accounts of TV show stars, the accounts opened by the audience for TV show stars, Instagram accounts and social networks such as Facebook and Twitter were examined; we tried to come to conclusions and make determinations over the themes, characters or persons, contents, the languages used and social readings in TV shows.

In this research, which studies the formation of audience perception through social media (the new media) with determination of contents and concepts of local TV shows and the perception of reality, the traditional one-sided functioning towards demand could be said to evolve into a system where the supply is shaped by demand through the new media understanding. This evolution takes place through not only main characters, supporting characters, narrative and music but also the economic values that will also constitute the main material of productions. The sponsors and products that will bring in material sources to productions are observed to be placed suitably and attractively into the productions in order to popularize such sponsors and products, increase sales and bring in revenue.

The determinations of the economic inputs that allow the TV show sector to exist (the products of all the sponsors that feature in a TV show) are again observed in the reflections found in all the social networks through the new media understanding. The manners of behavior of the social media can be considered as one of the indispensable elements for the TV show producers that shape the orientations and supply.

In terms of shaping the productions, determining the characters and creating the narratives, it could be said that the emotional rises and falls of social media users and the negative reflections of the determinants of the life in a TV show and the real life on the perception of reality cause an increase in the ratings at times.

Producers taking into account the individuals' desire to identify with the characters when particularly creating the characters could be viewed as an element that people on the social media cannot give up when expressing themselves.

The local TV shows that were about feudal systems, plantation owners and the mafia during the period from the 1990s until the early 2000 have been replaced with the productions that tell about the giant plazas, great economic powers and the inevitable rise of capitalism and that suggest power and wealth can only be found there from those years forward. The themes of such productions can be said to emanate from the rich girl-poor boy or poor boy-rich girl stories that were narrated over and over in Yesilcam (the Old Turkish Cinema) in the past years. In the recent TV shows, the level of overlapping of real life with the reality of the TV shows has gradually decreased. Such alienation and drifting apart from the reality result in production of almost fairytale TV shows.

The companies that possess the great economic powers, the lives of holding owners and bosses that are incompatible with the perception of reality and far-fetched (top model cars with private drivers, clothes that are equally good as those in fashion shoots, luxurious parties thrown, the flamboyant presents purchased) can be found extremely real by some audience. It is clear that the individuals that lead a real life in the same work environments do not overlap with those characters in the TV shows. As a result, the real people that imitate the lives of the TV show characters inevitably experience unhappiness and disappointment.

It is seen that people starring as partners in TV shows are expected by their fans to lead parallel private lives that are suited to TV shows. Recently, it is commonly seen that the partners in TV shows are forced to be together also in their real private lives, which is also discussed on the social media as an agenda. The fans not being able to accept it when their favorite characters starring as partners in a TV show start another TV show with different partners when the former one is over can be considered as one of the most significant indications that individuals are not able to differentiate between the real life and the life in TV shows.

The formation of audience perception through social media (the new media) with determination of contents and concepts of local TV shows and the perception of reality can be considered as a paradigm that continuously feeds one another. It is one of the important discussions of today that the public broadcasting advocates, "The public can demand lots of things, but the willpower instills whatever it wants into the society and the society embraces it" whereas the private broadcasting advocates, on the contrary, giving the society what it wants and doing whatever the society wants.

From this point of view, it could be suggested that the audience tends to identify themselves that they experience through the TV show heroes with a life that they are unable to live and is not likely to become true due to economic reasons. Such wishes and attitudes are an important factor for the TV show producers when creating their stories, characters, i.e. the screenplay through the social media. The momentary values in rating measurements can be viewed as an important indicator to increase the viewing rates of TV shows. Social media experts provide consultancy services to TV shows while producing plans that are based on high

ratings without taking into account the perception of reality in reference to the virtual or imaginary world created by individuals.

“The TV show and Cinema sector continues using the Social Media along with all its novelties just like all the other brands. The comments of followers and fans on anything from TV show stars to shooting quality have an influence on so many things from producing better projects to making changes in the theme of a TV show. In fact, even most productions that are planned to end tend to extend the plotline for a couple of episodes merely due to the reactions that may be received on the Social Media. All of us must have seen the hashtag that appears on the bottom right-hand corner during airtime of any TV show. These hashtags that are about the airing episode are intended for fans of the TV show and the stars to express themselves”. (<http://m.medyafaresi.com/kose-yazisi/dizi-filmler-sosyal-medyayi-nasil-kullaniyor/789972>)

The viewing and thus the commercial concerns of TV shows can never be ignored. Nevertheless, each TV show acting with the awareness that there is an audience that is and will be influenced by it can be thought as a social responsibility in terms of self-control. It should be kept in mind that a large audience includes adolescents and youngsters; and it should be taken into account that such groups are influenced by the behaviors, opinions and world views of the TV show characters that are presented in a very realistic manner at times. It should be taken into consideration that young individuals who try to become the real-life extensions of the role models being bullies, carrying guns, being brave like a hero that we come across frequently (sometimes as cute thieves, goodhearted murderers, handsome shams, etc.) may experience problems in the perception of reality. If we were to give a couple of examples from among tens of it:

“He ‘wanted to be like the magician’ in the TV show and lost his mind. Ferhat, who wanted to be like the magician in the TV show, lost his mind. Having recovered after a 1-week treatment, Ferhat talked and recognized his mother and father. However, he passed out again when he saw the TV. (<http://www.haber7.com/guncel/haber/408557-dizideki-sihirbaza-ozendi-aklini-yitirdi>)

“She imitated a TV show character and drank syrup thinking it were potion” (<http://t24.com.tr/haber/dizi-kahramanina-ozendi-surubu-iksir-diye-icti,41127>)

“9-year-old OnurOztepe imitated the hanging scene in KurtlarVadisi and died”. (<http://www.internethaber.com/kurtlar-vadisine-ozendi-kendini-asti-258393h.htm>)

“They aped KurtlarVadisi and tortured him for eight days” (<http://www.hurriyet.com.tr/kurtlar-vadisi-ne-ozenip-sekiz-gun-iskence-yaptilar-38735249>)

The increasing interaction between TV shows and the society and TV shows listening to the opinions of the audience can be considered as a positive indicator. However, TV shows should perceive their responsibilities towards the society -in terms of social responsibility, liability towards the audience, moral values, spiritual beliefs, gender roles, minority rights, ethnic discrimination- as not their secondary but fundamental duties.

THE EXPLORATION OF MEANINGS OF SOCIAL PRACTICE OF KOREAN COLLEGE STUDENTS

Mijung Lee
hyemyung2@naver.com
misuk park
altnr9631@naver.com

This study aims to explore the meanings of college students' social practice through multicultural mentoring in Korean society which is changing into multicultural society. From September 2015 to March 2016, targeting 12 college students participating in multicultural mentoring, an in-depth interview was conducted to analyze their experiences.

In the results of the study, the meanings of social practice through multicultural mentoring are like below. First, it is to learn how to walk together. Through volunteer activity, they learnt that everyone in Korea should be respected for diversity to live together. Second, it is to grow together. Through multicultural mentoring, mentees who are students from multicultural families improve their learning and also feel emotionally stable. Also, mentors learn and grow a lot through diverse experiences. Third, a sense of service is expanded. Through multicultural mentoring, college students get to know the pleasure of volunteer work, and then seek for more meaningful activities. Fourth, a community spirit is possessed. The social practice is for the public interest, which becomes a power to maintain communities. Such multicultural mentoring is based on the public interest to protect socially underprivileged people and also to maintain community. Fifth, the excellence is obtained. Through multicultural mentoring, college students experience the internal achievement. In other words, the excellence in judging what is right and wrong provides them with the internal achievement. Thus, social practice could be a source of composing healthy society through members' happy life. In order to have diverse social practices, each individual and the state should work together.

This study is expected to be used as basic data to explore social practice and also to increase college students' social practice.

THE HIGHS AND LOWS OF TEACHING ETHICS TO AN INTERNATIONAL AUDIENCE

Kevin Macnish

K.N.J.Macnish@leeds.ac.uk

ABSTRACT

In this presentation I will discuss the challenges and benefits of discussing philosophical ethics via online platforms. I will draw on the experience of teaching an online MA in applied and professional ethics for the last 5 years and a more recent project of designing a MOOC for research ethics at the University of Leeds, UK. Areas of particular interest include incorporating philosophical perspectives that go beyond traditional Western philosophy to ensure a wide application of the material as well as challenging students to think more broadly about their own ethical approach, and the challenge of distinguishing ethical values which are culturally embedded versus those which are more universal. This may be particularly acute in the case of research ethics where case studies may be culturally inappropriate in some specific instances and/or legitimate research practices may differ widely across cultures. There is a balancing needed in many instances between being genuinely provocative to highlight inappropriate behaviour and being insensitive or offensive. The presentation will be a means for discussion and thought exchange as much as presenting information.

THE IMPACT OF UNIVERSITY COMMUNITY ENGAGEMENT PROGRAMMES ON STUDENT'S SOFT SKILL

ABSTRACT

This paper review the impact of university-community engagement (UCE) programs on student's soft skill development based on UCE programs which were done within 200 kilometres from Universiti Tun Hussein Onn Malaysia (UTHM). It was found that the students' level of leadership skill, critical thinking and communication were enhanced through a systematic implementation this program. Overall, UCE's programs effect on student's soft skill and community development.

Key words: UCE, community development, student soft skill.

INTRODUCTION

In Malaysia, statistics show that the number of activities between universities and communities has increased since it introduced by Ministry of Higher Education (MOHE) in 2014. It reflects a cooperation based on mutual benefit. Engagement between universities and local communities has a long history. Every type of activities such as through university-public engagement, community-university collaboration and public engagement or action research has been started years before (Hart and Northmore, 2011). Through this activities, communities and stakeholders could gain new knowledge and experience that could further enhanced their level of resilience. The university on the other hand could expand their networking through their interaction with the stakeholders and community and achieved their objective to produce a "Holistic, Entrepreneurial and Balanced Graduates".

UCE PROGRAMME AND STUDENT'S SOFT SKILL

The main objective of UCE program is to encourage the participation of academics in community development for the betterment of both university and the community. To achieve this, UCE program is planned in line with the academics expertise. The program is considered a success if the community members participated. The Ministry of Higher Education Malaysia (MOHE) has set several criteria of UCE program which include minimal cost, high impact, transfer of knowledge and technology, sustainability and beneficial to the students particularly in enhancing their soft skills in communication, leadership, lifelong learning, team work, critical thinking, morale and ethic and entrepreneurship.

The implementation of UCE program also reflects the orientation of the university with community outreach unit. Social interaction is consistent with the university's role as a centre for producing the competent generation. While the community must be exposed with the knowledge and latest skills to provide the benefit of a university's impact on the community. Social interaction will create an element of knowledge and technology transfer from the student to the community. According to Azman Ismail et al. (2007) knowledge and skills transfer that occurs between the two units will affect the impact of the practice of communication between the two units. Moreover, technology transfer is usually done in project-based learning model (PBL) is also seen as one of the best and appropriate method in a direct impact on students (Balakrishnan et al., 2009). Project-based learning can be known as the best mediator to apply elements of leadership, teamwork, critical thinking and lifelong learning.

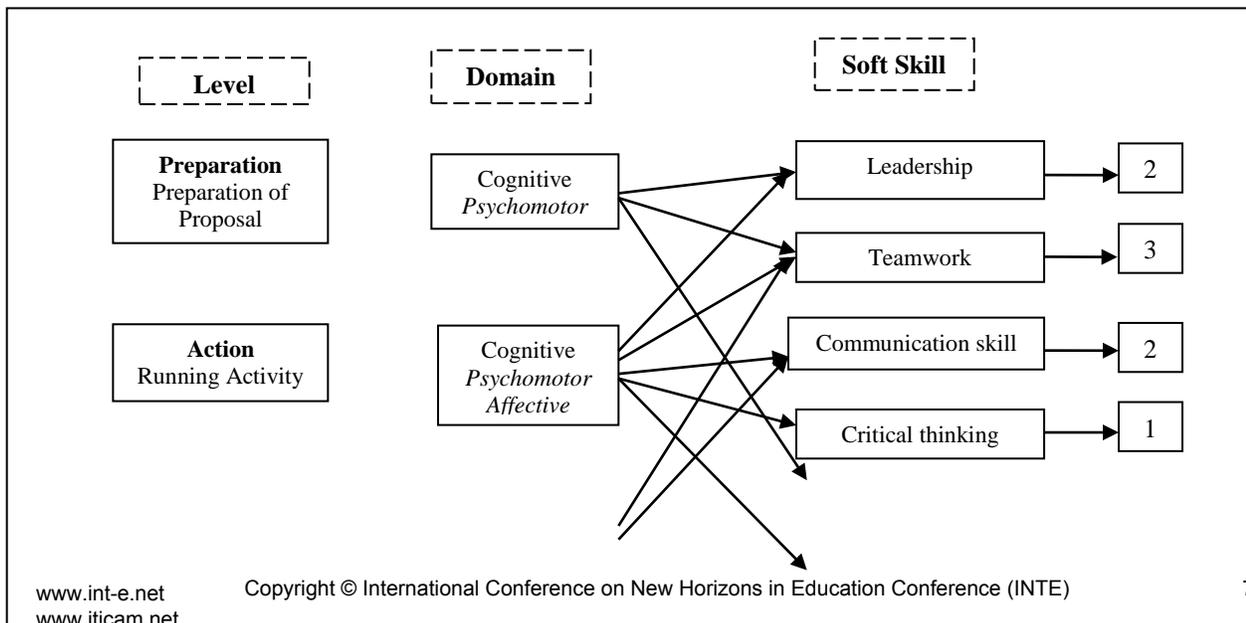

There are three stages of UCE program namely, the preparation of project proposals, the implementation of the program and the evaluation of the program effectiveness. Each level is designed to have an impact on students through their active involvement in UCE programs. Students will learn positive values through this program, improve their soft skill, academic performance and become a balanced and holistic student.

Level of UCE Program Implementation and Soft Skills

As mentioned above, UCE program have three levels which are preparation, implementation and evaluation. Each level has its own learning outcomes. The learning outcomes have three domain namely, cognitive, psychomotor and affective and each domain have the element of soft skills. At the planning stage students were asked to prepare a proposal on the activities or projects they planned to carry out. The proposals should be based on SWOT analysis of the target groups and the emphasis should be given on the program objectives, learning outcome particularly on leadership, teamwork and ethical and moral (which is cognitive and psychomotor domain) and project costs.

The implementation stage requires students to apply their knowledge, skills and abilities to achieve the objectives as proposed in the project that have been approved by the university. However, there are room for flexibility especially when spontaneous action is needed. The learning output include cognitive, psychomotor and affective domain which will be reflected in their leadership, lifelong learning, critical thinking, communication skills and team work.

The final stage is the evaluation stage where the effectiveness of programs and student performance were measured. At the university level, students will be assessed based on four criteria which are report writing, content, presentation skill and their ability to take questions during the Q&A session. This measurement indicate the effect of the program on psychomotor and affective domain and also on the students' communication skills, leadership skills and lifelong learning. Assessment by community covers the aspect of communication skills, team work, critical thinking and lifelong learning. Figure 1 shows the impact of UCE program on students' soft skill.

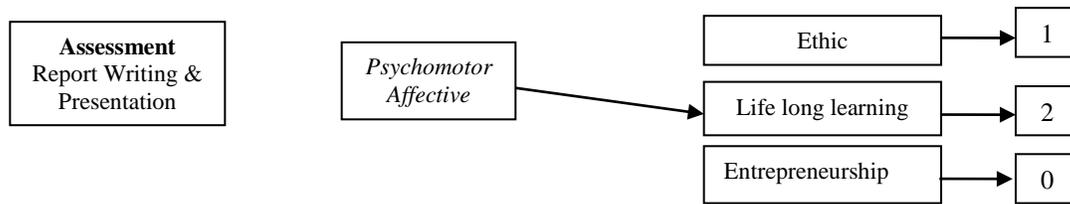

Figure 1 The Impact of UCE Program On Students' Soft Skill.

THE FINDINGS

The three stages in the implementation of the UCE program covers all domain (cognitive, psychomotor and affective) needed by the students at the institution of higher learning. Each domain also contain a distinctive elements of soft skills and are in line with the role of each domain. Table1 shows that students are able to apply or have almost developed all soft skills after the successfully run the program.

However, the level of soft skills acquired by the students varied accordingly to their ability and achievement. Most students were able to apply elements of teamwork in conducting the program despite working with students from different ethnic background. Elements of teamwork can be seen through joint activities, meetings and discussions in solving a problem.

Teamwork is an essential element that must be maintained by students in the long run, especially in their future career. Other soft skills, that is leadership, communication and life long learning are also important to the students in gaining experience in planning and implementing a program. Implicitly, this is part of longlife learning. It turns out that leadership and communication skills are very dominant in the implementation of UCE program but its influence is not as strong as teamwork. Critical thinking and ethics havelow influence UCE program implementation. Although both elements is important in producing competent students but its importance is in the context of teamwork. In line with the concept of UCE, entrepreneurship elements were found to be capable of giving a direct impact on the students' soft skills. Indirectly, these elements could be applied depending on the type of program and target groups such as low-income groups B40.

CONCLUSION

The implementation of UCE's program have a big benefit to the communities and university, especially in term of the application of students' soft skills. The using of SWOT analysis before planning a program helps the universities to organize program which gave higher impact to the communities. This effort is in line with the desire to develop a resilient communities. The four criteria outlined by the universities in implementing the UCE program (low cost, high impact, as well transfer of knowledge and technology and sustainability) helps the university to contribute according to the needs, requirements, satisfaction and expectations of the community. This is because, during the implementation of UCE program, the students have the opportunities to meet and communicate with the stakeholders. Ultimately, a holistic, entrepreneurial and balanced graduates is produced through the UCE program.

ABSTRACT

The study aimed to examine the impacts of inquiry-based learning model utilizing the structured, guided and open inquiry on students' problem-solving skills, science process skills, and scientific attitudes. A total of 68 Grade 12 students were selected as respondents. One group non-experimental design was employed. The impacts of the inquiry-based learning model were reflected in the paired t-test results and the improvement in their science projects. Finally, the findings from teachers' reflections on each of the inquiry approach were found to be effective to encourage students' independent study as well as improve their abilities in science literacy.

Key Words: Inquiry based learning, science, learning models

INTRODUCTION

Inquiry learning is a teaching method emphasizing on students actively develop their knowledge which is not directly transmitted from their teachers and it is compatible with the constructivist approach. Friesen (2009) emphasized that current teachers are facing more challenging teaching method due to the former concepts of knowledge, minds, and learning styles are longer relevant and they must work in different contexts. This is because teachers have to design their teaching practices focus on engaging students in both academically and intellectually by providing sufficient learning opportunities. As a result, Thailand Institute for Promotion of Teaching Science and Technology (2011) had highly emphasized learners' knowledge, thinking process, inquiry process, problem-solving, communication ability, decision making, and ability to apply the knowledge in their daily lives. This is aimed to train students to have the scientific mind, ethics, and appropriate. Thus this issue has been stated in Thailand science curriculum manual.

According to National Research Council (NRC) (2000), inquiry-based learning is depending on the amount of autonomy provided to students and covers an extensive range of approaches, stretching from teacher-directed structured and guided inquiry to student self-regulated open inquiry. In other words, inquiry-based learning is an approach that places students' questions, ideas, and observations at the center of the learning experience in the classroom (Pauli, 2009). Teachers play an active role throughout the learning process by establishing a classroom culture where students' ideas are respectfully challenged, tested, redefined and viewed as improvable, moving students from a position of wondering to a position of enacted understanding and further questioning (Scardamalia, 2002). Consequently, both teachers and students share the responsibility for learning is the underlying principle in inquiry-based learning approach.

Zion and Mendelovici (2012) identified the inquiry-based learning into three levels, namely structured, guided, and open inquiry. In structured inquiry approach, students do not need to think autonomously due to the questions, processes, and results are designed through a prescribed procedure by teachers. Therefore structured inquiry is suitable to develop students' basic inquiry skills but not sufficient to appreciate the real nature of science. In guided inquiry, although teacher provides students with questions and procedure but students have to explore and find the solutions by themselves. In short, students have to lead the inquiry process that involving decision-making and come up with their own conclusion. Open inquiry is considered as the most intricate level of inquiry-based learning which creates a learning community of teachers and students. Students need to perform like scientists and requires high order thinking abilities (Reid & Yang, 2012).

Inquiry-based learning has its potential to promote students' intellectual engagement and foster their understanding through a hand-on, minds-on, and research-based disposition towards teaching and learning particularly in the science subject. On top of that, inquiry-based learning also creates a complex, interconnected

nature of knowledge creation, enables teachers and students to build, test, and reflect collaboratively on their learning (Stephenson, n.d.). Stephenson further highlighted that the inquiry-based learning is an umbrella term that covers a number of other approaches to teaching and learning. Teaching practices that utilize a disposition of inquiry learning include problem-based learning, project-based learning, and design-based learning.

In reality, teachers have to face several challenges such as knowledge is necessary for participation, basic science skills needed, cultural mismatch, excessive individualism, and lack of experiences to draw upon while implementing inquiry-based learning (Hirsch, 2006; Delpit, 2006). Knowledge is the basic requirement for inquiry-based learning because students need sufficient knowledge to pursue an investigation based on the immediate situation and personal experience (Hirsch, 2006). Hence, teachers have to ensure students have sufficient knowledge before they are able to participate fully in the classroom practices. Besides, a related point that challenging teachers is the inquiry-based learning should lead to the science skills development. Delpit (2006) clarified that inquiry-based learning will only work for some students but not others especially those from marginalized groups who need access to the societal codes of knowledge in a more direct approach. The importance of experiences in inquiry-based learning implies that teachers have to find ways to incorporate richer experiences into learning. As a result, teachers have to encourage students to critically engage with books, websites, and ideas to extend their world. Another method is teachers have to organize field trips, service learning or nature study to expand their direct experiences. All these tasks seemed to be heavy workload to the teachers.

Thailand science education aimed to align science curriculum to be relevant to students' real life experience. Since science subject is a compulsory subject in Thailand Education System from Grade 1 to Grade 12, students are expected to reach common scientific literacy as indicated by Yuenyong and Narjaikaew (2009). Yuenyong and Narjaikaew highlighted the basic scientific literacy: Firstly, students hold an understanding of scientific knowledge and the relationship between science, technology, society, and environment. Secondly, students have to engage in thinking process and reasoning to investigate knowledge. Finally, students possess scientific habits of mind for the living.

LITERATURE REVIEWS

According to Zion and Mendelovici (2012), inquiry-based learning is only relevant but remains controversial to some teachers because of the facilities available in schools. Many past researchers such as Binns and Popp (2013), Blanchard et al. (2010), Bunterm et al. (2014), and Quintana, Zhang, and Krajcik (2005) claimed that guided inquiry-based learning helps students learn science content, master scientific skills, and understand the nature of scientific knowledge. Moreover, Trautmann, MaKinster, and Avery (2004) revealed that the structured and guided inquiry approach prevents wasting of learning time, reduces students' frustration of the undesirable results or experiencing failure as well as their fear of unknown.

Besides, past research findings indicated that open inquiry approach is an effective method to achieve a higher level of inquiry whereby students become accustomed to the nature of scientific knowledge, develop greater inquiry skills and practices, and employ in higher order thinking (Berg, Bergendahl, Lunberg & Tibell, 2003; Chinn & Mahlotra, 2002; Krystyniak & Heikkinen, 2007). Moreover, Jordan, Ruibal-Villasenor, Hmelo-silver and Etkina (2011), and Zion and Slezak (2005) found that student's functioning is closely related to teacher's determinations to assist the student's scientific literacy, creativity, initiative, responsibility, and motivation.

Tatar, Tüysüz, Tosun, and Ilhan (2016) had used Questionnaire of Factors Affecting Students' Science Achievement (QFASSA) to examine the influencing factors to a total of 606 science program university students from four state universities in Turkey. Their results showed that the most significant factors that affecting students' achievement are teacher and curriculum dimensions. Furthermore, Tatar et al. indicated that the most significant predictor is 'teaching the topics in a way that may arouse the students' curiosity' as one of the teacher dimensions. Tatar et al.'s findings were supported by Wolpert-Gawron (2016) who stated that inquiry-based learning is more than asking a student what he or she wants to know. It is about triggering curiosity as well as activating his or her curiosity.

Harris and Rooks (2010) investigated on the effective method to organize inquiry-based science learning in K-8 science classroom to cause extensive changes in classroom management practices. Harris and Rooks introduced a pyramid model about how the five interconnected management areas namely students, instructional materials, tasks, science ideas, and the overall social context of students' inquiry learning environment work together in such a way that the effectiveness of any of them is influenced by how the other management areas are managed. In addition, Harris and Rooks also proposed a close-knit relationship between management and instruction to

recognize the prevalent nature of managing the classroom for effective inquiry learning.

Sungur, Tekkaya, and Geban (2006) had studied the effect of problem-based learning to 10th grade students' academic achievement and performance skills. A total of 61 students from two classes which instructed by the same biology teacher were involved in their study using Motivated Strategies for Learning questionnaire. Sungur et al.'s results showed that students instructed with problem-based learning earned higher scores than those instructed with traditionally-designed biology instruction in both academic achievement and performance skills. Sungur et al. concluded that students in the experimental group seemed to be more capable in the use and organization of relevant information, in assembling knowledge and stirring toward better decision compared to the control group.

RESEARCH AIM

The main aim of this research was to investigate the impacts of the developed structured to open inquiry learning activities as an inquiry-based learning on students' learning outcomes particularly on problem-solving competency, science process skills, scientific attitudes.

METHOD

Research design and samples

One group non-experimental design was utilized. There was only a single group of 68 Grade 12 students from Koksi Pittayasan School in Northeast of Thailand who enrolled the science project class in the first semester of 2015 academic year were purposively selected in this study. Researchers created a treatment condition involving three phases namely structure inquiry approach, guided inquiry approach, and open inquiry approach and this single group of students was observed. The pretest-posttest design involves two measurements of the 68 participants were applied before and after the treatment surrounding in time the administration or occurrence of a single treatment that is structured to open inquiry approach. In this design, participants serve as their own control and comparisons are made before and after treatment. An assumption is made that differences between pretest and posttest are due to the treatment.

The overall intervention treatment was taken place for 20 weeks, two hours per week. Structured inquiry approach was applied in the first phase for the duration of for weeks. At this phase, researchers provided the knowledge about water quality and how to analyze water quality. This is followed by students used the knowledge to prepare a structured science project entitled as 'Water quality in our school'. In the second phase, researchers utilized the guided inquiry approach for the duration of six weeks. There were two learning activities in the second phase that involving galvanic cell from the metal electrode in the chemical electrolyte and galvanic cell from fruit electrolyte as well as non-corrosion metal. Researchers provided science knowledge which was associated with each of the projects. For example, knowledge related to the components of the galvanic cell and how it works as well as the corrosion of metals and corrosion protection of metals. Participants were assigned two science projects. This first project was creation a galvanic cell from metal electrodes in the electrolyte solution and galvanic cell from fruit electrolyte. The second project was protection the iron nail from corrosion.

Open inquiry approach was used in the final phase for the duration of eight weeks, followed by two weeks presentation. In this phase, each group consisted of six to seven participants who have to define a problem for doing a science project. While participants were planning for the science project, researchers observed and recorded the following issues such as (i) Source of the issue and selection of issue to do the project; (ii) Investigation for scientific knowledge that forms the basis of a science project, knowledge linkages, applying the knowledge to plan for a science project; (iii) Defining variables, setting hypothesis, planning to do a science project; (iv) Doing a science project, recording data, and presentation; (v) Discussion and conclusion, and writing a project report.

Research instrument

Research instruments were mainly used as tests to measure learning outcomes encompassing three areas namely problem-solving competency, science process skills, and scientific attitudes. Therefore three types of tests were used to measure the three areas of learning outcomes. All the three types of tests were adapted from Tornee (2014). Specifically, Tornee had adapted his instruments from two sources namely the problem-solving competency test from Organizational for Economic Co-operation and Development OECD (2013) while the science process skill test and scientific attitudes test from Vangpoomvai (2012).

The problem-solving competency test is a 32-multiple choice items, mainly used to assess four components of

problem-solving process namely exploring and understanding, representing and formulating, planning and executing, and monitoring and reflecting (OECD, 2013). The reliability (KR20) value was 0.89, discrimination index was 0.22 to 0.80, and the difficulty index was 0.21 to 0.68. The science process skills test is a 45-multiple choice items, mainly used to assess 13 different science process skills including observing, measuring, using number and calculating, classifying, space/space relationship and space/time relationship, communication, inferring, predicting, controlling variable, formulating hypothesis, defining operationally, experimenting, and interpreting data and conclusion. The reliability (KR20) value was 0.86, discrimination index was 0.22 to 0.69, and the difficulty index was 0.28 to 0.81. The science attitudes test was used to assess the change of students' attitudes after the intervention. All the items were purposely designed to evaluate six attitudes namely curiosity, reasonableness, responsibility and perseverance, organizing and carefulness, honesty and open-mindedness (Burterm et al., 2014). The reliability (KR20) value was 0.72.

Other than the three types of test stated above, another three instruments were used to evaluate the quality of science projects namely rubrics to evaluate science project, observation form, and interview protocol. First of all the three science teachers were requested to evaluate the science project by using rubrics rating scales. This step would be complemented by an interview protocol which was created by researchers to conduct semi-structured interviews to the same science project teachers to compare the quality of science projects of the current year and the previous year. There were six components of quality science projects taken into consideration namely originality, practicality, elaboration, multi-dimensional knowledge used, environmental friendliness, and aesthetic and attractive.

In addition, researchers used observation form to record teachers' reflections about the progress of their students through inquiry learning activities. Basically the focus of this research instrument was to observe knowledge and information usage for analyzing problems, selecting subject for experiment, experiment, setting hypothesis and design experiment, gathering and record data, discussing and concluding experiment and writing science project report, and evaluating the abilities of students' learning for structured and guided inquiry approach. However the final part of observation form was focusing on identification of problem, transferring knowledge and applying knowledge, identify variable, setting hypothesis, and planning to work the project, gathering and record data, discussing and concluding experiment and writing science project report, and evaluating the abilities of students' learning for open inquiry approach.

Data analysis

Quantitative data was analyzed by descriptive statistic using the mean score and standard deviation and inferential statistic using paired t-test. Paired t-test was used in 'before-after' structured to open inquiry approach. Paired t-test was identified to be suitable for this study because all the participants were matched pairs and it was considered as a case-control group. Researchers provided 40 hours of treatment that is structured to open inquiry approach for 20 weeks to the 68 Grade 12 students and followed by the investigation on the impacts of treatment related to problem-solving competency, science process skills, and scientific attitudes. On the other hand, qualitative data from observation and interviews were analyzed using content analysis.

RESULTS

Results are demonstrated according to the research aim as indicated above. The results present in two parts namely quantitative and qualitative findings. The initial results highlight the change on problem-solving competency, science process skills, and scientific attitudes of 12th Grade students before and after the intervention of structured to open inquiry approach in science learning activities. This is followed by evaluating the effectiveness of structured to open inquiry approach on the progress of Grade 12 students through feedback from teachers' reflections. Finally, the quality of the science projects is measured from quantitative finding from rubric rating scales as well as qualitative data by interviewing three science teachers.

Findings of Paired t-Test

The descriptive statistics of pretest vs. posttest of problem-solving competency, science process skills, and scientific attitudes for the 68 Grade 12 students are presented in Table 1. Their abilities are measured based on three categories namely problem-solving competency, science process skills, and scientific attitudes. All the posttest results show an increment compared to the pretest results after utilizing structured to open inquiry approach.

In addition, findings revealed that all the three categories of ability were more than 80 percent of the total score of each posttest compared to pretests which ranged from 52.63 percent to 72.23 percent. Specifically, the greatest increment of the total score is problem-solving competency as 32.93 percent (85.56% - 52.63%). This is

followed by science process skills as 23.80 percent (82.20% - 58.40%). The least increment of the total score is scientific attitudes 17.37 percent (89.60% - 72.23%). The highest standardized gain score [(posttest-pretest)/pretest SD] were science process skills, followed by scientific attitudes and problem-solving competency.

Table 1. Descriptive statistics of students' abilities

Abilities	Pretest		Posttest		%	%	Standardized Gain Score
	\bar{x}	SD	\bar{x}	SD			
Problem-solving	16.84	2.25	27.38	2.11	52.63	85.56	4.68
Science process skills	26.28	1.49	36.99	2.12	58.40	82.20	7.19
Scientific attitudes	90.28	4.33	112.00	4.01	72.23	89.60	5.02

The assumption was made at the initial stage of the mean scores of the paired samples are equal which means that the pretest scores for each category of ability in students' learning outcomes are equal to the posttest scores. The level of significant was identified as .05. Results of the study revealed that the mean scores between the pretest and posttest were different. Therefore, researchers rejected the initial assumption made and concluded that there was a significant mean difference between all the paired samples. In other words, all the students gained a higher score in their posttest compared to their pretest.

Table 2. Paired samples t-test

Paired posttest-pretest	\bar{x}	SD	Std. error Mean	t	df	p value
Problem-solving competency	10.54	1.43	.17	60.84	67	0.001
Science process skills	10.71	1.85	.22	47.64	67	0.001
Scientific attitudes	21.72	4.15	.50	43.20	67	0.001

Findings of the quality of Science project

There are three sets of qualitative data to quantify in order to determine the quality of science projects. The three science teachers evaluated a total of 10 science projects separately using rubrics rating scales. The mean score was calculated to make the decision about quality ranged from very poor, poor, fair, good, and very good. The results from the rubrics evaluation were shown in Figure 1 and Table 3.

Table 3 shows the summary of the quality of science project as well as teachers' interview data. The overall mean score was good for each component of quality science project except originality component which was at the fair level. Nevertheless, all the rubrics rating scales findings were supported by teachers' opinions. Rubrics rating scales and interview findings were focused on six components of quality, namely 1 as originality; 2 as practicality; 3 as elaboration; 4 as multi-dimensional knowledge used; 5 as environmental friendliness, and 6 as aesthetic and attractive. In summary, the three science teachers had their desirable quality of science project but they are satisfied with the improvement shown by students.

Table 3. Quality of 10 science projects and teachers' opinions

Part of assessment	\bar{x}	SD	Teachers' opinions
Originality	3.40	0.48	'Students can choose the issues around the school to work as a projects.' 'Their works using the scientific process to replace the local or inherited knowledge, or do as their mothers do.' 'They try to find new ideas, new methods to support their science projects.' 'Some are like old works, but are more variables in this time.' 'They can search a relevant theory that involves variables for adding in their works.'
Practicality	3.70	0.64	'Their tasks are able to be developed to be a better product.' 'The project result is clear, has a quantitative result so one can further developed.'
Elaboration	4.00	0.77	'They use the correct knowledge in defining the variables and design the experiment. Their works are reliable and they can do it successfully.'

			‘They use the group process. There is a clear task assignment. It is an important factor that makes the work successful.’
Multi-dimensional knowledge used	4.00	0.77	‘Students search the science knowledge of each variable, make knowledge linkage to describe their projects.’ ‘Students apply their knowledge to be associated with the new knowledge and use the knowledge for planning the experiment.’
Environmental friendliness	4.40	0.66	‘There are many projects that involve local participants and the community. They can use local materials and use the chemicals appropriately.’ ‘Their designs are based on their best study so they can use chemical materials and equipment efficiently, successfully.’
Aesthetic and attractive	4.50	0.67	‘Their works are attractive, look great.’

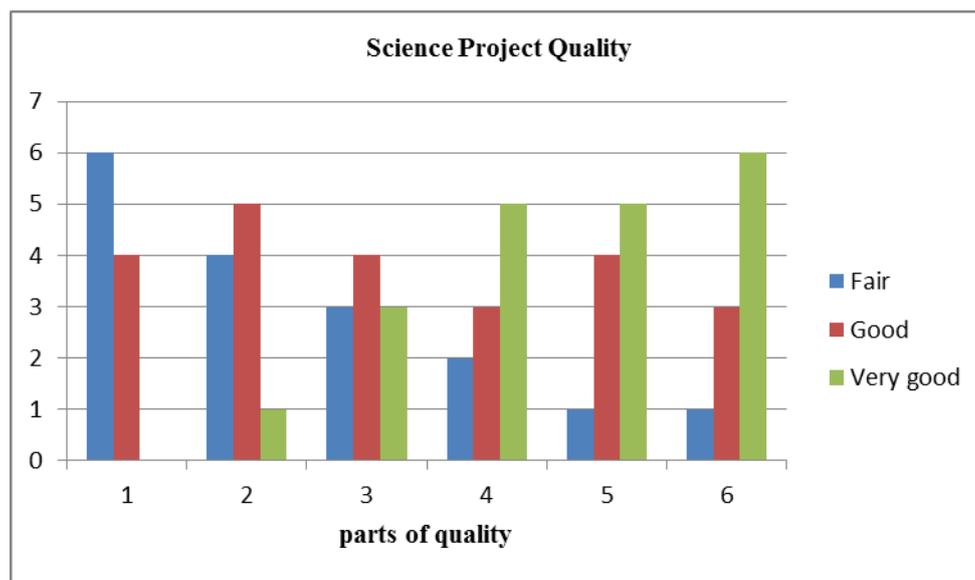

Figure 1: Quality of science project

Findings of the Teachers' Reflection

This study was conducted in three phases involving three approaches namely structured inquiry, guided inquiry, and open inquiry. After completing each phase, teachers would do the reflections through their observations. The results are revealed into three parts namely teachers' reflection after structured inquiry approach, teachers' reflections after guided inquiry approach, and teachers' reflections after open inquiry approach as follows:

Teachers' reflections after structured inquiry approach indicated that students found to be understood the process of doing the science project. They understood the scientific method and practiced the science process skills by doing the structured science project that assigned to them. Students are able to do the experiment by following the lab direction.

After guided inquiry approach, teachers' reflections revealed that students were able to use their knowledge about the galvanic cell to define the variables for making their galvanic cell by themselves. They designed the experiments by themselves. Their designs were not the same. They did the experiment, collected data, and did their projects by themselves. Because of each group selected a variety of electrodes so their results were a difference. They are able to define the dependent and independent variables. Finally, each group was successfully making the galvanic cell that produced electricity. They were very happy with their works. The same as making the galvanic cell using electrolyte solution from fruits, students are able to define different independent variables. Some students used different electrodes, the distance between electrodes, and different fruits as independent variables. However, teachers have to help them in the discussion and conclusion part. It can conclude that students can integrate relevance knowledge from textbook to define variables and to plan for doing the assigned projects by themselves except at the discussion and conclusion part that needs some assistance from teachers. Finally, students can do their two guided science projects, write reports and make the project presentations.

The proposed science projects in open inquiry approach were classified into two types. The first type was using their ideas while the second type was adapted from other previous projects but tried to add new variable or study in another dimension. From the teachers' reflections showed that students studied the knowledge that relevance to their variables to construct their knowledge to define the hypothesis and design the experiment. Students can do science projects. They are able to collect data, analyze, discuss, and make a conclusion by themselves.

DISCUSSION

The novel opinions on teaching and learning science are started to restructure the setting of classrooms. Therefore this research was aimed to combine the concept of outcome-based learning and the continuity of inquiry from structured through guided and open inquiry approach. Findings of this study indicated that all the three abilities namely problem-solving competency, science process skills, and scientific attitudes were improved with a higher total score of more than 80 percent. This implies that students had been provided more opportunities to practice their science process skills while they did the structured and guided science projects. Moreover, they also had to solve the real problems that occurred during the implementation of their science projects. As a result, they have been trained directly or indirectly to establish their positive scientific attitudes. This is because they have to think and act like scientists which may affect their scientific attitudes.

Science process skills have been highly emphasized particularly in a structured inquiry of learning whereby students were trained to do science project via the laboratory experiment. They learned the process and steps of doing the science project, thus practicing their science process skills while they were conducting their experiments. In addition, teachers provided information about the project as well as appropriate practices on the proposed problems while implementing guided inquiry of learning. This implies that guided inquiry learning should be considered by means of a kind of problem-solving training whereby students had to share their ideas in defining variables, design the experiments, and conduct the experiments independently. At this stage, students will be provided sufficient opportunities to design the patterns of the experiment to solve the entire question. Therefore they are trained to do science projects using problem-solving process and the scientific method.

After the students have been trained with structured and guided inquiry approach, they are able to do their independent thinking at every step of the created science process. This implies that they are able to integrate their knowledge to identify the problems. Firstly, they are able to think of the issues around their community and investigate by using their science knowledge that relevance with their science projects. Next, they are able to make knowledge linkage to identify, plan, and conduct the project successfully.

The ultimate findings are found to be in accordance with Zion and Mendelovici's (2012) findings. Zion and Mendelovici had proposed the three levels of inquiry from structured, guided to open in teaching the biology of high school in Israel. In addition, the implication from this study has shown that structured to open inquiry approach will be very useful particularly in teaching science because this approach is found to be able to support students to construct their knowledge from their experiential learning, using their basic abilities to improve their learning science literacy.

Abstract

The aim of this study is to emphasize Van's importance of gastronomy marketing and to reveal its existing potential in the process of city branding. In order to determine whether the local food culture has any attraction on tourism movement or not and to identify which are considered to be additive to ensure Van's branding. In this study to review Van's existing potential during the city branding process and highlight the importance of local foods of Van in this process as an important gastronomy product, a questionnaire; which is a cross-sectional area research, conducted. The questionnaire which was prepared by the surveyor conducted in the first section socio-demographic information form; gender, age, educational background, marital status, occupation and income state and in the second section Scale of Gastronomy Marketing in City Branding took part and carried out face to face method on the people who volunteered for the research. This study was modelled as descriptive survey model. The study was conducted without any change on the participants' attributes and tried to get opinions from the subjects only on the existing state. In this regard survey model was reasoned to descriptive survey model in order to reveal the city branding process with Van's present potential due to highlight the importance of Van gastronomy marketing. "Scale of Gastronomy Marketing in City Branding" that applied on the participants who attended the sample, SPSS 23.0 packaged software used and in the conclusion part paraphrased and made suggestions.

ABSTRACT

This contribution is based on partial data from the research "Health and Use of Health Care Services by Shelters Users", the aim of which was to identify key factors which have an influence on their health and use of health services. The research points to the importance of gender-sensitive social work practice in shelters regarding the life situation and the needs of their clients. We perceive shelters as a specific environment that provides support while they are also a source of potential stress and oppression. Homelessness is an extreme form of poverty and social exclusion and a gendered issue, as well. The position of the homeless men and women in our society is different because they are faced with dissimilar expectations and their perceived problems have different hierarchies. The partial research data show that social work in shelters should include self-reflection of social workers and the reflection of specific situations of homeless women and men and it should also include a dialogue and an orientation in normative expectations towards homeless men and women. To strengthen the gender competence of social workers is a way how to reach the aim.

Key words: Health care, health service, social work

INTRODUCTION

In the last twenty years, the range of individuals who find themselves in a situation of insecure housing or homelessness has greatly changed (Roscher, 2015) and their numbers continue to grow (Barták, 2011). These people move between different forms of housing and non-housing, while repeatedly going through episodes of homelessness. There is also a growing number of people who have not yet lost their homes, but are at risk, while they are not necessarily living on 'the edge' of society, marginalized, low-educated, unemployed and/or substance addicts (Keller, 2013). Homelessness is an extreme form of poverty that limits the possibility of the self-realization of people who find themselves in this difficult situation. The social image of a homeless person is more often associated with men than with women. This image of a homeless man is more acceptable to the public than the image of a homeless woman (Marek, Strnad, Hotovcová, 2012). Hetmánková (2014) points out the phenomenon of the "invisibility of female homelessness." Because homeless women perceive a more critical societal view of them, especially in connection with the inability to care for their children and the lack of ability to get children back into their own care, even after stabilizing the situation (Hetmánková, 2014), more frequently and intensively than men, they try to hide their homelessness and so resort to the so-called latent forms of homelessness (Haasová, 2005). This stigmatization is probably related to the stereotypical assumption of women's bonding with the family and the care of children and household. An uneven perspective of the public and social service providers on gender and homelessness have a direct impact on how homeless people see themselves (Hetmánková, 2014; Glumbíková, 2017). This state of affairs in today's society creates a need to reflect on the specific ways in which social issues affect the lives of men and women. These social issues are very often gender-based, and this should be an essential prerequisite for professionals facing these issues as well as educators in professions such as social work (Janebová, 2008). In this paper, therefore, the researchers look at social work in homeless shelters through gender optics, which means that they are trying to look for the specifics of social work with homeless men and women and emphasize the need for a gender-sensitive social work practice. Gender is understood here as a socially constructed set of characteristics, roles, patterns of behaviour, and social positions attributed to men and women. The text is based on the principles of social constructivism, which perceives social reality as a social construct created in interactions, communication and language. The researchers refer to the construction of social reality and the construction of identities (of both the men and women) using the example of "Health and Use of Healthcare Services by Shelters' Users" research. They emphasize the need to deconstruct the existing gender-insensitive discourse of social work. Understanding that the practice of social work is fundamentally affected by the level and quality of education and training of social

workers, the researchers consider to which extent these specifics are reflected in teaching of future social workers at universities, and recommend the bolstering of the gender competence of social workers.

SPECIFICS OF MALE AND FEMALE HOMELESSNESS

Male and female homelessness, its specifics and forms, as well as the experience of men and women who have lost their homes, are yet to be sufficiently examined in the Czech environment. Tichý (2007) points out that the causes of homelessness in women and men differ in terms of quality. Relationship factors are predominant in women's homelessness; in men, it's both material and personal factors. Also, Kolářová (2008) notes that the causes of the situation of homelessness in homeless women often lie in the disintegration of partnerships (the break-up of a marriage, the death of a family member who lived with a woman in a joint household, etc.). This situation is, according to the author, associated with the loss of a support network and a poor financial situation. Hetmánková (2014) states that the perspective of homeless women on their own situation is directly related to their day-to-day survival strategies and affects their experience of homelessness, which is significantly different from men. According to statistics, there are more homeless men than women (in 2011, there were 11,496 individuals who were identified as homeless according to the methodology in force; of this number, 21.5% were women (Géblová, 2012))., however in view of the feminisation of poverty, women find themselves in this situation progressively more often (Hetmánková, 2014), and even at a younger age; furthermore, they often have small children with them, and their experience sometimes involves very intense and long-term domestic violence (Alsaker et al., 2006; Hetmánková, 2014). It is their appearance and sexuality that makes women victims of violence (Šmausová, 2002). Bassuk et al. (2010) adds that, due to domestic violence, homeless women suffer from post-traumatic stress syndrome up to three times as much as men and twice as much from substance or alcohol addiction as well as depression as opposed to women in the majority population. Fitzpatrick, Kemp, Klinker (2000) see the occurrence of hidden homelessness characterized by so-called *couch surfing* at their friends' or acquaintances' places to be a specific feature of female homelessness. Although women are often more willing to act or get help, mainly because they have children, hidden homelessness is excluded from the scope of social services. Marek, Strnad, and Hotovcová (2012) still point out that women use the services of social workers, psychologists and/or doctors much more.

HEALTH SPECIFICS OF MALE AND FEMALE HOMELESSNESS

There is a strong link between homelessness and health (see, for example, Girard et al., 2010). This link is a major challenge for both social and health services intended for the homeless population. There are many factors that affect the health condition of the homeless. Extreme housing conditions and poor financial conditions lead to ignorance of health problems, both by professionals and by their clients.

There is a high incidence of chronic health problems that have not been treated by a doctor in the case of homeless people living in shelters, and these people often encounter barriers in their access to healthcare (Hwang, Bugeja, 2000). The main reason for the non-use of health services is that these services do not meet the needs of homeless people (Girard et al., 2010), and that there is stigmatization and prejudice against homeless people, which are also strongly gender motivated.

Folsom et al. (2002), for example, refer to the high incidence of psychiatric diagnoses of depression and schizophrenia in people living in shelters. The incidence of depression was more common among women in shelters as opposed to the incidence of schizophrenia, which was more often experienced by men. Hatton (2008) states that homeless women suffer from more severe health problems, particularly in connection with the experience of domestic violence. This is also related to the fact that women subsequently describe their state of health as being worse (they feel more pain and anxiety) than homeless men do (Dragomirecká, Kubisová, Anděl, 2004, Barták, 2011).

Bassuk, Melnick, Browne (1998) address the systemic barriers to the access to healthcare for homeless women/mothers with some experience of violence. The lower use of health services complicates their life situation. Gelberg, Browner and Lejano (2004) emphasize that women's healthcare is specific, especially because of their gynaecological needs. The authors point out that neglecting these needs can result in serious medical complications or in unwanted pregnancy. Wenzel, Leake and Gelberg (2001) accentuate the lack of information from the area of gynaecological care among women living in shelters. Johnson, Zlotnick and Perez (2008) investigated the effects of intimate partner violence and the resulting symptoms of post-traumatic stress disorder on the psycho-social functioning of women in shelters. The research highlights the need for the treatment of post-traumatic stress disorder, ideally directly in the shelters. Despite the incidence of this disorder in nearly 90% of the victims of domestic violence residing in shelters, women are not provided any adequate assistance (Johnson, Zlotnick, 2007). Enders-Dragässer and Sellach (2010) also point to the poor availability of assistance for these groups of women in common practice. This deficit leads, for some women, to a dramatic increase in

their emergency situation, as evidenced, for example, by references to suicidal thoughts in their testimonies. Also, Boscher, Ruppert and Lackner (2002) state that the life circumstances of homeless people encourage suicidal tendencies (approx. 60% of women without any permanent housing have experienced one or more suicide attempts).

Wei Lim et al. (2002) states that homeless women rarely use healthcare. The most common form of healthcare that homeless women use is an emergency room visit. Also, Glumbíková (2017) confirms that women from shelters do not go to see a doctor, if avoidable, and solve their health problems by visiting an emergency room. One of the factors influencing the use of healthcare is the shame that women feel about their looks and health condition. Perceived stigmatization and "labelling" by social workers is one of major barriers to their use of healthcare (Gelberg et al., 2004; Glumbíková, 2017). Glumbíková (2017) also shows that this labelling is associated with the gender-based construct of a "good mother." Czech society sees a highly valued ideal in a "self-sacrificing mother," who is fully subordinated to the needs of the child (Gjuričová, Kubička, 2009). Homeless mothers associate the approach and behaviour of healthcare personnel with the concern that they are not "good mothers," and with the concern that social workers are going to look at them as bad mothers, and in case of a child's illness are going to blame them, and thus eventually contact the Department of Social and Legal Protection of Children, which may lead to the child being taken away from them.

SOCIAL WORK IN SHELTERS

According to the Registry of Social Service Providers (2017), there are currently 216 homeless shelters for men, women, mothers with children and, exceptionally, for entire families registered in the Czech Republic. *"Social prevention services help prevent the social exclusion of those who are at risk of a traumatic social situation, and/or life habits and ways of life leading to a conflict with society, and/or a socially disadvantaged environment, and/or could be at risk of their rights and legitimate interests being breached by a criminal act committed by another individual. The aim of social prevention services is to help this group overcome their unfavourable social situation and protect society from the development and spread of undesirable social phenomena" (Section 54 of Act no. 108/2006).*

There are also special shelter facilities for victims of domestic violence which have a classified address. Homeless shelters are included in social prevention services in the Czech Republic (Průdková, Novotný, 2008). A shelter is a social service that is based on the principles outlined in the International Federation of Social Workers (IFSW) definition (2014) defining social work as *"...a practice-based profession and an academic discipline that promotes social change and development, social cohesion and the empowerment and liberation of people. Principles of social justice, human rights, collective responsibility and respect for diversities are central to social work. Underpinned by theories of social work, social sciences, humanities and indigenous knowledge, social work engages people and structures to address life challenges and enhance wellbeing"*. The Act no. 108/2006 on Social Services, Section 57, describes the homeless shelter as follows: *"Shelters provide temporary accommodation services for persons in an unfavourable social situation connected with the loss of housing."* The Social Services Act states that this service *"includes the following basic activities: a) provision of food or assistance in the provision of food, b) provision of accommodation, c) assistance in enforcing rights, legitimate interests and in the procurement of personal affairs"*. The Act on Social Services (108/2006) further stipulates that *"the persons pay a fee for the provision of social services in shelters..."*. The stay in a shelter is limited in time, most frequently for a period of one year.

Social workers in shelters help their clients solve a range of different issues, such as arranging for their identity documents and social security benefits, provision of healthcare, job search, family relationship support, childcare assistance, or assistance with seeking for subsequent housing. Part of the social work is also about connecting the client with other professionals or institutions.

Social work in shelters has its other legislative definitions, where the social worker is both the guardian of the order and the advisor and the confidant, so is perceived by the clients both as support and authority. The social worker's roles may then be in conflict. *"You can't tell them everything...they then decide about the housing and such ... it's better to talk to someone out there"* (a female respondent – Z4). Given the fact that they supervise adherence to strict rules in shelters (an absolute ban on alcohol, etc.), the shelters can be perceived as jail and the social workers as guards. *"I'm happy to be here, ma'am, that I'm not in the street or somewhere else, but it's still the same. It's like in detention here, except that they're open to come and go, otherwise it's like being in detention"* (a male respondent – M3).

Due to the multiple issue nature of clients' life situations and the accumulation of roles (see above), high demands are placed on social workers. Certain requirements, by their very nature, often go beyond the

qualification of a social worker. The performance of a social worker's profession is so demanding that it puts high demands on the qualifications of social workers. Pursuant to the Act on Social Services (Act no. 108/2006 Coll., Section 110, Subsection 1), the legal capacity, clean record, health and professional competence is a prerequisite for pursuing the profession of social worker. Professional competence to work as a social worker consists of, according to the law, at the minimum a degree from a higher professional education institution or a university degree, and possibly completion of accredited training courses in the defined range and field of expertise. Also, the professional profile of a social worker and a medical-social worker matches with the professional competence to perform the profession of social worker in providing social services in institutional health care institutions. Given the oft-mentioned complexity of the profession, the duty of further and continuous education of social workers also plays an important role in their training. The Association of Educators in Social Work (ASVSP) is responsible for increasing the professional quality of education in social work. It is a voluntary association of higher professional education institutions and universities, or parts thereof, which offer education in social work in the Czech Republic.

In social work with homeless men and women, there are still many taboos that have not yet received much attention. This invisibility is reflected in the arrangement of services, which results from the masculinisation of the topic of homelessness. There are strict rules and the absence of privacy in shelters. In seeking help, women are confronted with an environment where men and their needs often dominate. A possible strategy of "survival" in a shelter, and coping with the constant presence of others is the manifestation of dominance and the demarcation of one's space. Glumbíková (2017) notes that women in shelters must be "rougher;" they must be able to "earn respect" from others. These behaviour strategies are generally considered masculine. In women, we can observe some masculinisation of their own actions in order to ensure their own protection and the fulfilment of their needs.

RESEARCH METHODOLOGY

The topic of the health of homeless people is yet to receive more attention in the Czech Republic, as evidenced by the lack of a more comprehensive study on this topic in the Czech environment and the small circle of authors who have dealt with the subject so far (e.g. Dragomirecká, Kubisová, Anděl, 2004; Šupková, 2007; Barták, 2011). Therefore, in the first half of 2017, we carried out a qualitative part of the research "Health and Use of Healthcare Services by Shelters' Users" (the quantitative part follows in the second half of the year). 30 communication partners – 13 women and 17 men aged from 20 to 66 – participated in the qualitative part of the research.

Communication partners were selected using deliberate sampling through institution (the homeless shelter). The data was collected using a semi-structured interview. When conducting the research, the researchers followed the American Psychological Association (APA, 2010) Ethical Principles. Every communication partner signed an informed consent. The researchers used a constructivist approach to the grounded theory by Charmaz (2009) when analyzing the data. The overall research question of the qualitative part of the research was: *How do shelters users perceive their own health and how do they perceive health services and how is the topic of health and health services reflected in their narratives?* In searching for an answer to this question, the researchers have identified a number of gender specifics of social work with this target group. As educators in social work, they therefore voiced a valid question: how is it possible that the Czech curricula of disciplines such as social work do not usually include gender optics and the reflection of the gender specifics of social work?

RESULTS

Social workers are the ones who are almost exclusively in contact with shelter residents and they often do not consider the health condition of their clients a topic to be addressed by them. Glumbíková, Gojová and Grundělová (2017) note that published papers in the Czech professional literature (Trnka, Šnircová, Krejbič, 2006; Dvořáčková, Belešová, Kajanová et al., 2016) often emphasize the poor health state of homeless people to be a result of their lack of interest, negative and irresponsible approach to health, lifestyle and low health literacy. Given the outlined discourse, it can be assumed that social workers themselves can be subject to this insight about homeless women and men, and therefore they do not focus too much on this community's state of health, and may thus (even though sometimes unconsciously) participate in their marginalization and discrimination.

There may be several reasons for the non-use of healthcare services. Partial data show that stigmatization and prejudice against homeless people are one of the main reasons for the non-use or the limited use of healthcare by shelter residents. This stigmatization limits access to treatment and even affects other relationships and a client's own identity. The only exception to regular doctors' visits are the women-mothers who mainly associate healthcare and visits to healthcare facilities with their children. *"Well, first of all, kids need to see a doctor ... I*

don't need it for myself" (a female respondent – Z2). *"The most important thing is that kids are healthy... I don't matter"* (a female respondent – H4). This approach seems to be linked to the construction of a "good mother," whose image is related to characteristics such as warmth, sensitivity, adaptability or selflessness. It also seems to be part of a strategy to avoid being considered a "bad mother." The women themselves do not go to see doctors much, not even gynaecologists. *"I don't go to see any doctor, even though I should go to see a gynaecologist, but I haven't so far"* (a female respondent – Z2). *"I don't go anywhere, not even to see a gynaecologist...nowhere"* (a female respondent – H2). One of the possible explanations why women do not go for check-ups is that, as suggested by Hetmánková (2014), homeless women feel that they are viewed by the public, service providers, authorities, police and healthcare facilities as secondary, inferior and contemptible. *"The frequent consequence of such behaviour is the resignation of one's personal rights, including the right to help and support"* (Hetmánková, 2014: 82). Many homeless women, but also homeless men, choose an emergency room visit as a major strategy for solving their health problems. *"When I'm sick, I go to an emergency room ... not to see a doctor"* (a female respondent – H1). *"I don't ... I don't need anything ... I go to an emergency room here if I need to and that's it"* (a male respondent – M4).

Communication partners (predominantly men) generally described an oppressive approach on the part of doctors and other healthcare professionals, as well as society as a whole, as follows: *"I'll tell you what. When one is in trouble, collecting welfare benefits, then some doctors behave terribly. You're nothing but welfare trash for them, and that's horrible"* (a male respondent – V6). *"It seems to me that they think that there's nothing wrong with you and you just simulate some illness"* (a male respondent – M4). Homeless women and men have different perceptions when it comes to the concept of health and their approaches to healthcare.

It was women who talked more often about "psychological problems," particularly in the form of depression and anxiety, with women's mental health being associated with the past experience of domestic violence. *"I don't even know how I plucked up my courage at that moment, but I just ran off to the police station and spoke up about it all"* (a female respondent – H5). *"You can't even imagine that. I wasn't even able to wash myself, comb my hair or get dressed in the morning...that's how terribly I was feeling"* (a female respondent – VM4). Communication partners have associated their poor mental health with their "failure" in the role of a parent. *"I then had such a depression that my kids were taken away from me ... I wasn't able to look after them ... there was nothing I could do ... that they took my kids away made it even worse though"* (a female respondent – H5).

Men also mentioned some psychological problems, but it was mostly in the case that they had already been diagnosed with a psychiatric illness by physicians and somehow became aware of it. *"I've had different psychological problems ... I've always had some sort of depression where I felt like I didn't care about anything and just wanted to be somewhere alone. So I walked a lot, and didn't even eat. Life didn't matter to me"* (a male respondent – V4). *"I mentally hit rock bottom ... I got divorced... then when you lose your job...it also makes you depressed...then you have no money to purchase what you need and to live on. Then you start receiving some welfare benefits and that's not enough for you...it knocks you down on your knees"* (a male respondent – V5). It can be concluded that psychological problems occur in both homeless men and women residing in shelters, however, men are less often willing to verbalize them. In relation to male mental health problems, transcendence of "gender stereotypes" such as "men do not want any psychological help", "men do not need to talk/they will not want to talk" appears to be fundamental and men should be continuously offered the psychological help and the opportunity to "have a talk." Male communication partners have evaluated this opportunity to be very beneficial and necessary. Again, in this context, it is important to realize that recognition of the need for psychological help is generally perceived as challenging; therefore, it needs to be offered sensibly and comprehensibly (taking into account the current mental state of the client).

The difference in perception of the homeless shelter by men seemed an interesting fact. Women perceived shelters rather as an adverse environment for raising children as well as an environment which may be somewhat threatening to children. The men mostly talked about the need to get used to the shelter and its regime (including the setting of rules and the system of co-housing). *"It's not good for raising children and their poor health reflects it"* (a female respondent – VM1). *"No, not at all ... the kids' behaviour has become progressively worse here ... plus I'm constantly worried about them here"* (a female respondent – H4).

DISCUSSION AND IMPLICATIONS FOR PRACTICE AND EDUCATION IN SOCIAL WORK

Our research results are one of the examples which demonstrate that the needs and problems of social work clients are influenced by their gender. It's not just social work with the homeless, but social work in general that has a distinct gender dimension. It is strange that although we regularly deal with gender aspects of social work in practice, it is not often reflected in the education of social workers. Gender perspective is only exceptionally a subject of interest in Czech social work. Educators in social work and everyday practice continue to remain

insensitive toward gender inequalities (Janebová, 2008). Teaching about gender issues is not included in the Minimum Standards of Education in Social Work, there is only marginal mention in the part of sociology and psychology (ASVSP, 2012), and discussion on this topic is not a regular part of the curriculum. It can be deduced that students are not being goal-directed prepared and trained for these gender-specific situations. If we examine the curricula, which future social workers follow to prepare for the profession of a social worker in the Czech Republic, we find that the study courses reflecting gender specifics of social work are only rarely found at higher professional schools and universities. The analyses of stereotypes in society about men and women and their influence on the practice of social work is necessary (Taylor, 1995; Scourfield, 2001; Kullberg, 2004; Daniel, Featherstone, Hooper, Scourfield, 2005; Hicks, S., 2015, etc.) and gender competence of social worker as well. The gender competence is taken as a key qualification that was promoted to become an important element of professionalism in social work (Böllert, Karsunky, 2008; Czollek, Perko, Weinbach, 2009; Abdul-Hussain, 2012) that can regularly be found in foreign literature. Foreign curricula of study fields reflect gender and include it either as a separate subject or attempt gender reflection within each study course (for example, social policy, theories and methods of social work or psychology and sociology, etc.), ideally combining the aforementioned strategies of introducing gender optics into education. Janebová (2008) states that in the professional discourse of Czech social work the social worker is described as neutral in terms of gender, representing an abstract gender-neutral work, and the profession itself presents itself as gender neutral.

One of the possible reasons for this gender blindness of Czech social work is that Czech social work does not reflect any modernizing tendencies (Chytil, 2007) and inclines toward so-called traditional social work, which, according to Bettinger (2005), functions in the context of the neoliberal and political regulation framework, which, for example, involves the criminalization and stigmatization of service addressees, seeks official definitions of problems, and converts structural factors into their individual deficits, creates and reproduces actual forms of social exclusion, and attributes the status of an object to clients. Matoušek and Pazlar (2010) point out that the problem of traditional social work is mainly the unconscious projection of personal standards and/or standards of reference groups of social workers into the evaluation of clients. In the 1990s, Czech social work has established itself as a "case work" that addresses the problems of people by trying to adapt them to often discriminatory requirements of society and does not focus on changing the social environment. Social workers thus exert pressure on clients to change themselves on an individual level, regardless of the fact that the causes of their problems can be structural (Janebová, 2013). If social workers are not familiar with the wider structural context that causes social problems, and transfer these problems to a purely individual level or are not sensitive enough to the discrimination and oppression of clients or else do not reflect their own stereotypes and prejudices, they apply traditional theoretical concepts to the unique situations of their clients, thus contributing to their marginalization and discrimination. The so-called critical social work, which emphasizes the critique and analysis of oppression based on class, race and gender, and whose goal is the overall social transformation to overcome oppression and injustice, is devoted to the subject of marginalization in the context of social work (Healy, 2001 in Janebová, Černá, 2008). In order for social workers to be able to possess a critical perspective, reflection and self-reflection, they must have certain professional prerequisites based on the so-called gender competence at their disposal, which is created on a personal, professional and structural level (Abdul-Hussain, 2012). Gender competence involves the interaction of perception, analysis, reflection and behaviour with reference to gender (Czollek, Perko, Weinbach, 2009). It includes four interrelated areas. These include social competence (knowledge of the specifics of social problems of men and women, the ability to work not only with men and women, but also with transsexuals and intersexuals and the ability to solve their mutually problematic relationships), individual competence (e.g. reflecting 'doing gender'⁹, the ability to practice 'undoing gender'¹⁰), a professional competence (knowledge of gender equality data and facts, knowledge of gender constructions and stereotypes) and finally a methodological competence (knowledge of gender mainstreaming or gender-based counselling). These skills and competences are crucial for social workers since they work with a diverse clientele in a diverse society. Gender competence can help them identify and cope with the mechanisms of oppression and social exclusion. This should lead to anti-oppressive and more gender-sensitive social work.

In relation to the oppressive tendencies of some physicians, and within the framework of recommendations resulting from the research that can be implemented in social work, it could be possible to include a doctor's visit to a homeless shelter who has some experience with a given target group. Accompaniment to healthcare facilities or the so-called peer accompaniment to healthcare services is also perceived as supportive in this context. An important tool in relation to the public that helps address perceived oppression is the dissemination of the narrative and the knowledge of the multi-causal conditionality of the situation of the homeless as well as the promotion of a non-blaming attitude toward homeless people. This is the area where the researchers perceive the room and potential for social work, which can spread an anti-oppressive and gender-sensitive approach in cooperation with partner organizations and facilities. In addition, a competent social worker is able to adequately

reflect the context of the client's situation and apply the values of social work that are set out in the IFSW definition.

CONCLUSION

The phenomenon of homelessness and gender specifics call for the need to strengthen gender-sensitive approaches in services for homeless people. Using the example of the health research of the homeless shelter population, the researchers have attempted to demonstrate how deeply social work is connected with gender relations. Healthcare and the attitude to healthcare by the homeless shelter population has its gender specifics, which social workers in their role of counsellors and confidants of this community of people should reflect in their work. Despite these facts, gender aspects of social work are not reflected in the learning curricula of future social workers.

If the services for homeless people are to be accessible to them and copy their needs, they must be provided in a gender-sensitive manner, which should also be reflected in research, education, service delivery models and in wider social, health, education and economic policies. In a certain sense, this is a simplification because there are significant similarities in the health needs of homeless men and women as well as great differences between different groups of homeless women and different groups of homeless men. However, this does not mean that issues of maleness and femaleness are not important.

The issue of homeless access to health and social services should therefore be systemically addressed and should be based on the needs of the target population.

In particular, in women, homelessness is accompanied by threats and stigmatization that lead to the concealment and non-use of both health and social care services. The way out of the current situation is the transformation of existing masculinised universal services toward gender sensitivity. The researchers believe that one of the ways to transform services is competent personnel who are aware of the gender specifics of the homeless situation and are able to reflect both their own and other people's gender prejudices and stereotypes.

On the basis of the above findings, the researchers intend to prepare a project for the innovation and internationalization of existing study programmes at the Faculty of Social Studies of the University of Ostrava in 2018 at the level of study subjects by introducing a gender perspective into teaching as well as by enhancing the practical aspects of education through the teaching of such subjects by experts from abroad.

Acknowledgement: The research project SGS03/ÚUVAFM/2017 "Health and Use of Healthcare Services by Shelters Users" has been financially supported within the framework of the student grant competition for specific university research, the Institute for Research and Application of Fuzzy Modelling under the Centre for Excellence IT4Innovations.

THE IMPORTANCE OF INTERNATIONAL DISTANCE LEARNING FOR THE DEVELOPMENT OF INTERCULTURAL COMMUNICATION

Prof. Dr. Seda Çakar Mengü*
Assist.Prof.Dr.Murat Mengü**

Dazzling developments in communication technologies, increase in speed almost everywhere, disappearance of distances among people and the innovations in information technologies have also reverberated in education. Needless to say, today it is possible to have education anytime and anywhere, notwithstanding the probable limitations of time and space. In this sense, distance teaching offers students an opportunity to have education anywhere and anytime via the internet and it has already been a dynamic, effective and interactive method to provide education. Apart from the education models, such as distance teaching, e-education, e-school, prevalence of new education technologies including e-library, e-journals, smart boards, multimedia devices etc. have brought a new dimension to learning and teaching strategies.

As the information sources in global education system are continuously accessible, there is no need to limit education into certain periods of time. Introduction of the distance teaching programmes in international dimension in addition to those provided in national scale enables students to come together with individuals from different cultures and have the opportunity to look at things through their perspectives as well. This point is quite important with respect to current educational opportunities. In fact, education is one of the most important factors for the development of intercultural communication which has both interactive and interpersonal characteristics. While studying the communication of individuals with the members of different cultures, it is imperative to understand the difference in cultural codes. This approach initially necessitates examining the cultures taking part in a respective process separately. Efficiency of intercultural communication depends on the coding of the messages with respect to the intention of the sender as well as the comprehension of the receiver that the message perceived is the product of a different coding system. At this point, in order to enable the individuals form different cultures to understand each other and express

* Department of Public Relations and Publicity, Faculty of Communication, Istanbul University

** Department of Media and Communication Systems, Faculty of Communication, Istanbul Arel University

themselves, education appears as a significant means. International distance teaching programmes not only facilitate this function, but also require students to coordinate and cooperate. Being one of the vital elements of socialisation process, education is the area where individuals gain the ability to evaluate themselves as well as others and decide as a result of these evaluations. Therefore, group work is given special importance in virtual classroom activities. Here, the aim is to provide opportunities for the students to express themselves, develop persuasion abilities, balance their motivational and emotive affections as well as produce common ideas with the others.

The purpose of this study is to evaluate the effect of international distance teaching programmes on how students from different cultures realize themselves in group interactions, possess due knowledge technically and institutionally, make ethical decisions for their actions and come into contact with different cultures through a sample project.

Kültürler arası İletişimin Gelişiminde Uluslar arası Uzaktan Eğitimin Önemi

İletişim teknolojilerindeki gelişme, her alanda hızın artması, insanlar arasında mesafelerin azalması ve bilgi teknolojilerindeki yenilikler eğitim alanına da yansımıştır. Eğitimin belirli yer ve zaman sınırlamalarından uzakta istenildiği zaman ve yerde alınabilmesi sözkonusudur. Uzaktan eğitim, kişilerin istedikleri yerde ve istedikleri zamanda bilgisayar üzerinden eğitim almalarını sağlayan bir eğitim sistemidir ve öğretimin etkili bir şekilde aktarılabilmesi için dinamik, güçlü ve etkileşimli bir yöntem haline gelmiştir.

Uzaktan eğitim, e-eğitim, e-okul gibi yeni eğitim modelleri yanında bilgisayar, internet, e-kütüphane, e-dergi, akıllı tahta, akıllı sınıf, multimedya araçları gibi yeni eğitim teknolojilerinin yaygınlaşması, öğrenme ve öğretme stratejilerine yeni bir boyut kazandırmıştır. Küresel eğitim sisteminde bilgi kaynakları sürekli açık olduğundan, eskiden olduğu gibi eğitimi belirli zaman dilimlerine sıkıştırmaya da gerek yoktur. Ulusal uzaktan eğitim programlarının yanısıra uluslar arası boyutta uzaktan eğitim programları da oluşturulmakta ve öğrencilere farklı kültürlerden bireylerle biraraya gelerek onların gözlemlerinden ve bakış açılarından olaylara bakma deneyimi sunmaktadır. Bu durum günümüzün eğitim olanakları açısından oldukça önemlidir. Nitekim eğitim kültürlerarası iletişimin gelişmesi açısından en önemli unsurlardan biridir. Kültürlerarası iletişim hem etkileşimsel, hem de kişilerarası nitelik taşır. Bireylerin farklı kültürlerin üyeleri ile iletişimini

incelerken, kültürel kodların farklılığını anlamak gereklidir. Bu ise, öncelikle sürece katılan kültürlerin ayrı ayrı araştırılıp anlaşılmasını zorunlu kılar. Kültürlerarası iletişimin yeterliği, gönderilen mesajın, alıcının algılayabileceği ve kaynağın niyetine uygun şekilde kodlanmasına, alıcının da algıladığı mesajın farklı bir kod sisteminin ürünü olduğunun farkında olmasına bağlıdır. İşte bu noktada farklı kültürlerle mensup bireylerin birbirlerini anlamaları ve kendilerini ifade edebilmeleri için eğitim çok önemli bir araç konumuna gelmektedir. Uluslar arası uzaktan eğitim programları bu işlevi kolaylaştırmakta, öğrencilerin birlikte eşgüdüm ve işbirliği yapmalarını zorunlu kılmaktadır. Toplumsallaşma sürecinin en önemli unsuru olan eğitim, bireyin kendini ve başkalarını değerlendirme ve bu değerlendirmeler doğrultusunda karar verebilme yetisini kazandığı alandır. Bu nedenle sanal sınıflarda yapılan çalışmalarda grup çalışmalarına ayrı bir önem verilmektedir. Burada amaç, öğrencinin düşüncelerini ifade edebileceği, ikna kabiliyetini geliştirebileceği, güdüsel ve heyecansal duygulanımlarını dengeleyebileceği ve başkalarıyla ortaklaşa düşünceler üretebileceği olanaklar sağlamaktır.

Bu çalışmada amaç, farklı kültürden öğrencilerin grup etkileşimi içinde kendilerini gerçekleştirebilmelerine, gerekli bilgilere teknik ve kuramsal olarak sahip olabilmelerine, eylemlerinde etik kararlar alabilmelerine ve diğer kültürlerle bağlantı kurabilmelerine, uluslar arası uzaktan eğitim programlarının nasıl etki ettiğine yönelik değerlendirme yapmaktır.

Anahtar sözcükler: *Kültürlerarası iletişim, uzaktan eğitim, öğrenci ve öğretmen rolleri*

Introduction

It is an undeniable fact that stunning developments in communication technologies, skyrocketing increase in speed almost everywhere, disappearance of distances among people and the innovations in information technologies have produced significant consequences in the field of education as well. It is quite obvious that today it is possible to have education anytime and anywhere, notwithstanding the probable limitations of time and space. In this sense, distance teaching offers students an opportunity to have education anywhere and anytime via the internet and it has already been a dynamic, effective and interactive method to provide education

As discussed by Scovotti and Spiller (2011), globalization has filled the requirement for joint effort over considerable geological separations, provoking organizations to receive

innovations that encourage correspondence and continuous communication among a conveyed and assorted workforce.

In this sense, The Internet has given the likelihood to eradicate geographic and relational limits among individuals of differing foundations, has made open doors for broad electronic conveyance of news, data, and educational programs, and has changed the way we impart, share learning, convey training, and lead business.

As Web-based learning groups and online school organization extends exponentially grow all around, powerful intercultural correspondence and coordinated effort is of fundamental noteworthiness. Electronic direction gives chances to a different people to connect. So as to suit singular student's needs while upgrading their qualities and gifts, Confucius stated, guideline ought to be custom fitted to address singular student's issues. While educators are tested to comprehend and be delicate to the requirements of students in their plan and usage of Web-based courses, students' development pivots not just on their readiness, disposition, and dedication to accomplish shared objectives in an ocean of data, yet in addition on how they handle the difficulties of merging kindred learning group individuals' numerous perspectives, points of view, and methodologies (Wang, 2001).

The effect of regularly expanding quantities of online courses has been observed in educational modules arranged with respect to the principles of globalization, variety, and multiculturalism. As Rutherford and Kerr (2008) indicate, as a consequence of internationalization and globalization of instruction along with the requirements for well-educated and trained workforce, numerous universities have felt the necessity to offer more flexible programmes designed with regard to contemporary educational and communication technologies. Thus, teachers are getting to be noticeably mindful of the significance of the concepts of multiculturalism and interculturalism. At this point; however, some questions arise; "how do we integrate and address this multicultural dimension in a distance education course aimed at students who live in diverse cultural environments? How do the challenges of intercultural communication in an online environment affect online teaching and learning? What are the characteristics of an online course that is inclusive of all types of diversity, and what are the guiding principles for designing such courses?" (ibid. p. 64). Distance learning is one of the quickest developing areas of instruction (Moore and Tait, 2002 qtd in Rutherford and Kerr, 2008) and advancements in software engineering as well as the innovations in data processing and communication have impelled this development. The effect of consistently expanding quantities of online courses has denoted that the thoughts of assorted variety, multiculturalism and globalization are presently key parts of educational programs.

Discussion

It is quite obvious that the way and the instructive framework in which we learn are socially characterized. This is the reason why it is frequently hard to send out instructive frameworks and approaches to different nations that do not have similar values and principles (Hall, 1990). Hence, it seems quite probable to interpret that the level of acknowledgment and use of online courses is enormously affected by students' social, individual, “organizational, professional and discipline-based culture” (Rutherford and Kerr 2008: 68).

In an analysis of the effect of social factors on the conduct of studies in an online course, Morse (2003: 42-43) distinguished components that separate high-context and low context cultures.

Low context learning	High context learning
Emphasis on learning outcomes (students as contributors to exploration and/or development): student centred learning, active learning	Emphasis on teaching inputs (students as recipients and reproducers of material): All materials provided in class Rigid parameters set in course syllabi Identical syllabi for all students
Emphasis on attitudinally based "deep" learning: Development of personal skills, and attitudes toward lifelong learning	Content and knowledge based learning: Little emphasis on personal, transferable skills "diligence overcomes stupidity" = hard work
Wide variety of learning tools and assessment instruments: Assessment as feedback instrument Wide range of assessment/feedback tools (i.e. group assessment, teamwork, evaluation, etc.)	Individual and examination-based assessment: Frequent, regular, highly content specific assessment: Assessment is focus of learning Assessment identical for all
Informal lecturer/student relationships: Teacher as guide/facilitator/mentor in learning process Inherent informality of frequent one-on-one contact Intergenerational differences evident	Formal lecturer/student relationships: student performance dependent on teacher knowledge Address by title as a measure of respect (first name a sign of disrespect) Non-confrontational: accept teacher knowledge without question (avoid loss of face) Inherent wisdom in male and/or older persons dominates learning
High student numbers/high contact time: Efficient use of teaching resources sought	Small group sizes/low contact time: Deep teacher/student relationship sought

In a web based learning setting, students from a high-context culture will expect a specific level of convention and exact guidelines, for instance, to scan the webpage for extra assets that the teacher would then fuse into the course content. Conversely, students from a low-context-culture would most likely adjust all the more effortlessly to a casual style of

online collaboration and have no issue investigating a few data sources and reports on the Web to supplement course content on their own. Members of an online multicultural group need to grow, more than semantic capability and exactness to transmit one's way of life, solid intercultural open aptitudes to arrange a developing cyberculture (Rutherford and Kerr, 2008:71)

Various staff inclusion in international distance learning instruction gives benefits parallel to some brought in by Edwards, Cordray, and Dorbolo (2000) in regard to conventional classrooms: (1) the requirement for instructional lucidity and intelligibility, (2) the rise of an energetic virtual learning group, (3) the chance to watch and consider classroom flow from a crisp online viewpoint, and 4) the excitement of gaining from both personnel accomplices and understudies from an alternate culture.

Byram (2000) discusses that creating intercultural capability would mean building up a state of mind of interest and transparency, securing learning of societal and individual collaboration, and creating aptitudes to and basically translate new social information.

Rutherford and Kerr (2008) focus on three key instructional outline models for socially comprehensive learning:

1. The Multidimensional Model of Collis, Vingerhoets and Moonen, which goes past course substance and considers the various factors inside a learning domain that express socially particular esteems, (for example, the determination of the LMS, the language(s) utilized as a part of the course, and the social association of the course),
2. Seufert's Cubic Model, which proposes a three-dimensional model of contemplations, including the adaptability and assortment of innovation, the straightforwardness in the selection of devices, and a consciousness of multicultural setting and social contrasts, and
3. Henderson's Multiple Cultures Model, which perceives the impact of scholastic culture, the predominant culture, and the minority culture of the instructing and learning condition (pp. 75-77).

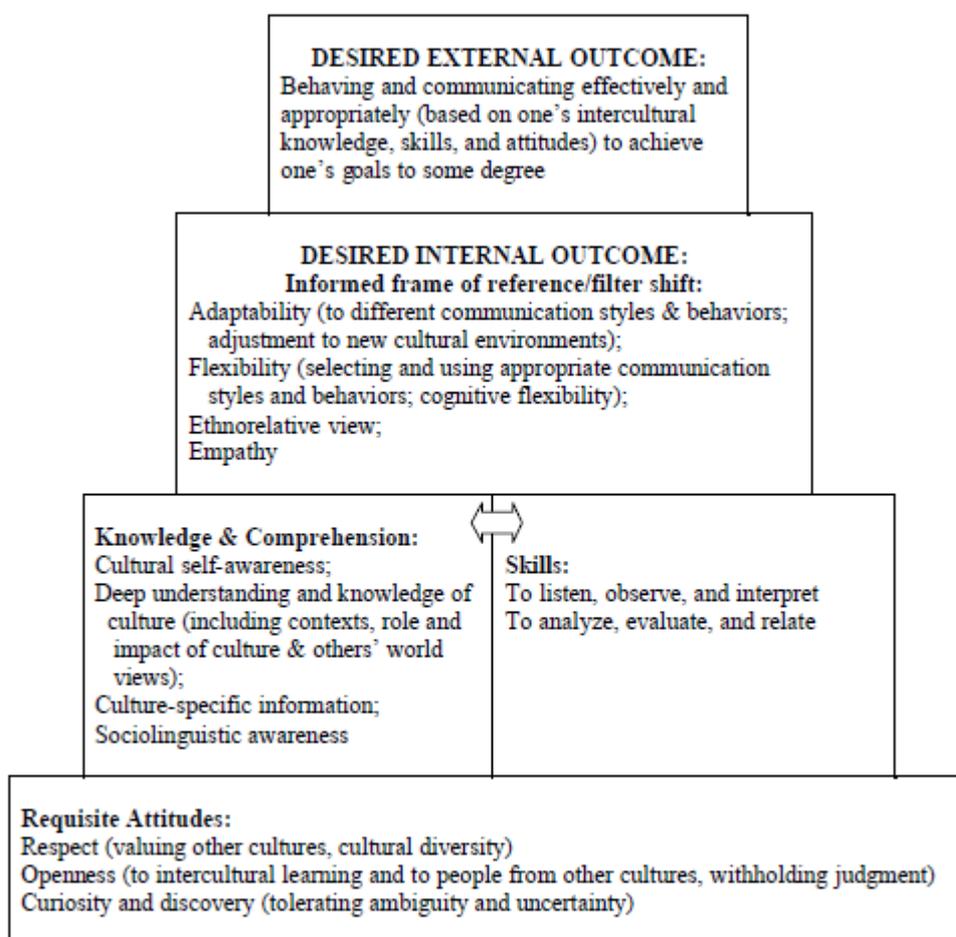

A contextual analysis conducted by Cifuentes (et. al. 1998) concentrates on the effects of cooperative exercises between two instructors and their understudies. We investigated the viability of separation learning for teenagers in advancing: 1) confidence, 2) accomplishment, and 3) multicultural comprehension. In Cultural Connections, different understudies crosswise over Texas worked together on multicultural exercises which helped them develop in confidence, accomplishment, and multicultural comprehension. This venture shows that in arranged classrooms students can interface with far off others to find out about and from their

points of view and to build their multicultural understandings. Likewise, advancements can cultivate group instructing crosswise over cultures and distances.

The Multidimensional Model introduced by Collis, Vingerhoets And Moonen (1997) indicates that the educational approach and innovation of an online course ought to expect clients' decisions from among various factors that express socially particular esteems. This implies all frameworks, from the beginning of the plan procedure, must coordinate this idea of adaptability. Collis, Vingerhoets and Moonen (1997) recognized seven measurements of a course where the thought of adaptability can be connected, and where the understudy in a separation learning circumstance could settle on a decision. These seven measurements include:

- > social organization of the course
- > selection of course content, progression, and learning activities
- > selection of course materials
- > selection of a mode of interaction in the course
- > selection of the technological platform supporting the course
- > language(s) used in the course, and;
- > the conditions under which the course is given (entirely distance or a hybrid approach)

Furthermore, Pyramid Model of Intercultural Competence put forth by Deardorff (2006, 2009) suggest moving from personal level (attitude) to interpersonal/interactive level (outcomes) and the “degree of intercultural competence depends on acquired degree of underlying elements”

Process Model of Intercultural Competence (Deardorff, 2006, 2009):

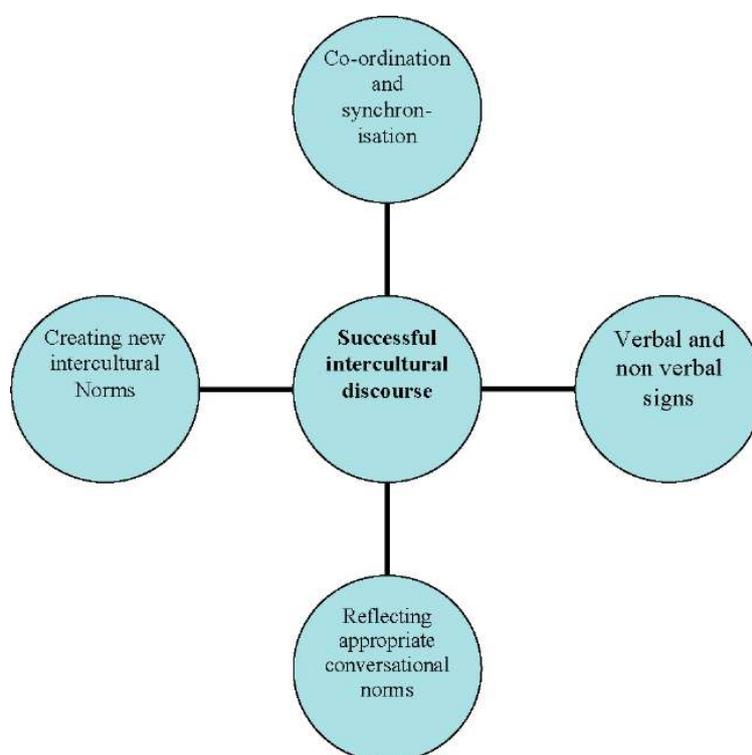

According to Byram (1999) “Cross-cultural” competence has several aspects:

- (1) Relational-Building and Maintenance Competence: Competence associated with the establishment and maintenance of positive relationships.
- (2) Information-Transfer Competence: Competence associated with the transmission of information with minimum loss and distortion.
- (3) Compliance-Gaining Competence: Competence associated with persuasion and securing an appropriate level of compliance and/or co-operation.
- (4) The origins of this model in studies of business people working on projects in other countries are perhaps betrayed in the third competence particularly (pp. 14-15).

Moreover, a model introduced by Little, Titarenko and Bergelson (2005) aims to create an international Web-based distance-learning classroom that can be used as a guide for those who might wish to pursue similar endeavors. Their experiences provide “the basis for identifying the conditions and practices that optimize the goals of providing a forum for

international education and enhancing reading and writing skills. A content analysis of the online Student-Led Discussions provides evidence that cross-national knowledge and understanding can be enhanced in this learning environment”

Depicting clearly the important factors in shaping a successful intercultural discourse, Dolabati (2010) has designed the following figure and mentioned that it is critical to discover how informative virtual situations and their particular qualities may influence “the kind and amount of language contact should take into account and (b) the kind of on-line community and (c) communicative genre (i.e. single-authored genres such as personal home pages vs. interactive genres such as chats or forums)” (Androutsopoulos, 2005: 14 qtd. In Dolabati, 2010). Hence, a virtual learning condition is viewed as the place in which there are both psychological and full of feeling challenges.

An article written by Prieto-Arranz, Juan-Garau and Jacob (2013) demonstrates that cultivating dynamic reflection on national personality talks may prompt the acknowledgment of the developed ('envisioned') nature of national groups. What this article at long last recommends is that the EIL classroom, by cultivating such transnational 'third spaces' joined with a reasonable transcultural approach, may well give a little yet important commitment to the general development of another era of very much educated, multilingual, basic people. In

this way, the members' enthusiasm for philanthropic issues and their relationship with current world social and financial issues can be viewed as a venturing stone towards a conceivable structure for the improvement of basic transcultural mindfulness, which is seen as fundamental in fruitful universal correspondence.

Online specialized instruments and the resultant dependence on translations and suspicions, viable correspondence among students of various foundations is exceptionally testing. A couple of cases of Web outline that might be interested in social elucidation include: different desires for correspondence (a few students may expect day by day correspondence from others in the group while others are not acclimated to imparting on the web), the sum and sort of data wanted and required (a few students may expect unequivocal data while other people who are usual to certain articulation don't feel good being immediate), correspondence styles and inclinations (some like to alternate, some get a kick out of the chance to form a hasty opinion, while others get a kick out of the chance to sit tight for signals), level of errand introduction (some are assignment driven high achievers while others take a laid-back position), variety in understandings (some are from the way of life where the course is arranged while others may arrange in a totally unique culture), assemble introductions (some lean toward and have encounter working in gatherings while others favor rivalry as opposed to joint effort), and gathering flow, that is, a few societies may seek a pioneer for heading while others work better when there is no single pioneer in the gathering (Wang, 2001).

Instead of up close and personal settings where communicators are perceived as human, in the Web condition, individuals are frequently externalized and generally perceived by name. Instead of vis-à-vis settings that are directed normally, in the Web condition, there is generally a 45 seconds time slack amongst occasion and communicate, rather than up close and personal settings where it is conceivable to drag a man aside and whisper in security, in online visit, this is impractical on the grounds that everybody has a similar space. Rather than eye to eye settings where communicators can pick their concentration of consideration (or obliviousness), in the video-conferencing condition, the camera setting manages watchers' consideration.

Cajander Daniels and McDermott (2012) has analysed the links between “the *contributing student pedagogy* and other forms of peer-mediated learning models, e.g. *open-ended group projects* and *communities of practice*” (p. 319). They find that a central worry in each of these models is the attribution of significant worth; particularly, acknowledgment of the benefit of discovering that is empowered by peer association, and the route in which

esteem is made and evaluated inside a learning group. Esteem is additionally key to hypotheses of intercultural skill. They look at the part that the idea of significant worth plays in the improvement cycle of intercultural fitness and relate it to its capacity in peer-interceded learning models. They additionally contend that components of social learning hypothesis, chiefly late work on esteem creation in groups of training, are extremely pertinent to the development and evaluation of the kind of exercises proposed inside the contributing understudy instructional method. They hypothetical investigation is arranged inside the setting of an all-around appropriated open-finished gathering venture course unit and our decisions are outlined with reference to understudy hone in this condition.

The authors firstly conclude that the idea of a contributing understudy instructional method is a helpful one for giving a system in which to talk about issues concerning peer-intervened learning and the acknowledgment and formation of significant worth in a learning group. The connections between the improvement of intercultural fitness and the contributing understudy teaching method learning cycle appear to us to be very certain, and this ought to empower thought of whether a greater amount of the hypothesis produced for the investigation of intercultural capability could gainfully be connected to the new instructional method. Secondly, they have found out that the hypothesis of open-finished gathering ventures normally lines up with that of contributing understudy instructional method at both the hypothetical and operational level. As far as the hypothesis, there seems, by all accounts, to be a solid association between their utilization of essential formational ideas, for example, dynamic joint effort, tending to valid, complex issues, re-examination of the connection amongst educator and understudy and the empowering utilization of innovation. In down to earth terms, at the level obviously improvement, the contributing understudy teaching method idea has been important to us concerning thinking about the following activity examine cycle in the advancement of the IT in Society course unit.

Byram (1997) discusses that the evaluation of a person's capacity to convey and interface crosswise over social limits is encouraged by an itemized depiction of the procedure included and meaning of what is anticipated from the person. It is vital to recollect that their points and reasons for existing are resolved to a limited extent by the societal settings in which they get themselves—national, universal and intra-national and by the distractions of foundations, which mirror those of the social orders in which they work.

Gudykunst (2004) offers seven *community building principles*:

“Principle 1: Be Committed. We must be committed to the principle of building community in our lives. Commitment to strangers is a prerequisite for community to exist.

Principle 2: Be Mindful. We must pay attention to what we do and say. When we communicate with strangers, we need to pay attention to the process of communication that is occurring between us and them rather than worrying about the outcome of our interactions.

Principle 3: Be Unconditionally Accepting. For community to develop, we must accept strangers as they are, and not try to change or control them

Principle 4: Be Concerned for Both Ourselves and Others. Communities are inclusive; they are not groups of like-minded people.

Principle 5: Be Understanding. We need to understand strangers as completely as possible.

Principle 6: Be Ethical. We must engage in behavior that is not a means to an end, but behavior which is morally right in and of itself

Principle 7: Be Peaceful. We need to work toward developing peace in all of our thoughts, words, and actions. If peace is the goal of our interactions with strangers, our communication with strangers will be effective” (pp. 370-372).

We believe that these principles can effectively be used in the design and implementation of distance teaching programmes.

A Sample Project

The Following Project, Namely International E-Learning As An Emerging Cultural Diplomacy Practice, Was Conducted By Prof.Dr. Ece Karadoğan Doruk, Prof. Dr. Seda Mengü, Prof.Dr. Emine Yavaşgel And Assoc. Prof Dr. Nilüfer Fatma Göksu From Istanbul University, Faculty Of Communication, Public Relations And Publicity Department.

Erasmus + supported project "e-profman" is an online training program that follows an applied curriculum on "Innovative Management, Leadership and Strategic Communication". (www.e-profman.eu). Outside of us, Macedonia's "School of Journalism and Public Relations" and Slovenia's "Faculty of Business and Applied Studies" are partners in the program. The program is a three-year program

Background of the Project

The virtual aspects of alternate and complementary higher education learning environments respond to the needs of the knowledge-based economy for continuous acquisition of new competences and skills to maintain high quality of productivity and efficiency. Teacher-directed learning is shifting to student-directed lifelong learning, whereby learning is undertaken anytime and anywhere. Lifelong learning encompasses professional learners who need to improve existing qualifications for current developments in their respective fields and those who wish to find new interests and add to their portfolio of skills. The dominant "problem-solved" approach in self-directed learning enables learners to articulate their own challenges, design their problem-solving strategies within a particular time frame, explore and synthesize resources for solving problems and provide solutions through discussion of the implications. The most suitable vehicle for acquiring knowledge and skills throughout life is online learning. Online learning includes Internet and computer-based learning, virtual classrooms and digital collaboration, and provides learners with a flexible and personalized way to learn and use a broad range of resources.

In their efforts to enhance the quality of online learning, higher education institutions (HEIs), especially from different countries, establish partnerships by creating virtual campuses. This way, online learning facilitates the international dimension of educational programs, and promotes transnational cooperation and sharing of expertise and human resources. Curricula jointly developed on virtual campuses are based on online and/or blended learning that offer interactive, multilingual and cost-efficient education by utilizing cutting-edge information-communication technologies (ICT). ICT supported learning environments provide virtual mobility that includes cross-border cooperation among learners from different backgrounds, and various cultures learning and working together. Virtual mobility also offers possibilities for learning schemes in foreign countries, international experience and intercultural understanding for lifelong learners, particularly for those who have significant professional, social or economic constraints

Description of the Project

The project established a virtual campus of three HEIs from Macedonia, Slovenia and Turkey that will develop and implement a joint online program for professional development in innovative management, leadership and strategic communication. Within the one-year programme, young working practitioners and bachelor students with no previous professional

work experience will master leadership, business and communication skills for management positions in a competitive transnational business environment.

The European Communication Monitor 2014 survey (www.communicationmonitor.eu) reports that one of the most significant challenges for communication management within the next 3 years will be the merging of communication and business strategies in order to become a valuable part of the decision-making process and strategic management of an organization. Interviewed professionals stated that top priorities for strategic communication will be coping with the digital evolution and the social web, building and maintaining trust, and dealing with sustainable development and social responsibility. Mobile communication will see the strongest rise in the near future. Online communication, face-to-face communication and media relations addressing online media will be close behind.

One of the overriding findings from the ECM 2014 survey is that communication professionals in Europe enjoy a stimulating job. Interviewees said that the 3 most important factors for career development and obtaining their current work position are further education on or off the job and networking among peers and colleagues. For young employees, the most significant factor was having work experience or an internship prior to employment, as well as proper mentoring. On the other hand, only 1/3 of the interviewees see valuable opportunities in their personal career.

The need to enable adults to life-long learning is emphasized in the renewed 2011 European agenda for adult learning that is directly linked to priorities established in the Europe 2020 strategy. Additionally, according to the Adult Education Survey coordinated by the EUROSTAT, 61.3% of the adults who have completed tertiary education participate in lifelong learning. Employees are much more likely to participate in education and training than the unemployed or the economically inactive. Furthermore, people with occupations regarded as `higher skills occupations` are much more likely to participate in education and training. Recent national policies in Macedonia, Slovenia and Turkey follow this tendency and include lifelong learning as one of the chief priorities. Moreover, policy documents and employment strategies, particularly those focused on young people, maintain that the absence of higher education often leads to unemployment issues.

"Opening up Education" (2013) stimulates HEIs to more open learning environments and innovative ways of teaching and learning through new technologies and digital content. The initiative proposes developing new business and educational models of curriculum development and OER in different languages.

This process is entirely applicable to professions like Management and Communication, which reflect the importance of globalization, entrepreneurship, and ICT in today's business environment. Young people should have a competitive edge in a rapidly changing transnational market. This encouraged the project's partner HEIs to offer a joint programme that would promote progressive pedagogical approaches, virtual mobility, intercultural cooperation and internationally recognized competences. The project will provide dissemination of teaching and learning innovations in three European countries; open and broad access to OER; and transnational networking through mutual recognition of knowledge and skills, fully in line with the Bologna credit-transfer system.

The project objectives are as follows:

1. Equipping the Programme's participants with appropriate skills and abilities in achieving competitive advantage and effective leadership behavior in a transnational corporate environment;
2. Providing interactive and flexible opportunities for students that exceed geographical, social and financial barriers by utilizing virtual classrooms and cutting-edge ICTs;
3. Providing newfound solutions and strategies through project-based and real-client courses and mentoring that students will apply in their workplaces and during organized internship in business and public sector;
4. Developing free online resources and learning materials relevant to the specific areas;
5. Acquiring international and intercultural experience via virtual mobility and establishing interaction and networking among highly-selective peers from other European countries;
6. Sharing of know-how and expertise between lecturers in developing online learning methods and courses;
7. Building connections between HEIs and business communities in the partner countries.

The Programme is designed to be completed in one year (January 2017 - January 2018) and it offers 8 online courses:

- From a Sparkle to Flame: The Power of Creation
- Linking Business, Strategies and Communications
- How to Make Things Work: Achieving Results
- Think Like a Leader, Act Like a Leader: Leadership Reasoning
- Creative Business Instincts

- Future Trends in Corporate and Marketing Communication
- Intercultural Communication
- Using Research @ the Workplace

and 3 blended learning activities:

- Students Camp
- Job Shadowing
- Final Seminar

Students will follow 5 online courses that will find most relevant to their professional interests. Also they will attend Students Camp and Final Seminar that support and follow up on the online classes.

The curriculum is practically-oriented and visibly tied to real-world experiences. The online courses incorporate service-learning opportunities that will allow students to engage in client-focused projects. Mentoring and the problem-based approach will provide students with new skills that can be implemented in their professional work. The teaching team is consisted of 18 lecturers with a long-established experience in lecturing. They are also researchers, analysts, consultants and most importantly, practitioners.

Online learning pedagogy and technology are utilized in the delivery of the curriculum that includes Internet and computer-based learning, virtual classroom and digital collaboration. It will provide participants from Macedonia, Slovenia and Turkey, particularly for those who are not mobile due to professional, social or economic constraints, to learn and work together from their homes or workplaces, using a broad range of online resources.

Conclusion

When we look at international student mobility in higher education, we see that the countries that are mostly selected by international students are the developed countries, and the countries where international students come from are the developing countries. The most important reason for this is that they want to close the lack of high-quality work force, which is the biggest minus of developing countries. However, emerging countries have recently begun to attract international students as a result of the breakthrough they have made in this sector. Because, the contribution of international students to a country in terms of economic, cultural, scientific and country prestige is important as long as it can

not be denied. China and Malaysia moved early between these countries and found themselves in the forefront. International distance education programs are also seen to be more prevalent in developed countries.

Education plays an important role in the economic development of countries because of the externalities that it has created from the social point of view, as well as the special benefits it gives to the individuals. As the level of education of the individual increases, qualified labor stress is overcome and scientific and technological innovations gain momentum. As a result of the increased efficiency of the labor, the national income level is rapidly increasing, and the income generated is becoming fairer. The rate of return on education investments is higher than the rate of return on physical capital investments, as education in increasingly educated societies is more democratic, facilitates economic and political stability, and reduces crime rates. Educational expenditures accelerate economic development due to the increased return on investment spending in the long run. (International Council of Higher Education and Education Report of Turkey, 2013, p.15) Therefore, it is necessary to increase the quality and quantity of distance education programs that are more cost-effective in developing countries.

THE IMPORTANCE OF SUTUDEN'S SKILLS PORTFOLIO

Belahmer Zakia

Communication and Language Department, ENSIA University MohammedV. Rabat, Morocco
belahmerzakia@gmail.com

ABSTRACT

The dream of each student is to succeed in his studies and get his diploma, but he does not think about his skills portfolio which serves as a framework for self-assessment, career planning preparation. Most of the students ignore the importance of this element which is the passport to the world of work. It doesn't only summarize the best work but it also focuses on abilities in terms of a list of skills. The portfolio facilitates the search for job by giving clear directions to students to follow as it contains the most important guidelines which are: the personal project, the professional project, CV and letter of motivation, job interview, company culture and the intercultural management. In this study, 2nd year students participated in an assessment experiment and provided skills portfolio which is a kind of self-evaluation and an inventory of all their acquired knowledge. Their work indicated that they were motivated to learn about themselves and the workplace.

Keywords: Personal project, Professional project, CV, application letter, Job interview, company culture, Intercultural management.

INTRODUCTION

As students enter college, most do not imagine being responsible for their own learning. They believe that, somehow, teachers make them learn or, in some cases, prevent them from learning. Many even see assignments, required courses, and exams as obstacles to get around on the way to their ticket to the future—the degree. While there has been talk for many years about professors moving from “sage on the stage” to “guide on the side,” e-portfolios are developing as a teaching/learning context where this is likely to happen. The practices associated with e-portfolio—e.g., designing “authentic” assignments, using engaging and active pedagogy, periodic self-, peer- and teacher-formative assessments, and requiring students to reflect on their learning—help to move *both* professors and students into a teacher/learner relationship where “guiding” really works. Emphasis shifts from delivering content toward coaching and motivating students as they try to solve problems that are of genuine interest to disciplines, professions, or communities. While additional research will be completed on e-portfolios *per se*, there is already promise in the fact that good e-portfolio programs use a combination of practices already shown individually to be effective in helping students learn. (See, for example, research on such practices in Bransford, Brown, and Cocking [2000]).

Literature Review

Here are some quotes of some important authors that define portfolio. For instance [1] “It is a powerful visual tool that provides evidence of self-assessment, personal reflections, learning, growth and development and a comprehensive and complex overview of skills.”

According to Kimball portfolio [2] “seeks to encourage students to become dynamic participants in their own learning...students are not merely the users of the system; they are, or should be, the authors of it”.

Whereas, Yang defined portfolio as [3] “a compilation of students’ work, which documents their effort, progress and achievement in their learning, and their reflection on the materials negotiated for the portfolio”. [4] “A portfolio is a container of documents that provide evidence of someone’s knowledge, skills and/or disposition” [5] (Bird Barton & Collins Teacher Portfolios. Hall explained a portfolio as [6], “A professional portfolio is a collection of material, made by a professional [teacher], that records and reflects on, key events and processes in that professional’s [teacher’s] career” . According to Shulman, Wolf and Dietz, [7] “A teaching portfolio is defined as a structured collection of evidence of teacher’s work across the diverse context and over time and framed by deliberation and reflective writing” . Xu. [8] Therefore, portfolio development is not a short event but it is long process through continuous reflection by including different learning activities.

THE STUDY

Skills portfolio is a means of communication which helps students to communicate adequately and precisely about his competence, qualifications, skills, aptitude for planning and experience .It can also link learning to the world of work [9] Romova & Andrew examined the benefits for learners who work with portfolios as pedagogical tools.. It helps students develop judgment, and even social responsibility. This skills portfolio is very important as it helps the student to launch new challenge; to rely on himself and discover his potentials; thing that will help him to have access to the world of job and the workplace. The present study aims to show the

impact of the realization of this portfolio on the future Engineer .The portfolio is a primordial tool for job search and interview. It helps him to introduce himself to others. It s a written documents that can be considered as a self description and self evaluation. Hence the student has some personal data which will be later useful for his professional life. The skills portfolio will facilitate many tasks especially the ones related to job search and recruitment. The personal information that the student incorporates into his portfolio can greatly reflect hisabilities as an individual as well as become a useful tool in marketing himself to employers,

Students generally use skills portfolios to collect their work, reflect upon strengths and weaknesses, and strive to improve their branding image . First of all the teacher makes a presentation of the skills portfolio and its different components

- A-Personal project
- B- Professional project
- C-CV and letter of motivation
- D-Job interview
- E-Company identity card
- F-Company culture
- G-Intercultural management

The first step:”The personal project». The student must think about himself in order to be aware of his strengths and weaknesses, his needs and his deep motivations, his MBTI profile and his organizational behavior. The student must know his “know-how” discover his Competence and his Communication skills; his ability to have an active listening .To what extent he is able to resist to change and stress. Is he able to adapt himself to team working and what about his attitude toward problem solving, his flexibility and adaptability to time management? Can he adopt Positive Attitude toward work pressure? What about his self-confidence. His know-how impact his behavior and his creativity and his way of communicating. To what extent he has willingness to learn and respect discipline and responsibility and also to have networking skills and Professional competences,..[10] Gallagher” also maintains that reflection is a major component of portfolios as it helps students to learn from experience and practice, thereby helping them to bridge the theory practice gap.” He says” through the reflective process students are able to identify gaps in knowledge and/or skills and competence, but also to reconfirm and document strengths, skills and knowledge”.

The second step:” The professional project” it’s the key for successful professional insertion. It pushes the student to analyze himself and to do a self-evaluation and evaluation of his environment and the workplace. Having a clear professional project helps to structure his CV and letter of motivation. It leads to a good job search and open new horizons. It must be SMART .The student elaborates a work which is a kind of introspection that can clarify his way. He has to highlight his personality; his motivation; aspirations and experience. The student must establish list of all the experience he has achieved during his training, summer job; curricular activities in his school of engineer and work done in associations.

The third step:” The CV and the application or motivation letter”.

Well written and organized CV must pick up the attention of the recruiter and it’s a key to a perfect job interview. The CV must contain Some components such as (personal details/date of birth, languages that student masters well and also refers to some activities that may highlight the student profile.

The application letter or the motivation letter must express clearly what the student would like to do, why he applies for this job, why did he choose this company. The motivation letter must reflect the personality of the student, his professional choice and his motivation. It has to be attractive enough to push the recruiter to invite the candidate for a job interview.

The job interview: The student has to follow three steps for having a successful job interview.(Before-During-after the interview).

Before: the student must do some prospection about the company ;to know the recruiter profile (consultant, DG ,chief of project; director of human resources etc...) the location of the company ,the working hours ,the turnover ,its culture etc ...Prepare himself to give the maximum of information and to be convincing in his arguments; in another word he must expect the unexpected.

During: The body language and eye contact are very important during the job interview. Also the non verbal language impacts the candidate behavior.

After: A week later or two the candidate must inquire about his acceptance or refusal and its reasons.

The fourth step: The company identity card: the student prepares the identity card of the company he has the intention to apply for. The identity card is the collection of all the information related to the company.

The fifth step: “The company culture». The student must be aware of the cultural dimensions of the company, the origin of the national and regional culture; the relationship between the employers.

The sixth step:”The intercultural management l». Cultural dimensions influences perceptions, interpretations and actions of people doing different works and tasks in a company. The ignorance of the cultural dimension can lead to some incidents, critical situations and cultural conflicts.

FINDINGS

After the realization of the student’s skills portfolio, the student has database which he can update each time he has realized a new task or he has got a new certificate.

Once the student’s skills portfolio is ready after five weeks of work; the department of communication and language at ENSIAS (Ecole Nationale Supérieure d’Informatique et d’Analyses des Systèmes) has established two techniques of evaluation. The first one is organizing “Professional coaching day” the aim of this event is to invite company directors, human resources responsible of different sectors and from socio-economic domains to participate either by giving presentation or public speech on specific topic or to participate to round tables .All these events are prepared and organized by the 2nd year students who are supervised by the teacher. We have also some professional recruiters; at this moment the student present his CV and letter of motivation and have some job simulations.

The second step of the evaluation of the student’s portfolio is done by the communication teachers (English and French) .The student is expected to have an oral presentation(10 mn) about his portfolio and then answer questions about his personal and professional skills .[11]

“During the process of preparing an assessment portfolio, learning is enhanced as students are encouraged to reflect on their experience, identify learning needs and initiate further learning” (Harris, Dolan, & Fairbairn). This experience is a new pedagogical technique in coaching students and guiding them toward the workplace with well organized document which is the skills portfolio. But it wasn’t successful 100%The skills portfolio. We had three categories of students:

The first category which represents 85% of the students who adhere to the realization of this portfolio and were willing to achieve the target aim and also participate to the organization of “the professional coaching day». The evaluation of their work was successful. They responded eagerly to the achievement of this task which helped them to analyze themselves and their behavior through self inquiry and self prospection. This work helped and prepared them for different kinds of job interviews .At that level the student is aware that his skills portfolio will allow him to be more personal and creative in order to exhibit his skills ,experience, knowledge and projects.The second category which represents 10% of the students who prepared their portfolio but didn’t come to make the presentation of their work and didn’t participate to the “ professional coaching day».The third category which represents 5% of the students who neither wrote the student’s skills portfolio nor attended the “ professional coaching day».The problem of this last category (5%) is that these students have personal problems such as lack of self-confidence, stage -fright (public speaking) and procrastination. So teachers and coaches have to supervise those students and coach them in order to overcome such weaknesses and to regain self-confidence, self- esteem and self confirmation.

CONCLUSION

The elaboration of the student’s skills portfolio is a primordial task as it reflects a positive image of the student and it lets him identify his strengths and areas of improvement it reinforces its application letter and figures out his 3 K (Knowledge ,Know-how ,Know to be). It s also a good tool for teachers to detect students who are in difficulties and help them to overcome some personal difficulties and prepare them for the workplace.

This experience was conducted with 2nd year students of school of computer science engineers, it can be extended at the level of the faculties and schools of the university in Rabat (Morocco). The students’ feedback

was positive and they were satisfied with their skills portfolio .Teachers and academicians in order to narrow the bridge between the working life and the educational system can create partnership with companies .So the company can benefit as it will recruit the adequate profile in the adequate job.

ABSTRACT

The utilizing of parking requires an efficiency and effectiveness in its application in accordance with the characteristics of parking users especially for Indonesian vocational students. Furthermore activities center located in big cities will be faced with fulfillment to a very large parking location requirement whereas the commercial value at that land location is more expensive because it is located in the city centers. A case study has already implemented to collect the data about parking users for educational students. An activities center based on Non-commercial institutions located in the city center will increasingly difficult in providing parking space because the characteristics of its users are not a commercial rate users. Educational institute in the higher education requires the supplying of large parking lots because of these institutions user almost all use private vehicles due to the unavailability of special mass transport at that institution. For making parking lots using efficiently that appropriate the users' characteristics at educational institutions that have more than 10 hours of operational activity requires an efficient management system based on effective service time. It can be concluded that the problems caused by ineffective and inefficient parking system can be solved based on the application of understanding in accordance with good accessibility characteristic at the education activities center location.

Key word : *Indonesia vocational students' understanding, Activities center, Characteristic users*

INTRODUCTION

The increasing number of smk students in Indonesia, especially in big cities, is increasing in line with global competition in improving education quality and competitiveness. Schools or educational institutions located in major cities have significant increases in student quantity annually. Large student expansion requires educational facilities and supporting facilities that support a scientific and educational education culture. Students of vocational education in Indonesia have a high increase in line with the needs of large vocational workers. Schools and Educational Institutions located in dense commercial areas and high land use require the development and understanding of users of the condition of the built parking system. The location of the parking is one of the most important facilities and the need for educational institutions in big cities that require placement and availability of sufficient land. Urban transport systems that do not allocate special transportation modes to school students encourage students to leave school by private vehicle. The available area of the park should be able to accommodate the parking needs of the activity system of the school or non-commercial institution. Efficient and effective parking systems require parking operational methods and forms to accommodate parking users in accordance with the service system's timing. Determination of the required unit of parking space requires proper identification according to user characteristics. The characteristics of parker users in educational institutions or schools especially those located in big cities require an understanding for the use of school support facilities to improve the ease of activity in school well and orderly. The parking area requires estimates and parker methods calculated based on the volume of parking users. And the order and efficiency of the parking is based on the parking user's understanding of the location and the accessibility to which parked vehicles are placed. The application of understanding of vocational students in Indonesia to the accessibility of the central location of activities in accordance with the characteristics of the users requires the development of techniques to improve efficiency in land use in Non-commercial institutions in Capital town.

THE STUDY

Parking is a condition not a vehicle that is temporary, being stopped is a temporary state of a vehicle for a while with the driver not leaving his vehicle.

Parking Characteristics

Parking characteristics include:

1. Volume

Parking volume is the number of vehicles using the parking facility at a time

2. Parking Capacity

Parking capacity is the number of vehicles that can be accommodated maximally in a parking facility at a certain time

3. Parking Accumulation

Parking accumulation is the number of parking vehicles prior to the survey plus the number of vehicles entering minus the number of vehicles out at the same time period.

4. Parking Length

Parking Duration is the time span of a vehicle's vehicle somewhere in one unit of time

5. Parking Usage Level

The rate of parking usage is the rate of use of one parking space obtained by dividing the number of parking vehicles by parking area / parking lot number for a certain period

6. Parking Index

Parking index is the percentage of the number of parking vehicles occupying the parking area. This characteristic is one way to know the level of parking requirement

7. Parking Availability

The availability of parking is the multiplication of the number of parking lots provided with the parking time divided by the average parking duration.

8. Parking Requirement

Parking requirements can be calculated using the formula of dividing the number of vehicles parking with the value of parking turn over ((number of vehicles) / (available parking space))

Determination of Parking Space Units (SRP)

The determination of parking spaces units (SRP) is divided into three kinds of vehicles and based on the determination of SRP for passenger cars are classified into three classes. As in Table 1

Table 1 Determination of Parking Space Units (SRP)

Category	Parking Space Unit (m ²)
1. a. Car passenger Type I	2,30 x 5,00
b. Car passenger Type II	2,50 x 5,00
c. Car passenger Type III	3,00 x 5,00
2. Bus/truck	3,40 x 12,50
3. Motorcycle	0,75 x 2,00

(source : parking planning and operating guidelines.1998)

Pattern Parking

The implemented parking pattern is in accordance with existing conditions in accordance with the needs of the system activity and space capacity. There are several parking patterns that have developed both in big cities and in small towns. The developed parking pattern is as follows:[3,5,6]

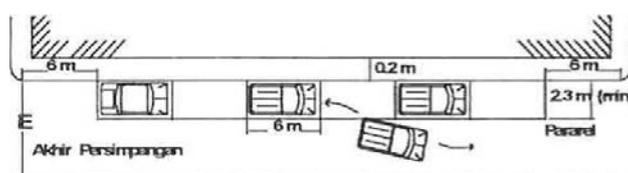

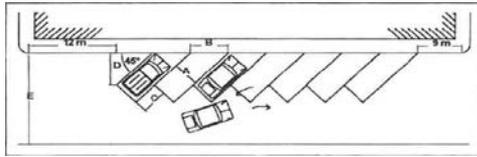

Figure 1 Parallel parking arrangements

Angle = 45°

Angle = 90°

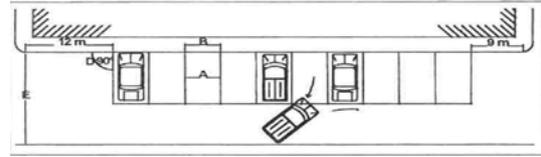

Figure 2 The parking procedure forms of the angle 45° and 90°

Existing parking conditions at campus area with parking area 329,90 m²

Figure 4 Existing off street parking I

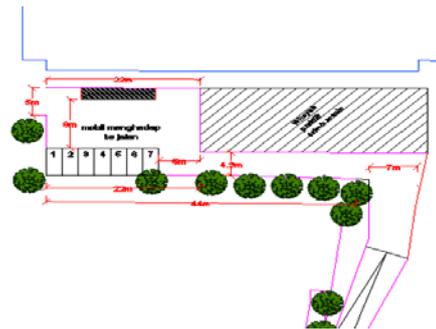

Figure 5. Design of parking zone I

The parking location I conditions are parking plans with :

1. SRP four-group wheel I is 2.3 m x 5 m
 2. Parking in area 1 is Off Street Parking parking or off-street parking
 3. Pattern parking
 4. According to parking angle 90° with the provision of effective space maneuver of 6.2 m, “Warning”
- With the factors above the area 1 is only able to accommodate the parking needs of 7 vehicles.

Existing parking conditions at campus area with parking area Area 950,85 m²

Figure 6 Existing off street parking II

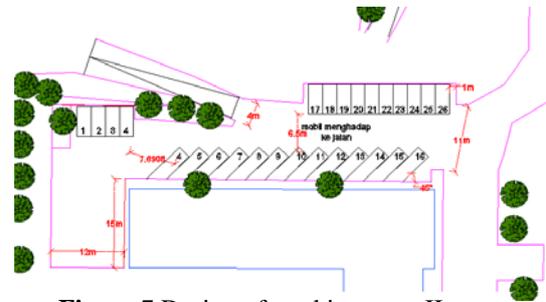

Figure 7 Design of parking zone II

The parking location II conditions the parking plan according to:

1. SRP four-group wheel I is 2.3 m x 5 m
2. Parking on area 2 is Off Street Parking or off-street parking
3. Pattern parking
4. According to the parking angle 45° with the provision of a 1 m 3 lane alleyway, Warning

FINDINGS

The method used in this study is a spaciousness survey with data collection through the questionnaire design. The utilise of this method has done to determine the research variables used :

1. Variable of Characteristic behavior
2. Variable of Characteristic time parking vehicle
3. Variable of Vehicle volume number

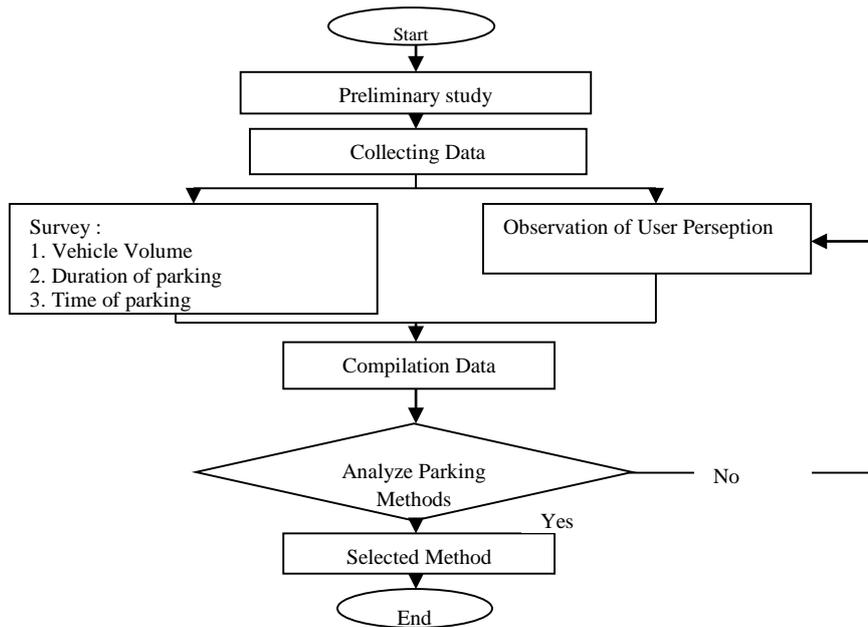

Figure 8. Research Flow Chart

Parking User Characteristic

Vehicles using parking locations are based on vehicles entering and exiting the parking area. It is done to know the volume of vehicles in accordance with the time of their activities. Characteristics of parking users at vocational schools with the highest number at the time of Tuesday

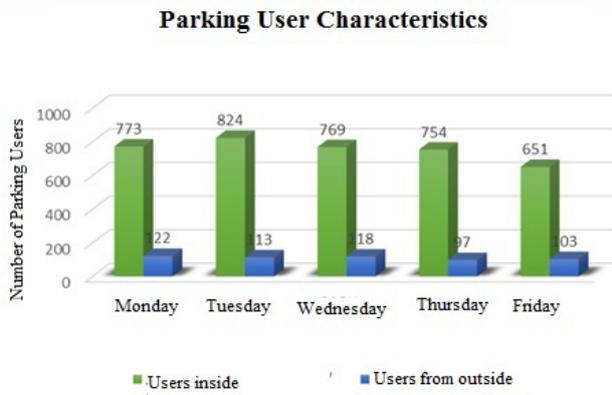

Figure.9. User Characteristic

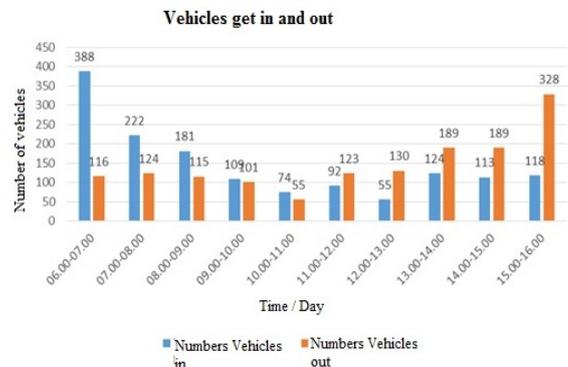

Figure.10. Vehicle Volume

In and out vehicles occur during hours of busy activity resulting in a lack of user accessibility to reach the central location of activities. So it is necessary to implement a parking system that can accommodate at peak hour with the right parking method. Refer to the data analysis can be gained that at 08: 00-09: 00 is the peak hour of the employees and students arrival in UPI, and the peak of the vehicle out occur at 15: 00-16: 00 which is the time up for working employees, lecturers and student activities. And the duration of the vehicle parked is used to assess the incoming and outgoing vehicles, parking location in accordance with the time of service. With the number of vehicles 25 for duration of 1-2 hours and the number of vehicles 15 for the largest duration of 9-10 hours activity activities in non-commercial locations on campus is determined based on teaching and learning activities in accordance with the activities of vehicle users. Parking accumulation is used to determine the number of vehicles parking, and it also used to plan the parking area as needed. From the survey results show that the volume of vehicles and activity time characteristics greatly influence the behavior of the parking location. The duration of vehicles in the parking area determines the need for parking space and causes the level of the need for large parking spaces. So the ease to use the parking space during peak hours will be difficult to access.

Figure.11. Parking Duration

Figure.12. Parking Accumulation

Understanding the behavior of parking users by using the approach of parking user participation in a classroom with the sweeping of the efficient parking model with the estimated model with the unit of parking space method which is calculated from the value of the parking index obtained. So the behavior can understand the model of the parking usage method which is effective and efficient to facilitate the parking user to reach the location where the activity center will be

Figure. 13. Result understanding of parking behavior

Figure. 14. Understanding Proses of parking behavior

CONCLUSION

The total volume of vehicles greatly affect the ease in the required capacity of parking space required. Characteristics of parking users determine the level of parking duration based on the type of activities undertaken in the ongoing vocational education activity system. The duration of the parking time requires sufficient parking space capacity due to the increased volume levels during busy activity hours. The model of the parking method based on the determination of the unit of parking space calculated from the parking index value determines the unit capacity of the parking space effectively and efficiently. Understanding of parking user behavior from the model explanation with the method of user participation interaction on the parking method will determine the ease of accessibility to the center of activity

THE INFLUENCES OF SOCIAL SUPPORT ON CAREER ADAPTABILITY IN COLLEGE STUDENTS : THE MEDIATING EFFECT OF CAREER DECISION-MAKING SELF-EFFICACY

Ye-ji Sim

occult47@hanmail.net

Soon-hwa Yoo

shyoo@pusan.ac.kr

The purpose of this study is to examine a mediating effect of career decision-making self-efficacy on relationship between social support and career adaptability on college students. For this study, questionnaires measuring social support, career adaptability and career decision-making self-efficacy were completed by 300 college students. Correlation analysis was applied to find out the correlation among these variables and hierarchical multiple regression analysis to verify the mediating effect of career decision-making self-efficacy on the association between social support and career adaptability. Finally administered to verify the mediating effect of career decision-making self-efficacy on the association between social support and career adaptability Sobel test was used to confirm the mediating effect.

The major findings of the study are as follows.

Firstly, there are significant correlations between social support, career adaptability and career decision-making self-efficacy.

Secondly, the relationship between social support and career adaptability is mediated by career decision-making self-efficacy.

Lastly, the relationship between social support and career adaptability is partially mediated by career decision-making self-efficacy.

Consequently, the social support perceived by college students has influenced on their career adaptability and career decision-making self-efficacy. And career decision-making self-efficacy is shown to mediate only the path between social support and career adaptability. Therefore, these findings give deep and reasonable understandings on the associations among college students social support, career adaptability and career decision-making self-efficacy.

Limitations to the current study and recommendations for future research are discussed.

The Interconnection of Mathematics Achievement Levels and the Academic Performance of Science Undergraduates at Suan Sunandha Rajabhat University

ABSTRACT

This study investigates the interconnection of mathematics achievement levels and the academic performance of undergraduate students at the faculty of science and technology. Linear Regression Analysis and Pearson product Moment Correlation Coefficient are utilized for results interpretation. The correlation is being categorized from 13 majors. Data collected is from the sample of 788 online report submitted by science graduated students who have graduated during the academic year 2012-2016. The results of the study indicate that there is a positive significant linear correlation between the mathematics achievement and the academic performance. Linear Regression analysis shows that 53.8% of the curriculums, mathematics achievement have a significant effect on the grade point average.

INTRODUCTION

In higher education setting and from the lens of educators, any study result or formally academic achievement or performance is the learners' individual development in obtaining knowledge literacy, skills and attitudes. In addition, the academic achievement is also used as an indicator of qualitative characteristics and competencies based on the learning process standardized by higher education institutions. In fact, study result relates directly with various other factors and not limited to the learning process. Bloom, 1976 cited in Vinijkul, S., identifies Learner himself or herself, Instructors, Learning Activities, and Learning Atmosphere as factors attributed to students' achievement. It can therefore be inferred that learner's academic performance is also the indicator toward any academic institution's achievement in providing the educational services.

Bussaban, K. and Prapasuwannakul, N. 2016 depicts that the Science and Technology undergraduate study results can be attributed to background knowledge or the prior academic performance. The most vital foundation for the development in Science and Technology is Mathematics. It is also considered crucial for the human resource development in the field of Communications, Reasoning and Problem Solving. Thipkong, S., 2002 underscores this view by specifying that for Thailand to advance its foothold in highly sophisticated technologies requires extensively uninterrupted research and development. Advanced technologies are for the scientists who require advanced mathematics for clarification, experimentation and predictive analytics. Referencing Kulnajsiri, P., 2002, Mathematics as a tool for studying Science and Technology. Mathematics is deployed to assist in human development in the area of problem analytics and analysis, prediction, planning and optimal decision-making. Bankar, K.A., et al, 2009 report their finding that score of mathematics of the accounting students commands positive influence on study result and is statistically significant.

The administration of courses and curricula at the Faculty of Science and Technology, Suan Sunandha Rajabhat University in Thailand undertake the view that mathematics is a tool in advancing Science and Technology. This is reflected in having one or two advanced mathematics subjects as a required course in every program being offered. Nevertheless, specific issues are being reported, for instance, student's negative view toward Mathematics and insufficient foundation. The impacts lead to final grades on the mathematics related subjects. Astonishingly, 50 percentile of the students earn D grade, a barely pass. This causes major concern to the administrators to further resolve the potentially soon to be debacle if the incident persists. This gives rise to the questions on whether or not this group of students needs some kind of educational supports, would this group of students yield eventual study result in the low to substandard category and/or would this group of students depicting any quality of the learning process. Since there is no definitively concrete finding on these issues till date, we therefore undertake the study to discover whether or not by installing mathematics subjects into any program of study to identify any direct interconnection to the academic achievement of undergraduates of Science and Technology as a result. The objectives of this study are (1) to study the levels of interconnectivity on of success in taking mathematic subjects and academic achievement in each curriculum and program of study

being offered and (2) to study if the success in taking mathematic subjects would attribute to the academic achievement in each curriculum and program of study being offered and at which percentile.

THE STUDY

The data gathering stage

The primary data employed in this study is from the students' academic results reported to the university's registrar system and who are the graduates of the Faculty of Science and Technology, Suan Sunandha Rajabhat University in Thailand during the academic year 2012-2016. In fulfilling the study objectives, the sample of 788 online reports submitted are used based on cluster sampling technique. In lieu of 13 programs of study, 50 online reports submitted in each program are randomly selected.

Variables

In this study, students' mathematics achievement is evaluated and measured by adopting an average grade of mathematics and statistics courses in each curricula or the program of study while the Academic performance is measured by using grade point average

Statistical Analysis

Pearson product Moment Correlation Coefficient is useful when the research tried to determine whether two variables are related, the strength of the relationship between the variables and what type of relationship exist. The coefficient of determination or r -squared value denoted r^2 is use to determine percent of the variation in y (The Academic performance) explained by the variation in predictor x (mathematics achievement). Simple linear regression is designed to summarize and study relationships between two continuous (quantitative) variables, average grade of mathematics and grade point average and to predict the influence of x on y .

FINDINGS

Finding of the study indicated that there was a positive significant correlation between the students' mathematics achievement and their academic performance all programs at 0.05. The Pearson Correlation coefficients are presented in Table 1. They show quite strong association for program in Chemistry, Food Science and Technology, Biotechnology and Informatics Mathematics.

Table1: The Pearson Correlation Coefficient

Programs	Pearson Correlation
Chemistry	0.929
Food Science and Technology	0.877
Biotechnology	0.831
Informatics Mathematics	0.818
Biology	0.796
Home Economics	0.788
Industrial Microbiology	0.744
Applied Physics	0.721
Applied Statistics	0.705
Computer sciences	0.675
Information Technology	0.664
Food Industry and Service	0.617
Environmental Sciences	0.574

Results of the simple linear regression analysis are presented in Table 2. They indicate that are 86% of the variation in students' academic performance is explained by their mathematics achievement for Chemistry students' program and 68.5% ,66.4%,62.7%,61.5%,48.9%,44.7% of the variation in students' academic

performance is explained by their mathematics achievement for Biotechnology, Informatics Mathematics, Biology, Home Economics, Applied Statistics and Computer Sciences students' program of study, respectively.

For Food Science and Technology, Industrial Microbiology, Information Technology, Food Industry, Environmental Sciences and Service programs, the same model is not applicable due to the fact that the statistical testing is not satisfied and is not a strong belief that it is appropriate.

Table 2: Statistics value for linear regression analysis

programs	β_0	β	R_{adj}^2	F	Durbin	P-value for normality of the error distribution	
Chemistry	1.305	0.625	0.860	370.015	2.165	0.200	*

Computer sciences	1.857	0.413	0.447	56.748	2.024	0.200	*
Information Technology	2.176	0.291	0.435	74.945	1.218	0.148	
Food Industry and Service	1.928	0.348	0.370	34.470	2.513	0.014	
Environmental Sciences	1.865	0.415	0.321	35.462	0.985	0.200	

* appropriate model

Linear Regression analysis shows that 53.8% of the curricular, mathematics achievement has a significant effect on the grade point average.

CONCLUSIONS

This study aims at identifying the interconnection among academic achievement and the success in taking mathematics subjects and to confirm that the latter has direct influence and impact on the former for the graduates of Science curricula in offer. The result of conducting the study depicts the interconnection of success in taking mathematics subjects and the academic achievement using Grade Point Average (GPA) represented in linear shape. Of 13 different programs of study undertaken, in line with one another find the same direction.

The tendency of high interconnection is appeared in the Chemistry, Food Science and Technology, Biotechnology and Informatics Mathematics program of study representing linearity of $r > 0.8$. Furthermore, the study does further support the hypothesis that success in taking mathematics subjects can be employed to predict the academic achievement of students in the following programs of study: Chemistry, Biotechnology, Informatics Mathematics, Biology, Home Economics, Applied Statistics and Computer Sciences.

For rest of programs of study, the factor on the success of taking mathematics subjects is not insufficient to be employed in predicting academic achievement using GPA. By taking into consideration success in taking other subject to be an additional factor is a possible alternative as of this time.

Since mathematics subjects, for example, calculus and statistics, are offered during the first year of study, the success in taking these subjects are inevitably of vital source of preliminary indicator in providing necessary assistance to the student taking any program of study.

ACKNOWLEDGEMENT

The authors wish to acknowledge their grateful appreciation for the financial subsidy provided by Suan Sunandha Rajabhat University.

ABSTRACT

In the study, secondary school students' perceptions of environmental risk perceptions and their attitudes towards the environment were investigated. The study was conducted on 1003 secondary school students from Ankara, Turkey. Survey method is used in this study which is a descriptive research. To determine state of students' environmental risk perception the Environmental Appraisal Inventory (EAI) was used. New Ecological Paradigm (NEP) scale was used to determine student attitudes towards the environment. Multivariate analysis (MANOVA) has been used to determine whether class, school type and gender makes a difference in the risk perceptions. The relationship between environmental risk perceptions and environmental approaches were determined the Pearson correlation coefficient. In the MANOVA test, it was determined that the genders, school type and class levels showed significant difference in terms of scores obtained from the EAI scale.

INTRODUCTION

The dominant social structure in the world creates and shapes new environmental problems. In the history of humanity, human intervention in nature has never reached as large a scale as it is now. Humans have now become a fundamental and decisive factor in the system of the earth. Human activities cause global environmental changes which humans suffer from. Hazards that affect the environment can be either human-induced, such as technological risks, or an act of nature, such as volcanic eruptions or meteorites. There are two types of human-induced global environmental changes. The first type can be directly effective on a global scale, for example, on oceans or the atmosphere. The second type involves the accumulation of regional changes that cause a global impact; for example, though it is local, the destruction of a forest area as a habitat for a large number of species can be effective on a global scale as it will cause a substantial portion of all species in the world to disappear (Turner et al., 1990). Certain environmental problems that are influential today generally include the greenhouse effect or global warming, the depletion of ozone layer, hazardous materials and wastes, the degradation of water resources and wetlands, the destruction of forests, urbanization, and population growth. Environmental problems that arise as human intervention in nature increases have brought about risks that threaten the life on earth. In this regard, risk can be considered a social structure of modern society. Risk perception that is the main component of risk analysis is most often used in the context of natural hazards and threats to the environment or health (WHO, 2013). According to Ulrich Beck who introduced the concept of risk society in 1992, modern societies have been occupied in identifying and managing risks for a long time (Zwick & Renn, 2002). Risk here refers to the likelihood of the undesired side effects of an action or an event (Renn, 2003). Risks are also associated with incidents that have undefined origins and signs (Karger & Wiedemann 1996). Unlike the point of view of science and technology, the perception of risks by non-experts is not objective (Karger & Wiedemann, 1996; Meili, 2005). Risk perception refers to the evaluation and adoption of sensory perceptions or information about risks and hazards in an individual's mind. Experts usually equate a risk with the expected average loss (damage) per unit of time. However, non-experts perceive risks as a complex, multidimensional phenomenon that has a decisive impact on the perceived risk size in case of risky situations and in which even the subjective expectation of loss (damage) plays a secondary role (Renn, 2003). The factors of risk perception for non-experts include the following (Slovic 1987; Renn, 2003; Bennet & Calman, 2010): the identification of risk sources and the causes of risk (natural or anthropogenic), the possibility of dominance and personal control, the familiarity with risk sources, the willingness to take risks, the likelihood of a risk source causing a disaster, the objective distribution effect of benefit and risk, the reversibility of risk results, personal experiences with technology and nature, and exposure. Sandman has formulated the risk perception as Perceived Risk (R) = Hazard (H) + Outrage (O). Risk perception is the subjective judgment of people about the features and intensity of a risk. It is composed of two components: hazard and outrage. Hazard (technically and scientifically) refers to the combination of the likelihood of a particular event (e.g. an increase in cancer rate, a catastrophic accident) and the

severity of its consequence. Outrage (the subjective component) focuses on an opposite situation of the risk dimension. This category includes the nature management of risk. The basic components of outrage factors include "the involuntary nature of the issue, the artificial (industrial) nature of the risk, the use of cover-up or silence, attempts to engage message recipients to persuade them about the issue, the occurrence of accidents, double truths around the issue, conflicts of interest, contradictory messages and inequitable distribution of risk". Anantho (2008) defines risk perception as the subjective judgment of individuals about the seriousness and characteristics of a risk. since the 1970s, research on risk perception has focused on why people perceive risks differently (Chauvin, Hermand & Mullet, 2007) and has been conducted on the basis of different approaches and models. Research based on a techno-scientific approach (Marks, Martin & Zadoroznyj, 2008) considers risks to be identifiable and measurable and associates risk perception with the visible, familiar, clear, controllable, forgettable, voluntary and rapidly observable nature of risks. The psychometric model also accepts that risk perception is determined by risk characteristics as it is suggested by the technoscientific approach and it also suggests that there may be other factors that affect risk perception (Slimak, & Dietz, 2006). According to the comprehensive personality model, personal attributes such as extroversion, compatibility, conscientiousness, emotional consistency and mental capacity are considered in assessing risk perception (Chauvin, Hermand & Mullet, 2007; Slovic, 2007). According to the value-belief-norm theory, sociodemographic and sociostructural properties and religious beliefs as well as personal values affect risk perception either directly or through the worldview (Stern, et. al., 1999). The risk society approach that became widespread in the 1990s suggests that risk has played an increasing role in life and the concept of risk is related to the social structure composed of historical, social and cultural content (Yalçinkaya & Özsoy, 2003). Risk and risk perception are evaluated differently by people in line with their own attitudes and moral values. People generally do not want to be informed about undefined risks; they prefer to ignore them when they feel they have no effective defense against threats (e.g. in case of unavoidable risks, WHO, 2013). The 1989 report of the U.S. National Research Council (NRC) noted that the perception level of technological risks changed with the economic level. Similarly, Riechard and McGarrity (1994) found that the risk perception among young people significantly differed by socioeconomic status; however, there was no general change in the level of risk perception between the low and high socioeconomic level groups as the difference was specific to the risk source. Risk perception, on the one hand, is influenced by people's moral values, on the other hand, shapes their behavior (Sandman, 2013). In general, psychologists have identified two ways of thinking since the 1980s. The first is characterized by a simple reasoning that focuses on the relevant information filtered by intuition. The second is characterized by a mature capacity and a conscious analytical way of thinking that evaluate a broad range of knowledge (including statistical data). The second way of thinking is a typical scientific assessment, while the first is the common way of thinking shared by many people (scientists are included in this group if they act as "ordinary people"). Communication based on reasoned arguments such as effective risk management practices, relevant safety statistics, etc. cannot affect those who have the first way of thinking (Bennet & Calman, 2010). These two ways of thinking highlight how to reframe information, among the greatest challenges of risk communication, in a manner to be understood by ordinary people. The results of a multinational GlobeScan survey in 2013 demonstrate the importance of these studies. According to the results of this survey, environmental concerns among people around the world have been in decrease since 2009 and have now dropped to the lowest level of twenty years. It should be noted that protective measures taken by health care institutions are more effective when the risk is perceived more clearly by the society (Sandman, 2013; World Health Organization, 2013). Research of two decades ago reported increased public awareness of ecological risks in parallel with the growing awareness of environmental degradation and sustainability (Dunlap & Merting, 1995; Slovic, 1996). The decline in environmental concern in recent years despite the increased environmental problems indicates the complex nature of the interaction of factors that influence risk perception.

The results of risk perception research based on different approaches and models are of key importance in guiding risk management and contributing to risk mitigation activities. Environmental risk analyses concerning public opinion focus on how people assess various technological and environmental risks and react to environmental risks, how these risks are presented and communicated, and how risks are organized in social processes. The identification of public perceptions of environmental risks forms a basis for an effective strategy of environmental risk management (Frewer, 2004). In line with these arguments, this study attempts to investigate secondary school students' environmental concerns as they will influence the future environmental policy of the nation. As risk perception can be regarded as a sign of concern, the study aims to identify participants' environmental risk perceptions. It is of major importance to understand risk perceptions and underlying processes in order to be more informed about the way how people evaluate.

METHOD

The study was conducted on 1003 students studying in secondary schools. Survey method is used in this study which is a descriptive research. A 26-item environmental risk perception scale, based on the Environmental Appraisal Inventory (EAI) developed by Daneshmandi and MacLachlan (2000), was used in the study. The 7-point Likert-type scale (1 = no danger, 7 = extremely dangerous), which includes items about technology and

human-induced hazards, natural disasters and risks related to daily life, was translated into Turkish and used by the researchers. A 5-point Likert-type scale (New Ecological Paradigm), developed by Dunlap and Van Liere in 1978 and revised in 2000, was used to determine student attitudes towards the environment.

Data Analysis

Data obtained from both scales (NEP-EAI) describe as mean and standard deviation. A factor analysis was conducted for the 26 risk items for all 1003 respondents combined. To identify the loadings of the 26 risk items, Principal Axis Factoring was used with promax rotation method.

Multivariate analysis (MANOVA) has been used to determine whether class, school type and gender made a difference in the risk perceptions and environmental approaches of the students. The relationship between environmental risk perceptions and environmental approaches were determined by calculating the Pearson correlation coefficient.

Sample

In terms of gender, 56% of the students were male and 44% were female. The age groups of the participants were between 15-16 years (63%) and 17-18 years (34%). Grade-level distribution was as follows: 70% of the students were in grade 9 and 10, 30% were in grade 11 and 12. In terms of schools, 43% of the students were attending Anatolian High School, and 57% were attending Technical High School.

FINDINGS

The data obtained from EAI scale describe mean and variance in Table 1. The mean and variance values are ranked from high to low.

Table1. Mean ranking of EAI items

Rank		Mean	Variance
1.	18. Impure drinking water	5,96	1,520
2.	19. Large fires	5,81	1,522
3.	11. Water shortage (e.g. drought, water depletion)	5,79	1,631
4.	15. Change to the ozone caused by pollution	5,68	1,600
5.	1. Water pollution	5,64	1,701
6.	4. Pollution from factories	5,63	1,542
7.	16. Earthquakes	5,63	1,620
8.	24. Chemical dumps	5,61	1,654
9.	22. Radioactive fallout	5,55	1,618
10.	17. Soil erosion	5,45	1,555
11.	14. Radioactivity in building materials	5,43	1,718
12.	7. Acid rain	5,39	1,726
13.	20. Floods or tidal waves	5,29	1,618
14.	21. Germs or micro-organisms	5,24	1,589
15.	3. Pollution from cars	5,16	1,660
16.	25. Video screen radiation	5,16	1,726
17.	5. Pollution from burning rubbish	5,01	1,668
18.	23. Fumes or fibers from synthetic materials	4,94	1,722
19.	6. Smoking in public buildings	4,93	1,865
20.	26. Pesticides and herbicides	4,93	1,790
21.	2. Storms (e.g. lightning, hurricanes, tornados, snow)	4,89	1,686
22.	12. Noise	4,56	1,848
23.	13. Visual pollution (e.g. billboards, ugly buildings)	4,50	1,928
24.	9. Number of people (e.g. crowding, population explosion)	4,35	1,877
25.	8. Pollution from office equipment	4,07	1,780
26.	10. Fluorescent lighting	3,54	1,954

When the table is examined can be noticed that 'impure drinking water' was the item given the highest mean rating, while the item 'fluorescent lighting' was considered the least threatening by the sample.

The Bartlett's Test of Sphericity was used to see whether or not data have a normal distribution with multiple variables. The results of the chi-square (χ^2) test are found to be significant, showing that data have a normal

distribution with multiple variables (Tabachnick & Fidel, 2005). The Kaiser-Meyer-Olkin (KMO) value is found to be 0.946, an acceptable level. The results of the Bartlett test are also significant ($\chi^2 = 12740,23$; $p < 0.00$). In research articles, findings should be given here and the above-mentioned principles should be considered.

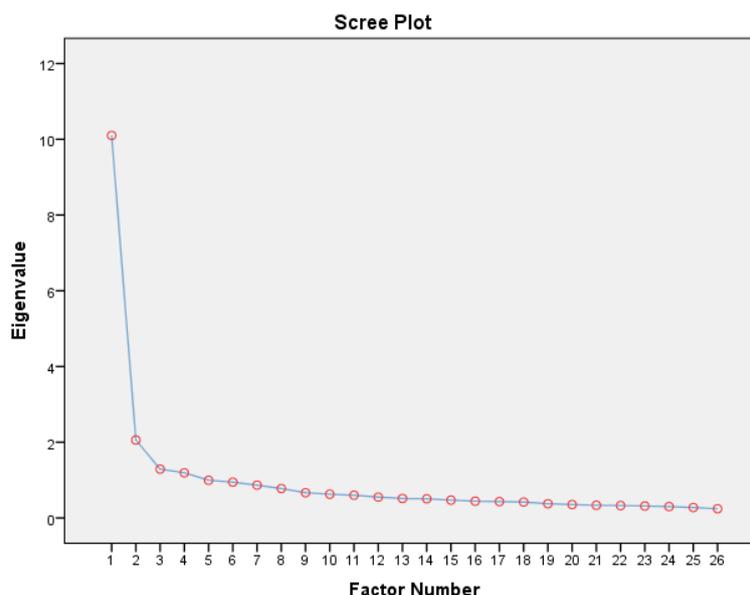

Figure 1. Scree plot for 26 item EAI scale.

The sample matrix developed by the promax rotation was analyzed using the principal axis factoring method. Figure 1 shows scree profile of items. When the scree plot is evaluated it is determined that the factor structure of EAI scale fit three factorial solution.

Table 2. Results of rotated factor analysis on the EAI scales' items

	Factors		
	Industrial Risks	Natural Disasters	Everyday Life Risks
24. Chemical dumps	0,880	-0,047	-0,072
25. Video screen radiation	0,695	-0,089	0,145
14. Radioactivity in building materials	0,674	0,050	-0,002
22. Radioactive fallout	0,627	0,144	-0,063
15. Change to the ozone caused by pollution	0,606	0,242	-0,055
11. Water shortage	0,522	0,166	-0,061
23. Fumes or fibers from synthetic materials	0,480	0,044	0,232
26. Pesticides and herbicides	0,454	-0,154	0,211
1. Water pollution	0,434	0,183	0,016
4. Pollution from factories	0,431	0,234	0,086
17. Soil erosion	-0,048	0,803	0,065
19. Large fires	0,077	0,775	-0,038
16. Earthquakes	-0,009	0,757	-0,014
18. Impure drinking water	0,256	0,688	-0,175
20. Floods or tidal waves	-0,036	0,592	0,213
8. Pollution from office equipment	-0,212	0,106	0,766
10. Fluorescent lighting	-0,11	-0,058	0,725
13. Visual pollution (e.g. billboards, ugly buildings, litter)	0,203	-0,049	0,529
12. Noise	0,199	-0,062	0,524
9. Number of people (e.g. crowding, population explosion)	0,159	-0,059	0,463
5. Pollution from burning rubbish	0,127	0,208	0,431
6. Smoking in public buildings	0,000	0,211	0,411

In the initial factorial analysis, it was found that three items (Pollution from cars, Acid rain and Germs or micro-organisms) are included under more than one factor. So these three items were omitted and the factorial analysis was repeated

The first factor includes those risks concerning industry originated issues, the second, natural threats, the last one, in daily life experienced problems. Therefore, the factors are called “industrial risks” (Cronbach’s $\alpha = 0.88$), “natural disasters” (Cronbach’s $\alpha = 0.87$), and “everyday life risks” (Cronbach’s $\alpha = 0.79$). The item analysis shows that the corrected item total correlation coefficients are above .20.

The mean and standard deviations values obtained from the EAI subscales are given in Table 3 along with students’ class level.

Table 3. Means and Std. Deviation of EAI –subscales according students’ class level

EAI Subscales	Class	N	Mean	Std. Deviation
Industrial risks	9	363	5,564	1,101
	10	338	5,365	1,158
	11	302	5,363	1,282
	Total	1003	5,436	1,180
Natural disasters	9	363	5,797	1,196
	10	338	5,591	1,194
	11	302	5,464	1,435
	Total	1003	5,627	1,278
Everyday life risks	9	363	4,394	1,237
	10	338	4,443	1,229
	11	302	4,440	1,266
	Total	1003	4,424	1,242

Table 3 shows that natural disasters are most risky perceived by participants. The mean values of industrial risks and natural disasters subscales tend to increase as the level of class decreases.

Table 4. Means and Std. Deviation of EAI –subscales according students’ school types

EAI Subscales	School type	N	Mean	Std. Deviation
Industrial	High School	431	5,666	1,107
	Vocational High School	572	5,263	1,204
	Total	1003	5,436	1,18
Natural	High School	431	5,662	1,217
	Vocational High School	572	5,601	1,323
	Total	1003	5,627	1,278
Everyday life	High School	431	4,586	1,214
	Vocational High School	572	4,302	1,25
	Total	1003	4,424	1,242

The mean values of all types of subscales which high school students have, are higher than the mean values that vocational high schools' students have (Table 4).

Table 5. The means and std. Deviation of EAI –subscales according students' gender

EAI Subscales	Gender	N	Mean	Std. Deviation
Industrial risks	Male	558	5,195	1,245
	Female	444	5,738	1,016
	Total	1002	5,435	1,180
Natural disasters	Male	558	5,445	1,357
	Female	444	5,853	1,133
	Total	1002	5,626	1,278
Everyday life risks	Male	558	4,224	1,269
	Female	444	4,674	1,163
	Total	1002	4,424	1,243

The female students have higher mean values in all subscales than those male have.

Table 6. MANOVA results

Variables	Wilks Lambda	F	df	Error df	p	η^2
Level of class	0,972	2,372	12	2609,002	0,005	0,010
School type	0,966	11,711	3	986	0,000	0,034
Gender	0,953	16,324	3	986	0,000	0,047

To detect the effects of level of class, type of school and gender on the students' environmental risk perception multivariate analysis of variance was conducted. The Wilkis Lambda values indicate multivariate significance. According to η^2 value for gender it points out 4.7 % of variance of the dependent variables. In addition, η^2 values of .034 and .010 for type of school and level of class respectively indicate explained variance between 3.4 % and 1 % (Table 6).

Table 7. Flow up test results

EAI Subscales		Type III Sum of Squares	df	Mean Square	F	Sig.	η^2
Level of Class	Industrial	16,748	4	4,187	3,274	0,011	0,013
	Natural	19,743	4	4,936	3,166	0,013	0,013
	Everyday life	11,644	4	2,911	1,967	0,097	0,000
School type	Industrial	24,103	1	24,103	18,845	0,000	0,019
	Natural	0,001	1	0,001	0,001	0,979	0,000
	Everyday life	9,168	1	9,168	6,196	0,013	0,006
Gender	Industrial	59,269	1	59,269	46,339	0,000	0,045
	Natural	43,923	1	43,923	28,174	0,000	0,028
	Everyday life	39,53	1	39,53	26,714	0,000	0,026

The ANOVA results show that level of class led to a significant effect in the subscales of industrial risks and natural disasters and their η^2 values state that it can account for only 1.3% of the variance, indicating that it has a small-size effect. Gender, on the other hand, led to significant effects in all subscales and their η^2 values indicates that it accounts for 4.5 % of the variance for the industrial risks, for 2,8 % of the variance for natural disasters and for 2.6 of variance for the everyday life risks. The other independent variable, the type of school, have significant effect on subscales of industrial risks and everyday life risks.

Table 8 point out the Pearson correlation coefficients between EIA subscales and NEP subscales. The Pearson correlation coefficients ($r=.429$) between NEP subscale and Industrial risks subscales indicates moderate positive association. Furthermore, the correlation coefficients between Natural disasters subscale ($r=.367$) and everyday life risks ($r=.254$) indicate that the strength of association between the variables is weak.

Table 8. Pearson correlation coefficients between EAI-subcales and NEP subscales

	Industrial risks	Natural disasters	Everyday life risks
NEP	,429**	,367**	,254**
	0,000	0,000	0,000
DSP	,079*	-0,016	-,072*
	0,012	0,612	0,022

** p<.001 * p<.005

While correlation coefficients between NEP subscale and all three EAI subscales each are significant at p value of .001, DSP subscale have quite weak association between Industrial risks subscale and also Everyday life risks.

CONCLUSIONS

In the study, environmental risk perception was analyzed in term of salience. For this sake, items are ranked from high to less risky perceived. It is remarkable that the items related with water locate among the high risky perceived items, for instance “impure drinking water”, “water shortage” and water pollution”. This result can be expected since the high media attention afforded to this issue in recent times. In addition, since issues regarding to water can bring forth potential health problems, students have perceived these water related items in EAI-scale most risky. In addition to this conclusion, it is expected that the students’ risk perception regarding water issues were pessimistic when limited water sources of Turkey are taken into consideration. In the present study, mean values of items ranged between 5.96 and 3.54 while in another study which was conducted by Atav & Altunoğlu (2010) before seven years with the same scale, it was detected that mean values of items ranged between 6.58 and 3.98. It can be concluded that as time passes, the students are more optimistic in term of environmental risk perception.

In the current study, it was attempt to define the students’ perception patterns in scope of environmental issues. For this purpose, obtained data by EAI scale was evaluated by factor analysis. According to these analysis, EAI-scale have three factors. The first factor was entitled as industrial risk since its items were mainly related with human activities which had adverse effect for environment and nature. The items of second factor represented natural threats and of this reason, it was named as natural disaster. The last factor which was named as everyday life risks consisted of the items related with people's usual daily experiences. The results of factor analyses indicated similar factorial structure with the results of original study (Walsh-Daneshmandi, & MacLachlan, 2000). In addition to factor analyses, the item analysis was performed and obtained high Cronbachs’ α coefficients for each subscales displayed strong internal consistency. In the light of these findings, EAI-scale can be evaluated as reliable and valid measurement tools.

In the study, the environmental risk perception of secondary school students was analyzed with respect to level of class, school type and gender by MANOVA test. Results of the test indicated that there was a statistically significant effect of these independent variables in favor of girls, high school students and the 9th class students. Particularly gender was one of the most effective variable when the values of η^2 were interpreted (Table 6 & Table 7). Although the effect size of gender was quite low, it was detected that gender was a source of variance for each EAI-subcales while school type had statistically significant effect on industrial risks and everyday life risks subscales and level of class was an effective independent variable on industrial risks and natural disasters subscales. According to literature related with environmental concern, females consistently reported more pro-environmental views and greater levels of concern about specific environmental problems than man did (Xiao & McCright, 2015). According to gender socialization hypothesis, women were more concerned than men for environmental problems that pose significant health and safety risks for people, because women learn connecting with other people and expressing concern about their well-being through socialization into their society (Freudenburg & Davidson 2007). The another significant variable on environmental risk perception was type of school. Taskin (2009) and Tuncer, Ertepinar, Tekkaya, & Sungur (2005) found out that there was a significant difference in scope of environmental attitudes and concern between students from different school types. Especially Taskin (2009), in the same manner of the present study, pointed out that vocational high schools’ students had less pro-environmental worldview and also less concern towards environmental issues and he explained these results with the blaming the same-sex education and the decrease of education quality in vocational high school. In addition to this explanation, Tuncer, Ertepinar, Tekkaya, & Sungur (2005) concluded that the significant difference of environmental concern and attitudes in favor of private school between students from different school types. Despite the Turkish educational research literature offered very rare empirical evidence regarding to biology or environmental education in vocational high schools, Kaya and Gürbüz (2002) found out that students in vocational high school stated that lesson hours for biology were insufficient, also they perceived the biology lesson was less important. In same direction, Cerrah and Ayas (2000) pointed out that

biology teacher evaluated biology curriculum prepared for vocational high school as not appropriate for students' knowledge level and interest. In accordance with these previous researches, the fewer environmental risk perception of students in vocational high school can be explained by the effects of curriculum and general educational aims of this schools in contrast to other types of high schools. It was aimed firstly that the students acquire the vocational formation in vocational high schools and of this reason, there is no sufficient time and resources (laboratories, physical construction of school etc.) in such schools for delivering knowledge in academic manner and provide pro-environmental affection, behavior etc.

In the study, it is found out that EAI subscales had positive moderate association with NEP subscale. The higher NEP subscale scores indicate endorsement of pro-environmental worldview which is represented by existence of ecological limits to growth, importance of maintaining the balance of nature, and rejection of the anthropocentric notion (Dunlap 2008). In contrast to this, DSP subscale showed very low associations with EAI subscales (Table8). In present study, high DSP scores indicate the endorsement of the rejection of anthropocentric evaluation of environmental issues. The results of some previous studies pointed out that the individuals from Turkey were confused or undecided regarding clearly rejection of anthropocentric worldview (Atav, Altunoğlu, Sönmez, 2015; Erdogan, 2009). Thus, EAI subscales can be used in future research to predict endorsement of a pro-environmental worldview. The NEP scale has been reported as predictive of support for pro-environment policies, perceived seriousness of air and water pollution, and self-reported pro-environmental behaviors (Dunlap, Van Liere, Mertig, & Jones, 2000). Although there is empirical evidence that an association exist between EAI subscales and NEP subscales, Walsh-Daneshmandi, & MacLachlan (2000) suspect that the EAI is predictive of at least some of these constructs and they suggested future investigation for predictive potential of EAI scale regarding supporting pro-environmental policies and pro-environmental behaviors.

ABSTRACT

The purpose of the current study is to investigate pre-service primary school, science and mathematics teachers' teaching and learning conceptions. The sample of the study consists of 50 science, 65 mathematics and 77 primary school teacher candidates from a public university in Turkey. In this survey study, the data were collected through "Teaching and Learning Conceptions Questionnaire" developed by Chan and Elliot (2004). The Turkish version of the scale adapted by Aypay (2011) has 30 items with the two subscales, namely constructivist and traditional. Data were analyzed using descriptive statistics, MANOVA, Pearson's correlation, and independent sample t-test. There was significant difference in the constructivist subscale scores of pre-service teachers according to their gender in favor of females. Also, there was significant difference in the traditional subscale scores of pre-service teachers according to their attended education program in favor of pre-service mathematics teachers. The pre-service mathematics teachers' traditional subscale scores were less than the others'. In addition, there was a significant negative, but low relationship between academic achievement and the traditional subscale scores. Besides, there was a significant positive, but low relationship between academic achievement and the constructivist subscale scores.

Keywords: Pre-service teachers, Primary school, Science, Mathematics, Teaching and learning conceptions

INTRODUCTION

The terms teaching and learning are at the opposite side of each other in the sense of meaning. While learning is mostly based on student-centered education, teaching is based on a teacher-centered education (Aypay, 2011). Most teachers have previously had tendency to use teacher-centered education in their classroom (Wright, 2011). It is a bit difficult for teachers who use traditional teaching methods in their classes to actively implement constructivist education in the following years (Pajares, 1992). However, in studies that have been carried out recent years, it has been stated that most teachers tend to use student-centered education in their classes (Weimer, 2002). For this reason, it is important to give importance to the student-centered education in pre-service education, especially of teachers who have a great contribution to the education of their students. Thus, supportive policies are needed for the realization of student-centered education during the university education of teacher candidates (Lamanauskas, 2012). In developing these policies, it is thought that the determination of teaching and learning conceptions will be effective in student or teacher-centered education preferences of teacher candidates.

Teaching and learning conception are defined by Chan & Elliot (2004) as the beliefs that teachers have about their preferences of teaching and learning and their ideas about the role of teachers and learners within the process of knowledge acquisition. There are two main conceptions opposing each other in teaching and learning. These are traditional conception and constructivist conception (Aypay, 2010). Traditional conception in teaching

¹This study is a part of the project of "17.KARİYER.04", supported by Afyon Kocatepe University, Scientific Research Projects Coordination Unit.

utilizes teacher-centered teaching strategies. In this conception, it is seen that teacher is the source of knowledge and that student is the passive receiver of knowledge. On the other hand, the constructivist conception uses student-centered teaching strategies due to the fact that this type of learning helps students develop critical thinking and collaboration skills and learning takes place in environments where students are able to participate actively (Chan, 2004; Bıkmaz, 2017). This is because at the core of constructivism there is learner's constructing and applying knowledge. What is in question is not the repetition of the information, but the transfer and restructuring of the information. Constructivist learning is not just about listening and reading; students are required to have active participation in the learning process such as discussing, defending thoughts, developing a hypothesis, questioning and sharing thoughts (Perkins, 1999). Therefore, teaching and learning conceptions of individuals are an important component in different disciplines.

It is stated that beliefs about mathematics play an important role in the process of learning mathematical knowledge (Sezgin-Memnun, 2015). It is seen that teachers like students also have beliefs regarding the nature, learning and teaching of mathematics; Especially "traditional" and "constructivist" beliefs, which are adopted by teachers, seem to have an influence on mathematics teaching of teachers (Howard, Perry and Lindsay, 1997). The beliefs of teacher candidates and teachers regarding the nature and teaching of mathematics influence the teaching methods they use in the classroom; it is also stated that the beliefs of teachers influence the beliefs of students on this subject. (Baydar and Bulut, 2002). In a similar way, it is emphasized that constructivist approach can be used easily at every stage of science teaching (Singh and Yaduvanshi, 2015), and that the teaching approaches that science teachers use in the classroom environment are effective in teaching science efficiently (Garbett, 2011).

When the literature is examined, there are many researches in which teacher candidates' teaching and learning conceptions are examined in terms of different variables. Some of these researches examine the teaching and learning conceptions of teacher candidates in general (Aydın, Tunca and Alkın-Şahin, 2015; Baş and Beyhan, 2013; Saçıcı, 2013; Oğuz, 2011), some of the researches are based on gender-based differences (Kayhan, Haser and Işıksal-Bostan, 2013; Aypay, 2011; Başpınar, 2015; Eren, 2009), some of the researches examine the followings; the differences of these conceptions according to the level of class (Eryılmaz-Çeviren, 2016; Kayhan, Haser and Işıksal-Bostan, 2013); the difference according to the education program (Bilgin and Aykaç, 2016, Chan, Tan and Khoo, 2007) and differences according to academic achievement (Chan, Tan and Khoo, 2007).

The Turkish education system has implemented the traditional teaching and learning approach for a long time. The constructivist-approach based curriculum has been applied since 2005. Thus, educating teacher candidates in the constructivist teaching concept is considered as a critical aspect in the training of new teachers, as well as, the overall development of teaching and learning conceptions. It seems to be of great importance to determine the teaching and learning conceptions of teacher candidates who are expected to apply constructivist approach in future. The goal of the current study is to investigate the teaching and learning conceptions of primary school, science and mathematics teacher candidates and then to compare them in relation to some variables (gender and attended education program). In addition to it, the other purpose is to study the relation between the academic achievement and the constructivist sub scale scores.

THE METHODOLOGY OF THE STUDY

The current study is a quantitative research designed in the survey model. The participants of the study were pre-service teachers attending different education programs at an education faculty. The sample of the study consists of 50 science, 65 mathematics and 77 primary school teacher candidates from a public university in Turkey, 2016-2017 academic year.

Current study, the data were collected through "Teaching and Learning Conceptions Questionnaire" developed by Chan and Elliot (2004). The Turkish version of the scale adapted by Aypay (2011) has 30 items with the two subscales, namely constructivist and traditional. Cronbach Alpha values of the TLCQ were calculated by Aypay (2011) as 0.71 and subscales of the TLCQ were calculated for constructivist and traditional as 0.88 and 0.83, respectively. Cronbach Alpha values of the TLCQ were calculated as 0.89 and subscales of the TLCQ were calculated by researchers for constructivist and traditional as 0.85 and 0.88, respectively. In the analysis of the collected data, descriptive statistics, independent sample t-test, MANOVA, and Pearson correlations were calculated.

FINDINGS

This study examined in detail pre-service primary school, science and mathematics teachers' teaching and learning conceptions. Furthermore, this study examined the pre-service primary school, science and mathematics teachers' teaching and learning conceptions in terms of some variables (gender, attended education program,

academic achievement) with independent sample t-test, MANOVA, and Pearson correlations procedure.

The difference of the pre-service primary school, science and mathematics teachers' "Teaching and Learning Conceptions Questionnaire-TLCQ" scores according to their gender are presented in Table 1.

Table 1: Independent sample t-test analyses of the pre-service primary school, science and mathematics teachers' TLCQ scores according to their gender

TLCQ	Gender	n	Mean	SD	t	p
Constructivist	Female	142	4.60	0.43	3.84	0.001*
	Male	50	4.33	0.46		
Traditional	Female	142	3.00	0.89	-1.057	0.292
	Male	50	3.15	0.77		

*p<0.05

As seen in Table 1, there was a significant difference between "constructivist conception" scores of pre-service primary school, science and mathematics teachers according to their gender and this difference was in favor of female pre-service teachers. But, there was no significant difference between "traditional conception" scores of pre-service primary school, science and mathematics teachers according to their gender.

The scores that pre-service primary school, science and mathematics teachers obtained from TLCQ are presented in Table 2.

Table 2: Scores that pre-service primary school, science and mathematics teachers obtained from TLCQ

Questionnaire	2 Subscales	n	Min. Score	Max Score	Mean	SD
TLCQ	Constructivist	192	2.25	5.00	4.53	0.46
	Traditional	192	1.00	5.00	3.03	0.86

The results of the MANOVA test performed to determine whether there was a difference between the TLCQ scores of pre-service primary school, science and mathematics teachers according to their education program are presented in Table 3.

Table 3: The results of the MANOVA test on whether there was a difference between the TLCQ scores of pre-service primary school, science and mathematics teachers according to their education program

Effect	Value	F	Hypothesis df	Error df	p	η^2
education program	Wilks' Lambda 0.755	14.151	4	376	0.000*	0.131

*p<0.05

As seen in Table 3, there was a significant difference between TLCQ scores of pre-service primary school, science and mathematics teachers according to their education program [Wilks Lambda (Λ) = 0.949, F(4, 376)=14.151, p=0.000, η^2 =0.131]. MANOVA analysis for the TLCQ scores of pre-service primary school, science and mathematics teachers according to their education program are presented in Table 4.

Table 4: MANOVA analysis for the TLCQ scores of pre-service primary school, science and mathematics teachers according to education program of study

TLCQ	Education program	n	Mean	SD	Df	F	p	η^2	Difference
Constructivist	Pre-service primary school teachers (1)	77	4.51	0.48	2	0.133	0.876	0.001	-
	Pre-service science teachers (2)	50	4.55	0.40					
	Pre-service mathematics teachers (3)	65	4.54	0.47					
Traditional	Pre-service primary school teachers (1)	77	3.17	0.85	2	29.860	0.000*	0.240	2-1
	Pre-service science teachers (2)	50	3.54	0.66					1-3
	Pre-service mathematics teachers (3)	65	2.48	0.71					2-3

*p<0.05

As seen Table 4, there was a significant difference between the “traditional conception” subscale in the TLCQ of pre-service teachers according to their education program.

There was a significant difference between traditional conception scores of pre-service teachers in terms of pre-service science teachers and pre-service primary school teachers and this difference was in favor of pre-service science teachers. Thus, pre-service science teachers’ traditional conception scores are higher than pre-service primary school teachers’ scores.

There was a significant difference between traditional conception scores of pre-service teachers in terms of pre-service primary school teachers and pre-service mathematics teachers and this difference was in favor of pre-service primary school teachers. Thus, pre-service primary school teachers’ traditional conception scores are higher than pre-service mathematics teachers’ scores.

There was a significant difference between traditional conception scores of pre-service teachers in terms of pre-service science teachers and pre-service mathematics teachers and this difference was in favor of pre-service science teachers. Thus, the pre-service science teachers’ traditional conception scores are higher than pre-service mathematics teachers’ scores.

The relationship between pre-service teachers’ TLCQ scores and their academic achievement are presented in Table 5.

Table 5: The relationship between pre-service teachers’ TLCQ scores and their academic achievement

		Academic achievement
Constructivist	Pearson correlation	0.286**
	Sig. (2-tailed)	0.000
	N	192
Traditional	Pearson correlation	-0.230**
	Sig. (2-tailed)	0.001
	N	192

**p<0.01

The coefficient of correlation in Table 5 shows that there exists a positive and low significant relationship ($r = .286$) between Constructivist conception and Academic Achievement. Besides, there exists a negative and low significant relationship ($r = -0.230$) between Traditional conception and Academic Achievement.

CONCLUSIONS

The first result of the current study has shown that there is a significant difference between the “constructivist conception” scores of teacher candidates according to their gender. The constructivist conception scores of female teacher candidates are higher than of males. However, there is no significant difference between “traditional conception” scores of teacher candidates according to their gender. Kayan, Haser and Bostan-İşıkşal (2013) have determined that there is a significant difference according to gender in the beliefs of the primary school mathematics teacher candidates regarding mathematics teaching and learning. It has been stated that this difference is in favor of women in both constructivist beliefs and traditional beliefs subscales. Likewise, also in studies conducted by Aypay (2011) and Eren (2009), it has been determined that female teacher candidates adopt constructivist approach more. However, it is seen that different results are obtained in some studies. For instance in the study that was conducted by Aydın, Tunca and Alkın-Şahin (2015), it has been found that teacher candidates have adopted constructivist conception more than traditional conception in teaching and learning and male teacher candidates are more inclined to constructivist approach than female teacher candidates. On the other hand, in the study conducted by Başpınar (2015), it has been determined that there is no significant difference in the subscales of both constructivist beliefs and traditional beliefs according to gender in the primary school teacher candidates' beliefs regarding teaching and learning mathematics. In a similar way, Bilgin and Aykaç (2016) and Chan, Tan and Khoo (2007) have determined that there are no significant differences in the teaching and learning conceptions of teacher candidates according to genders.

The second result of the study shows that there is significant difference in the traditional subscale scores of teacher candidates according to their fields of education. The traditional subscale scores of mathematics teacher candidates were less than of the others. Similar results were obtained in some studies in which the differences between teaching and learning conceptions of the teacher candidates in different branches were examined according to the program they studied (Bilgin and Aykaç, 2016; Chan, Tan and Khoo, 2007).

The third result of the study has shown that there is a significant negative, but low relation between academic achievement and the traditional subscale scores. Besides, there is a significant positive, but low relation between academic achievement and the constructivist subscale scores. In the study conducted by Chan, Tan and Khoo (2007), it has been determined that the teaching and learning conceptions of teacher candidates differ according to academic achievement.

It may be advised to conduct new studies in different branches in a larger sample group due to the fact that different results have been obtained both in the literature and in the current study, where the differences of the teaching and learning conceptions of teacher candidates have been examined according to the gender and the education program.

New studies may be conducted due to the fact that few studies were found regarding to determining the relation between the teaching and learning conceptions of the teacher candidates and their academic achievement.

Quantitative research methodology is used in this study and mixed method studies may be conducted in order to obtain in-depth results in subsequent researches.

ABSTRACT

Technological developments in the international arena have affected many countries' education systems, as well as being in many areas. As a result of the integration in the education of technological developments, it has caused the change of the professions in the field of education and training, especially in the institutions that educate teachers. The purpose of this study was to investigate pre-service science teachers' self-efficacy toward technological pedagogical content (TPACK) throughout one academic term. The research was carried out with a total of 41 pre-service science teachers from Duzce University in 2016-2017 fall academic years. The study employed an experimental method, namely the pre-test / post-test pattern used with a single group. The data were collected by using the "Technological pedagogical content knowledge (TPACK) self-efficacy scale for pre-service science teachers on material development" developed by Balçın and Ergün (2016). The collected data was analyzed using paired-samples t-test. Also, data are evaluated on 0.05 level relevance and its percentage, frequency, average and standard deviation levels are calculated. When 41 pre-service science teachers' self-efficacy level toward TPACK was evaluated, it was found that their level increased at the end of fall semester (when compared to the beginning of that semester). According to the findings obtained in the research, gender did not affect the TPACK self-efficacy for pre-service science teachers on material development.

Keywords: Technological pedagogical content knowledge (TPACK), self-efficacy, pre-service science teacher, material development

INTRODUCTION

In recent years, the use of technology in science education has been an emerging theme. This has entailed equipping pre-service science teachers with necessary knowledge and skills to effectively integrate technology into the teaching process. In other words, pre-service science teachers are now expected to have technological pedagogical content knowledge (TPACK), which refers to a blend of technology, pedagogy and content knowledge, to enable creative and meaningful technology integration decisions in specific learning contexts. TPACK is also defined as the knowledge of choosing suitable pedagogical methods and technological tools while teaching a subject, using technology to solve difficulties encountered by learners, and supporting students' knowledge and understanding with technology (Mishra & Koehler, 2006). The theoretical framework of TPACK is used in the process of defining, researching and developing knowledge of effective technology integration of teachers both in Turkey and in the world.

Formed by the intersection of content, pedagogy and technology knowledge, TPACK emphasizes that this knowledge should be addressed, not independently of each other, but in an interactive manner (Mishra & Koehler, 2006). For example, it is not enough for a teacher, who wants to use a research and inquiry-based teaching strategy in science class to teach astronomy and space sciences, to have content knowledge of only subject matter (e.g. planets), or only teaching method knowledge within the scope of pedagogical knowledge (e.g. inquiry-based teaching strategy) or only technology knowledge (e.g. simulations). Taking difficult concepts, possible misconceptions and students' prior knowledge about planets into consideration, the teacher should have knowledge of determining technological tools that can be used in the teaching of the subject, have skills to comprehend how those technological tools and materials will support students' inquiry-based learning process, and have competence to figure out how and when to integrate technology into the teaching process. This example indicates that TPACK is a cluster of information generated by the synergy and interaction of content, pedagogy and technology knowledge with each other. TPACK-oriented in-service training programs are implemented to ensure that teachers can integrate educational technologies into the teaching process (Bell & Bull, 2008; Guzey, 2010). These technologies are slow-motion animations, computers, probeware (instruments that make scientific measurements), SMART Board (multimedia applications) hypermedia (simulation), microscopes, web 2.0 tools,

internet, video, camera, video-camera and hyperstudio (Angeli & Valanides, 2005).

It has been observed that teachers are challenged in classroom practices due to the fact that technology education focuses on theoretical knowledge rather than practice, and technological tools and materials are taught irrelevantly of their field of application (Genç & Genç, 2013). New approaches developed to overcome these challenges emphasize the application of curricula which concentrate on the interaction of technology, teaching methods and subject areas (Harris & Hofer, 2011). It is stated that in-service training programs aimed at improving teachers' technology integration knowledge should be designed by taking into account culture and context (Valanides & Angeli, 2008). In-service training programs prepared in accordance with reflective and authentic models suggest that teachers be encouraged to participate as active learners (Tantrarungroj & Suwannathachote, 2013). Such methods as direct instruction, lesson plan development, fieldwork, peer education, participation in online communities and teacher design teams are highlighted in in-service training programs of pre-service science teachers. The use of such models as practical applications, cooperation, discussion and learning through design is proposed for pre-service science teachers' TPACK development (Jimoyiannis, 2010). It has, however, been observed that most TPACK in-service training programs are implemented in short periods of time, and more importantly, the literature on how teachers apply the knowledge and skills they have learned from these programs to classroom practices is limited (Baran & Canbazoğlu Bilici, 2015). The effect of TPACK in-service training programs on pre-service science teachers' TPACK levels was measured using questionnaires, interviews, lesson plans and classroom observations (Graham et al., 2009; Gough & Roehrig, 2009; Kafyulilo, Fisser, & Voogt, 2014). However, these scales were generally applied at the beginning and end of the training program, which did not allow for enough time to analyze their long term effects. This situation has called for longitudinal studies to examine the effect of TPACK in-service training programs on pre-service science teachers' TPACK self-efficacy and classroom practices (Baran & Canbazoğlu Bilici, 2015).

The aim of this longitudinal study is to fill a critical gap in the literature by investigating the effect of TPACK training programs - structured within the theoretical framework of TPACK – on pre-service science teachers' TPACK self-efficacy levels. Teachers' self-efficacy is one of the factors affecting their achievements and goals in their professional lives (Çakıroğlu, Çakıroğlu & Boone, 2005). Teachers with high levels of self-efficacy are more willing and determined to solve a problem they encounter in their professional lives (Bandura, 1977). Teachers with low levels of self-efficacy, on the other hand, have difficulty establishing an effective learning-teaching environment and giving confidence to students in the teaching process (Tschannen-Moran & Woolfolk Hoy, 2007). Similarly, the integration of technology into the teaching process depends on teachers' self-efficacy beliefs regarding technology knowledge and technology use (Abbitt, 2011; Ertmer & Ottenbreit-Leftwich, 2010; Ottenbreit-Leftwich, Glazewski, Newby, & Ertmer, 2010; Wang, Ertmer, & Newby, 2004). Teachers' self-efficacy beliefs regarding TPACK play an important role in technology use (Lee & Tsai, 2010). In this regard, studying and longitudinally examining teachers' TPACK self-efficacy levels will provide information on one of the factors affecting teachers' use of technology in the teaching process.

METHOD

The effect of TPACK training programs on pre-service science teachers' TPACK self-efficacy levels was assessed using a single-group repeated measurements design, which is one of the experimental designs used to evaluate the cause-and-effect relationship between variables (Büyüköztürk et al., 2008; Karasar, 2005). A single-group repeated measurements design is used to investigate whether there is a time-dependent statistically significant difference in participants' behavior by measuring their pre-test and post-test scores for dependent variable (Uluyol, 2011). The independent variable of this study is activities carried out in the Instructional Technology and Material Design course and the dependent variable is pre-service science teachers' TPACK self-efficacy levels. The aim of the study is to measure the effectiveness of the independent variable by carrying out repeated measures for the dependent variable.

Sampling

The study sample consists of 41 third-grade pre-service science teachers (3 males, 38 females) taking the course of Instructional Technology and Material Design in fall semester of 2016-2017 academic year.

Activities within the Scope of TPACK

Instructional Technology and Material Design course included 23 different activities (Table 1) designed in accordance with the course content and Science Teaching Curriculum. The aim of this course is to teach pre-service science teachers the practical application of science education technologies specific to their field of study (scientific measurement instruments, simulations and animations etc.) and non-specific to their field of study (web 2.0 tools, SMART Board, tablets, etc.). Trainers provided participants with theoretical knowledge about an activity and then allowed them to perform it individually or as a group. The activity was completed with the feedback given about its products.

In addition, participants were presented with samples of technology-enriched materials at the beginning of the academic year and given information on plans of a technology-integrated sample lesson. At the end of this activity, participants were divided into groups of four to prepare technology-enriched products within the scope of a science topic. During the fall semester, they were given the opportunity to prepare their technology-enriched products for 4 hours each week. They presented their products at the end of the lesson every week. Trainers provided feedback about the products and shared their latest version with all participants.

Data Collection

A Scale of Technological Pedagogical Content Knowledge Self-Efficacy (Balçın & Ergün, 2016) was used to measure the change in participants' TPACK self-efficacy levels after the implementation of the training program. The TPACK self-efficacy scale was administered as pre-test and post-test in the first week and last week of the fall semester, respectively.

TPACK is a 40-item and 5-point Likert type scale composed of 8 factors; TPACK, TK (Technological Knowledge), and CK (Content Knowledge) and PK (Pedagogical Knowledge) belonging to minor fields of science, and CK, PCK (Pedagogical Content Knowledge), TCK (Technological Content Knowledge) and TPK (Technological Pedagogical Knowledge) belonging to major fields of science. Participants were asked to respond to statements using the scale ranging from "strongly agree," "agree," "neither agree nor disagree," "disagree" and "strongly disagree." Responses to positive items were measured by assigning the value of 5 to "strongly agree," 4 to "agree," 3 to "neither agree nor disagree," 2 to "disagree" and 1 to "strongly disagree." Responses to negative items were measured by assigning the values in reverse order at the evaluation stage.

The Cronbach alpha reliability coefficient of the overall TPACK was found to be .855 for pre-test and .887 for .887 post-test. The Cronbach alpha reliability coefficient values of the eight subscales for pre-test and post-test ranged from .866 to .892.

Data analysis

Data were statistically analyzed using the SPSS, version 20.0. Shapiro-Wilk values were examined to determine whether the data obtained from TPACK- SES (Self-Efficacy Scale) showed a normal distribution or not. Shapiro-Wilk values were greater than significance level .05 (p pre-test = .567; p post-test = .495), indicating that the data set had a normal distribution. A t test was performed to assess the change in participants' self-efficacy levels during the training program in the fall semester and to determine whether the effect of the training program persisted afterwards (Büyüköztürk, 2007, p. 71).

FINDINGS

Mean scores of the scale and subscales show that post-test scores are higher than pre-test scores (Figure 1). The separate analysis of the mean scores of subscales indicate that participants' self-efficacy levels increased as a result of the training program.

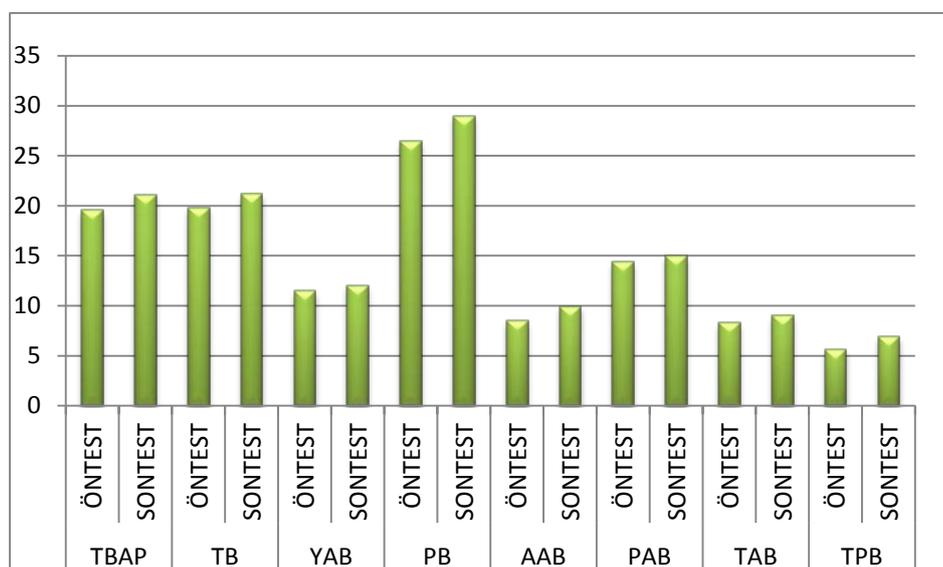

Figure 1. TPACK -LAS Mean Scores of TPACK -LAS Pre-test and Post-test

Table 2 shows the t-test results on whether there is a significant difference between TPACK - SES pre-test and post-test scores.

Table 2. T-Test Results of TPACK - SES Pre-Test and Post-Test Scores

Tests	N	X	S	sd	t	p
Tbap pre	41	19,56	1,226	40	6,449	.000
Tbap post	41	21,12	1,977			
Tb pre	41	19,83	1,358	40	5,198	.000
Tb post	41	21,17	2,011

Total post	41	124,20	3,970			

Table 2 indicates that across the scale, there is a statistically significant difference between participants' post-test and pre-test scores.

CONCLUSIONS

This longitudinal study investigated the effect of TPACK on pre-service science teachers' self-efficacy beliefs. T-test results indicate that participants' post-test self-efficacy scores are statistically significantly higher than their pre-test self-efficacy scores after the fall semester training program. Similarly, Graham et al. (2009) reported in their study with 15 science teachers with different professional experience that participants' TPACK, TPK, TCK and TK self-efficacy levels increased after a training program conducted. They also stated that the increase in participants' TCK levels were higher than the increase in other knowledge levels. Kafyulilo, Fisser and Voogt (2014) determined in their study with 12 science teachers that the highest increase in participants' self-efficacy levels after a TPACK-based training program was observed in TCK, followed by TPACK, TPK and TK. In light of studies with similar results, it is possible to state that TPACK-based in-service training programs with an emphasis on the use of technological tools and materials contribute to the improvement of teachers' technology-based knowledge structures (TPACK, TCK, TPK and TK).

Although Ansyari et al (2012) did not find a statistically significant difference between participants' pre-test and post-test CK scores after a 3-week TPACK-based in-service training program organized for English teachers, they found that trainers' instructional methods in TPACK-based trainings may have an effect on participants' CK self-efficacy levels. They stated that the increase in participants' self-efficacy beliefs regarding all knowledge structures (TK, PK, PCK, TCK, TPK and TPACK) except CK after the in-service training might be due to the fact that instructors who taught in the training program focused on technological knowledge and pedagogical knowledge rather than course knowledge. In this study, participants' CK self-efficacy levels might have been affected by the fact that they failed to give adequate answers to course-focused questions addressed by instructors. For example, some participants' inability to answer the question of how acceleration-time, velocity-time graphs of their motion should be as they walk towards a motion detector in the activity on the use of scientific measurement instruments (probeware) might have made them recognize a gap in their content knowledge and affected their self-efficacy levels.

The results show that there is a statistically significant difference between participants' pre-test and post-test self-efficacy scores regarding the contextual dimension of TPACK-SES. This might be due to the emphasis on contextual factors (teacher beliefs, culture, school resources, classroom physical environments) affecting technology use in classroom activities. Contextual dimension is generally ignored in TPACK studies. However, the increase in participants' self-efficacy scores as a result of the contextual dimension addressed in this study is consistent with results of other studies which emphasize the importance of focusing on contextual dimensions affecting TPACK (Koh, Chai, & Tay, 2014).

THE INVESTIGATION OF PROSPECTIVE MATHEMATICS TEACHERS' METAPHORICAL PERCEPTIONS RELATED TO TECHNOLOGY

Emine ÖZDEMİR

eozydemir@balikesir.edu.tr

The study aimed to investigate prospective mathematics teachers' perceptions related to technology. The behaviors, meanings, perceptions and experiences related to concepts can be defined through phenomenological approach (Yıldırım & Şimşek, 2008). For this reason, phenomenological research design was used in this study and the prospective mathematics teachers' metaphors for aspects of technology were collected as data. In order to explore the metaphors for aspects of technology, the prospective teachers were asked to provide written answers to questions such as: "Technology is like ...?, because...?". The participants in the study were second-, third- and fourth-grade prospective teachers studying in the Mathematics Education Department of the Necatibey Faculty of Education at Balıkesir University. They were chosen by simple random sampling. The qualitative data related to the prospective teachers' metaphorical perceptions were coded thematically, and frequency and percentages were calculated. The results and suggestions will be presented in full text.

The Key to Successful Project-based Learning (PBL) Assignments: Multiple Opportunities for Assessment and Redirection

Submitted by
Dr. Alice E. Stephens

for the
2017 International Conference on New Horizons in Education (INTE)

Abstract

Frequent feedback used in project-based learning assignments enables teachers to adapt their instruction to target the learning needs of students and emphasizes the process, effort, and strategies involved in accomplishing the task rather than focusing solely on the final product. As a consequence students come to value learning as the result of cumulative effort (Dweck, 2000). This paper investigates the relationship between assessment and redirection, and subsequent successful final projects in a media course. In this example of project-based learning opportunities for multiple feedback provided students with information to develop their work and produced significant learning gains for those students who were able to act on the feedback.

**THE LEVELS OF ENGLISH LANGUAGE (EFL) AMONG STUDENTS OF PUBLIC
UPPER-SECONDARY SCHOOLS IN POLAND. THE APPROACHES TOWARDS
ASSESSMENTS OF DIFFERENT TYPE OF STUDENTS –
FORMATIVE ASSESSMENT AND ADJUSTMENT OF EDUCATION
REQUIREMENTS**

Adam Z. KRZYK

The Jesuit University Ignatianum in Cracow, Poland
English Philology Department
adamkrzyk@yahoo.com

Abstract: The article intends to elaborate on aspects of teaching English mainly students' level of language proficiency that they represent when they enter upper secondary schools in Poland. The author is to present various levels of knowledge represented among students during their first year of upper secondary school. Furthermore, the author is to present methods and lexical contents which are covered during the language lessons to finally show students assessment criteria imposed on each of a student, how they differ. The article analysis the language teaching process and adjustments made to it considering different type of students and alterations done to requirements along mentioned teaching process. All to find out if such changes mostly done in good faith can be examples of fairness and equality and imposed with best interest of students or not.

Key words: English as a foreign language, upper-secondary school, language proficiency, formative assessment and adjustment of education requirements.

Introduction

The 21st century developed plurilingual and comprehensive (in contrary to 20th century monolingual) approach towards languages. Late 20th century policies of the European Union assumed that at some point in individual's life one will acquire second language through some kind of formal type of learning¹. The approach towards those whose first language belongs to one of the dominant languages (English, Spanish, German and French) is different to those whose languages are minor languages (Swedish, Finish, Polish, Czech, Hungarian etc.) where often high level of fluency in second language acquisition is expected.

Even though, the number of people who are able to communicate in the English language is raising every year as people are taught foreign languages through public and private education (language schools). Still, very young Poles do not speak any foreign language unless one of parents is a foreigner. Typically only through education young Poles are able to speak one or two foreign languages. The Polish education system of today is based on the Education System Act of 7 September 1991 (with further amendments) which states that, "Education and upbringing serve the developing of young people's sense of responsibility, admiration of the fatherland and respect for the Polish cultural heritage, while being open, at the same time, to values of European and world's cultures. The objective of the school is to provide each pupil with conditions necessary for his/her development and to prepare him/her for the fulfillment of family responsibilities and civil duties based on the principles of solidarity, democracy, tolerance, justice and freedom"². As far as the language acquisition is expected for students to know at least one foreign language – preferably English – and ideally two foreign languages as it was stated during the European Council Meeting in Barcelona in 2002³. Mainly for this reason

countries like Poland introduced foreign language education at very early stage of public education both in primary school and lower-secondary school where students are required to study two foreign languages⁴. Teaching languages in Poland is mainly done through different types of public and private schools (private language schools too). Structurally speaking, the education system in the Republic of Poland is based on pre-school institutions as well as primary, lower-secondary, and upper-secondary schools. It is obligatory for every pupil to study (attend school) until they are 18 years old. As far as foreign languages are concerned English is one of the most popular foreign languages taught in Europe and Poland is no different⁵. Mainly, due to the historical influences the languages popular in Poland were Russian and German respectively. However, after 1990 when Poland became a democratic country, and especially after 2004 when it joined the European Union Polish education system favoured English as the main foreign language. Undoubtedly, it is connected with the significant shift towards multilingualism. Various types of actions can be seen to promote language learning, as a result there are greater opportunities than ever to learn not one but often two foreign languages within public education system. As, there is even greater emphasis in European countries for additional language learning. However, among primary school students there are only 7,9% of them who learn a second foreign language in Poland⁶. During this stage of education the entire emphasis is placed on first language teaching, which itself is a new concept as previously students started learning a foreign language much later.

English language teaching in Poland

Each pupil in Poland attending a public school starts with preparatory English language classes as early as in pre-school. Students aged 3-6 are engaged in 15 minutes long classes and when they are aged 7-9 in 30 minutes long classes during which they have possibility to learn different aspects of English like: numbers 1-10, colours, toys, animals, parts of human body, clothes, food, birthday, adjectives and adverbs of movement, members of family, shopping and goods, parts of house, house equipment, sport disciplines, days of the week, seasons, the weather, musical instrument, means of transport, outdoor games, holidays (Krajewska, 2015, pp. 18-26). Students learn new language through educational games, songs, quizzes etc. As it is believed that “children usually have a tendency to be dedicated and excited learners, without the inhibitions which older children bring to their schooling” (Koutsompou V., 2013, pp. 27-37). For this reason Polish Ministry of Education decided to introduce foreign language teaching as early as pre-school and primary school educations. It is mostly done through different methods of foreign language teaching, parts of lessons are conducted using more traditional approaches like especially popular during the early stage of teaching the Total Physical Respond Method, which bases on engaging students in a conducted lesson through actions (Larsen-Freeman, 1990, p. 54). Such classes are usually based on activities like dancing, singing, drawing, painting, etc. This method is used in primary school in classes between grade 1-3 and even more in pre-school activities which are dedicated to young students of English. Additionally, the Direct Method is used while teaching as it is intended for students to be exposed to a foreign language as early as possible, to be able to imitate newly acquired language. Furthermore, as it is believed teaching students entire sentences will allow them to learn vocabulary and grammar fast – learning by repetitions (drills). “It is these basic patterns that constitute the learner's task. They require drill, and more drill, and only enough vocabulary to make such drills possible” (Richards, Rodgers, 1999, p. 46). Both pre-school and first stage of language education in primary school in Poland bases on learning through

⁴ One can read: „Since September 2008 a foreign language classes were to be taught in primary school and a second language will be introduced to lower-secondary school” [in: Guza, L. *Lower-secondary students are to study two foreign languages* [online] <http://praca.gazetaprawna.pl/artykuly/28041,gimnazjalisci-beda-sie-uczyc-dwoch-jezykow-obcych.html> [20 July 2017]

⁵ „English is the most widely spread foreign language which is taught in European schools. In the previous issue of Key Data on Teaching Languages at School in Europe 2008 it was stated that English dominates in Europe as it is used in 14 countries. In countries where it was not state which language should be chosen English also is the most popular language”. [in:] Gorowska-Fells, M. (2012). *Kluczowe dane o nauczaniu języków obcych w szkołach w Europie 2012* [Key Data on Teaching Languages at School in Europe 2012], w: Czasopismo dla nauczycieli. Języki: obce w szkole [Foreign languages in school], Warsaw, p. 53.

⁶ Wittenberg A., Klinger K. (2015). *Nauka języków obcych w polskich szkołach: Uczniowie są niczym niemowcy* [online] <http://serwisy.gazetaprawna.pl/edukacja/artykuly/897091,nauka-jezykow-obcych-w-polskich-szkolach-uczniowie-sa-niczym-niemowcy.html> [15 July 2017].

discovery and playing educational games as it is desirable that the learning process to be pleasurable for pupils, grading students which at this point is used more as a process of rewarding them and not necessarily giving them feedback .

However, language teaching in grades 4-6 changes. There are approximately 290 teaching hours of foreign language devoted to three years, meaning that there are at least 3 hours of English per week lasting 45 minutes each. At this point each topic is devoted to different themes like: man, house, school, work, family and social life, food, shopping, travelling and tourism, culture, sport, health, wild life. Each lesson is divided into tasks where students are practicing exercises devoted to listening, speaking, reading and writing.

Those who complete the primary school enter the lower-secondary school (gymnasium) which last for 3 years. Pupils aged 13-16 from now on are required to learn two foreign languages – normally English and German much seldom French, Spanish or Italian. Here, the topics which are going to be covered are divided into 14 themes – human, home, school, work, family and social lives, food, shopping and services, tourism and traveling, culture, sport, health and nature (Tittenbrum, Piotrowska, 2012, pp. 10-20). On each lesson students are exploring the abovementioned theme through discussions, reading articles, listening to dialogs, writing stories, essays, etc.

The levels of language proficiency in Polish public school

As far as levels of proficiency are concerned pupils start their education as beginners to obtain the level of A1 (where A represents – basic user, B – independent user, and C – proficient user)⁷ during their early primary school years and A2 at the end of it. As far as lower-secondary education is concerned students are required to reach B1 the level of language proficiency and at the end of their public education in upper-secondary school the level of B2 of language proficiency. Pupils' development is examined through standardized test which is set by the Central Examination Board and assessed by Regional Examination Boards. The exam itself is obligatory and it has an impact upon the admission to upper-secondary circle of study in contrary to lower-secondary circle of study where the results are not taken into consideration during the admission. It serves as an guideline for parents and teachers in most cases.

In reality students entering the upper-secondary school represent different levels of language proficiency which can be verified on various ways. At first students entering upper-secondary school are equipped with lower-secondary leaving certificates which show their grades. In addition, they have results of their standardized foreign language exam. Both results may only serve as a guide and need to be verified because during the final year students' results tend to be overstated by teachers. It is done in good faith, as teachers want their students to finish with distinction or as far as those whose performance at school was unsatisfactory to let them finish school. If it comes to the standardized foreign language exam set by the Central Examination Board it is impartial, still it is designed in a way that students are provided with answers that they have to choose. It is worth saying, there are no deductions for answering it wrong. Students when they do not know the answer are encourage to guess it. Not to mention, that most times they guess right answers because of their instinct. So instead of learning the language they are taught how to distinguish a right answer among wrong ones. Also, the answers that the student can choose from are very different, for students it is very easy to spot at least one answer which is completely wrong. Another way how the language level can be checked is by language placement test, it is also a multiple choice exams, mainly for this reason teachers often erase answers and ask students to write the correct answer instead. Some of educators also choose to speak with students to see what is their language fluency. Generally speaking students take an external exam after lower-secondary school to gather enough points to be accepted to a school of their choice. They can choose three of them and only than they set a priority. If they do not collect enough points to be accepted to a school of their first choice they need to reapply to a second priority and if not succeeded to their third one.

Once a student is in school, normally a class with approximately 35 students is divided into two groups. Sometimes such groups are formulated according to their levels of language proficiency and sometimes not as for example students attend a technical school were they are divided by professions they are willing to specialize

⁷ For further information see: (CEFR – Common European Framework of Reference for Languages) [online] https://www.coe.int/t/dg4/linguistic/source/framework_en.pdf [30 May 2017].

in. Some schools, however not many, developed a strategy to create language classes to which students attend depending on their language proficiency despite the actual grade they are in. For most of schools such arrangement is impossible as there are other classes that are required to be run in smaller groups like: physical education and professional classes in technical schools. However, the reality for majority of schools is that within one group of 12 students (each class needs to be divided when there are at least 23 students in it) there are students with mixed abilities students.

Characteristic of foreign language teaching in upper-secondary school

Theoretically, the approach used in public education system is the process of individualization of studying to ensure the ideal conditions for students to achieve success by taking into consideration their needs and potential. The curriculum is adapted to students' individual abilities by using the *eclectic approach*⁸ while performing classes.

The main aim behind language teaching in upper-secondary school is to prepare students for upcoming matriculation exam which is required to enter university. At the upper-secondary level there are 450 hours for two foreign languages, which around 300 of them are dedicated to the first language (English) and around 150 hours to the second (German, French, Spanish, sometimes Portuguese. Nowadays, there is a growing demand for Asian languages like Chinese and Japanese which are becoming extremely popular in Poland. The number of hours dedicated for a main foreign language is 300: 2 for the first year, 2 for the second, 2 for the third and 4 for the final year of study (technical school) whereas for the extended level there are 510 hours: 2 hours for the first year, four for the second year⁹, four for the third year and seven for the final year of studying. Students entering any type of upper-secondary schools choose classes – normally they specialize in two subjects. The number of such two subjects are extended. If it comes to English, students have a chance to prepare for matriculation exam or the extended form of it. Still, students whose number of hours are not extended can choose to pass extended version of matriculation exam. Here, the first year of upper-secondary school is normally treated as a catch up year for each students so their language abilities will be at more or less the same level. Only later the classes should be challenging and though provoking even though the topics are not different from the lower-secondary school. Teacher is not concentrating its efforts on covering basic vocabulary, it is being revised quickly during the early stage of the lesson when students are asked simple questions as an introductory part to find out how familiar they are with the material.

In theory, it needs to be stated that within curriculum at upper-secondary school there are no beginner students as obligatory the English language is taught in lower-secondary school for this reason a foreign language school be revised and its knowledge expanded. For this reason students should use already known vocabulary and structures to be encouraged to acquire new lexical forms and grammatical structures.

For this reasons, teacher performance needs to be very flexible as within one language group there are usually students with mixed abilities. As, such situation brings a lot of challenges ahead of a teacher who needs to work with both weak and strong students with those whose abilities to absorb new material are much better and those who needs far greater amount of time. There are also those whose background knowledge is greater than others who are struggling with basic aspects of English both vocabulary and grammar. Not only have they various starting levels of English as they have been studying in different lower-secondary schools they also learn at very different speed. Above already mentioned situation teachers often deal with students with dyslexia, dysgraphia and dysortography not to mention students with lower than average intellectual development.

Mainly, for above mentioned reasons when assessing students teachers need to take various approaches. The approach towards students is stated in the Advancements on Educational Requirements to Psychophysics Possibilities Results from Students' Individual Needs. It needs to be stated that such adjustment should not be done by eliminating elements of the curriculum but by dividing each of the aspects of lesson into these aspects necessary for the language process so the student will be able to succeed on the next lesson. As far as assessment is concerned mistakes where teacher is able to recognize a piece of vocabulary is considered correct, it is acceptable for the student to write in print or use a computer, also students have more time to answer and

⁸ A method of language teaching that combines various approaches and methodologies to teach language depending on the aims of the lesson and the abilities of the learners [online] <https://www.teachingenglish.org.uk/article/eclectic-approach> [10 July 2017].

⁹ The following number of hours is dedicated to foreign language teaching in a technical school.

write exams and each of exercises are to be explained to them. The assessment itself should cover shorter parts of materials. As far as all students are concerned formative assessment (assessment for learning) should be used as before, during and after the process of learning students should be aware what is he/she going to achieve during the learning process (aim of learning), what is being covered and what is the most important what student during the learning process has acquired throughout the learning process – should be discussed.

Conclusion

Undoubtedly, there is a high demand for quality English lessons to be performed in public schools where mixed ability students are treated accordingly – to help them achieve their educational goals. Also, it needs to be said that most of the changes are done in good faith so to help those in need. Still, the reality seems to show, that instead of helping students, teachers allow them to seek excuses not to try harder. As, in reality educators often need to prolong the time students have for answering and writing assignments. As a result students with educational problems are rarely involved during English language classes where new material needs to be introduced on every lesson which lasts 45 minutes. For this reason students are given shorter exams, easier tasks so the time is not spend only on them, as it has to be remembered that there are at least 10 other students in a language class and some of them might require more difficult tasks to be covered during classes. Also, it needs to be said that the matriculation exam is the same for all kind of students, the only help allowed is that such students are given 30 minutes longer when writing their exam. Unfortunately, as a result such students are struggling to pass from class to class as teachers do not have time during classes to help them and additional hours are not provided. Either such student will attend a private language school or private classes or they will have huge difficulties obtaining required 30% during their matriculation exam. It is commonly observed that such students graduate from the upper secondary schools without obtaining matriculation exam. For this reason, each student should be treated differently, help of any kind should only be restricted to certain amount of time, not prescribed for life.

ABSTRACT

The purpose of this study is to examine the meaning of global citizenship in the community activities of immigrant women in international marriages. To this end, I interviewed three transnational community officers of Korean women in international marriages. I wanted to find out what these Korean women are doing through the community and the meaning of global citizenship. The results of the study are as follows. First, it showed behavior that resisted social prejudice and discrimination. Second, there was an activity for cultural coexistence between the home country and the country of residence. Third, they practice transnational respect for humanity through the community. The conclusions of this study are as follows. Immigrant women in international marriages have various influences on their home country and their country of residence through community activities, and their activities are carrying out global citizenship by practicing service and harmony.

KEYWORDS: Prejudice and Discrimination, Community, Global Citizenship, Korean Immigrant Women in International Marriages, Respect for Humanity.

INTRODUCTION

Korea has a unique phenomenon in which 84.6% of migrants are women. This is because marriage of foreign women has increased by 28% every year from 2002 to 2013 (Statistical Yearbook of Immigration and Foreign Policy, 2015: 48). Married immigrant women are subject to considerable difficulties, prejudices and discrimination in Korean society. They are in the position of daughters-in-law, wife, and mother in each family in Korea, but suffer considerable conflicts due to language barriers, cultural differences, and low economic standing (Seol Dong Hoon, 2005). However, foreign married immigrant women do not show a passive attitude to their reality. Rather, they actively rebuild their lives. Married immigrant Filipino women residing in Korea form a community to share employment related information and link social networks. It also supports women who suffer from violence and conducts collective action. It also stabilizes economic survival in the Korean society through the Philippine community and complements the position of immigrants (Kim, Jung-sun, 2012: 65, 73). Similarly, Korean-American women who have left Korea since the 1950s and married abroad have also formed communities in their own countries. Married immigrant Korean women carry out a variety of volunteer activities in their country of residence and form their own network. These community activities are now more than a generation ahead of foreign married immigrant women residing in Korea. The experience of the married immigrant Korean women in the foreign community will help to understand the phenomenon of the Korean multicultural society. The purpose of this study is to explore the meaning of global citizenship in Korean marriage. This study will have two effects. First, it will be an opportunity to renew the awareness of Korean married women in Korean society. Second, we can understand foreign married immigrant women who are currently engaged in similar community activities in Korea. Third, we can expand the understanding of Korean society's multicultural reality. Accordingly, the research questions are as follows. First what are the community activities of married immigrant Korean women? Second, what is the significance of global citizenship in the community activities of married immigrant Korean women?

THEORETICAL BACKGROUND

2.1 Internationally married immigrant Korean women

The international marriage of Korea began when the US military presence began due to liberation and the Korean War. At the time of the Korean War, the exit that the Korean women chose for themselves and their families was marriage migration. However, some married immigrant Korean women experience prejudice and discrimination in American society. Even in the Korean community within American society, they are either left out or in a position of alienation (Park, Hae-gwang, 2015: 151). The identity of married immigrant women married to Filipino soldiers remains quite firm and patriotic. However, in Korean society, being considered

outsiders these women are not an object of interest (Kim Minjung, 2015: 277). Korean women who married and migrated to a Japanese farming village are proud of their identities and self-culture, and are active in social activities. However, they are exposed to the obstacles and exclusiveness of the Japanese community (An Taeyoon, 2011: 71). Married immigrant Korean women actively live their lives in the country of residence, but they are experiencing prejudice and discrimination in the society of the country where they live and even in Korea are not given much attention. In addition, previous studies on married immigrant Korean women mainly deal with individual cultural adaptation and identity, and there is almost no research on the community activities of married immigrant women. Therefore, this study examines the community activities of married immigrant women.

2.2 World citizenship

The increase of migration and the development of communication have restructured the whole world into a narrow area. Therefore, the problem of one region is not the problem of the region alone, and it can affect all the regions of the world. Therefore, global consciousness, that is, global citizenship, is demanded from the members of modern society. (2007: 127, 131) is a component of global citizen consciousness, which is divided into citizen consciousness, multinational consciousness, global community consciousness, and national community consciousness. In addition, Kim Seon-mi (2007: 132-140) divided global citizenship into four categories. First, it is a field of international thinking that has critical thinking and analytical ability about international social issues and responsibility for world problems. Second, it is an area of international understanding. This means multicultural understanding and understanding and insight into international issues. Third, the domain of international values and attitudes refers to contributing to humanity and public good. Fourth, in the field of social relations, it was called as cooperation for solving the problems and the ability to network with various members of society. Individuals with global citizenship therefore need the ability to think critically and rationally about what is happening in the international community. In addition, global citizenship means to actively participate as a democratic citizen with humanity and to work together on common problems. Therefore, the purpose of this study is to examine what the global citizen factors are in the community activities of Korean married immigrant women.

RESEARCH METHOD

3.1 Collecting research participants and data

For this study, we conducted in - depth interviews with three research participants in the internationally married Korean women 's community. The characteristics of the study participants are as follows.

<Table 1> Characteristics of participants

Research participants	age	Residence period(year)	residence	Job	Migration background
Research participants	70s	about 50	USA	Entrepreneur(Company)	Family immigration
Research participants 2	70s	about 40	Germany	Entrepreneur(Hotel)	Nurse
Research participants 3	60s	about 40	USA	Pastor	Marriage immigrant

The study participants are from the United States and Germany, with a residence time of around 40 years. Interviews took place in October 2016, and interviews took more than 60 minutes for each individual. The questions were about the content, purpose and reason of community activities. Before the interview, the purpose of the study and the rights of the participants were discussed with them. We also recorded the results after obtaining consent for the recording. We asked the participants to review the recordings for transcription and modification. All the parts that required revision were revised.

3.2 Method for research

The purpose of this study is to explore the meaning of global citizenship in community activities of married immigrant Korean women. The qualitative research was carried out to achieve the purpose of the study. Qualitative research is conducted when researching a specific group or seeking a more detailed understanding of a particular issue (Creswell, 2007; Hung-Sik Cho, et al., 2010: 65). Qualitative research places a lot of interest on 'meaning' and the focus is placed on discovering that meaning. It also focuses on the historical, social, and cultural contexts associated with specific situations (Kim, Byung-chan, 2010). In-depth interviews were conducted for this qualitative research. Qualitative research will be an appropriate method for examining the meaning of global citizenship, since there are places where we can see married immigrant women organizing and

working in their communities.

RESULTS

The purpose of this study is to explore the meaning of global citizenship in the community activities of international marriage immigrant women. The results of the study revealed three meanings and two sub - themes, respectively. The results of the study are shown in <Table 2>.

<Table 2> result

Meaning	Subtopics
1. Resisting discrimination and prejudice	1) Prejudice and discrimination in home and host society 2) Through prejudice and be unity
2. Activities for cultural coexistence	1) Service activities without discrimination of nationality 2) Adapted to the foreign culture
3. Practice transnational respect for humanity	1) Constantly serving 2) Help each other to live together

4.1 Resisting discrimination and prejudice

Community activities of research participants are meant to restore their self-esteem against the discrimination and prejudice imposed on them in their home and country of residence.

4.1.1 Prejudice and discrimination in home and host society

"Even at that time if I did speak English I was discriminated against, so even if I went to another country and spoke English fine, I couldn't speak English in Korea. Also, when I went to the market in Korea they noticed that I had come from the US and they looked at us differently from the way they look at Koreans. Apparently we look a little different because we lived in a foreign country for a long time." (Research participant 1)

" The children were teased at school and came home and cried. Mom Why did you marry my dad? If you had not married dad, the school kids would not have made fun of me as chinese. Obviously it can't happen overnight but I want to resist those stereotypes that I've been a victim of." (Research participants 3)

Participant 1 refers to a discriminatory experience she had experienced when she came to Korea. As a result of living in a foreign country for a long time, the differences between them have appeared, and therefore they have experienced different attitudes despite them all being Korean. In addition, study participant 3 shows a willingness as a mother to resist the racial discrimination their children receive in their country of residence. This shows a psychological constraint that research participants have a sense of social affiliation in their home country and countries of residence. Social affiliation is a psychological sense of belonging regarding family, friends, colleagues, and other members of society regardless of how psychologically close or far they are. This becomes the basis for individual self-esteem (Lee and Robbins, 1995; Pretty, 2002; Liaoning and Kim, Kyung-min, 2016: 40). This exclusion of social intimacy and belonging is the reason why married migrant women form their own community and maintain their own sense of belonging.

4.1.2 Through prejudice and be unity

"Youth shelters, free meals, protection of abused women, donation of rice cake soup for Korean seniors, donation to Las Vegas police, experience of traditional Korean culture, support for US soldiers and their families, Kimchi 20 boxes, (Including the activities of Las Vegas, Washington State, Minnesota, North Texas, Oklahoma, etc., quoted in the 12th World KIMWA guide book).

Research participants are members of the international marriage Korean women's community and carry out various volunteer activities in their areas of residence. Such service activities help with the weaknesses in the society and alleviate conflicts, fulfill the needs of others, and strengthen the character of citizens of citizens. This can be understood as the practice of national citizenship and global citizenship. National citizenship means the character of citizens and ability to contribute to the maintenance and development of a democratic community as a citizen of the political community. This can also be understood as a global citizenship (Kim, Namjun, 2015::12).

4.2 Activities for cultural coexistence

Cultural coexistence is indispensable for various nations to be in harmony. In this regard, international marriage women looked at how they are doing.

4.2.1 Service activities without discrimination of nationality

"We serve in American society as well as Vietnamese people. What we want to do next is sponsor married immigrant foreign women who have difficulties in adapting to Korea. We are ready to sponsor multiple people to do that even today." (Research participant 1)

Married immigrant Korean women are helping not only Koreans but also immigrants from other countries when they serve in their own communities. They also want to help foreign married immigrant women in Korea. As such, Korean immigrant women are focusing on the needs of others, regardless of nationality, race and political interests. This indicates that we are practicing activities that contribute to goodwill and public well-being which are some of the characteristics of global citizenship.

4.2.2 Adapted to the foreign culture

"I have to adapt quickly. We have to learn what they do. I have to in order to live comfortably. Because we lacked language skills, I had to work with my body. I hated to hear people say "They can not speak and they can not work." Because we were not able to speak well we watched others and just worked. So we got recognition. And then I learned the character of the people of the country little by little, I realized what I had to do and gradually changed." (Research participants 2)

Korean women who migrated from their own countries tried to learn the habits and attitudes of the people of the country and the way they worked in order to adapt. This effort to adapt has played a role in linking Korean married women to the society of the countries in which they reside.

4.3 Practice transnational respect for humanity

The community activities of married immigrant Korean women are not oriented toward a single nationality, but are based on affection and compassion toward all human beings.

4.3.1 Constantly serving

"We do a lot of volunteer work in the branch. If those in international marriages do not serve the Korean associations or other organizations can not do big events." (Participant 1)

"When other people helped those who have been sent to prison under false charges or helped women in international marriages we helped with them." (Research participants 3)

To marry and immigrate to a different country means that their lives should be taken by the roots, moved to the new environment in a way that they can live. In this environment, they chose not just to focus on themselves, but to serve others and give of themselves. This can also be seen as a cooperative spirit, another component of global citizenship. In other words, global citizenship means to demonstrate cooperation, (Kim Seonmi, 2007) to network with various members of society as one area of the social relationship of global citizenship and solve common problems.

4.3.2 Help each other to live together

"There are people who have been in international marriages for a long time and while they lived in foreign countries never visited Korea. It's because of money. We want to help some of those people, and we have to look also for those people with difficult family situations." (Study participants 2)

Among Korean women in international marriages living in a foreign country some are successful, but more people are living in an environment where they have never been to Korea for decades after marriage. The community of Korean women in international marriages is working very diligently to prepare measures for these people. Married immigrant Korean women are communicating, helping, sharing, and practicing philanthropy not only for themselves but also for everyone who lives near them. These practices demonstrate and put into practice the character of global citizenship.

CONCLUSIONS

The purpose of this study is to explore the meaning of global citizenship in the community activities of internationally married immigrant women. The results were classified into two parts. First, what are the community activities of married immigrant Korean women. Second, What is the meaning of global citizenship in their community activities.

First, the community activities of Korean women are classified into the following three categories. First, there is resistance to discrimination and prejudice. Second, there was activity for cultural coexistence. Third, there was the exercise of transnational respect for humanity. Married immigrant Korean women are working with international values and attitudes that contribute to humanity and the public good by organizing, serving, and sharing in their communities. It also demonstrates the characteristics of global citizenship by cooperating with various members of society to solve common problems. The significance of global citizenship in the married immigrant Korean women's community activities is cooperation. They are subject to discrimination and prejudice because of their different language and cultural settings in their respective countries of residence. However, they did not concentrate on their problems but instead listened to others who needed help and sought to cooperate with others. This is comparable with the survival strategies of the trees that grow on the volcanic islands. Jeju Island in Korea is a volcanic island with rocks beneath thinly covered soil. The trees extend their roots sideways to connect with the roots of other trees to overcome strong sea winds and typhoons. Rather than creating its own strong roots, the tree has a strategy of living with other trees through joining forces and cooperation. Just as the trees on the volcanic island coexist and survive, Korean women are also cooperating with others and living together through community activities. In the present situation where all the world is becoming a neighbor, these married immigrant Korean women can find the principle that all of us should pursue. Rather than pursuing a strategy to adhere to and protect the interests and rights of individuals and societies, it is important to think about how to move toward sharing and cooperating with each other.

ABSTRACT

As the strategic leadership of school administrators affects the quality according to the standard for internal quality assurance in schools, this research aimed at studying the consistency of the model and the influence towards individual level and organization level. The population was 3,763 school administrators and teachers in 84 schools while the sampling group remained 730 persons from 43 schools selected by multistage sampling technique. Data was collected by using a 5-rating scale questionnaire and a note form for the result of Ordinary National Educational Test (O-NET). The consistency between the model and empirical data of each influence was analyzed through the multilevel models. The findings indicated the χ^2 at 72.448, df at 67, χ^2/df at 1.081, P-Value at 0.303, RMSEA at 0.011, SRMRw at 0.0022, SRMRb at 0.009, CFI at 0.998, and TLI at 0.997. The value of these indexes represented the consistency between the model and empirical data with the "excellence" scale of the criteria. The strategic leadership of school administrators could affect the quality according to the standard for internal quality assurance in schools ($R^2 = 0.913$). The influence of individual level of the model was 0.955 with statistical significance at the 0.01 level. The influence of organization level of the model was 1.000 with statistical significance at the 0.01 level.

Key words: Leadership, Educational quality, School administrators

INTRODUCTION

The trend of globalization causes changes in various dimensions quickly. These changes are happened according to many important factors. First, it is qualified population which receive qualified education, so the strategy for effective management is required for quality of learners, learning outcomes, the internal quality assurance system, and cooperative building among organizations for educational development investment (The secretariat of national reform council, 2015) However, Thailand confronts with problems in quality of education which may affects the quality of learners in the country. The important evident which reflect the problems about the quality of Thai education are derived from the observation of international organizations and the assessment of domestic organizations such as the result of quality assessment from the Office for National Education Standards and Quality Assessment (Public Organization) and the result of the Ordinary National Education Test (O-NET). These two results found that most learners have knowledge in importantly fundamental subjects below the standard assessment. These results were similar to the study of Programme for International Student Assessment (PISA). It reported that Thai learners had knowledge in science subject in high level for 1%, and 74% of Thai learners had difficulty in Thai subject. For example, Thai learners couldn't read and interpret Thai language (Svasdivat Na Ayudhya, 2013).

These empirical evident held back the capability of national competition, so Thai education is necessary to have new educational management by the qualified system according to the strategic management from administrators who have leadership strategy. The leadership strategy will be a way to help the administrators to specify directions and analyze circumstances of their organizations for appropriate strategies. As a result, they will be able to perform these strategies, control and assess the outcome of their organizations' performance. The strategies are essential to specify the achievement of the organization. The factors of organizational achievement include the knowledge and ability of administrators who have leadership strategy and the capability to think strategically (Wootton & Horne, 2010). Thus, the leadership strategy of administrators must be able to expect the future by wide perspectives in long period in order to specify directions of education. However, the leadership strategy still has flexibility in order to reach the objectives of organizations. It can be seen that this leadership will focus on the objectives considerably, but the strategy is ready to be changed as needed according to situations if the administrators will make it achieve towards the objectives of the organization (Somprach, 2016).

The strategic leadership is the state that the school administrators present their views of success of organizations in the future for a long period which is similar to the leaders who focuses on motivating personnel (Nahavandi, 2000) by giving them rewards resulting from their successful work assessment and giving authority to their personnel. Although the administrators greatly focus on the success of goal, the methods to reach that goal still have flexibility. Also, they can change the strategy as needed. Thus, the leaders of organization are essential to have ability to predict the future, specify directions and strategies, and use the strategies in their performance (DuBrin, 2006; Hitt, Ireland and Hoskisson, 2007). Therefore, the strategic leaders have to be responsible for many things, especially encouraging the strategic administration to reach the achievement (DuBrin, 1998; Hooper and Potter, 2001).

Davies and Davies (2004) gave that perspective that the strategic leadership was related to the development of strategies and organizational processes, leading and personnel development, the development of culture and value system, the development of distinctive competencies, and the development of Networks to activate power of members to develop their capabilities to reach higher levels and have more potential. Therefore, it caused awareness in the mission and vision of the group, which would motivate colleagues to have powers in developing their educational institutes better and encourage the strategic administration successfully according to the specified visions. Then, the leaders can create qualified jobs, have abilities in working and skills, and have knowledge and capabilities with a clear goal. The strategic leaders need to communicate and build understanding with other people to get participation. Colonel Stephen (2004) proposed the concept that the leaders with strategic leadership had important roles including (1) have the skills to specify goals, (2) provide vision and focus, master in command and peer leadership skills, (3) inspire others to think and act, and (4) have goals, methods, and approaches together. Dubrin (2006) explained the characteristics of strategic leadership which consisted of (1) situations led by specifying directions, (2) stimulating and creating inspire for organizations, (3) initiating creation for survival of the organizations and giving rewards deriving from work achievement, and (4) reforming which emphasizes on leading for changes.

Therefore, the administrators should have strategic leadership because it is important for reformatory changes in quality of education according to the standard of internal quality assurance of Thailand. However, the administrators and personnel are necessary to help each other to specify directions and strategies for the success, and the most important thing is that the administrators need to motivate and inspire personnel to perform strategies so that they will be able to reach their goals.

According to the evident and above important idea, it showed that the quality of Thai education must be developed by strategic management by the educational administrators in centers, regions, areas, schools, and performers. Therefore, the researcher focused on studying the effect of the strategic leadership of school administrators on quality according to the internal quality assurance in Thai schools. The researcher used the concordance of the model and empirical data and the influence in organizational and individual levels by the analysis technique of the multi-level structural equation model (MSEM) in order to create concrete regulation in strategic drive for more effectiveness of the internal quality assurance in Thai schools. Also, learners can receive quality education actually.

THE STUDY

The researcher studied literature and related research and synthesized them to be variables and compositions in an interval scale and ratio scale as follows. An independent variable is the strategic leadership of administrators which composes of five parts below:

- X₁ : High level cognitive activity : HCA
- X₂ : Strategic direction : DIR
- X₃ : Strategic formulation : FOR
- X₄ : Strategic implementation : IMP
- X₅ : Strategic evaluation & control : EVC

A dependent variable is the quality for internal quality assurance standards in schools which has a composition in five parts as follows:

- Quality of learners : QLN
- Process management : PMN
- Learning management on student centered : LSC
- Effective internal quality assurance : EQA
- Achievement : ACM

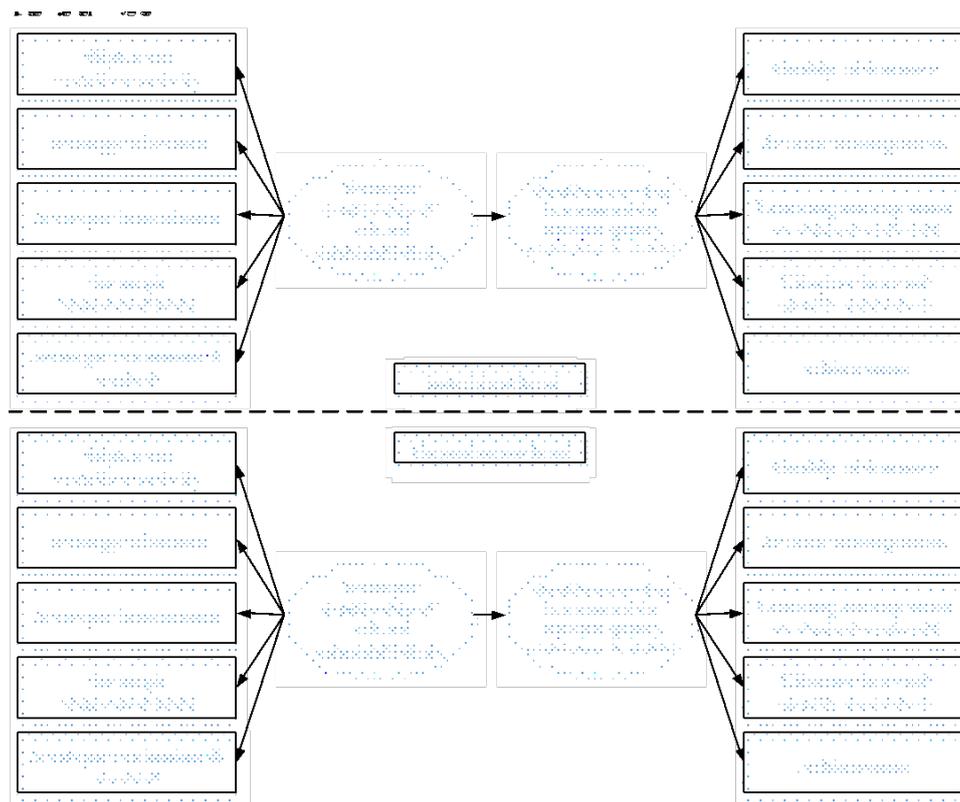

Figure 1. Conceptual Framework

Population: The population of this research were school administrators and teachers who work in Office of Secondary Educational Service Area 25 from 84 schools in a total of 3,736 people. Three stages sampling were selected to use in this study as follows;

Stage 1 Cluster Sampling: Categorizing school by locations of 10 campus then random 5 campus schools to be the representative of all campus concluding Kanlayanamitra, Prasart Phraya Phai, Nong Song Hong – Phol, Nam Phong – Kranuan, and Chumphae Man Chompoo.

Stage 2 Stratified Random Sampling: Grouping 4 school size by Budget administration and human resource management benchmark of Office of the Basic Education Commission (OBEC) as follows (1) school with the number of more than 2,500 students were considered to extra-large size; (2) school with the number of 1,500-2,499 students were considered to large size; (3) school with the number of 500-1,499 students were considered to medium size; and (4) school with the number of 1-499 students were considered to small size.

Stage 3 Simple random sampling: Simple random sampling was conducted to select school administrators and teachers from stage 2 by giving questionnaires randomly.

Sample: The sample of this research were school administrators and teachers total of 730 participants were specified by Cochran (1977) sample size formula at 99 percent of confident level with acceptable error ± 5 percent.

Research instruments: The primary data for this study were collected by rating scale questionnaire and learning outcome form for recording O-NET result of grade 9 and grade 12 in the class 2016.

FINDINGS

The consistency of Multilevel Structural Equation Models (MSEM) Strategic Leadership of school administrators affected to Quality Assurance in Education as shown in Table 1.

Factor loadings, observable variable validity of school administrators' Strategic Leadership Multilevel Structural Equation Models (MSEM) that affected to Quality Assurance in Education

The result of Strategic Leadership Multilevel Structural Equation Models (MSEM) of administrators affected to Quality Assurance in Education analysis were found that every latent variable contained more than 0.05 Intra class correlation: ICC (Shrout & Fleiss, 1979), which means the value of ICC were between 0.572 and 0.764. The structural equation models can be constructed as follows figure 2.

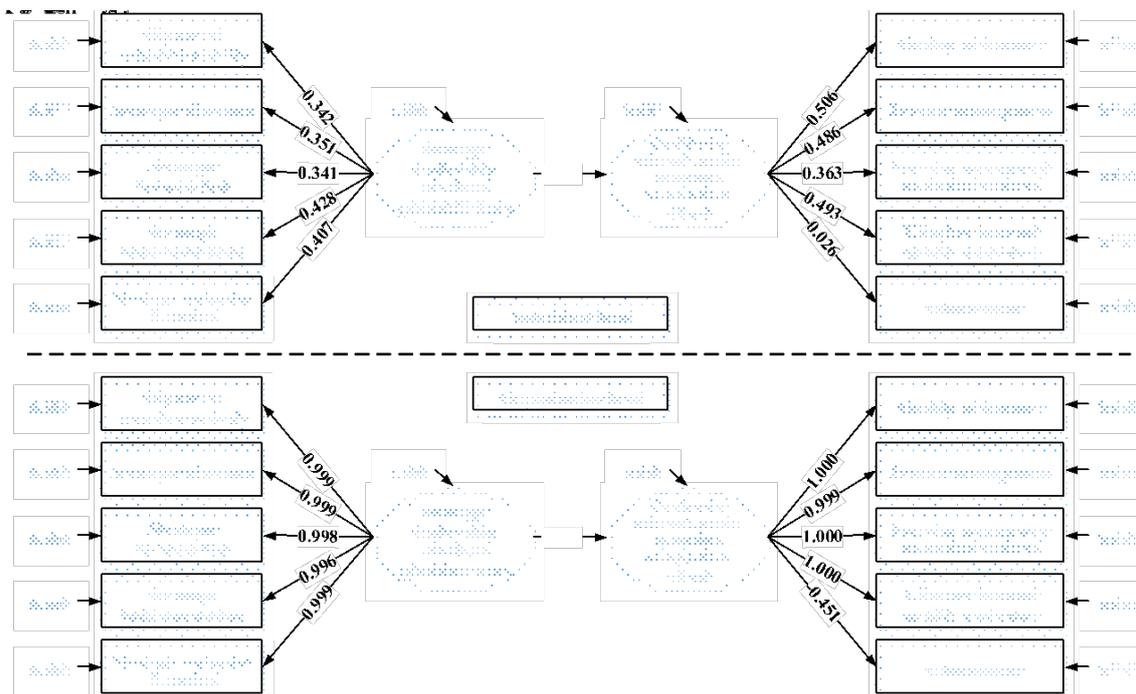

Figure 2. The Multilevel Structural Equation Models (MSEM) Strategic leadership of school administrators affected to Quality Assurance in Education

Concerning preferences, the within level shown that standard solution (®) of the Multilevel Structural Equation Models (MSEM) strategic leadership of school administrators were positive: Standard solution (®) = 0.341 - 0.428 with .01 level of significant. Considering from each components, the highest level are strategic implementation component that all of the standard solution (®) were positive: Standard solution (®) = 0.363-0.506 with .01 level of significant except standard solution (®) of achievement component were: standard solution (®) = 0.026. For others component, the highest level of Standard solution (®) were quality of learners.

For the between level, the Strategic Leadership Multilevel Structural Equation Models (MSEM) of school administrators revealed that standard solution (R) were positive: Standard solution (R) = 0.996 – 0.999 with .01 level of significant except standard solution (R) achievement were negative: Standard solution (R) -0.451.

The result were: the Chi-Square test of model fit (χ^2) = 72.448; the Degree of freedom (df) = 67; the Chi-Square test of model fit (χ^2) per Degree of freedom (df) = 1.081; P-Value = 0.303; root mean square error of approximation (RMSEA) = 0.011; standardized root mean square residual (SRMR) = SRMRw 0.022 and SRMRb 0.009; Comparative Fit Index (CFI) value = 0.998; and Tucker-Lewins (TLI) = 0.997, indicating that The Strategic Leadership Multilevel Structural Equation Models (MSEM) of school administrators affected to Quality Assurance in Education is valid and well fitted to empirical data. (Tabachnik and Fidell, 2007; Steiger, 2007; Hu and Bentler, 1999; Shama et al, 2005)

The results of the study on direct effect, indirect effect and total effect of strategic leadership among the school administrators towards internal quality assurance standard were shown in Table 2.

The direct effect, indirect effect and total effect of multi-level structural equation model of strategic leadership of the school administrators affecting the educational quality according to standard for internal quality assurance.

Dependent variable	Affecting QIQA		
	Direct effect	Indirect effect	Total effect
Independent variable			
Within : SLSAw	0.955**	-	0.955**
Between : SLSAb	1.000**	-	1.000**
R ² of QIQA = 0.913			

* P-value < .05, ** P-value < .01, SLSA: Strategic leadership of school administrators, QIQA: Quality for internal quality assurance standards in schools

According to Table 2, it revealed the results of direct effect, indirect effect and total effect of strategic leadership among the school administrators towards internal quality assurance standard as follows. Based on the structural equation model at within level, it revealed that the strategic leadership of school administrators at within level (SLSAw) influenced the school internal quality assurance (QIQA) with none of indirect effect. The total effect was at 0.955. This indicated that the strategic leadership of school administrators at within level was highly influenced the school internal quality assurance with the statistical significance at .01.

According to the structural equation model at between level, it found that the strategic leadership of school administrators at between level (SLSAb) contained direct effect towards the school internal quality assurance (QIQA) with no indirect effect. Consequently, the total effect was at 1.000 which indicated that the administrators had high influences of the school internal quality assurance with the statistical significance of .01.

CONCLUSIONS AND DISCUSSIONS

The multi-level structural equation model of strategic leadership of school administrators towards the school internal quality assurance was relevant to the empirical data at excellent level which was also relevant to the evaluation of Tabachnik and Fidell, 2007; Steiger, 2007; Hu and Bentler, 1999 and Shama et al, 2005. The value index included Chi-Square test of model fit (χ^2) at 72.448, Degree of freedom (df) at 67, Chi-Square test of model fit (χ^2) of Degree of freedom (df) at 1.081, P-Value at 0.303, Root mean square error of approximation (RMSEA) at 0.011, Standardized root mean square residual (SRMR): SRMRw at 0.022 and SRMRb at 0.009, the Comparative fit index (CFI) at 0.998 and the Tucker-Lewins Index (TLI) at 0.997.

The model of strategic leadership assessment at within level found the total Standard solution (R) with the statistical significance at .01 prioritized by the forth aspect, strategy to action. Besides, the model of school internal quality assurance assessment was most found the Standard solution (R) with the statistical significance at .01 except the aspect of achievement which gained no statistical significance at .01 of Standard solution (R). The result was firstly introduced the aspect of students' quality. According to between level, the model of strategic leadership assessment found the total of Standard solution (R) with the statistical significance at .01 while the model of school internal quality assurance was most found the Standard solution (R) with the statistical significance at .01 excluded the achievement.

The strategic leadership can be indicated through organization image with the explicit goal of success gained from the setting of directions and strategies. To achieve the goal of success, the direction setting is in line with the vision, mission, and strategy of organization. As stated by Sanrattana (2014), people did not get success from fate; the success comes from the strategic action and adjustment in specific situation. This statement is also relevant to DuBrin (2006) that leader must recognize future prediction, direction and strategy setting and action. Moreover, Duggan (2013) has specified the elements of active strategic leadership towards people, i.e. (1) mission transference, (2) structure planning, (3) inspiration and motivation for target achievement and (4) power recognition for proper decision.

Consequently, high strategic leadership can actively drive the organization especially in developing and enhancing internal quality assurance standard. The previous research revealed that strategic leadership contained statistical significant impact the overview quality based on internal quality assurance standard of organization. It has been pointed out that the analysis of achievement was negative which was not significantly different. These elements did not reveal to be proportional compared with others since the proportion has not been approved by the expertise and that not approved by Confirmatory Factor Analysis: CFA. The results revealed the differences between this specific element and the others. The others were proved through the overview of empirical facts among administrators and teachers. The aspect of achievement was one of empirical data based on individual O-NET test of students; therefore, type of data consisted more specific and varied than the first part of data. This can be indicated that strategic leadership can affect the school internal quality assurance standard. However, it has no impact on students' achievement because the teaching arrangement is controllable. The administrator is able to arrange teaching setting except classroom management because it is teachers' roles. This can reflect that high strategic leadership can produce high internal quality assurance standard. Also, the quality and standard of internal quality assurance system can enhance efficient classroom management.

The impact of strategic leadership of director influenced the quality of school internal quality assurance standard with 0.953 of structural equation model at within level and 1.000 of structural equation model at between level. The numbers indicated that both levels significantly influenced institutes at .01. The strategic leadership was situated as a crucial role to promote the transformation of education quality for both organization and individual since strategic leadership has to motivate participants to participate for direction and strategy setting and action in order to achieve the goal. This is relevant to the statement of Davies and Davies (2004) that strategic leadership is related to strategic development and organizational process, leading and developing people, developing culture and value system, developing distinctive competencies, and developing networks in order to stimulate their competence with high potential. The strategy might motivate participants and that can improve better institute and support the successful strategic management based on the vision for quality action

SUGGESTION

Suggestions of this research were extracted from the study of strategic leadership that highly influenced the internal quality assurance standard. So, the system for strategic leadership, as a school administrator, should be developed to advance internal quality assurance standard as follows.

(1) The analysis of structural equation model suggested that the element of achievement is to be paid attention which should be extracted as a latent variable as well as employ path analysis of strategic leadership towards the assurance quality standard and achievement respectively.

(2) The analysis of structural equation model also suggested that some variables containing specific features that can be varied to another level based on multi-level analysis: organization, classroom, and individual.

(3) The organization influential analysis suggested high influences that might be caused by one site study. The study site contained similar aspects. Therefore, study site should be extended.

ABSTRACT

The main aim of this study was to examine the improvement in students' attention abilities of Grade 11 students after the intervention of neurocognitive constructivist guided-inquiry based (NCGI) and conventional structured inquiry 5E (SI5E) teaching models to the experimental and control groups respectively. The NCGI teaching model was developed by researchers. The obtained samples were 34 students in the experimental group and 31 students in control group who had been randomly selected from three classes of Grade 11 students in one secondary school located in the northeastern of Thailand during the second semester of 2014 academic year. Researchers employed a 2 (teaching model: NCGI vs SI5E) x 2 (time of measure: pretest vs posttest) experimental design. Results of this study showed that there was no significant difference between groups on the dependent variables before the intervention. However, the dependent variables namely the auditory attention, visual attention (Thai letter) and visual attention (picture) were significantly differences between groups after the intervention. The developed teaching model NCGI has been proofed to be successfully enhanced students' attention abilities.

Keywords: Auditory attention, conventional structured inquiry 5E model (SI5E), neurocognitive constructivist guided-inquiry based teaching model (NCGI), visual attention.

INTRODUCTION

Current national science standards require an inquiry-oriented approach to teaching that permits students to experience science as an 'active process' that closely reflects the actual work of scientists (American Association for the Advancement of Science [AAAS], 1993; National Research Council, 2000, 2012). The expanding frontiers of cognitive and neural sciences propose a new opportunity to create a more comprehensive theory of human learning (Anderson, 2009). According to Anderson, the two emerging fields, namely neurocognitive learning and constructivist philosophy of science teaching and learning to be a context for integrating a neurocognitive model of information processing with modern perspectives on how students think and learn scientific ideas and ways of knowing through inquiry. The constructivist philosophy science teaching and learning has already become a major guiding model for instructional design in many subjects, particularly in the science subject. In addition, teaching students with the concept of discovering, critical thinking, questioning, and problem-solving skills are one of the main standards of science and technology teaching (Balim, 2009). Balim believed that constructivist guided-inquiry approach should be used in which students learn more effectively by constructing their own knowledge.

Cognitive function refers to an intellectual process by which one becomes aware of, perceives, or comprehends ideas, involves all aspects of perception, thinking, reasoning, and remembering (Mosby's Medical Dictionary, 2009). Advances in classroom curricula often come together with increased demands on students to have the higher order of cognitive functions in practice (Srikoon, Bunterm, Nethanomsak & Tang, 2017). Papakostas (2015) summarized that cognitive functioning is a broad construct involving attention (the ability to focus on a stimulus of interest against a background of stimulus considered irrelevant and potentially distracting), immediate memory (the ability to remember something for a short time after it was presented), delayed memory (the ability to recall something presented in the distant past), cognitive speed (the rate at which different mental

processes and tasks happen), and executive functioning (the ability to integrate sensory input and memory in order to complete a task).

Attention represents “a set of cognitive abilities that allow living beings to cope with the enormous amount of information flooding the sensory system, and to use this information in goal-directed and adaptive behavior” (Klaver, 2009: 204). It is the cognitive process of selectively focused on one aspect of the environment while ignoring other things and also been mentioned to as the allocation of processing resources (Fougnie, 2008). Sarter, Bruno and Givens (2003: 247) summarized that the efficacy of practically every step in the learning process, from the detection, selection, and filtering of sensory inputs to the manipulation of information in the working memory store, and the construction of associational chains to recall and rehearse information and to re-network it into a new context, has been conceptualized to be depending on attention functions and capacities. According to Luck and Vecera (2002: 235), attention is an essential part of the information process which involving the multiple dissociable cognitive processes and being related to each other. Therefore, attention can influence working memory learning outcomes (Loaiza & McCabe, 2013). It is needed for removing unwanted sensory inputs or irrelevant behavioral tasks and is worthwhile when some cognitive system or process receives too many inputs. Attention can function to limit the number of inputs and allow processing to stay in an effective way (Vecera & Rizzo, 2003).

CONCEPTUAL FRAMEWORK

The main aim of this study is to investigate the attention abilities after the intervention of both teaching models, namely neurocognitive constructivist guided-inquiry based model (NCGI) and conventional structured inquiry 5E model (SI5E). The attention abilities are the auditory attention, visual attention (Thai letter), and visual attention (picture). All teaching models are used to provide opportunities for teacher and students to learn how the student’s knowledge, cognition, emotions interact with environments and how both variations occurred through learning process (Joyce, Weil & Calhoun, 2015). Current thought in educational neuroscience is blended to provide a perspective on modern learning theory and teaching model, especially in relation to some emergent ideas in correlations and patterns in the neurocognitive processing of information that focus on attention for improving students’ learning abilities (Anderson, 2009).

Neurocognitive constructivist guided-inquiry (NCGI) teaching model

NCGI teaching model was developed by researchers and used to teach the experimental group. The syntax of NCGI teaching model consists of seven steps as follow: (i) Teacher introduces emotional arousal; (ii) Students set their learning goals; (iii) Students are encouraged to express their ideas or their prior knowledge as a baseline for making a connection with new knowledge; (iv) Teacher provides opportunities for students to present their knowledge by utilizing their multi-sensory in diverse aspects through hands-on activities or complex tasks. Students show their understanding by inquiring, exploring, and using the problem-solving skills to conduct the experiments or solve their problems. Teacher provides scaffolding, facilities, and assists students while they are doing their tasks to maximize their competencies; (v) Students construct their own knowledge by making the connections between the new knowledge and their prior knowledge or linking the classroom content to the community; (vi) Teacher practices some executive function tasks using the learned content, and (vii) teacher applies various strategies to monitor and evaluate students’ learning. Students are encouraged to revise and reflect on the learning activities in order to detect any misconception occurred.

Structural inquiry 5E (SI5E)

On the other hand, the conventional SI5E teaching model was used to teach the control group. This SI5E model is the teaching model recommended by Thailand Ministry of Education and supported by the Institute for the Promotion of Teaching Science and Technology (IPST) (2012) in a standard classroom. The syntax of SI5E model consists of the five steps: (i) Engagement: Teacher introduces the topic that is intended to study, asks the students to make a specific topic, and interact with the material; (ii) Exploration: Teacher motivates the students to do experiment according to the proper laboratory manual procedure. Teacher explains the procedure for the inquiry method, followed by the preparation of apparatus while students perform the experiment and analyze the collected data; (iii) Explanation: Students are requested to prepare the experiment results and present the results to the class; (iv) Elaboration: Teacher questions the students with a prepared set of applied questions that relating directly to the topic of their previous investigation, and (vi) Evaluation: Teacher observes and takes notes of the students’ performance including their discussion, the way they answer the questions, and how they conduct the actual experiment (Bunterm et al., 2014).

Attention abilities

Sternberg (2012) introduced attention is comprised of sustained attention, focus attention, selective attention, and divided attention. The process of attention begins with alertness, selected attention, and executive control. Based on the reviews of Sieb (1990) and further supported by Sternberg (2012), attention can be defined as the brain areas involved in attention are in the prefrontal association cortex (PAC). As a result of the PAC mechanisms, only one sensory stimulus activates the orientation, alerting, awareness, arousal, and cognitive systems and then, therefore, attention occurs. Furthermore, Gray, Rogers, Martinussen, and Tannock (2015) have determined the working memory mediates the pathway between attention and subsequent learning outcomes.

Previous research findings revealed that attention is the most essential information process because it includes organizing information into a coherent structure and optimizing conceptual understanding (Mayer, Kim, & Park, 2011; Yang & Chang, 2015). In addition, past researchers (Loaiza & McCabe, 2013; Yang & Chang, 2015) have proved that attention influences working memory outcomes. This is further supported by a recent study (Srikoon et al., 2017) indicated that the learner brain findings are powerful for education only insofar as they have assisted to change our perspective of how learning and development happen. Previous studies demonstrated the strong relationship between working memory and science achievement (Danili & Reid, 2004; Gathercole, Pickering, Knight & Stegmann, 2004; Tsaparlis, 2005). In addition, it has been reported that working memory also showed the positive correlation with chemistry problem test (Tsaparlis, 2005). Ropovik (2014) found that working memory accounts for about 63 percent of the variation in the ability to learn. The variables in this study are elucidated in Figure 1.

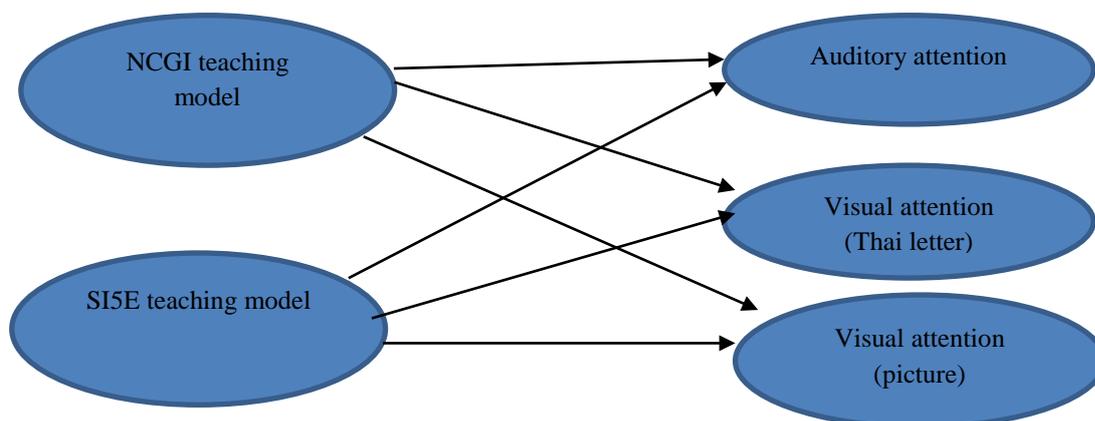

Figure 1. Conceptual Framework

PURPOSES OF THE STUDY

The main purpose of this study was to explore the influence of using NCGI teaching model on attention abilities compared to using SI5E teaching model. This research is a subsequent study after the developed NCGI teaching model was verified by the three experts in science education before implementing the actual study. More specifically, the study sought to achieve the following purposes:

- i. To identify Grade 11 students' auditory attention and visual attention in both experimental and control groups before and after implementing NCGI and SI5E teaching models respectively.
- ii. To study the differences between experimental group and control group in their auditory attention and visual attention.

METHOD

Research design and participants of the study

A 2 (teaching model: NCGI vs SI5E) x 2 (time of measure: pretest vs posttest) experimental design was employed in this study. The NCGI model was developed and implemented in the experimental group while the SI5E model was used in the control group. Participants' attention abilities were assessed in both groups before and after interventions. The participants were randomly selected from a total of 65 Grade 11 students from three classes in a secondary school located at northeastern of Thailand during the second semester of 2014 academic year. The selected participants were equally distributed into the experimental and control groups after

considering their gender and age. In order to remain the homogeneous, there were 34 students in experimental group (male students = 10; $M_{age} = 16.74$, $SD = .56$) and 31 students in control group (male students = 5, $M_{age} = 16.77$, $SD = .42$). This was to ensure that both groups were no differences either in their age ($t(63) = .31$) or their gender as well ($X^2 = 1.62$). This experimental design was employed in order to investigate the variation or changes in the attention abilities after the intervention of teaching model (NCGI or SI5E). In another word, this design is considered as a true experiment because it is generally associated with the conditions that directly affect the variation.

Research instrument

Attention battery test was used as research instrument. All the tests were administered in the Thai language to ensure the participants were clear about the questions. All the tests had been evaluated the goodness of fit test for construct validity as well as test-retest for testing the reliability by Bunterm et al. (2013). The attention battery test used to measure participants' audio and visual attention. Audio attention was measured by sound attention battery test while visual attention was measured by letter attention battery test and dot attention battery test.

Sound attention battery test was comprised of three sub-tests, namely simple task sound, sustained sound, and selected choice sound. In the simple task sound sub-test, the stimuli were sound frequency '500Hz'. Participant was given 50 trials and they were asked to press '1' immediately when they heard the sound (test-retest reliability value = 0.954). In the sustained sound sub-test, the stimuli were sound three kinds of frequency: 500, 1000, and 2000 Hz. The target stimulus was sound frequency '500Hz'. Participants were given 50 trials and were asked to press '1' immediately when they heard the target sound. The occurrence of the target stimulus was 20 percent. The occurrence of each distracter stimulus was 40 percent (test-retest reliability value = 0.946). In the selected choice sound sub-test, the target stimuli were 500Hz and 1000Hz sound. Participants were asked to press '1' if the stimulus was 500Hz and press '2' if the stimulus was 1000Hz. Participants were given 50 trials. Test-retest reliability value was 0.822. The letter attention battery test and the dot attention battery test were covering the same pattern of their four sub-tests. For example, the letter attention battery test including simple task letter, focus letter, sustained letter and select choice letter while the dot attention battery test including simple task dot, focus dot, sustained dot and select choice dot. Participants were given 50 trials for each sub-test.

In the simple task letter sub-test, the stimulus was a Thai alphabet "๓". Participants were asked to press '1' immediately when the stimulus appeared on the screen (test-retest reliability value = 0.955). In the focus letter sub-test, the stimuli were two Thai alphabets "๓" and "๓". "๓" was the target stimulus; "๓" was the distracter. Participants were asked to press '1' immediately when the target stimulus appeared on the screen (occurrence of the target stimulus was 20%, test-retest reliability value = 0.938). In the sustained letter sub-test, the stimuli were 44 Thai alphabets. The target stimulus was "๓". Participants were asked to press '1' immediately when the target stimulus appeared on the screen (occurrence of the target stimulus was 20%, test-retest reliability value = 0.959). In the select choice letter sub-test, the target stimuli were two Thai alphabets "๓" and "๓". Participants were asked to immediately press '1' when "๓" appeared and press '2' when "๓" appeared on the screen (test-retest reliability value = 0.966).

In the simple task dot sub-test, participants were asked to press '1' when a dot appeared in the upper left-hand side of a two by two grid (test-retest reliability value = 0.979). In the focus dot sub-test, the stimuli were two pictures, a dot appeared in the upper left-hand side of a two by two grid and a dot appeared in the upper right-hand side of a two by two grid. Participants were asked to press '1' when a dot appeared in the upper left-hand side of a two by two grid. The target occurred in 20 percent of trials. Test-retest reliability value = 0.976. In the sustained dot sub-test, the target stimulus was a dot appeared in the upper left-hand side of a two by two grid. The distracters were a dot that appeared in other locations of a two by two grid. Participants were asked to press '1' when the target stimulus appeared on the screen. The target occurred in 20 percent of trials (test-retest reliability value = 0.966). In the select choices dot sub-test, the target stimuli were a dot appeared in the upper left-hand side of a two by two grid and a dot appeared in the upper right-hand side of a two by two grid. Participants were asked to immediately press '1' when the first stimulus (upper left-hand dot) appeared and press '2' when the second stimulus (upper right-hand dot) appeared on the screen. Test-retest reliability value = 0.970.

RESULTS

Researchers used a 2x2 multivariate analysis of variance (MANOVA) to examine whether the developed NCGI teaching model would enhance the Grade 11 students' attention abilities better than using conventional SI5E teaching model. As the samples comprised of two groups, the researchers had to consider the following

assumptions before the groups were treated equally. The first assumption was that there should be no outliers. The second assumption was that the all the dependent variables should be approximately normally distributed for each group and, finally, there was the homogeneity of variances. The results of this study are presented in accordance with the research aim that is indicated above and proposed in three sections according to the groups of dependent variables, namely auditory, visual (Thai letter), and visual (picture) attention. The findings are presented in two parts namely descriptive and inferential findings. The initial findings emphasize on the attention abilities of Grade 11 students before and after using the NCGI and SI5E teaching models in their science educational instruction. This is followed by evaluating the variation occurred from these two teaching models on Grade 11 students' attention abilities.

Attention was the dependent variable which consisted of two aspects, namely auditory attention and visual attention. The auditory attention variable was measured from these three tests: Simple sound, sustained sound, and select choices sound. Since the Box's M test was significant, so the level of significant was set at .001. There were significant main effects of pedagogical condition and time of measure, both of which were qualified by a significant pedagogical condition x time interaction effect, $F(3,61) = 61,523, p < .001$; Pillai's Trace = .752; $\eta^2 = .752$, observed power = 1.000. The univariate tests showed significant interaction effect for all three auditory attention tests. The interaction effect for simple sound, $F(1,63) = 91.106, \eta^2 = .591$; sustained sound, $F(1,63) = 113.164, \eta^2 = .642$, and select choices sound, $F(1,63) = 23.742, \eta^2 = .274$, were significance at $p < .001$. The results from pairwise t-tests of pretest showed that there were no group differences in all sub-tests of auditory attention variable. Table 1 indicates that the descriptive and inferential statistics of pre-test vs post-test performances revealed a better improvement in the experimental group who followed the NCGI teaching model compared to the control group who followed SI5E teaching model.

Table 1. Descriptive and inferential statistics of pre-test vs post-test for auditory attention

Dependent variables	Experimental group (N=34)					Control group (N=31)					Independent t-test
	Pre-test		Post-test		Paired t test (df = N-1)	Pre-test		Post-test		Paired t test (df = N-1)	
	M	SD	M	SD		M	SD	M	SD		
Simple sound (range: 0-50)	27.29	3.958	41.09	3.334	21.323**	25.84	3.992	29.87	3.948	5.024**	1.475 12.413**
Sustained sound (range: 0-50)	28.53	3.816	40.00	3.348	18.391**	27.26	3.633	29.00	3.899	2.598**	1.373 12.233**
Select choice sound (range: 0-50)	28.85	2.298	36.85	1.438	18.492**	28.55	2.307	33.58	1.996	11.806* *	.533 7.632**

** $p < .01$; * $p < .05$

On the other hand, visual attention was measured in two parts: Thai letter and picture. There were four tests used to collect the accumulated data related to visual attention letter variable, namely simple letter, focus letter, sustained letter, and select choices letter. The Box's M = 55.590 ($p = .087$) showed the observed covariance matrices of the dependent variables were equal across groups. The data were appropriate to analyze with this technique. There were significant main effects of pedagogical condition and time of measure, both of which were qualified by a significant pedagogical condition x time interaction effect, $F(4,60) = 57.302, p < .001$, Pillai's Trace = .793, $\eta^2 = .793$, observed power = 1.000. The univariate tests showed significant interaction effect for all four visual attention tests. The interaction effect for simple letter, $F(1,63) = 24.605, \eta^2 = .281$; focus letter, $F(1,63) = 121.755, \eta^2 = .659$; sustained letter, $F(1,63) = 47.033, \eta^2 = .427$; and select choices letter, $F(1,63) = 19.944, \eta^2 = .240$, were significance at $p < .001$.

The results from pairwise t-tests of pretest showed that there were no group differences in all sub-tests of the visual attention (Thai letter) variable. Table 2 shows that the descriptive and inferential statistics of pre-test vs post-test visual attention (Thai letter) performances revealed a better improvement in the experimental group who followed the NCGI teaching model compared to the control group who followed SI5E teaching model.

Table 2. Descriptive and inferential statistics of pre-test vs post-test for visual attention (Thai letter)

Dependent variables	Experimental group (N=34)					Control group (N=31)					Inde-pendent t-test
	Pre-test		Post-test		Paired t test (df = N-1)	Pre-test		Post-test		Paired t test (df = N-1)	
	<i>M</i>	<i>SD</i>	<i>M</i>	<i>SD</i>		<i>M</i>	<i>SD</i>	<i>M</i>	<i>SD</i>		
Simple letter (range: 0-50)	31.12	2.226	37.85	1.438	16.695**	30.74	2.206	34.52	1.913	8.545**	.683 7.994**
Focus letter (range: 0-50)	30.53	3.816	39.00	3.348	13.581**	29.29	3.617	29.32	3.219	.078	1.340 11.855**
Sustained letter (range: 0-50)	28.15	2.002	31.85	1.258	10.034**	28.00	1.673	28.42	.923	1.416	.320 12.441**
Select choice letter (range: 0-50)	29.74	2.538	35.79	1.431	13.158**	29.10	2.371	32.58	1.996	10.533*	1.045 7.509**

** $p < .01$; * $p < .05$

The other part of visual attention was picture. There were also four tests used to collect the accumulated data related to visual attention picture variable, namely simple dot, focus dot, sustained dot, and select choices dot. Since the Box's M test was significant, so the level of significant was set at .001. There were significant main effects of pedagogical condition and time of measure, both of which were qualified by a significant pedagogical condition x time interaction effect, $F(4,60) = 70.904$, $p < .001$, Pillai's Trace = .825, $\eta^2 = .825$, observed power = 1.000. The univariate tests showed significant interaction effect for all dependent measures. The interaction effect for simple dot, $F(1,63) = 24.367$, $\eta^2 = .279$; focus dot, $F(1,63) = 90.290$, $\eta^2 = .589$, sustained Dot, $F(1,63) = 44.741$, $\eta^2 = .415$, and select choices dot, $F(1,63) = 20.135$, $\eta^2 = .242$, were significance at $p < .001$.

The results from pairwise t-tests of pretest showed that there were no group differences in all sub-tests of the visual attention (picture) variable. Table 3 shows that the descriptive and inferential statistics of pre-test vs post-test visual attention (picture) performances revealed a better improvement in the experimental group who followed the NCGI teaching model compared to the control group who followed SI5E teaching model.

Table 3. Descriptive and inferential statistics of pre-test vs post-test for visual attention (picture)

DISCUSSION

The results of this study indicate that Grade 11 students who were exposed to the neurocognitive constructivism and more guided formed of inquiry teaching model showed greater improvements in their attention tests compared to their peers who were taught using the conventional structured inquiry teaching model. This result correlates with Srikoon et al.'s (2017) findings. Srikoon et al. revealed that the overall attention, working memory, and mood conditioning have been improved after the intervention of neurocognitive-based teaching model compared to the conventional structured inquiry model among the Grade 9 students in a high school located in Mahasarakham province, Thailand. This finding is also consistent with the past research findings from Rattanavongsa, Bunterm, Wattanathorn and Muchimapura (2013), Srikoon and Bunterm (2016), Uppasai and Bunterm (2015), Wangpoomyai, Bunterm, Wattanathorn and Muchimapura (2012), Wannatong, Bunterm, and Wannanon, (2013), Wuekprakhon, Bunterm, Wattanathorn, and Muchimapura (2010), and Thorell, Lindqvist, Bergman, Bohlin and Klingberg (2009).

Researchers introduce this NCGI teaching model consists of several elements which have enabled students to move from structured to guided inquiry coupled with neurocognitive learning theory. The NCGI teaching model has provided students' gradual experience through different levels of inquiry thus motivating cognitive functioning abilities. The teacher is a key figure in implementing inquiry processes from the structured to the guided inquiry level. It is, therefore, imperative that teachers participate in the inquiry teaching program as they also develop professionally (Zion & Mendelovici, 2012). According to Zion and Mendelovici, learning by inquiry is a vital step in developing a scientifically literate, critically, logically and creatively thinking student.

This present study examined the effectiveness of the developed NCGI teaching model to enhance attention abilities of students. The current results helped to confirm the structural aspects of the school-related skills, attention abilities are able to be improved by a fascinating way that experience sculpts brain systems into their mature state (Byrnes & Vu, 2015). For education to truly benefit from these findings in a durable, deep way, for the full implications to become apparent, teachers must examine closely the theory on which good practice is built, to reconcile the new and exciting evidence with the developed NCGI teaching model. For example, affective and social neuroscience findings suggest, however, that emotion and cognition, body and mind, work together with students of all ages (Immordino-Yang, 2011).

ABSTRACT

This study explores the pedagogical significance of the challenge spirit reflected in Koryo Saram's life in Central Asia. The research participant selected for this study is Chae Yevgeniya, a third generation Korean or "Koryo Saram" living in Kazakhstan, one of the Russian Commonwealth or CIS countries. For the life history research, the team met her in Almaty in May 2014 and July 2016 to start the field research. The cooperative attitudes of the research participants as well as the positive and open mindedness about the life history research contributed as the fundamental role in bringing out the life stories from the research participants in much more natural way. The essential issues of this study, through life history of Koryo Saram, are to understand the socio-political context of that era and how the participant perceives and expresses the diaspora resulted from forced migration. The most prominent aspect shown through the life history of participant is the Spirit of Challenge. The term, Spirit of Challenge, presents how Koryo Saram overcame harsh economic and political oppressions. The spirit of challenge was attributed to the ethnicity of Korea, and this ethnic spirit could be defined as accumulation from the 'Cultural DNA' of Korean people. The pedagogical significance of this Challenging Spirit is manifested from passion for life, dedication and positive human relations at the workplace, and finally the ethnic pride as Koryo Saram.

KEYWORDS: Koryo Saram, Life History, Challenge Spirit, Ethnic Spirit, 'Culture DNA'

INTRODUCTION

This study aims to explore the educational meaning showed in personal life of Chae Yevgeniya, the third generation of Koryo Saram living in Kazakhstan.

From 1864, farmers in the northern part of the Korean Peninsula began building villages across the Tumen River, cultivating a barren land in the Ussuri River basin and the residence of Koryo Saram increased gradually. This was mainly because of Korea's economic difficulty caused by Japanese capitalists' land plundering in the period of Japanese occupation in 1905. However, many independent activists with political inclination had started to move to the Far East with them since Korea's frustration of autonomy (Jung, Byeongjin & Nam, Biktoreu, 2011). However, in August 1937, according to Stalin regime's 'order' of deportation of 'people from Choseon' living in the Far East, about 170 thousands of Koryo Saram had been loaded on 60 transport trains and transferred to Middle Asia by November 1937. During these transfer, numerous Koryo Saram were died due to severe cold and hunger. As CIS(Commonwealth of Independent States) in the period of transformation after collapsing of Soviet Union had strengthened nationalistic policies focused on major race, the discrimination against minorities had more strengthened. Especially, Koryo Saram in Uzbekistan were under the double trouble of discrimination and financial difficulty (Sung, Donggi, 2007). After losing their jobs only because of their ethnicity as Koryo Saram, they were dispersed all over the Russia, so their ethnic identity has been weakened (Kim, Jungwan, 2016).

The movie 'Koryo Saram: The Unreliable People', which won the best film of Asia from Toronto International Film Festival in 2007, is a documentary film based on the deportation of Koryo Saram living in the Far East of Stalin regime. It has the story of Koryo Saram's deportation from the Far East to Middle Asia by Stalin who labelled Koryo Saram as 'unreliable people' and of Koryo Saram in Kazakhstan where had made the whole country as one big concentration camp for the migrants.

Koryo Saram who had stayed out of Korea's attention suddenly became a hot issue in Korea as well as the world, and the academic studies on Koryo Saram were actively conducted. Among them, there are studies conducted by Ko Gayoung(2008), Bae Eunkyung(2008), and Hwang Youngsam(2008) addressing senior Koryo Saram's individual life histories who had no choice but to succeed. These studies showed the dynamic history of Korea and Koryo Saram' life change, and left curiosities about Koryo Saram's life and spirit.

This study wondered where the challenging spirit of Koryo Saram who have been living undaunted challenging lives in the extreme conditions came from. Also, this study searched where their unique identity as 'Koryo Saram' in the globalization of migration was from.

SPIRIT OF CHALLENGE AND THE CULTURAL GENE OF KOREANS

The challenging spirit is defined as an enthusiastic challenging attitude of individual or organization to make good use of opportunity in spite of uncertainty and dangerousness about the future (Woo, Yeonghui, 2016). The challenging trait was studied mostly pertaining to job performance. The challenging trait related to work is also described as the degree of mental capability, and all members are presented challenges to as the focal factor of satisfaction in degree of personal fulfillment (Kraut & Ronen, 1975). Given this, it can tell that the challenging spirit of persons, who are positive and adventurous, and feel personal achievement with innovative thinking in uncertain conditions and circumstantial changes, appears higher. The first action of human to challenge is self-confidence. Self-confidence brings the positive thinking, and the positive thinking brings passion and dauntlessness. This assertive mind creates the challenging spirit and the challenging spirit becomes life-changing motto.

In case of Korea, Korea achieved the "Miracle of Han River" from the ashes of the Korean War in 1950's, and Korea is still challenging to the world with untiring passion. It is said that this challenging spirit comes from Korean's national spirit. The national spirit is built by accumulation of peculiar psychology and culture to the people of that nation. Then, here comes a question: What is the peculiar culture to Korean?

Lee Hangu(2009) developed the logic of Korean cultural gene by raising the need to find a cultural gene in order to establish a Korean identity based on 'Identity' of Eriksson.

Because identity is not immutable but evolving with growth, it is said that identity changes according to circumstances. However, Lee Hangu(2009) determined that changing identity was radically different from falling into confusion without being able to establish identity. Therefore, there always remains such questions: 'Who are we?' and 'What people are we?' Culture gene is original elements of culture. It means that original idea or image, and one creative thought or theory are all culture genes and they are combined to create a new culture by forming a unique culture.(Lee, Hangu, 2009). Studying Korean's culture genes means studying human soul, so it is needed to be concerned about Korean's culture gene to know more about Korean (Hwang, Byeonggi, 2014).

According to Cho Yoonjae, the cultural characteristics of the Korean people are 'patience' and 'tenacity' and 'tenacity'(Lee, Hangu, 2009), and experts selected distinctive aspects such as 'naturalness', 'dynamics', and 'fun' and ordinary people chose 'politeness', 'tenacity', and 'culture of community' in the survey about Korean culture gene done by Korean Studies Advancement Center in 2012(Joo, Yeongha et al, 2012). Dynamics and tenacity of Korean culture are acknowledged by many foreign people. Therefore, the first word, which foreign people learn from Korean, is 'hurry, hurry'. It is thought that the passionate and challenging spirit, and Korean power with tenacity may be the representative culture genes of Korean.

RESEARCH METHOD

This study is a research on life history with the story of personal life of a research participant. The study on life history is one of the qualitative research methods exploring certain individual's life. It is said that the study on life history is the research method, which allows to find how the person views his or her own life and which role and identification he or she shapes(Goodson & Sikes, 2001), and it helps to find social and historical context and the researcher can construct knowledge together with the research participant. Therefore, the study on life history is the research method focused on that individual's entire life, and it must be possible to understand social and historical context through the story of his or her life. Fulfilling that, the chosen research participant must have social and cultural typicality related to the study subject(Min, Seongeun et al, 2017).

The first time I met this research participant at the Korean Education Center in Almaty Kazakhstan to study on life histories of Koryo Saram in May 2014. This study continued from May 2014 to July 2015, and the data was collected for 3 times through vivid stories that Koryo Saram experienced. And the photos provided by the research participants were used as the ancillary data. The written approval for the opening of that photos and recording of the interviews was obtained. I got help from the Russian students studying in Korea for the transcription work. To bring out the exact meaning of Russian words in the transcribed data in the process of

translation into Korean, several Russian students majoring Korean literature reviewed the transcribed and translated data. Analyzing the data selected through these process will be done on the third phase of the study of life history.

Table 1: Schedule of interview and the process of collecting data

The interview date	Place	Interview the time required	Other Details
2014.05	Korean Education Center in Almaty	2hours	Visiting Korean Education Center, exploring research participants and research methods, and having orientation for life history description
2014.05	Korean Education Center in Almaty	2hours	Presenting active attitude and willingly inquiring interview
2015.07	Korean restaurant in Almaty operated by nephew	2hours	Selecting a place for interview and inviting research participants

THE RESULT

Chae Yevgeniya is a typical model of female Koryo Saram of being weak in appearance but sturdy in spirit. Our research team ran an orientation for seniors at the school of elderly of Korean Education Center in Almaty about how to describe their own life histories. The reason why I got a strong impression from Chae Yevgeniya was her question: "Do you know Anna Karenina?" I was little hesitant, then she said "If you study me in depth, you can meet Anna Karenina, the passionate Russian woman.". This was the first time the research team met with her, and she showed willing to participate in the study. Because she wished to leave her story behind record for her children, grandchildren, and descendants to let them know tough but beautiful Koryo Saram's life. The educational meanings in her life are classified into four great categorizations.

4.1. *Passionate life in challenges and adventures*

Chae Yevgeniya moved to Tashkent, the capital city of Uzbekistan with her parents in 1950 at her age of 12. Since her father's hometown was Vladivostok and she was born in Yakutia, it is assumed that the reason of their migration is considered to come from her grandfather's migration. As she moved to Tashkent from a Russian rural area, she could experience a big city. She was good at Russian language in Uzbekistan as well as in Russia, she could be a model student at her school and a popular girl among students and teachers.

Chae Yevgeniya said her hobby was reading books, however it is thought that was more like studying than true reading. On this wise, Chae Yevgeniya strived to concentrate on her studies. Besides, she was challenging and adventurous to do something new as much as she concentrated in her studies. Her most favorite activities were like riding motorbike or skydiving.

“One of my hobbies was studying. I couldn't get the good score all the time, but I enjoyed the procedures of studying. During my college days, I did modern gymnastics, and even I won the first prize. My husband didn't let me do the motor sport due to its dangerousness, and I had to leave my parachute club because my weight was too light.”

It could be found that Chae Yevgeniya loved sports as well as reading books, and she enjoyed adventures and challenges. Her will of constant challenges regardless of the results seems extraordinary. She actually mentioned the novel <Anna Karenina>, and she did have a passionate romance. She proudly said she had raised her two children successfully without getting re-married after her husband died. It is assumed that the vivid memories of love made her small but sturdy in spite of her loving husband's absence. We, humans tend to build memories and to reminisce about them in hard times. It was possible to find a lesson from the case of Chae Yevgeniya that people try to overcome tough lives by doing such thing.

4.2. *Family and colleagues as a meaning of my life*

Every mother's love for her children is expressed in sacrificial love. To raise her two children without her husband, Chae Yevgeniya also worked as a chief of laboratory at the institute during daytime and taught chemistry at an evening university of technology at Chirchik during nighttime. She had to work as both mother and father for her children after her husband's death. She sent her son to a medical school to make him a doctor like her husband and her daughter to a college of education.

"I have taught at school and university for a long time. I worked very hard when I was young, however my income was small. It was too small to raise two children well. I couldn't do lecturing unless taking a doctorate, so I decided to be in the doctoral course. After I obtained the doctor's degree, I could get a job at 'Institute for General Science' and then became the chief of laboratory and I got good income. That job was the only work to be able to save my family with two college students."

Picture 1. Colleagues in the Research Institute (the second right in the front row. Chae Yevgeniya)

As she interviewed, Chae Yevgeniya said she must get a better job and be at a better position to support her family, and it can be understood that she achieved them by challenging to the higher course (the doctoral course). Her two children were what she lived for and the meaning of her life. It is assumed that two main reasons, which made a woman sturdy, were firstly love with her husband and secondly her devotion to her children.

Chae Yevgeniya said her former colleagues from the institute were like her family. She also said that her job was very important to her to be financially independent and to support her family, and her colleagues were like also family members.

"I think my job was the most important to me. I believe one's job is most necessary thing in one's life just like family, school, and religion. When you get a job, you can get to know the world through it and you can get through the world, I think. Of course, my job wasn't a part of a big famous company, but I believe the researches and studies that I've done were all necessary for our society to move forward. I think my colleagues were like my family and they were everything to my life. I am always grateful them, even now."

Chae Yevgeniya's interview would encourage us to gravely think about our professionalism and work ethics. She found how precious the job and colleagues were in the belief of that the job gave a chance of not only financial support but also self-realization and the colleagues were 'like family'. She has been endeavoring to maintain healthy relationships with other ethnics as a member of minority in Kazakhstan.

4.3. *Pride and ethnic education as Koryo Saram*

Wherever they settled down, the first thing that Koryo Saram did was to build schools. They together built schools earlier than their own houses for the ethnic education. As we can see the high educational zeal in Korea, it was able to see the Korean's educational spirit from Koryo Saram. Chae Yevgeniya also had great interest in education, and had various opinions on operation of Korean Education Center. As she raised her son and daughter well through the system of education, she was very enthusiastic about education.

"My grandchildren have dreams and chances to study. And that is very important. My parents did their best to give us the best educational chances then, and now my children are sending their kids to the best schools. I believe as they come from better schools, they can achieve greater goals. I think, after parents fulfill their responsibility for the education of their children, it is up to the children's intentions and efforts that what they will do then."

As shown above, Chae Yevgeniya had her own healthy philosophy of education as "Parents must be responsible for the children's education." It seems that she was fully aware of that there were correlations among parent's interest and support about education, and efforts and achievement of learners, as an education expert because she had years of experience in teaching at university. She also emphasized that the determination and efforts of corresponding learners were important. Chae Yevgeniya told about the social status of Koryo Saram in Kazakhstan as follows:

“Most of Koryo Saram in Kazakhstan are living well. They are successful not just in economical field but also in political field. I believe if our children contribute to the development of Kazakhstan, the presence of Koryo Saram here will be noticeable.”

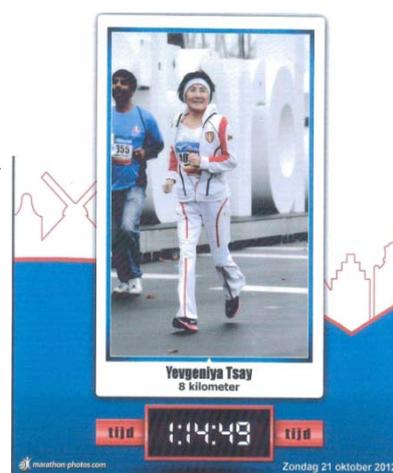

Then she complaint about his son and daughter spoke in Russian with their kids at home. She expressed her discomfort about her son and daughter speaking in Russian, she spoke in Korean at home though. However, she expressed pride in her grandchildren because they answered 'Kareiski' for the questions of where they came from. It could feel that she had dignity and pride about her ethnicity.

4.4. Not 'My' but 'We': culture of community of the Korean people

There are studies, which have shown that people who have lived life to the full are happier and have high self-efficacy. Chae Yevgeniya considers herself very happy and valued person, and a necessary person in the family and society. And she tells those beliefs to her descendants pleasantly. Although her past was hard enough for her husband's early death, but it is thought that was a process and motive she lived a life of devotion.

“Anyway, my life was so tough and difficult, but my daily life was very happy and I think I am still needed by my family and this society. Because my children, grandchildren, daughter-in-law, and son-in-law... they are living happily and especially there is the most important thing in their lives, love. My children take very good care of me and spend much time speaking with me.”

Chae Yevgeniya's most memorable thing with her children was that she participated in the Amsterdam Marathon at age of 75 and finished her 8km race with a record of 1hour 14minutes and 49seconds. As <Picture 2> shows, Chae Yevgeniya challenged to a marathon race with her son, daughter-in-law, and in-laws. Eventhough it is not easy for her age, she never stop to challenge if there is family with her.

Picture 2. Participating the Amsterdam Marathon

“I think I am still young and can live longer, I want to join in their lives. I participated in the Amsterdam Marathon at age of 75 because my children invited me to join. I always enjoy sports and like to walk, and that is why they asked me in. I ran 8km with my son, daughter-in-law, and in-laws. That was the biggest celebration in my life.”

As we can see, Korean's culture gene was found in Chae Yevgeniya who had never been to Korea. She had designed and lived her life in the community, that is family, and it can tell that the tenacity and passion of her continuous challenges in spite of her age over 70 are the culture of the Korean people with Korea's tradition. It shows that the national spirit is alive and breathing in the point of community spirit and culture which emphasize 'We' then 'My'.

CONCLUSIONS

Through the life of Chae Yevgeniya, the educational implications of Korean's cultural gene are quite great, even though their origins and backgrounds are far different. This study can find her passionate life, positive relationships with others as a member of minority, and her will to inherit national pride and spirit as Koryo Saram.

Parents were strongly responsible for their children's education, and they continued to respect the ethnic spirit and maintain ethnic identity through cultural practice rather than language. They shared the sense of duty that attempts to leave their children with the ethnical scent and not to forget the least ethnical culture and language to retain the identity of Koryo Saram lapsing naturally in the course of time.

A patriotic act can be found in Chae Yevgeniya's efforts to keep the daily life rituals without simplifying them to show the greatness of her mother country and people. The journey of life of Chae Yevgeniya who still join in a race and challenge has not been finished yet. Her life, which overcame wretched past and became a member of the country and society, where she migrated in, successfully, awakens passion and challenging spirit of the youth living in our times. The challenging spirit, which Chae Yevgeniya showed, seems to be the representative cultural gene of Korean.

Abstract

The exemplary family is a family that becomes the example towards the formation of a harmonious society. This is the dream of every family. However, the understanding about the formation of the exemplary family from the Islamic perspective has been neglected in forming a family. This study aims to study the perception of the participants who attended the course on the formation of the exemplary family, which is the 'Talk on Harmony' Program, towards the characteristics of the exemplary family according to Islam. The study design is a survey. The data were collected using the questionnaire instrument distributed to 63 participants of the familial course, which is the 'Talk on Harmony' Program, organized by the Malaysian Consultative Council of Muslim Women (*Majlis Perundingan Wanita Islam Malaysia* (MPWIM)), Islamic Da'wah Foundation Malaysia (*Yayasan Dakwah Islam Malaysia* (YADIM)) in Kuala Lumpur. The data were analyzed using the SPSS version 23 computer software, using descriptive statistics. Research findings show that the mean of the respondents' understanding of the characteristics of the exemplary family is high. This is reflected from examples such as, the family being an example to other families (4.47), a family who lives based on the teachings of the religion (4.52), a family who loves each other (4.55), a family who lives harmoniously in the society (4.45), and a family who is wise in managing its economy (4.37). It therefore shows that each family member must pay attention to refer to the Quran and Sunnah, and also the history of the prophet hood as their guidance in forming the exemplary family, as well as giving their cooperation in creating a successful exemplary family.

Key words: family, exemplary, harmonious, model, marriage

Introduction

A marriage is a type of worship that is encouraged by Allah the Almighty. One of the wisdoms of a marriage is to create a happy family. Through the bond of a marriage, a husband and wife is blessed by Allah SWT with offspring as their excitors. The fact is, every family member is in need of love and affection from each other. As said by Allah SWT in Surah al-Furqan (25), verse 74, which means:

"And those who say,"

"Our Lord! Grant unto us wives and offspring who will be the comfort of our eyes, and make us an example for the righteous".

According to the interpretations of al-Rahman (*Tafsir Pimpinan al-Rahman*), this verse states that all those who believe in Allah SWT would always make supplications to Him so that they are blessed with righteous and pious wives and offspring. In fact, they would also implore so that they are granted with vast knowledge to perform good deeds, and hence to be emulated by those who want to abstain from the prohibitions of Allah.

Thus, the demonstration of this happy family will form an exemplary family, and subsequently become the example and model for other families. An exemplary family is a family that can be emulated and can serve as a

role model for other families. According to Hasan (1994: 111), an exemplary family is a family that could be made as a guide, a role model, a source of motivation and encouragement, and possessing all that are good and noble to be emulated by other people. Muhammad Uthman (1991: 25) said that an exemplary household is one that is centered on the Quran and Sunnah, is good in its governance of the household economy, is always clean, is built on the feeling of love and affection, is a family whose members are mutually responsible, and also emphasizes on the children's education. According to Sidek Baba (2010: 70), the exemplary concept is the main factor in educating children on how to learn and emulate good deeds from other people. In the appreciation of this exemplary family concept, the Malaysian Consultative Council of Muslim Women (MPWIM), the Islamic Da'wah Foundation Malaysia (YADIM) has created the Exemplary Family Awards, starting from the year 2014. It is a recognition of the family that has successfully raised and developed excellent and quality offspring. The recognition of the chosen exemplary family will result in it being used as a role model, and thus bring about a positive image to other families (YADIM 2014:4).

Methodology

This is a quantitative research which design is a survey. The data were obtained from the analysis of the content of the Quran, the *tafsir* (the interpretations of the Quranic verses), theses, books, paperwork and journals. These data are used to support, enhance, and refine, as well as to deepen the researchers' knowledge of the theoretical aspects (Ahmad Sunawari Long 2014:100). Data were collected using the questionnaires which were distributed to 63 respondents. These respondents were purposively selected (purposive sampling) among the participants of the familial course "*Program Bicara Sakinah*" (Talk on Harmony Program) held in Kuala Lumpur, which was organized by MPWIM, YADIM on the 26th of April 2016. Purposive sampling is suitable to be used in this study because the researchers are required to set certain characteristics which should be available in the respondents. This is mentioned by Ahmad Munawar & Mohd Nor Shahizan (2015: 62), who stated that this procedure requires the researcher to set certain characteristics of the respondents of the study. The use of the questionnaire is further supported by Othman (2013: 167) who said that through a questionnaire, information from the respondents can be obtained easily, cheaply and quickly. The data were analyzed descriptively to determine the frequency, percentage, mean and standard deviation using the SPSS version 23 computer software. Results of the Alpha Cronbach show that 0.98 of the respondents have good understanding of the characteristics and concept of the exemplary family.

Research Findings and Discussion

A total of 63 participants have answered the questionnaire about the perception towards the characteristics of an exemplary family. The respondents are the participants of the familial course "*Program Bicara Sakinah*" in Kuala Lumpur. Discussion of the findings revolves around the respondents' background and their understanding of the characteristics of the exemplary family.

Background of the Respondents

Research findings show that the respondents involved in this study are between the ages of 18 to 74 years old. There are 4 respondents (6.5%) aged 41 years old. This is followed by 3 respondents (4.8%) aged 30, 48 and 52 years old. Next, there are 2 respondents (3.2%) each for the ages of 36, 37, 42, 44, 49, 51, 53, 60, 64, 69 and 70 years old. Finally, there is one respondent for each of the following ages 18, 31, 33, 39, 45, 46, 50, 61, 63, 65, 68, 73 and 74.

Table 1: Gender

Gender	Frequency (N)	Percentage (%)
Male	10	16.1
Female	53	83.9
Total	63	100.0

Source: 2016 Questionnaire

Table 1 shows that most of the respondents are female aged between 18 to 74 years old, compared to the male respondents. Most of the participants are in their 20s and 40s, and are individuals in the process of shaping the characteristics and personality of their family members. It is thus a necessity for them to attend parenting courses such as the '*Program Bicara Sakinah*'. The fact is, family development according to Sayyid Qutb (2010: 236) is a process of fair distribution of duties between the husband and wife, in the effort of creating a family that is able

to contribute to the survival of the religion and society in the future.

Table 2: Education

Occupation	Frequency (N)	Percentage (%)
Malaysian Certificate of Education	34	54.8
Malaysian Higher School Certificate (STPM)	2	3.2
Diploma	10	16.1
Bachelor's Degree	2	3.2
Others	15	22.7
Total	63	100.0

Source: 2016 Questionnaire

Table 2 shows the respondents' highest level of education, where 34 people (54.8%) own the SPM (Malaysian Certificate of Examination) certificate, 2 people (3.2%) with STPM (Malaysian Higher School Certificate), 10 respondents (16.1%) own a diploma, while another 2 of them (3.2%) hold a Bachelor's Degree. Meanwhile, the education level of another 15 respondents (22.7%) are not known. With this, majority of the respondents own a certificate in SPM (MCE), with 34 people (54.8%) compared to those with a higher level of education, which is a Bachelor's Degree at only 2 people (3.2%). The fact is, the parents' standard of education is very important in assessing their level of parenting skills. Studies have shown that parents with the highest level of education would demonstrate good parenting styles, which are in line with the education they have received. According to the study of Zarinah and Rozumah (2011: 62), a mother's level of education is her force and strength in educating and raising the children.

Table 3: Occupation

Occupation	Frequency (N)	Percentage (%)
Government	4	6.5
Private	9	14.5
Self-employed	27	43.5
Others	23	35.5
Total	63	100.0

Source: 2016 Questionnaire

Table 3 shows the occupations of the respondents involved in this study. 4 people (6.5%) work with the government agencies, 9 of the respondents (14.5%) work in the private sector, and 27 respondents (43.5%) are self-employed, while 23 of them (35.5%) are involved in other types of employment. The respondents' occupation in the category of self-employment is very high (43.5%), based on the respondents' age facts. The respondents' occupation in the category of government sector is relatively low (6.5%) because of the factor of the higher educational qualifications, as shown in Table 3. The truth is, employment is important in determining the level of the parents' parenting styles on their children's education. Research have shown that parents who have good occupation will educate their children well and spend their time wisely with them. According to Mustafa Daud (t.th: 4), the parents' income and employment status have a great impact on the development of their children's behaviour.

Table 4: Marital Status

Marital Status	Frequency (N)	Percentage (%)
Single	1	1.6
Married	50	80.6
Widowed	9	14.5
Others	3	3.3
Total	63	100.0

Source: 2016 Questionnaire

Table 4 shows the respondents' marital status. In this study, 1 person (1.6%) is still single, 50 respondents (80.6%) are married, 9 people (14.5%) are widowed, while another 3 (3.3%) fall in the category of others. Most of the respondents who participated in the parenting program fall into the already married category (80.6%), compared to just one person who is still single (1.6%), as shown in Table 4. This finding shows that there is a relationship between respondents who are already married and their employment distribution, and they are also more interested in taking part in familial courses to enhance their knowledge in family management. Hence, parenting programs are important in providing knowledge and skills for both parents in shaping their married life. Apart from that, parenting knowledge and skills are also equally important for individuals about to embark on their married life.

Table 5: Participation in Parenting Programs

Involvement	Frequency (N)	Percentage (%)
Yes	30	48.4
No	33	51.6
Total	63	100.0

Source: 2016 Questionnaire

Table 5 shows that the number of respondents in this study who participate in parenting skills programs are 30 people (48.4%). Meanwhile, 33 of them (51.6%) have never participated in any parenting skill programs. The percentage of respondents who are involved in parenting skill programs are at different levels. It can thus be said that the participation of the individuals in parenting skill programs, whether they are already married or not, is not important in the creation of a family.

Table 6: Understanding about the Characteristics of an Exemplary Family

No.	Statement	Strongly Disagree	Disagree	Not Sure	Agree	Strongly agree	Mean	SD
C1	Is a role model to other families	0 0%	0 0%	3 4.8%	31 50.0%	24 38.7%	4.47	.69

Source: 2016 Questionnaire

Table 6 shows the respondents' understanding about the characteristics of an exemplary family. C1 item "An exemplary family is a role model to other families" (Mean = 4.47). This characteristic is emphasized in the works of Hasan (1996: 112-113) and Muhammad Khairul & Rafikul (2011: 81-98) who said that parents should become the role models to their children, to educate the children so that they will set good examples to the society, to give them encouragements and motivation to build up their confidence, to become the children's

supervisors and advisors, to emphasize on their education, as well as to always monitor their children's interaction with other people. C2 item "The members of an exemplary family would always keep in touch with each other" (Mean = 4.45) and C3 item "The members of an exemplary family have mutual understanding between them" (Mean = 4.47). These characteristics are mentioned in the research of Muhammad Khairul (2011: 92), who stated that two-way communication plays an important role in the family institution, which requires both parents to interact wisely with their children. The strength of the family institution begins with good communication techniques used by the parents. This is further supported by Christopher Spera (2005: 130), who explained that parents could approach their children by getting involved in the children's after-school activities, such as by helping them with their school work, keeping track of their school progress, and by monitoring their activities with their friends.

C4 item "An exemplary family's life is centered on the religion" has a mean of 4.52. According to Muhammad Thalib (1993: 124), every parent needs to guide their children to lead their lives based on the religion and faith in Allah SWT, because they would be held accountable for their children's wellbeing in the hereafter. As a matter of fact, the father as the head of the family needs to guide and lead all of his family members towards the attainment of Allah's pleasure. The mean value for the C5 item "The members of an exemplary family love each other" is 4.55. As stated by Sidek Baba (2010: 115), parents need to show reasonable love and affection for their children, even when the latter make any complaints to them. As for the children, the display of their love towards the parents is made by showing respect towards their parents' commands. The C6 item "An exemplary family calls upon other people to perform good deeds" (Mean = 4.48). This characteristic is mentioned by Muhammad Thalib (1993: 166), who said that parents need to educate their children to do good deeds so that there will be no damage, hostility, bloodshed and life-threatening situations.

The mean for item C7 "An exemplary family practices effective communication" is 4.42. This is supported by Sidek Baba (2010: 108), who stated that a family that practices effective communication makes their children's thinking skills to develop and new ideas to be generated. In fact, the best example in communicating is through the examples shown by the individual who is speaking or giving the advice. Imam al-Ghazali defines good communication as one that is done from the heart, with the heart, and would subsequently develop a type of belief. Zaaba on the other hand, stated that communication is the process of strengthening a person's intellect and character, which is healthy thoughts. As for item C8 "An exemplary family lives harmoniously in the society", the mean is 4.45. Muhammad Thalib (1993: 145) mentioned that a family that lives and socialize in a society would establish good ties and rapport with their neighbors. This is achieved by visiting their neighbors regularly and having mutual respect for each other. The mean for C9 item "An exemplary family always perform congregational prayer" is 4.55. This characteristic is mentioned in the work of Nur Dalilah and Raihanah (2013: 157) who said that congregational prayer will have a positive impact on the development of an individual, as well as hindering a person from experiencing life problems.

C10 item "An exemplary family holds knowledge sharing sessions at home" has a mean of 4.29. The research of Muhammad Khairul and Rafikul (2011: 93) found that successful families have unity and family planning. This is because family activities will strengthen family ties since each family member would make time to perform their activities together. The mean for C11 item "An exemplary family practices having meals together with the family members" is 4.45. Noorfizah (1995: 15) mentioned this characteristic in her study, whereby family members are encouraged to always practice eating together. This is highly demanded because children could be educated properly in accordance with the teachings of the religion while having their meals together. In fact, the practice of eating together enables for a major part of the children's behaviour to be educated in accordance with the Islamic teachings. C12 item "An exemplary family always perform recreational activities together" (Mean = 4.39). Noorfizah (1995: 87) also mentioned that performing recreational activities help to form a more intimate relationship among all the family members, apart from enabling them to enjoy a different atmosphere compared to that at home. Meanwhile, A'dawiyah (2004: 90) stated that family members who perform recreational activities are able to clear their minds of their problems, reduce stress, and also keep their bodies healthy. This is because, Islam encourages its followers to always stay fit and to abstain themselves from various diseases.

C13 item "An exemplary family will always be present at the mosque for activities to enliven the house of Allah" (Mean = 4.44). According to Mohd Nur (2013: 302), a mosque is the place where the characters and morality of the Muslim generation are nurtured. As demonstrated by the Prophet Muhammad SAW and his noble companions by always bringing their children to the mosque to perform congregational prayers once they are able to take care of their own cleanliness and to fulfill their own needs. The mean for C14 item "An exemplary family contributes good ideas to the society" is 4.39, and the mean for C15 item "An exemplary family would always extend its help to the society" is 4.39. Muhammad Thalib (2009:148) mentioned this characteristic by stating that all forms of human relations are the ultimate relationship in human life, and it is

thus the duty of each individual to create a relationship bond in order to be blessed by Allah the Almighty. The research of Mohd Yusof and friends (2011: 42) found that familial and social relationships are important in ensuring the stability of the community's well-being.

C16 item "An exemplary family strives to resolve family conflicts in the best way possible" (Mean = 4.44). Based on the research of Nur Dalilah and Raihanah (2011: 161), it is found that a family whose members have poor level of prayer will create opportunities for family conflicts to happen. The mean for C17 item "The members of an exemplary family take care of their health by practicing a healthy diet is 4.42. This characteristic is mentioned by Nur Zahidah and Raihanah (2011: 40) in their study. They said that a family that is in good health and does not suffer from any illnesses, be it physically or morally, would benefit the individuals in the family. C18 item "An exemplary family manages the family economy wisely" has a mean of 4.37. The characteristic of managing the family economy wisely is mentioned by Siti Rahayu and Yu Kin (2013: 3). According to them, a good family is a family that is wise in controlling its financial management, whether in making purchases using coupons or doing so during sales, in order to save money which could be used for other purposes. Nur Zahidah and Raihanah (2011: 40) also stated that a family's economy has a huge impact on its members' peace and happiness in life. Therefore, every family needs to be encouraged to attain prosperity and goodness for its family members, such as having a stable income, a strong economy, good accommodation, education, as well as having the support of the whole family. C19 item "The members of an exemplary family would actively engage themselves in community activities" (Mean = 4.31). The work of Muhammad and Rafikul (2011: 96) found that a good religious leader is a person who is both respected and emulated by the associations in his or her society. In fact, the religious leader also plays an important role in the society.

The analysis of the mean scores presented show that the respondents' understanding of the characteristics of an exemplary family is at a good level for the establishment of exemplary families. Therefore, each family member would give their mutual cooperation and support for each other. Meanwhile, the family module of the State of Malacca (2005) specifies that in terms of strengthening the family and household institution, there are several noteworthy aspects such as the appreciation of Islamic values and practices, communication, and also the management of the family economy, in portraying the atmosphere of positive family life and vice versa.

Conclusion

Based on the findings of the research and the discussion made about them, it can be concluded that each participant of the familial course "*Program Bicara Sakinah*" has the knowledge related to the exemplary family. The characteristics of the exemplary family need to be applied since they play a huge role in the development of the exemplary family as required by Islam. Exemplary families are important in producing a harmonious generation, society and nation. The strength of the family institution symbolizes that the development of the children is also good, so that it is able to develop the society and the nation. Therefore, in each marriage, there needs to be deep understanding between the husband and wife about developing a family that is in line with the Islamic requirements. The couple would need to cooperate with other family members in creating the exemplary family, and would subsequently be emulated by other family members. Overall, the results of this research show the respondents' understanding about the development of the exemplary family in Malaysia. Once the characteristics of the exemplary family from the perspective of Islam have been identified, they can then be used as a guide for both the individuals and the society in the effort of creating families that are happy and to be emulated by the society.

ABSTRACT

This qualitative study focuses on providers of the so-called pseudo-social services to seniors in the Czech Republic who provide services without proper registration to elderly people dependent on the care of others. The aim of the research conducted through semi-structured interviews was to find out reasons leading the providers of these services to not being registered and to find out their opinions on that practice with an emphasis on the quality of the provided services. The data showed that the providers of pseudo-social services see their activity to be necessary and beneficial, especially to the seniors themselves and their family members. They often believe that they are able to meet the seniors' requirements better than the registered social services thus providing better quality. It is apparent from the research results that the providers of pseudo-social services offer their services to meet the public demand without which their "business" would disappear.

INTRODUCTION

The socio-economic transformations of the Czech society after 1989 and the associated processes of individualization, economization and marketization affected not only the market sector, but also penetrated the sphere of services, including social services. Consequently, the client is taken as a customer, the service provider as a seller, and services as a product of the market, which results in economization and marketization not only of these services but also of relationships and bonds. The requirements for services efficiency and quality have been increasing, the customer's satisfaction becoming a priority according to their individual needs. *Individualization brings more freedom and a sense of authenticity, but also more uncertainty, the risk of loneliness, and the feeling of insecurity* (Keller, 2005, p. 27). The emphasis is then placed on the financing of services, especially by the client, who decides which service to choose (Malík, Holasová, 2014). In the market area, the customer is paying for the services himself/herself whereas in the social sphere the clients receive allowances from the State to pay for them. Since 2007, social services in the Czech Republic can only be provided on the basis of registration under Act No. 108/2006 Sb., on Social Services (hereinafter referred to as the "Act"), which stipulates the maximum cost of reimbursement for specific acts. The client has a guaranteed price and can calculate the cost of the services he/she orders. The setting of the maximum possible price becomes a barrier for the service providers, as it often happens that the client's income does not cover the cost of the service provided, especially when his/her residence is in a remote location, far from the location of the provider's seat. The registered providers may apply for subsidies for the social services provided, but they have no guarantee of when and how much support they receive, and at the same time there is no relevant link between the quality of services and the volume of the subsidies allocated (Malík, Holasová, 2014). Therefore, multi-source funding is important for the providers to sustain their services. Marketization of the market also produces negative impacts, especially the lack of capacity or the absence of some types of social services offered. In connection with the above mentioned Šimfková (2015) also points out the danger of the low-income clients' inability to afford social services.

The situation described above opens up a space for the so-called gray zone, which includes activities to avoid control and is part of a shadow economy that includes illegal activities, i.e. moonlighting (Holman, 2010). In the Czech Republic, the gray economy can mostly be found in the area of household work and non-financial transactions. It also includes legal production and services, the income from which is deliberately not declared, or underestimated. Typical is a large number of small cash, unrecorded transactions whose primary purpose is to avoid paying taxes and insurance, or avoiding regulations (Rais, Klička, Road, 2015). The main problem with unregistered providers of field services for seniors in the gray zone is that they do not have registration to provide social services under the law and thus violate not only the legal rules but also the ethical and moral ones. In the area of provision of services without registration, this essentially includes the transfer of public resources spent through care allowances into the informal economy without the possibility of checking their quality. In this paper, we refer to services provided to seniors without proper registration as pseudo-social services. The term "*pseudo-social service*" is used to mean "false", or services that are not registered as social services in

compliance with the valid legislation, and therefore they cannot be called that way. In addition to the above mentioned designation, we also use the terms "*unregistered services*", "*unlicensed services*" and "*hidden services*" as synonyms, because they are not officially registered in any manner. Their system of operation is based on oral agreements between the providers and the clients, or in the case of elderly persons, their family members. In these services, care is usually given by a worker without professional competence and other qualification preconditions stipulated by law. Professional competence according to Section 116 of the Act means *acquiring the basic or secondary education and taking an accredited qualification course; taking an accredited qualification course is not required for natural persons who have acquired ... the competence to perform the medical profession in the field of nursing, ... the competence to pursue the profession of social worker ... and for natural persons who have acquired the secondary education in the field of education stipulated by the respective implementing legal regulation*. Another aspect is that there is no quality control in "hidden services", they are not bound by the standards of quality of social services, nor social work standards are secured there, as it is with the registered services subject to inspection. If a registered social service fails to meet the criteria, registration for the provision of social services may be withdrawn. The unregistered, or hidden, provider of pseudo-social services has nothing to lose. It should also be emphasized that the elderly users often need qualified health care which is difficult to obtain from unregistered social services providers. The issue of "business" in social services has been widely discussed in the past decade in the Czech Republic (see e.g. Malik Holasová, Gojová, 2013, Laan, 2006, Winkler, 2000, Musil, 1996), but not enough attention has been paid to the related pseudo-social services and their quality (see, for example, Vávrová, Dořičáková, 2016, Janebová, Celá, 2016, Janebová, 2015), as this is a new oncoming phenomenon that will sooner or later will have to be dealt with by the Czech legislation. The negative impacts of the market on social services, and not only for the elderly, are not exclusively a Czech problem as similar questions have been discussed in the scholarly Euro-American literature for at least a quarter of a century (see, for example, Starr, Holzhausen, 2012; Colombo et al., 2011; Brandt, Haberkern, Szydlik, 2009, Hwang, Powell; 2009, Mozos 2009; Sarasa, Billingsley, 2008; Eikenberry, Kluver, 2004; Harris, 2003; Clark, Newman, 1997; Barlett, Le Grand, 1993).

THE STUDY

The research aim of this qualitative study was to identify *the reasons leading the providers of unregistered services to the target group of seniors not to register their services, and to deal with this practice with an emphasis on the quality of the services provided*. In relation to this goal, we have identified the main research question: *What are the reasons of providers of unregistered services for seniors not to register themselves?* and a partial research question: *How does the fact that the services are unregistered influence their quality according to their providers?* A qualitative research strategy has been chosen because an inductively abductive way of research allows us to explore more dimensions of the problem, from the specific to the general ones (Padgett, 2017). The main components of qualitative research include the collected data, and the analytical and interpretative procedures through which we come to some conclusions or theories (Strauss, Corbin, 1997). The data collection was conducted through *semi-structured interviews with the pseudo-social services providers*. The criteria for selecting informants were (1) the fact that they were providing services to the target group of seniors for more than 1 year without registration, while (2) they knew about the statutory duty of the social service registration. We gained the informants by a deliberate selection using the snowball sampling technique (Moorse et al., 2009). We first contacted three providers, on the basis of informal relationships, about whom we knew that they were providing the pseudo-social field services for the elderly. They subsequently referred us to other providers of unlicensed services. In total, we obtained testimonies from 10 people. The description of the socio-demographic characteristics of the informants is shown in Table 1.

Table 1: The socio-demographic characteristics of the informants

The code of the informants	The education of the provider of unregistered services	The sex of the provider of unregistered services	The age of the provider of unregistered services	The type of the service provided	The type of license	The period of provision of the unregistered service
P1	Secondary school	female	64	field	none	1,5
P2	University	female	43	field	Trade certificate	5
P3	Secondary school	female	37	field	Trade certificate	5
P4	Vocational school	female	62	field	none	3
P5	Secondary	male	31	field	Trade	2

	school				certificate	
P6	Secondary school	female	40	field	none	3
P7	Secondary school	female	53	field	none	20
P8	Vocational school	female	38	field	Trade certificate	2
P9	Vocational school	male	65	field	none	1
P10	Vocational school	male	40	field	Trade certificate	2

The data source: the authors' own research, 2017

While conducting the research, we followed the ethical principles: anonymity was guaranteed to the informants, their informed consent was confirmed in writing, and each of them had a chance to interrupt or terminate their participation at any time during the research. The data collection in the form of interviews took place in a secure environment determined by the informant. The interviews were recorded as audio recordings and then literally transcribed and analyzed.

THE DATA ANALYSIS AND FINDINGS

The acquired transcripts were repeatedly read and analyzed using open encoding procedures and notes containing the emerging interpretations and conceptualizations (Howard, Berg, 2016). The transcribed material was thus analyzed in accordance with the approach known as the generic inductive qualitative model (Hood, 2014) or as a general encoding paradigm (Maxwell, 2005). The data was analyzed with the ATLAS.ti8 program which allows to capture and visualize the relationships within the social phenomenon examined. The resulting **64 found codes** were grouped by content relationship into **seven significant groups**:

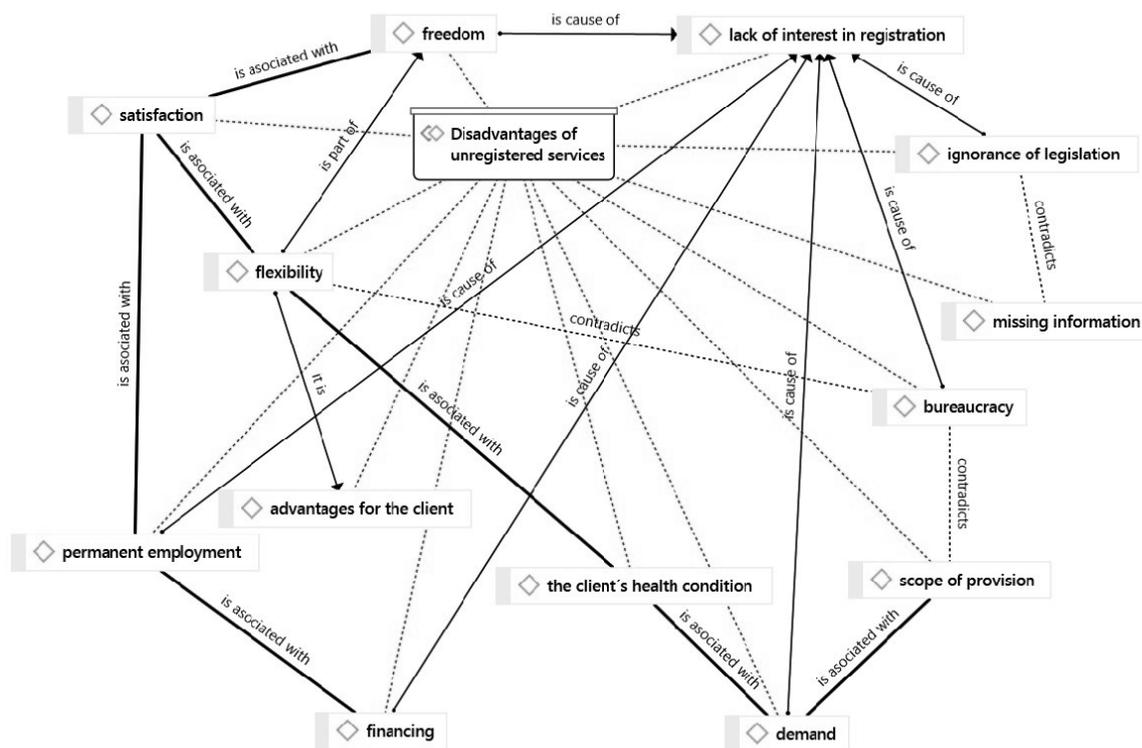

1. Reasons for non-registration

2. Disadvantages of unregistered services
3. Demand for services
4. Conflict with legislation
5. Benefits of unregistered services
6. Benefits for the client

7. Quality of services without registration

Following the research objectives, we present an analysis and results **(1) showing the reasons of the providers of pseudo-social services not to register** and **(2) their opinions concerning the quality of pseudo-social services provided**.

(1) The main reasons leading to non-registration of pseudo-social services given by their providers include in particular the high level of **bureaucratic** work associated with registration as well as their need for a certain level of **freedom** which the provider enjoys due to not being registered: ... *the need to comply with all the rules that registered services must comply with. Yeah, I feel some professional and personal pressure here (P3). I do not have to fill in statistical data like other registered providers ... that is terrible bureaucracy (P6). So, the bureaucracy - definitely in the first place, we do not have to go to various authorities and fill in really crazy applications, permissions, and so on (P7). Registered social services are connected with a number of absurd obligations that prevent employees from providing quality services (P9).*

Figure 1: Reasons for non-registration of field services provided to seniors

The data source: the authors' own research, 2017

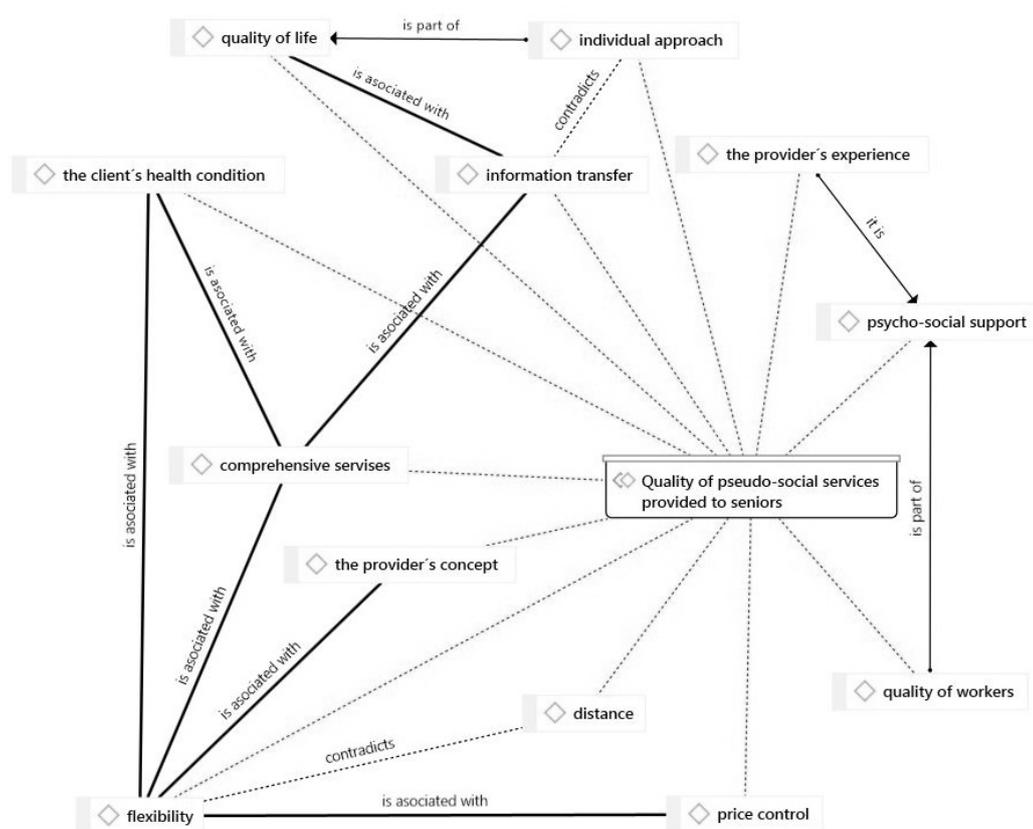

The interviews also revealed that some of the pseudo-social service providers are not registered because they do **not have** the necessary **information** or **knowledge of legislation**. They perform their services on the basis of a trade license, which is contrary to the law: ... *it was enough for me to come to the Trade Licensing Office and it was easy, I mean to get the license ... the trade license gives me what I have, we have clients that is why I did not need that. ... but I have more options due to my trade license, and I see that this is just an addition to it and it is not the key thing that makes my livelihood, I would not go into it (P3). ... so I started doing business with a trade license (P10)*. Others are **not interested in registering** because they do not see any advantage in that: ... *maybe, when I have more clients I will find some advantages, or, I do not know, I have not needed registration so far, not at all (P2)*.

Another reason is **flexibility** that allows for a **higher range** of services based on **demand** that is often dependent on the **health of the client**: ... *we are flexible and meet the client's needs (P3)*, which, according to unregistered providers, brings **advantages** especially for the **client**: ... *one has time, he/she can talk to their clients, have a chat, they are bound by time, there is no distinction*. According to providers of pseudo-social services, this approach brings **satisfaction** not only to clients and their family members, but also to workers themselves who are guaranteed **permanent employment**: ... *they need a long-term job (P2)* with an **adequate pay**: ... *I do not like to be institutionalized, because I like to be the master of my time (P7). I work according to how many clients I have, and I can also work more hours a day and even during holidays. No one regulates me. More hours also mean more earnings, and that's an interesting job then (P8)*.

(2) The data obtained also revealed that providers of pseudo-social services perceive their own activities necessary and beneficial, not only for the seniors themselves, but above all, for their family members, as they increase the **quality of their lives**: *Mostly, they are all seniors who still have children in the active age, that is, they are employed, and since there appear seniors with serious medical conditions such as carcinomas and the like, so there is essentially no certainty as to how long that person will or will not live, that is, when I decide, being, I do not know, at the age of fifty, for example, and I know that I'm still missing out on retirement, and now I decide to leave the job, I do not have a guaranteed job, I have no place to go, so if they are not the seniors but the family members, they use the services for these reasons because they are afraid of losing their jobs and looking for new ones. This is basically the most common case (P3). ... people turned to me for help with the problems they had in their family due to the lack of time to take care of the family member (P8)*. They also think that they are able to meet their requirements better than registered social services and provide **better care** (see Figure 2) based on an **individual approach**: *So there must be an individual approach (P1)*, **flexibility** associated

with a **comprehensive service offer** taking into account the current **health state** of the client and the **distance** of his/her place of residence: ... *in fact, everything that he asks for a person to live normally ... hygiene, also eating, anything, help, help, anything ... 24 hours a day ... providing health and social care, the provider having a social feeling and being simply available (P2). ... services provided daily, in the morning, at noon, in the evening (P4).* An important part of the quality is also, according to the providers of pseudo-social services, their experience and the quality of his/her staff: ... *I think, and I dare to say from my experience that these unregistered services are closer to the people, they can work with them sort of "better" ... I see the quality there. (P3). ... with the client, I do not have to count every minute, so I can perform better service, we can go out for a walk with the client, we can sit on the bench, read a book (P6). ... I do it, well, in a complex way... so it's mostly people at that terminal stage, you know. And there, what turned out to be good was taking care of the lady who was looking after her dying mother and was totally down, I take more care of her than her mother and they are amazed that it is, of course, no novelty at the market, for God's sake. But in fact we neglect them. As a society, we neglect such people. Or those caretaking institutions neglect them. (P7). The quality is derived from the quality of workers (P9).* The above mentioned principles are typical of the **providers' approach**.

Figure 2: Quality of pseudo-social services provided to seniors

The data source: the authors' own research, 2017

The research results show that providers of pseudo-social service are aware of **the information people share** as they offer their services based on the field-based demand without which their "business" would disappear. ... *some asked me to stay with them (P1). We have clients ... (P2). There was a great demand for our service (P3). They asked me, having no other option to get any service (P4). ... I was approached by someone (P5). My clients began to turn to me saying that there were no such services here and I more or less accepted their offer and started to do it. I always have some work (P6). The demand for my services is several times higher than what I can manage (P9). ... those who were interested in these services, ... also clients are approaching me ... it is common that a client or his/her family member who did not manage to find a registered service provider turned to us (P10).* They are often able to **regulate their fees** according to the client's financial situation. *I do not have an hourly rate ... it's always an agreement with the clients or their relatives ... in terms of money we try to achieve an agreement where my fee should not be higher than their allowances (P1). ... we can also be cheaper for the family (P7). ... I am able to offer the client a price according to their social and economic situation because I know the profession quite well (P9).*

CONCLUSIONS

The rising quality of life linked with the rising level of health and social care in all developed countries is one of the conditions for increasing life expectancy, which is associated with the aging of the population. In the near future, it is necessary to take into account the fact that the demand for health and social services provided to the target group of seniors will grow¹, and all developed social welfare states will have to allocate funds to ensure them. Following this, it will be necessary to regulate the existing inflexible network of quality social services and, if necessary, to modify the legislative conditions so that bureaucratic obstacles should not discourage service providers from registering, which guarantees a certain degree of quality. In the Czech Republic, in the current situation, a normal citizen can hardly distinguish a registered social service from a non-registered one. If he/she chooses an unlicensed service, because he/she has no other option, he/she is not protected by the State against possible "poor quality".

The results of the research showed that the main reason of Czech providers of pseudo-social services not to register is the high level of bureaucratic burden associated with registration under the law. They also mentioned personal freedom, flexibility and permanent employment with adequate financial income, which, in their opinion, the registration does not bring. One of the serious findings of the research was the fact that some providers of unregistered services do not know the legislation in force or do not have enough information about mandatory registration. Consequently, they act in violation of the law. In conclusion, we may say that the unregistered providers perceive their activities to be necessary and beneficial, even if they perform them "secretly", i.e. outside the main stream of registered social services. Clients and their family members turn to them especially in emergency situations where they need to ensure care and are rejected by registered providers who do not have sufficient staffing capacity or who provide social services only in limited times or in a certain territory. Providers of pseudo-social services often believe that they are able to provide better services to their clients than registered providers as, in their opinion, they meet individual needs of clients and their families better, e.g. they can, among others, regulate the price for the provided social and economic services according to their clients' social and economic situation.

ABSTRACT

The aim of this study is to identify the importance and place of sports in leisure activities of the 3rd and 4th year P.E (Physical Education) students in the Sports Departments and Schools of Sports Sciences and Technology of Hacettepe, Gazi, Ankara, and Middle East Technical Universities, as well as to define the relationship between leisure activities and demographic characteristics.

A total of 348 students, specified through a stratified sampling method, participated in this study. Data was collected through a questionnaire with multiple-choice questions prepared in the light of the variables defined by the researcher. The questionnaire was applied to the students studying in the departments of Schools of Sports.

In the questionnaire, the students were asked multiple-choice questions related to their leisure- sports activities and their participation in such activities. The evaluation of student demographic characteristics and how they utilized leisure-sports activities were shown in percentages and frequencies and the connection between them was defined by Craner's V test.

A significant connection between gender and the preference of leisure-sports activities has been noted in the study. The reasons for the preferences were; the time allocated for leisure-sports activities, the rate of making use of the facilities, lack of sufficient of equipment, problems faced with the facilities used, and the organization of leisure activities.

Key words: Leisure activities, sports, demographic characteristics

INTRODUCTION

Development in technology and industrialization, today, has brought about several changes, which affect human life-style and cause new behavioral adaptations (Çamlıyer, 1991: 23).

Sports and human life are two inseparable unity. As assumed in all world countries, except in our case, sports activities are one of the most effective ways in raising a healthy and reliable generation, in development and even to take a place as a nation in the developing century.

It is a fact that we have a young generation in which the student population is the most sensitive, dynamic, open to innovations, and initiating part. The students in higher education occupy a very important place and are our source of happiness as well as the potential inspiration trust for the future. Therefore, issues to do with the students and their leisure activities are common concerns of all higher educational institutions. In this respect, as for all countries, leisure activities are closely related with social, cultural, economical, political, and managerial systems of our country (Mutlutürk, 1991: 76).

In recent years, university students participate in recreative activities and spend their leisure time provided for them as partly organized facilities during their university studies. In this respect, universities have a leading role in the students' using their free time productively. While the recreation programs and the infrastructure develops interaction among the young generation, it also satisfy their reasons for participation (Balci, 2003: 163).

The concept of "Leisure" has been defined differently, but similar to each other by several writers.

Tezcan (1992) defines "leisure" as "*it is the time when an individual feels free of all self or others-oriented obligations and does an activity of his/her choice*" According to Abadan (1961), "*leisure is the free period when one doesn't have to sleep, eat, do cleaning, attend classes, study or work somewhere*". "*Leisure is the free period for someone except from time to work, sleep, and meet other needs*" add Gökmen & Açıklım (1985: 33).

Participating in outdoors sports activities for university students can not be compulsory. A student wishes to prove himself/herself in a branch of sports he/she prefers to learn more and develop skills. The involved, in this respect, must try to meet students' needs and expectations with the facilities available because if an individual does not have satisfaction in what he/she prefers to do, then he/she may become inclined to be involved in unwanted activities. When young individuals do not have any worth activities during their free time, they usually pick up bad habits (Aydoğan, 1993: 86).

Young people have different preferences and expectations in the use of their free time. Young ages are very important in one's life because it is the phase when one matures regularly and continuously (Özbay & Öztürk 1989: 21).

Kılbaş (1994) underlines the advantages of the use of "leisure" as; "selffulfilment", "adventure", "selectiveness", "self-expression", "creativity", "variety of interests", and "socialization".

The most important reasons for participating in leisure activities are; "getting pleasure in what one does", "doing something different from ones work", "interacting with friends", "having new experiences", "feeling the happiness of success in some issues", "experiencing the feeling of being creative", "doing something good for the society", and "spending time".

The facilities for sports activities for university students in our country are directly proportional with the investments done in this field by the universities. When we consider the issue as sports only, we see that there are many problems faced. The main handicaps are facilities, equipment, infrastructure, teaching staff etc. In order to eradicate or minimize such problems and lead students to sports encouraging and pains-taking organizations are necessary, through which will increase the number of the young generation who will know and enjoy the sports environment more, and use their time in useful activities. As a result, this will constitute the future society with individuals able to form healthy friendships, respectful to rules and regulations, eager to struggle, respectful to others' rights, harmonious, successful, and understanding

METHODOLOGY

Research Method

A quantitative research method was made use of in this study. It is a "Related Research" model which is a descriptive study, a general search model. It was a case study aiming at defining student views about the effect of "the place and role of sports in leisure habits of university students". With the quantitative method it was aimed to find out the factors affecting leisure habits of the students as well as to specify any changes in terms of their demographic characteristics. The scale was a questionnaire composed of multiple-choice questions with statements in which students' demographic structure and the level of leisure habits were specified.

The Participants

In the 2015-2016 academic year, a total of 348 students, 52 from Hacettepe University, 258 from Gazi University, 27 from Ankara University, and 11 from ETU (Middle East Technical University), were picked through random sampling method as participants.

Data Collection Tool

A questionnaire with multiple-choice questions related to their leisure habits was conducted to collect data to specify their leisure activities and their participation in these activities

The questionnaire was in two parts. The first part was of seven questions to define the participants' personal characteristics. The second part was of twenty questions to define their leisure habits and the place of sports in their habits. A total of 27 multiple-choice questions were asked the participants

Data Analysis

The data collected in this study was analysed through SPSS 20.00 program and the students' responses were given in percentage (%) and frequency (f) distribution. Cramer's V test was conducted to specify the relationship. The meaningfulness level was set as $p < 0.05$

FINDINGS

The tables below show the role of age, gender, and the universities they are studying at in terms of leisure activities

Table 1: Distribution of the students in terms of their ages

Age range	f	%
20 – 21	66	19
22 – 23	209	60.1
24 – above	73	20.9
Total	348	100

As it can be noted in Table I, %19 of the students were between the ages of 20 – 21, %60.1 of them were between 22 – 23, and %20.9 were 24 and over

Table 2: Distribution of the students in terms of their gender

Gender	f	%
Female	138	39.7
Male	210	60.3
Total	348	100

As Table 2 shows, %39.7 of the students were female and %60.3 were male

Table 3: Distribution of the students in terms of the universities they were studying

University	f	%
Hacettepe Univerdity	52	14.0
Gazi University	258	74.1
Ankara University	27	7.8
METU	11	3.2
Total	349	100

As in Table 3, %14.9 of the participant students are from Hacettepe University, % 74.1 are from Gazi University, %7.8 are from Ankara University, and %3.2 are from METU.

Table 4: Student interest in sports

Interest in sports	f	%
Spectators	41	11.8
Licenced sportsmen	183	52.6
Sports for health	78	22.4
For fun	46	13.2
Total	348	100

As Table 4 reveals that %11.8 of the participant students are interested in sports as spectators, %52.6 are licenced sportsmen, %22.4 do sports for health, and %13.2 are interested in sports just for fun

Table 5: Lenght of leisure the students have

Period	f	%
Have no time	35	10.1
1 – 2 hours	79	22.7
3 – 4 hours	159	45.7
5 hrs. and over	75	21.5
Total	348	100

As it is shown in Table 5, %10.1 of the students do not have time for leisure activities, %22.7 have 1-2 free hours, %45.7 have 3-4 free hours and , %21.5 have five or more free hours

Table 6: The distribution of facilities available for use for leisure

Facilities	f	%
School facilities	187	53.7
Club facilities	47	13.5
GSGM facilities	16	4.6
Private gyms	18	5.2
Official facilities	15	4.3
Free nature	30	8.6
Total	313	89.9

It can be noted in Table 6 that %53.7 of the students make use of school facilities, %13.5 make use of club facilities, %4.6 benefit from GSGM facilities, %5.2 go to private gyms, %4.3 use official facilities, and %8.6 benefit from the nature.

Table 7: How much do students benefit from school facilities for their leisure?

Period	f	%
Every day	59	17
Once a week	146	42
3-5 times a week	108	31
Total	313	89.9

The findings in Table 7 indicate that %17 of the students make use of school facilities every day, %42 of them once a week, and %31 of them 3-5 times a week.

Table 8: The relation between universities and the problems in the use of the facilities for leisure

Shortages on the facilities														
	Illimination		Material		Heating		Equipment		Dressing rooms		W.C/Shower		Total	
	f	%	f	%	f	%	f	%	f	%	f	%	f	%
H.U	-	-	19	5.5	1	0.3	1	0.3	28	8	3	0.9	52	14.9
GU	5	14	84	24.1	15	4.3	14	4	74	21.3	66	19	258	74.1
A.U	-	-	16	4.6	1	0.3	1	0.3	3	0.9	6	1.7	27	7.8
METU	-	-	-	-	-	-	-	-	11	3.2	-	-	11	3.2
Total	5	1.4	119	34.2	17	4.9	16	4.6	116	33.3	75	21.6	348	100

Cramer's V= 0.223

H.U: Hacettepe University

G.U: Gazi University

A.U: Ankara University

METU: Middle East Technical University

Table 8 reveals a significant relation among the problems faced in terms of use of the facilities for leisure

Table 9: The reasons for picking sports-branches for leisure

Reasons	f	%
I have the ability and I'm very good at it	101	29
I'm with my friends	41	11.8
For a healthy life	76	21.8
Location suits me	2	6
For fun and excitement	93	26.7
Total	313	89.9

As Table 9 shows, %29 of the participant students stated their preferences as because it was the only branch they were good at. %11.8 preferred it to be with friends, %21.8 considered it to be healthy, %6 preferred it because of the location, and %26.7 did it for fun and excitement.

Table 10: The relation between gender and leisure preferences

REASON	GENDER				TOTAL	
	Female		Male		f	%
	f	%	f	%		
I!m very good at it	58	16.7	53	15.2	111	31.9
To be with friends	8	2.3	41	11.8	49	14.1
For health	28	8	56	16.1	84	24.1
Location suits me	1	0.3	1	0.3	2	0.6
For fun and excitement	43	12.4	59	17	102	29.3
Total	138	39.7	210	60.3	348	100

Cramer's V= 0.241

Table 10 indicates a significant relation between the reasons for sports preferences and gender.

Table 11: The rate of participation among students in leisure activities organized by the school

Rates		
Do you participate?	F	%
Yes/I participate	109	31.3
No/I don't participate	240	68.7
Total	348	100

Table 11 shows that while %31.3 of the students participated in leisure activities organized by the school, % 67.7 of them do not do so.

CONCLUSION AND SUGGESTIONS

The findings from the research and suggestions based on the results are presented in this section.

FINDINGS

%60.3 of the participants were male and %39.7 were female, most of them between the ages of 22-23.

The distribution of the participants in terms of the universities they studied at was as; 52 from Hacettepe University, 258 from Gazi University, 27 from Ankara University, and 11 from METU, selected through a random method. As for their demographic characteristics, the majority of them were between the ages of 22-23, the number of male students was higher than the female and the biggest number of them were from Gazi University.

A big majority of the participants were licenced sportsmen. %24.4 of them did sports for health, %13.2 for fun, and %11.8 were interested in sports as spectators. While many went to matches, some did not do so. Öncü (2014) did a study in P.E (Physical Education) departments of some universities in Ankara related to students' leisure activities and found out that %96.9 of them were spectators in competitions Another finding showed that the majority of the participants were interested in sports for health.

%10.1 of the students stated that they did not have any leisure time, %22.7 had only 1-2 hours, %45.7 had 3-4 hours, and % 21.5 had 5 or more free hours for leisure activities. Today, it is assumed that, parallel to the developments in technology, people spend less time at work or for other activities and so they have more free time.

It is also noted that, people spend less time at work and other activities and because they do the same things every day, they feel bored and need to spare time for leisure activities, which is becoming a crucial part of life.

When we examine the distribution of facilities students make use of for leisure and the rate of benefit they get from school facilities, we see that %13.5 of them use club facilities, %8.6 benefit from nature, %5.2 go to private gyms, %4.6 use GSGM facilities, and %4.3 prefer official facilities. %63.5 of the students complain about insufficient equipment as a handicap in their leisure activities. %15.8 are unhappy about the lack of activities they want to do. %12.1 of the participants express worries that, because of their jobs, they can spare little time for leisure activities or they are hindered.

It has been noted in this study that the students can benefit from university courts only one day a week. 167 (%48) of them benefit from the courts once a week, 113 (%32.5) use the courts 3-5 times a week, and only 68 (%19.5) students use the courts every day. This rate seems almost equal at Gazi University, Ankara University, and METU, but at Hacettepe University the students can make use of the facilities for 3-5 days. The differences are due to either insufficient capacity of the facilities or the students' less leisure time. This indicates that there is a significant relation between leisure time and the benefit students get from school facilities. %42 of the students benefit from school facilities once a week, %31 3-5 times a week, and %17 use the facilities every day. %61.8 of the students spare 2 or more days to do leisure sports, %23.6 spare one day a week, and %4.6 spare one day a month for leisure sports activities. %53.7 of the students make use of school facilities in their leisure.

When students' time spared for leisure sports activities, the rate of benefit they get from school facilities, availability of equipment, and the relation between the school and organization of leisure activities are concerned, it can be noted that in all schools they have 2 or more days. 266 (%64.9) students spare 2 or more days a week, 32 (%9.2) spare a day a month. These findings indicate the existence of a significant connection between the universities and the time the students spare for their leisure activities.

%34.2 of the students relate the insufficiency of school facilities to lack of material and %33.3 to dressing rooms and wardrobes. %21.6 complained about the problems to do with showers and W.C. %4.9 expressed worries about weak heating, %4.6 raised views about limited equipment, and %1.4 found illumination very weak. The participants strongly emphasized that such problems should be eradicated without any delay. The biggest problem at Hacettepe and METU is with dressing-rooms and wardrobes. On the other hand, Gazi and Ankara Universities experience problems with limited material.

A solution to these problems is believed to help a lot the number of participants in leisure activities which will have sound contributions to the benefits of leisure activities. Therefore, the involved should consider more about this issue. A big majority of the students state that they benefit from the school facilities with limited equipment and pointed out that they can use the facilities only one day a week. They relate this to the fact that the courts are fully occupied and the capacity is quite low. They also expressed worries about the problems they face with the dressing-rooms, showers, and lavatories. It has also been noted that a big majority of the students did not participate in the leisure activities organized by the universities, with the fact that the universities lacked the activities the students preferred.

There are several factors in picking a preferred leisure activity. %29 of the students pick activities in which they are good and are suitable for them in terms of their abilities. %26.7 pick activities for fun and excitement, %21.8 for health, and %11.8 for the sake of being with friends. These findings indicate that students prefer the activities they are good at and get more pleasure in doing them.

As for the relation between gender and leisure preferences, 138 (%39.7) of the participants were female and 210 (%60.3) were male students. When we examine the reasons for leisure sports activities, we see that most students prefer branches suitable for them and they can do. Male students prefer the branches for fun and excitement. The findings reveal the relation between gender and the reasons for preferences.

The participant students spend 3-4 hours daily on leisure activities on their own. It is clear that parallel to technological developments, people spend less time at work and other activities and thus they can spare more time for their leisure. The lessening of activity hours as well as the boredom they feel with doing the same things, lead them to leisure activities. The participation in activities organized by the universities is low. %68.7 of the students do not participate in these activities, but only %31.3 do, which is an indication of low participation. The reason for this is, as stated by the students, that they do not get the pleasure in these activities, but they are more interested in different branches. They argue that if branches they like are included in the activities, there will be more participants.

The findings show that a big majority of the students do sports in their leisure. The students come from almost the same sports culture and they have very similar concepts and views. It has been clearly noted that they prefer branches they are good at and do them as much as they can with the limited equipment and facilities provided by the universities they are studying at. In our country, it is obvious that leisure activities and education in organizational fields are supported with the aim for communal change, and help individual personality development (Kılbaş, 2001).

The fact that, a big majority of students start leisure activities at university years, the involved should organize leisure activities and lead the students to participate. Therefore, the type of recreation activities the students participate in, length of participation and type of organizations should be considered and provide the students with the organizations and facilities they prefer to participate in. More participation can be a positive factor in this issue.

At the end of this research, it has been clearly noted that there is a significant relation among the student preferences of leisure activities, gender, the time allocated for leisure, equipment available, the rate of making use of the facilities, and the activities organized at universities. A big majority of university students are almost at the same age. Their priority in the activities is their skills and the pleasure they get. However, insufficient equipment and facilities limit their sports activities. This research was carried out to specify students' demographic characteristics and the what sports they do in their leisure.

ABSTRACT

Social media addiction is considered as a sort of Internet addiction. Individuals who spend too much time on social media have a desire to be notified of anything immediately, which can cause virtual tolerance, virtual communication and virtual problems. Behaviours that force the person into these actions can be explained as social media addiction. This study aims to determine the relationship between social media addiction and life satisfaction among university students as well as the effect of social media addiction on predicting life satisfaction. The participants are composed of 612 (380 female, 232 male) university students. Social Media Addiction Scale-Adult Form (Şahin and Yağcı, 2017) and Life Satisfaction Scale (Diener, Emmons, Larsen and Griffin, 1985; Köker, 1991) were used in the data collection process. Pearson product-moment correlation coefficient and regression methods were used to analyse the data. The results indicated that there is a negative relationship and moderate correlation between life satisfaction and social media addiction. There is also a significant relationship, according to the regression analysis, between life satisfaction and social media addiction levels.

Keywords: Social media addiction, life satisfaction, university student.

INTRODUCTION

Internet is such technology that makes it possible for people to get all sorts of information in a snap and to communicate with other people at a fast pace. With this feature, internet has been a tool of communication penetrating every sphere of human life. Internet in today's world is a popular tool used by not only adults and teenagers but also children and seen as a free time activity in a multitude of countries across the globe.

According to the Internet World Stats (2017), the number of Internet users worldwide has reached to four billion. The proportion of Internet and social media usage (e.g. Facebook) to population is 27,7 and 11,7 % in Africa; 45,2 and 13,4 % in Asia; 77,4 and 39,9 % in Europe; 59,6 and 55,8 % in Latin America; 56,7 and 30,3 % in the Middle East; 88,1 and 62,1 % in North America; 68,1 and 51,7 % in Australia. In Turkey, according to the same survey, the proportion of Internet users is 59,6 % and that of social media (Facebook) is 53,2 %. The rate of increase over the last 15 years is 93,4 %. According to the Turkish Statistical Institute (TUIK, 2016), the proportion of individuals using the Internet in Turkey is 61.2%. As for the purposes of Internet usage in Turkey, 82.4% of individuals who use the Internet in the first three months of 2016 have shared their social networking profiles/photos, messages and content. This ratio is higher among adolescents and students when compared to the other age groups (TUIK, 2016).

Social media is one of the most important means of communication today. The frequency of social media usage has increased in parallel with the increase in frequency of Internet usage (Tektaş, 2014). Over the last few years, social media use has become an increasingly popular free time activity in a multitude of countries across the world (Kuss & Griffiths, 2011). People visit social media sites to engage in many different types of entertainment and social activity, including games, time-wasting, socialising, posting photos, and communicating (Allen, Ryan, Gray, McInerney, & Waters, 2014). Excessive (Ceyhan, Ceyhan and Gürcan, 2007) or problematic use (Young, 1988; Davis, 2001) of the Internet or being online for 8,5 to 21,5 hours in a week (Yang and Tung, 2007) is defined as addiction.

Addiction is generally evaluated in terms of using substances like alcohol, drug, and tobacco. Recently, it is argued that such behaviours as gambling, eating, and sleeping cause addiction, too. As Fidan (2016) points out, addiction comprises technological devices and applications like computer, Internet, online games, mobile phone, etc. Internet addiction is accepted among the most common types of technological addiction today (Young, 1988; Şahin, 2011). Internet addiction (Young, 2004), online addiction (Tüzer, 2011), game addiction (Fisher, 1994; Horzum, 2011), social network addiction (Griffiths, 2012), cybersex addiction (Schwartz & Southern, 2000), mobile phone addiction (Bianchi & Phillips, 2005; Fidan, 2016), Facebook addiction (Andreassen, Torsheim, Brunborg &

* This work was supported by the Ahi Evran University Scientific Research Projects Coordination Unit. Project Number: EGT.A3.17.014

Pallesen, 2012), Twitter addiction (Said, Al-Rashid & Abdullah, 2014), and social media addiction (Andreassen, Torsheim, Brunborg and Pallesen, 2012; Şahin ve Yağcı, 2017) have been investigated in the context of behavioural addiction and are gaining importance in tandem with the developing technology.

Social media addiction is regarded as a kind of Internet addiction (Kuss and Griffiths, 2012). Being hooked on social media, wanting to be always online on social media, being directed with uncontrolled motivations and being affected negatively in other spheres of life due to this situation are regarded as the symptoms of social media addiction (Andreassen and Pallesen, 2014).

There are an increasing number of researches in the literature on the relationship between social media usage and human psychology (Pempek Yermolayeva and Calvert, 2009; Correa, Hinsley and de Zúñiga, 2010; Salehan and Negahban, 2013; Lepp, Barkley and Karpinski, 2014). Some indicate that social media use make people happy (Eren, Çelik and Aktürk, 2014). Others usually consider life satisfaction as personal contentment (Diener, Emmons, Larsen, & Griffin, 1985). Ellison et al. (2007) argue that mostly individuals with low levels of life satisfaction seek to join in social media in order to improve their psychological well-being.

The main argument about how life satisfaction leads to problematic Internet or social media use is that people prefer to spend more time on the Internet so as to avoid the feeling of dissatisfaction and to seek psychological satisfaction (Demir, Peker Özköklü and Aygün Tuğrul, 2015). Spending more time on the Internet to keep away from life dissatisfaction is seen as a significant factor increasing the possibility of problematic Internet use. Accordingly, Internet turns into a pretext to evade the sources of dissatisfaction and leads to problematic use (Çelik and Odacı, 2013; Esen, 2010).

Based on the reasons above, this study aims to determine the levels of life satisfaction and social media use among university students and put forth the relationship between their levels of life satisfaction and behaviours of social media use.

Objective of the Study

This study aims in general to analyse the relationship between social media addiction and life satisfaction as well as the effects of social media addiction on life satisfaction. The answers are sought for the following questions:

1. Is there a significant relationship between university students' social media addiction (virtual tolerance and virtual communication) and their life satisfaction?
2. Does university students' social media addiction significantly predict their life satisfaction?

METHOD

Study Model

This is a descriptive study based on a survey model. As it is known, survey models aim to reflect an existing situation as they are (Karasar, 2016). This study aims to examine the relationship between social media addiction and life satisfaction among the students of Faculty of Education.

Study Group

The participants included 612 students (380 female, 232 male) from different grade levels in the Ahi Evran University Faculty of Education. Distribution of the participants per grade level is as follows: 31,9 % of the participants (195 students) are first graders, 19,4% (119 students) second graders, 30,9 % (189 students) third graders and 17,8 % (109 students) fourth graders. The average age of the respondents is 20,34±1,10.

Data Collecting Instruments

The data were collected via "Demographical Information Form", "Social Media Addiction Scale: Adult Form" and "Life Satisfaction Scale". Psychometric properties of those measuring tools are specified below.

Demographical Information Form: Needed information about the participants' demographical characteristics such as grade level, gender, and department was obtained through a personal information form.

Social Media Addiction Scale - Adult Form: The SMAS-AF developed by Şahin and Yağcı (2017) is a five-point Likert type scale including 20 items that can be gathered under two factors (virtual tolerance and virtual communication). Confirmatory factor analysis showed that the two-factor model fitted the data ($\chi^2=7051,32$; $sd=190$, $p=0,00$; $RMSA=.059$; $SRMR=.060$; $NFI=.59$; $CFI=.96$; $GFI=.90$; $AGFI=.88$). Internal consistency coefficients of the subdimensions were ,92 for virtual tolerance and ,91 for virtual communication. Coefficient of total internal consistency was ,94. Test-retest reliability coefficients were found as ,93 for the scale in total; ,91 for

virtual tolerance and ,90 for virtual communication. The analysis proved that SMAS-AF is a valid and reliable scale that can be used to determine social media addiction among adults.

Life Satisfaction Scale: Life satisfaction was measured using the Turkish version of the Life Satisfaction Scale (Diener Emmons, Larsen and Griffin, 1985; Köker, 1991). This is a five-item, self-reported, seven-point Likert-type measurement scale (1=strongly disagree to 7=strongly agree). Higher scores indicated higher levels of psychological well-being. The scale measures overall life satisfaction and is suitable for use with individuals of all ages from adolescent to adult. The scale was translated to Turkish using the Face Validity technique developed by Köker (1991). The correlation between the scores of each item and the total scores of the scale were satisfactory. The test-retest reliability value of the scale was .86, the internal consistency coefficient was .80, and the test-retest reliability coefficient was .85.

Data Analysis

The students were divided into groups, and the scales were implemented in the classroom. The participants were fully informed of the purposes of the study before the scales were administered. Pearson product-moment correlation coefficient and regression methods were used to analyse the data. SPSS 22 was used while analysing the data.

RESULTS

This section includes the results of the analysis carried out to determine whether social media addiction and life satisfaction levels of students participating the research vary or not in accordance with the independent variables.

Findings related to students' social media addiction and life satisfaction levels are specified in Table 1.

Table 1: Students' social media addiction and life satisfaction levels

Variable	N	M	SD	Level
Virtual tolerance	612	24,72	9,26	Low
Virtual communication	612	17,20	7,01	Low
Social media addiction (Total)	612	41,92	15,03	Low
Life satisfaction	612	23,47	6,95	moderate

Table 1 shows that students' life satisfaction level is moderate, while their level of social media addiction and the relevant subdimensions is low. The relationship between students' life satisfaction and social media addiction and subdimensions was calculated via Pearson correlation technique and the results are presented in Table 2.

Table 2: Correlation between students' life satisfaction and social media addiction levels

Variable	VT	VC	SMA	LS
Virtual tolerance (VT)	1,00			
Virtual communication (VC)	,70*	1,00		
Social media addiction (SMA)	,94*	,90*	1,00	
Life satisfaction (LS)	-,27*	-,32*	-,31*	1,00

N=612, *p<0.01

As seen in Table 2, there is a significant negative correlation between students' life satisfaction and social media addiction ($r=-,31$; $p<.01$) as well as their average scores of virtual tolerance ($r=-,27$; $p<.01$) and virtual communication ($r=-,32$; $p<.01$). This significant negative correlation between the scores means that the score the students get on a dimension decreases when their score on another dimension increases. We also studied whether the subdimensions of social media addiction predict life satisfaction.

Table 3: Multiple regression analysis of social media addiction in terms of life satisfaction

Variable	B	Std. Error	β	t	p	Partial R	Part r
Constant	29,469	,790		37,296	,000		
Virtual tolerance	-,067	,040	-,089	-1,657	,098	-,067	-,064
Virtual communication	-,252	,053	-,255	-4,743	,000	-,189	-,182
R=,323 R ² =,105 F _(2,-609) =35,540 p=.000							

The results of multiple regression analysis on how social media addiction and its subdimensions predict life satisfaction are seen in Table 3. Accordingly, there is a low-level, negative and significant relationship between social media addiction and life satisfaction ($R=.323$, $R^2=.105$, $p<.01$). Two subdimensions of social media

addiction account for only 10 % of the total variance. T-test results regarding the significance of regression coefficients indicate that only virtual communication is a significant predictor of life satisfaction, whereas virtual tolerance, the other variable, is not effective to a considerable extent.

DISCUSSION AND CONCLUSION

Internet as a mass communication tool is increasingly impacting and penetrating every sphere of human life, which gave rise to the emergence of sites of social networks called social media. This study examined the relationship between social media addiction and life satisfaction among university students.

The results indicated that the students' level of social media addiction is low while their level of life satisfaction is moderate. A significant negative correlation was observed between the students' life satisfaction and social media addiction and their average scores on virtual tolerance and virtual communication defined here as the subdimensions social media addiction. Social media addiction and its subdimensions show a high-level positive intercorrelation. The mentioned subdimensions are significantly coherent with each other. The more the participants are addicted to social media, the less they are satisfied with life.

As the regression analysis showed, social media addiction is an important predictor of life satisfaction, albeit affecting it negatively. According to the t-test results regarding the significance of standardized regression coefficients, virtual communication as a subdimension of social media addiction is an important predictor of life satisfaction ($p < .01$). However, virtual tolerance does not appear to be a significant predictor of life satisfaction ($p > .01$).

There are several studies supporting this result in the relevant literature. Balcı and Koçak (2017), Satıcı and Uysal (2015), and Spraggins (2009), for example, assert a positive relationship between social media use and life satisfaction. However, there are some studies not supporting the results of this study. Doğan (2016), Oh, Ozkaya and LaRose (2014), Mahan Iii, Seo, Jordan and Funk (2014), Ong and Lin (2015) argue that social media usage positively predicts life satisfaction.

In today's world, technology is progressing at an unbelievable speed and continually connects people of every age and type. This is the case for teenagers in particular. Considering the countries that are going through a process of change and development, e.g. Turkey, it is observed that technological processes and SNS are on the increase and becoming more of an issue (Doğan, 2016). From this point of view, social media use has a considerable place in students' life and negatively affects their life satisfaction.

In conclusion, there is a low-level, negative and noticeable relationship between social media addiction and life satisfaction. Social media addiction is an important variable in predicting life satisfaction. Social media addiction affects life satisfaction of university students in a negative way to a significant extent.

The number of studies examining the effects of social media on people in both Turkey and abroad is limited. We think it is worthwhile to carry out similar studies using different samples and variables.

Abstract

This research aims to describe the high-order-thinking process of students around coffee plantation in solving open-ended problems on topics germane to coffee. The present study was a descriptive research with qualitative approach. The research participants were 80 students chosen from elementary and primary high schools around a coffee plantation. High order thinking skill denotes the ability to think critically and deploy metacognition capacity encompassing the following indicators: (1) the ability to solve the problems, (2) the ability to give reason and evidence, (3) the ability to communicate, and (4) the ability to reflect and evaluate. The research results indicated that elementary school students tended to have problem-solving ability related to themes regarding coffee with different possible answers, but they were unable to provide logical reasons and evidences, and they were unable to reflect and evaluate the answers given. Furthermore, students' high order thinking skill in junior high school around the coffee plantation was also not maximal in that students were only able to provide various answers correctly along with the logical reasons and evidences. However, those junior high school students were unable to reflect and evaluate on the process of solving open-ended problems. In general, the tendency of the students around coffee plantation indicated that the students did not have a maximum high order thinking skill in solving the open-ended problems related to themes pertinent to coffee. It was because the students still had yet to master satisfactory metacognition ability, particularly germane to the ability to reflect and evaluate and the ability to give logical reasons and evidences.

Keywords: Thinking process, critical thinking skill, metacognition, coffee plantation

INTRODUCTION

Indonesia is the third largest coffee-producing country in the world after Brazil and Vietnam. Furthermore, East Java is the second largest coffee producer in Indonesia and Jember is the second largest city producing coffee after Malang in East Java (Suratno & Kurniati, 2017). This evinces that most of the regions in Indonesia, especially Jember district, are coffee plantation areas. This is also in line with the existence of several schools devoted to providing education around the coffee plantation.

The ability of students around the coffee plantation of Sidomulyo Jember in solving the problem on themes pertaining to coffee within the realm of Mathematics and Science is very low, in that the students are only able to do problem solving operation procedurally as taught by the teacher by writing simple mathematical formulae. However, the students have difficulty deploying the knowledge related to coffee and their experience in coffee farming when they deal with solving problems at school (Suratno & Kurniati, 2017). In addition, the cognitive thinking ability of students in Jember district in solving high-order thinking problems, especially those complying with PISA standard (The Program for International Student Assessment), is reported to be low inasmuch as it only reaches the exploration and comprehension stage, while at the stage of representing and formulating daily-life problems, the students have not been able to develop these competencies (Kurniati & Annizar, 2017).

Based on the data aforementioned, making changes in classroom learning especially for Mathematics and Science lessons is inevitable. In this study, Mathematics and Science teachers around coffee plantations are accustomed to applying conventional instruction with expository methods. The task given by the teacher is routine task in that the completion stage is similar to what the teacher has taught. Therefore, critical thinking

skills and metacognition of these elementary and primary school students around coffee plantations do not develop optimally. The determination of learning models which match the characteristics of the students around the coffee plantation and focus on the ability of high-level thinking is based on the students' initial ability and condition, one of which is their thinking process. So and so, the results of the present study are expected to help teachers to determine the instructional model or method or approach suitable to develop high-order thinking ability of the students, especially critical thinking and metacognition skills.

High-order thinking skills, based on Bloom's Bloom's Taxonomy, consist of analytical skills (C4), evaluation (C4), and creation (C5) (Anderson & Krathwohl, 2013). At the level of C4, C5, and C6, students are said to have high-order thinking ability because students are able to perform investigations, analysis, conclusion formulation, and the invention of new ideas from a problem given by teacher. The other abilities of high-order thinking are critical thinking, logical thinking, reflective thinking, metacognitive thinking, and creative thinking (Collins, 2014). Furthermore, Brookhart identifies high-order thinking skills in three categories, namely knowledge transfer, critical thinking, and problem solving (Brookhart, 2010). Referring to the notion of high-order thinking skills above, the indicator of high-order thinking in this study only focuses on the ability of critical thinking and metacognition. The selection of these two indicators is because the abilities feasible for maximum development to the students in coffee plantation area only pertain to the ability of critical thinking and metacognition. As such, future study can focus on the other facets of high-order thinking abilities.

Critical thinking categories consist of providing logical, reflective reasonings that focus on "believe or do" thought (Norris & Ennis, 1989), and "artful thinking" consisting of reasoning, questioning and investigating, observing and describing, comparing and connecting, finding complexity, and exploring viewpoints (Barahal, 2008). Furthermore, critical thinking and problem-solving skills according to P21 encompass the ability to reason effectively, use system thinking, make judgments and decisions, and solve problems (P21, 2017). In critical thinking skills, the term *thinking* means that students can apply decisions and procedures with critical reasons.

Metacognition is the knowledge that focuses on the cognitive processes in the thinking process of each student and produces all thoughts and activities required in thinking (Desoete, Roeyers, & Buysee, 2001). Metacognitive skill denotes a component of the executive control of individual's cognition. Metacognitive skills refer to three skills which comprise of self-monitoring skills, self-assessment skills, and self-regulation skills (Kayashima & Inaba, 2004).

Based on the theoretical studies concerning critical thinking and metacognition abovementioned, the high-order thinking indicators in this research pertain to the indicators of critical thinking and metacognition, *inter alia*: (1) problem solving ability, (2) the ability to give reason and evidence, (3) the ability to communicate, and (4) the ability to reflect and evaluate. First, the problem-solving skill referred to in this study is students' ability to understand problem, design the problem-solving strategy, implement the strategy that has been designed, and re-check the problem solving process. In addition the problem-solving abilities under investigation are also based on students' collaboration, which complies with the ability stipulated in P21. Collaboration-based problem-solving ability is an important component that can be useful in the daily life of students as the question given is an open-ended daily-life questions (Ras, Krkovik, Greiff, Tobais, & Maquil, 2014). Second, the ability to provide reasons and evidence related to the problem-solving process is the ability to state the reasons for each step of problem solving along with relevant definitions and theorems. Third, the ability to communicate in question constitutes oral and written communication. Written communication is related to the ability to write symbols related to Mathematics and Science, the ability to provide detailed answer, and the ability to connect materials that have been studied with the learning experience surrounding themes regarding coffee. Furthermore, oral communication is related to the students' ability to present the results of problem solving. Fourth, the ability to reflect and evaluate under investigation is pertinent to the ability to re-check answering process and to determine other methods or solutions of the solutions already given. If the students' answers are found erroneous, then they will be able to locate the error and able to rectify it. Problems given to the students are problems that are related to themes concerned with coffee and problems of non-routine matters. Non-routine problems in this regard are open-ended in nature, which are open to various answers and solutions for a single problem.

RESEARCH METHOD

The present study was qualitative descriptive in nature, which was devoted to gaining the description of high-order thinking skills particularly pertinent to critical thinking skills and metacognition of students at elementary and primary schools situated around Garahan coffee plantation in Jember. The high-order thinking skills under investigation were scrutinized when the students dealt with open-ended questions related to themes on coffee covered in Mathematics and Science subject. Research subjects in the study were 80 students chosen from 2

elementary schools and 1 primary school in the aforementioned area. The determination of high-order thinking process was backgrounded by the accomplishment of students' thinking process, which met 4 indicators. The indicators of critical thinking and metacognition of the students in the research comprised of (1) problem-solving ability, (2) the ability to provide reason and evidence, (3) the ability to communicate, and (4) the ability to reflect and evaluate.

The phases in the present study encompassed (1) providing open-ended questions germane to themes concerned with coffee to the research subject, (2) analyzing the students' answer so as to probe their critical thinking and metacognition process, (3) carrying out data triangulation through interview to gather more data, which had yet to be obtained during test item accomplishment, and to confirm students' answer, and (4) drawing conclusion pertinent to the students' critical thinking and metacognition process by referring to the analysis on test performance and interview. The determination of research subjects was done by snowball throwing, coupled with guided open-ended interview.

In addition to analyzing the results of test and interview, observation on students' performance during taking the test through think aloud method was made operative. Students were requested to speak softly upon accomplishing the open-ended questions given. The clues of students' tendency in high-order thinking process when doing open-ended question were amassed by transcribing all results obtained from the test, interview, and think aloud process into tables, so the tendency of thinking process could be made visible.

RESULT AND DISCUSSION

The subjects in this research were 50 students of grade V and VI at Sidomulyo 3 Public Elementary school of Garahan village, Silo, Jember, and 30 students of class VII at Satu Atap Primary school of Garahan village, Silo, Jember. All research subjects worked on open-ended questions for Mathematics and Science materials with the theme concerning vegetative cultivation of coffee. The questions given were 4 essay questions which had to be done in 90 minutes. Before students worked on the open-ended questions, they had been asked to write a short story of their experiences related to farming coffee and a short description on whether their parents owned coffee plantation or worked as labourers at coffee plantation. There were 60 students whose parents worked as laborers at coffee plantations and 20 students whose parents had their own coffee plantation. All students knew and even once experienced the process of farming coffee through grafting and the process of determining the spacing between coffee trees in order for proper growth.

The students' tendency in working on open-ended questions was limited to accomplishing 1 out of 4 questions given, with the ability to provide logical reason and the reflection ability found low. The data obtained from the open-ended question found out that 5 students could answer 2 questions correctly, 50 students could work on 1 question, and 25 students could not answer the questions correctly. Each cluster of data was analyzed in terms of the tendency in critical thinking and metacognition.

The students who could answer 2 out of 4 questions had medium high-order thinking ability as they only mastered satisfactory problem-solving ability and communication ability, be it oral or written. On the other hand, in terms of the ability to provide logical reason and evidence as well as the reflection and evaluation ability, the students had yet to be competent. The students tended to think procedurally when solving problems as taught by their teacher. As such, their answers in doing open-ended questions were correct, yet their ability was not maximal. Upon accomplishing the first question, the students tended to apply the knowledge taught by their teacher, but they had not provided logical reason and evidence related to their experience concerned with farming coffee. When working on question 2, the students could in fact do it correctly and write symbols of the angle and width of two-dimensional figures to determine the spacing between coffee trees. The students' reflection ability on question 2 developed quite well, because they could do re-checking when they accomplished open-ended question and they could find out other ideas or answers, which were different from the initial answers. These additional answers or ideas were based on their experience in farming coffee aged at 0-6 months old. In addition, they also were able to find out the cutting angle of coffee stalk for grafting, which was tapered angle ranging from 35 to 65 degrees.

The students who could answer 1 out of 4 questions had low high-order thinking ability with satisfactory problem-solving and communication ability, be it oral or written. However, their ability to write symbols was proven erroneous in that they used hectare for meter scale. The symbols of width, circumference, and length for the spacing between coffee trees were written correctly. The ability to provide logical reason and evidence as well as the reflection and evaluation ability were not evident in the students with low high-order thinking ability. The students tended to think inductively as they worked on open-ended questions in that they referred to several examples of coffee planting they experienced when helping their parents. Mathematics knowledge they mastered was proven very low, inasmuch as they had yet to apply the formula of circumference, width, and angle determination based on mathematical theorems and definitions. The students were not able to determine

the ideal angle for grafting, yet they were only able to determine tapered angle without any precise figure. The students could not determine the ideal age of coffee stalk for grafting, but they could determine the stalk diameter for the very purpose, which was 15 cm. The students could not determine the solution or find out new idea for question number 1 as they were only able to provide 1 correct solution.

The students who were not able to do the questions correctly were classified as having no high-order thinking ability. This was because they had not been able to master (1) problem solving ability, (2) the ability to give reason and evidence, (3) the ability to communicate, and (4) the ability to reflect and evaluate. The students were unable to solve the open-ended questions due to the following reasons. (1) They never knew the vegetative cultivation process. (2) Their parents did not work in coffee plantation. (3) The mathematical ability germane to determining the circumference and width of two-dimensional figure, angle of a figure, and length was not maximal. (4) The students' knowledge related to grafting and vegetative cultivation was not maximal.

The research findings evinced that the elementary school students tended to master problem-solving ability related to themes concerning coffee with variant answering process, but they were not able to provide logical reason and evidence, nor were they able to do reflection and evaluation on the answers given. Furthermore, the high-order thinking ability of the primary school students around the coffee plantation had yet to reach its uttermost inasmuch as they were only able to provide various correct answers supported with logical reason and evidence. Nevertheless, these primary school students were not able to do reflection and evaluation on problem-solving process on open-ended questions. In general, the students' thinking tendency had yet to attain maximal high-order thinking when working on open-ended questions related to themes concerning coffee. This was because the students had not mastered satisfactory metacognitive abilities required, particularly pertinent to reflection and evaluation ability as well as the ability to provide logical reason and evidence.

CONCLUSIONS

Based on the data analysis scrutinizing the students' tendency of thinking process, the study concludes that in general they have yet to master maximum high-order thinking skills in dealing with solving open-ended questions concerned with themes on coffee. This is because they have yet to master satisfactory metacognition ability, particularly the ability to reflect and evaluate as well as the ability to provide logical reasons and evidences.

SUGGESTIONS

One suggestion resulting from the study recommends teachers of Mathematics and Science teaching around the plantation area to determine apt instructional model or method or approach for developing their students' critical thinking and metacognition skill. Critical thinking and metacognition process of the students revealed in this study can serve as the cornerstone to extrapolate elementary and primary school students' initial ability in solving problems related to themes concerning coffee.

ABSTRACT

Due to the language limitations of hearing-impaired students, it is important to organize field courses and language courses with an interdisciplinary way in vocational education programs. The aim of the study is to examine the cooperation process between Professional Language courses and Language Arts courses to support career awareness activities of hearing-impaired students, as part of familiarizing their profession and preparing after graduation process. The research was conducted with senior students of The School for the Handicapped, Anadolu University, in fall and spring semesters of 2015-2016. The research was an action research project. The courses involving career awareness and career planning activities were supported interdisciplinary by language courses. At the end of the research, it was determined that students were able to use the terms and concepts of career planning, perform activities, and that the studies were enable students necessary repetitions and contribute langugae skills of students.

Key words: Hearing-impaired students, employment, career awareness, interdisciplinary, language development

INTRODUCTION

Effective use of language skills, composed of reading, writing, listening, and speaking, has strong influence on personal and academic life of a person. Field courses in vocational education programs require effective use of reading and writing skills. Due to the language limitations of hearing-impaired students, it is important to provide language support and to perform field courses with interdisciplinary studies.

Interdisciplinary approach is a cooperation based approach that combines two or more disciplinary fields together and provides contribution to learning process from all parties (Jacobs, 1989). Today's educational programs should support the development of the students, who can easily understand critical thinking, can learn general or specialized issues by themselves, can act independently. Researches underline the integration of knowledge from different fields and the interdisciplinary unification through the cooperation between the courses from different fields (Jacobs, 1989; Schirmer, 2000).

Progressively, general and special education programs are organized according to the methods of interdisciplinary aducation (Glynn, Aultman ve Owens, 2005). Silliman and Wilkinson (2004) listed the benefits of interdisciplinary education programs, in which same topic is studied with different time periods by two or more experts from different disciplines through different teaching methods, and materials, and activities as: a) Concepts and terms are used various ways in different disciplines. These repetitions provide permanence in learning. b) Interdisciplinary education may help students to establish relationships between the parts of education program, to learn the information they missed during the lessons, and to transfer the information to

other domains. c) Interdisciplinary education may also help to create opportunities for students to establish relationships between their learning and their daily life experiences.

It is important for hearing-impaired students, who have limited vocabulary and language skills, to have a professional terminology in order for their success in academic and professional life. On this base, it can be said that supporting vocational education of hearing-impaired students with language courses and conducting field and language courses together are important. Vocational programs, planned as interdisciplinary and courses, performed to help students for learning professional knowledge and terminology, affect the development of students in a positive way (Jacops, 1989; Schirmer, 2000). With intensive and systematic education programs that suits the needs of hearing-impaired students, they are able to gain literacy skills and required skills for their profession as their normal hearing peers (Kertschmer & Kretschmer, 1978; Paul, 1998; Richek, Caldwell, Jennings & Lerner, 2002; Walker, Munro & Rickards, 1998).

Examining studies on disability and hearing-impaired individuals in Turkey indicate that majority of the research is related with the following issues; distribution of disability by types, demographic features of disability, law and regulation issues, descriptive studies of educational methods, and reports, prepared by various institutions about disability (Akardere, 2005; Genc & Cat, 2013; Karasu, Girgin, Uzuner, Kaya, 2016; Mamatoglu, 2015; Ozgokceler & Alper, 2010; Ozturk, 2011; Turkiye Ozurluler Arastirmasi Raporu; 2002; Uzuner et al. 2011).

For the employment of hearing-impaired individuals, Erdiken's two descriptive researches (2003-2007) on employment of hearing-impaired collage graduates and an action research of Uzener and Derican (2013) on preparing effective portfolio were found. Referring to this field that have considerably small number of research appeared, it is determined that there is a need for research on career awareness and development of career planning of hearing-impaired students and on employment of hearing-impaired students in Turkey. Due to the limitations in language skills of hearing-impaired students, this type of studies, conducted with hearing-impaired students, necessitates language support, in other words, need for an interdisciplinary approach.

The research was conducted with the senior students of Anadolu University, The School for the Handicapped (SfH), in 2015-2016 school year. It was part of a larger research, which was examined the activities and processes of career awareness and career planning of hearing-impaired senior students. In this research, cooperation process of language and field courses and how this cooperation was established will be explained.

THE STUDY

With the aim of improving educational activities in educational settings and examining educational process, the research was carried out with action research method. Action researches, which are originated from the needs of their participants, involve how teachers may improve their practice, with one or more teachers, consultants, and managers, examining the improvements and taking required actions (Fraenkel & Wallen, 2003). Action researches show a cyclical character, which is continuous and interrelated. (Figure 1)

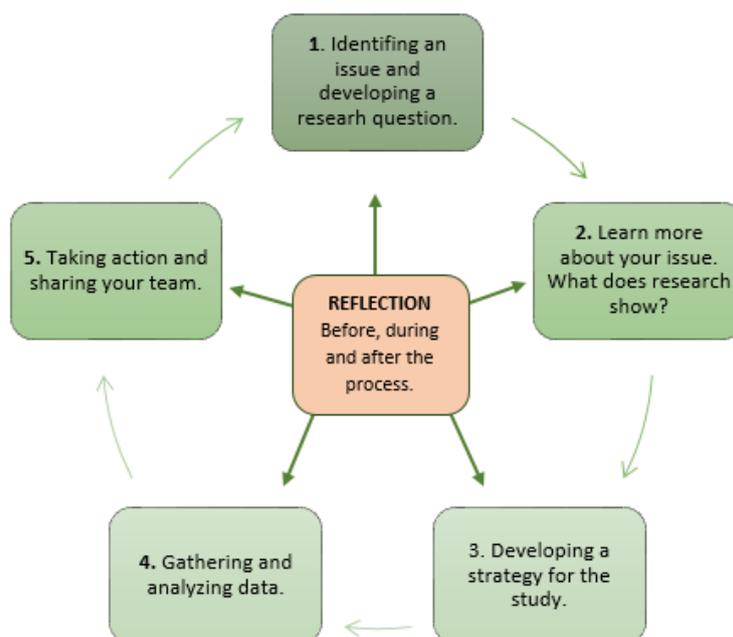

Figure 1: The Action Research Cycle (KNILT-2011)

Setting

The research was carried out at the School for the Handicapped, which was established in 1993-1994 and is one and the only institution that provide vocational education for hearing-impaired university students in Turkey. The school provides education in four programs; Graphic Arts Bachelor's Degree Program, Ceramic Arts Bachelor's Degree Program, Computer Operator Training Associate Degree Program, Architectural Drafting Associate Degree Program.

The data of the research was collected in four classrooms; two language classrooms, one classroom of Architectural Drafting Program, and one computer laboratory of Computer Operator Training Program. Physical conditions of all the classrooms are organized considering the needs of hearing-impaired students (Girgin, 2003). The windows of all classrooms had curtains and blinds and walls of the classes were covered with echo preventing sound insulation material. Also, language classrooms had carpets.

Participants

The participants of the research were senior students of SfH, researchers, and the members of trustworthiness committee. The participant students were 26 senior students, who attended Graphic Arts Bachelor's Degree Program, Computer Operator Training Associate Degree Program, Architectural Drafting Associate Degree Program. The average age was 23. One of the students used cochlear implant and all the others had ear level hearing aids. The 16 of the students had severe level hearing impairment, seven of them had profound level of hearing-impairment, and three of them had moderate level of hearing impairment. Communication was based on 'Whole Language' method in classrooms. Before the research process, students were informed about the purpose and the process of the research and written permission letter was taken from them. Since Ceramic Arts Program had no senior student, during the research process, students of this program did not involve in the research.

The research data was collected by the first author, who was carried out the courses "Writing and Speaking Skills" and "Turkish Language Skills," and the second and third authors, who were carried out the courses "Professional Language" and also responsible for the field courses of vocational programs. Trustworthiness committee also involved internship coordinator and advisor. Researchers were faculty members, who had around 20 years of experience both in their professions and in the education of hearing impaired. In addition, they had experience in action research and participated to action research projects, doctorate studies and book translation projects in the field. The researches of them were presented international congresses and published in academic journals. Internship coordinator, who participated to the study, had 18 years of experience with

hearing-impaired students and had a certificate of sign-language. She also participated to all focused courses of the research in order to enrich the coordination between the researchers, who conducted the courses. Field expert, who was the advisor of the research, had a 31 years of experience in the field of hearing-impaired and participated to action research projects as researcher and coordinator.

Data Collection Techniques and Analysis

Research data was collected through; classroom observations and video recordings, reports and voice recordings of research meetings, course plans and reflections, products of students, documents, interviews, e-mail and Facebook messages and sharings, diaries, and Whatsapp messages. For validity and reliability study of the data collection tools and techniques, expert opinion had been taken. Data collection and data analysis were conducted concurrently. In relation to the goals of the research and based on the decisions taken in research meetings, the data was systematically, cyclical and reflectively analysed.

Research Process

Hearing-impaired university students, who attended different programs of SfH faced with various problems in their daily and private lives and in their academic developments, due to their language limitations. Students required language support for their daily language use and for the field courses. For that reason, in addition to vocational courses in SfH, there were intensified compulsory and elective language courses in each program. Researchers needed to make regulations for the improvement of career awareness of students, because of the problems, which involved insufficient internship process of students, unpreparedness of students for post-graduation issues and their weaknesses to cope with these situations, and communication problems, due to language limitations. For providing solutions to these problems, an action research was designed by the researchers. Application data of pilot study was started to collect in 2014-2015 school year. With the action plans, which planned and developed in the process, defined activities were performed and placed into the programs of the school.

Application data of the research was collected, enriching with new activities, concurrently in “Professional Language” and “Language Arts” courses of the programs that have senior level students, in 2015-2016 school year. For the purpose of the development of career awareness, defined activities were performed (Table 1). In “Writing and Speaking Skills” and “Turkish Language Skills,” courses, the contents of Professional Language courses were supported by enriching the terms and concepts of aforementioned activities, examining various types of document and form examples, ad making “text correction exercises” for the texts of the students.

Table 1: Performed Activities, Type of Language Support and Dates

Activities	Type of Language Support	Dates
Internship Story	5W1H writing exercises	19 and 26 October 2015
	Text correction exercise	9 and 16 November 2015
	Language correction for presentations	9 ve 16 November 2015
Interview with Graduates 2016	Interview and observation	14-16 October 2015
	Text correction for posters	2 December 2015 -13 January
Job Application Portfolio	Examination of necessary documents for job application	29 February/7-14 March 2016
	Exercise for resume writing	29 Şubat/7-14 March 2016
	Exercise for completing job application form	7-21 April 2016
	Exercise for writing job application letter	
	Exercise for writing reference letter	
Workplace Visits	Question preparation and Poster presentation	11-21 April 2016

FINDINGS AND CONCLUSIONS

In the research, which was carried out with action research, the findings, of which the cooperation process between language and professional language courses and how this cooperation was performed, were explained through weekly cycle of the research and conducting process of each activity.

The Weekly Cycle of the Research

In the research that examined the cooperation between language and field courses, the weekly cycle of the research is presented in Figure 2. All of the courses and monitoring meetings were conducted systematically and in a cyclical way. In the research, overall evaluation of the research process was provided continuously, through the decisions that were taken during the meetings and reflective evaluations made after the courses.

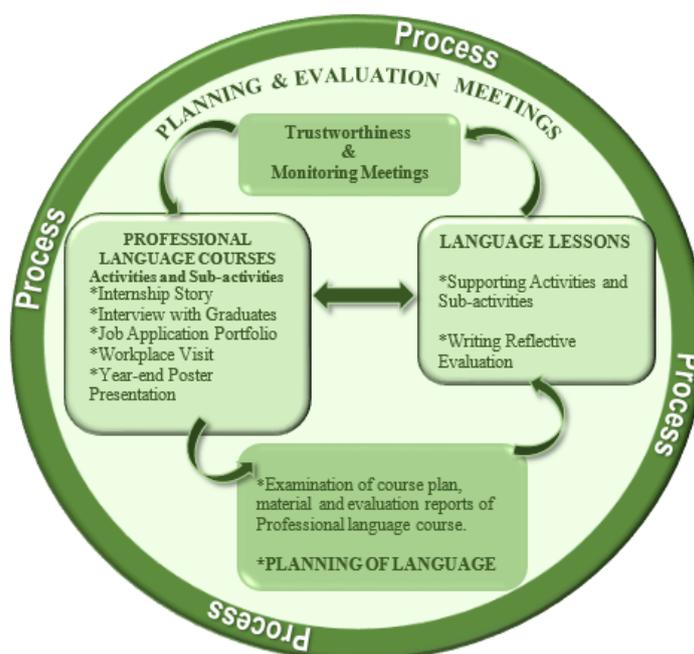

Figure 2: The Weekly Cycle

The trustworthiness and monitoring meetings were held on Tuesdays. Discussions on application of the decisions taken in previous meeting, action plans that were developed for the problems, planning of course plans and materials of the next week, and literature reviews were part in these meetings. There were 31 meetings between the dates 30/09/2015-10/05/2016. In addition to monitoring meetings, researchers continued to exchange information on the internet or at informal meetings during the week.

In the research, course plans and materials were shared via e-mail. The instructor, who was responsible for the language courses, planned her courses in the light of the decisions taken in meetings, course plans, reflective evaluations, and used materials of the instructors, who were responsible for the professional language courses. In case of need, instructor of language courses communicated with instructors of professional language courses via face to face communication, e-mail, or Whatsapp and took information that would guide her course planning. Language courses were carried out with the students of Computer Operator Training Program on Tuesdays ((3x45'), and with the students of Graphic Arts Program (2x45') and Architectural Drafting Program (3x45') on Thursdays in the school year, which took two semesters/14 weeks.

As a result of the evaluations and plans, defined activities performed by the instructors, who were responsible for the field courses, and language support was provided by the instructor, who was responsible for the language courses. For production of written and verbal material, instructors of Professional Language and Language

courses were supported writing phases of the students, according to their needs and levels (Pressley, Roehrig & Bogner, 2002; Tompkins, 2007).

As seen in the weekly cycle of the research, the study was conducted through the cooperation between field course instructors and language course instructor. Teaching information and terminology through interdisciplinary studies made positive contribution to the development of hearing-impaired students (Jacops, 1989; Karasu, Girgin, Uzuner & Kaya, 2012; Kaya, 2012; Schirmer, 2000; Uzuner & Derican, 2013).

The Performing Process of Activities

In this part, it will explain how these activities and year-end poster presentation, which were supported by language courses, were performed. In the beginning of the school year, before the course support was not given, the concepts; “process,” “career,” “career planning,” “awareness,” were studied in the courses and examined concepts were enriched by examples. After each activity, students were evaluated by exam, homework, and/or final exam grades.

Language Support for the Internship Story Activity. In order to familiarize students with workplaces, Internship Story Activity was performed, involving that the internship process of students, as the first workplace experience of them, was examined, transformed into the story format, and shared with other students of the school in Professional language courses, in Fall semester. Before the texts were written, language courses started with the repetition of the issues, which were the characteristics of “introduction, development, and conclusion” sections that a story should have in text structure, and the elements that should be in a story form. After the preparation of writing phase, draft texts were written and reviewed and corrected texts were transferred to Power Point presentations by the students. The language correction studies of Power Point presentations were made in both Language and Professional Language courses. The finished presentations were presented to all students of the school on the date 20 Kasım 2015. The presentations were particularly for the students, who would perform their internships on that year. (Figure 3)

Figure 3: The Review/Correction Study of Written Material and School Presentation of Internship Story

Language Support for the Interview with Graduates Activity. In Fall semester, interviews were planned with the graduates of SfH, who worked in their fields, in to familiarize students with workplaces, with works performed and with possible problems faced in workplaces. The questions, which would be asked to the graduates, were decided by discussing with students in Professional Language and Language courses. After the interviews, students were asked to prepare poster presentations, which involved questions and answers. Language correction study of prepared posters were made in Professional Language and Language courses. Prepared posters presented with the participation of the whole students of the school, on the date 25 Şubat 2016. (Figure 4)

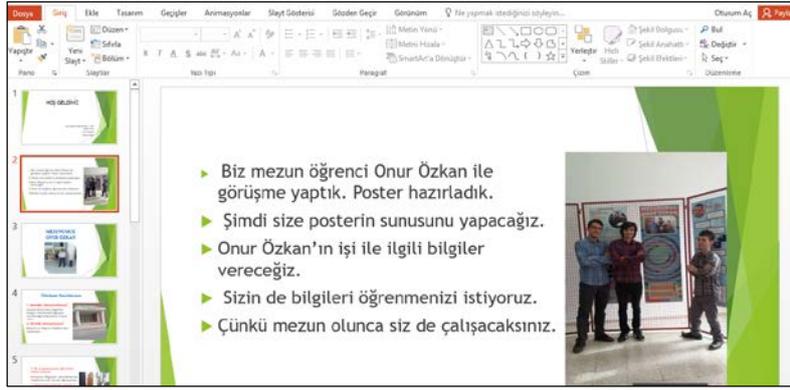

Figure 4. An Example for Poster Presentation of Interview with Graduates

Language Support for the Preparation Job Application Portfolio Activity. In the process of the research, aiming for familiarizing students with the steps that needed to be done in job application procedures and preparation of them to these processes, cooperation with TEA (Turkish Employment Agency) was established. In this cooperation, with the support of TEA and career counselors of TEA, “Job Application Techniques” presentation, which was used by TEA, was shared with the students. The language level of the presentation was adapted to the levels of hearing-impaired students by the researchers, who were responsible for the Professional Language and Language courses and the presentation was studied with the students in related courses.

Preparation of the contents of the job application portfolio took six weeks. Preparation of Job Application Portfolio activity was started in Professional Language courses by focusing on what were the documents, which were used in job searching and application and on how they were presented. The writing of the documents in the job application portfolio and review and correction of them were made in Language courses. Preparation of each activity was named as “sub-activity” in the research. In the study, conducting process of the documents; resume/CV writing, job application form/document, job application letter, and reference letter, was presented in the following part. (Figure 5)

Figure 5: Examples for Job Application Portfolio Studies (Resume, Letter of Reference)

The sub-activity of a resume/CV writing: Different examples of resumes were examined in the classes and frequently used words and terms in the texts such as; exempt, registered, career goal, marital status, experience, certificate, hobby, reference, were explained and exemplified. The issues, like communication method, percentage of disability, condition of disability were added to the document, in order to be explanatory about the disability characteristics of hearing-impaired students, during the job application process. The students were given lessons about how they expressed these information, during the job application. At the end of the process, each student was prepared her/his resume/CV and applied to the job application portfolio.

The sub-activity of filling a job application form: Exemplary application forms were downloaded from the internet and different types of forms were completed. The frequently used terms in the forms, such as exempt, registered, contact, experience, income, demand, being liable, were explained and exemplified with the students.

The sub-activity of writing a job application letter: With the students of each program, field related job advertisements were examined and exemplary job application letters for these advertisements were written. In addition to these, for the companies and institutions (Arcelik, Anadolu University, ...), which the students wanted to apply, job application letter writing studies were done. These prepared job application letters, which were written with different reasons and for different companies, applied to students' job application portfolios as examples.

The sub-activity of writing a reference letter: A text, which involved the meaning of the word "reference," the goal of the reference letter, and the types of reference letters, and two different types of reference letter examples were examined. The instructor, who was responsible for the language courses, behaved as a model for students, by writing different types of exemplary reference letters. At the same time, students were asked reference letters from their field course instructors and received reference letters were placed in portfolios of the students.

Writing job application letter and reference letter sub-activities were carried out using "Shared Writing" method. In shared writing, while the texts are created by the students and instructor, the pencil is continuously in the hand of the instructor. The instructor steers students with asking questions, accepts the language coming from the students, makes written and verbal corrections, if necessary, during the writing of the text. The sentence that will be written is decided together and one common text is written (Asselin, 1999; Pressley et al. 2002; Tompkins, 2007). It was determined that preparing the texts in this way had positive contribution to the development of students' skills, which were aimed to improve in the research.

In the writing resume/CV sub-activity, while the rules of effective resume writing were studied in Professional Language courses, resume writing study was done in Language courses. All of the writing tasks of job application letter and reference letter sub-activities were carried out in Language courses. Preparation of other documents, which would take place in the portfolio was done with the cooperation between Professional Language and Language courses. Medical report, audiogram, course attendance documents, certificates, and transcripts were the examples for other documents that were necessary for the job application portfolio.

Language Support for Workplace Visits Activity. Before the workplace visits activity, different question lists were made with the students in Professional Language courses, in order to find out what kind of information that the students wanted to learn from the staff of the workplaces. The questions received from the students were written on the board and the corrections were made, if necessary. After that, the lists were enriched with additional questions, which were missed by the students, but believed as necessary for the development of the students' awareness by the instructor. After the workplace visits, the review and correction studies for the answers received in interviews were made in Professional Language and Language courses.

At the end of the year, students were asked to present all of their works in poster format. The texts, written in order for the posters, were prepared in Professional Language and Language courses. The poster presentations were shared with other students and instructors of the school in year-end exhibition. (Figure 6)

Figure 6: Year-end Exhibition and Poster Presentations of Career Planning Process

In the writing process of the written materials, the strategies of “Question Asking” and “Modeling” were used intensively in Professional Language and Language courses. Being a model is a strategy, which is often used in the studies for development of language skills and especially for the development of writing process (Mayer, 2017). It is believed that given language support and applying the strategy of modeling are effective for the development of students (Tompkins; 2002).

According to the type of the activity, which was performed in the research, the development periods of the products were varied. Some of the activities were completed in 2-3 weeks, for example, the preparation of job application portfolio study had been carried out for a longer time. It was thought that different language levels and personality of students had effects on these different time periods (Marschark, Lang & Albertini; 2002; Schirmer, 2000).

According to the characteristics of the activities and of the students, some of the activities were performed consecutively, some of them were performed concurrently. For example, the activities of Job Application Techniques Presentation, Preparation of Job Application Portfolio, and Workplace Visits were carried out concurrently. One of the reasons for this was that Job Application Techniques Presentation and Preparation of Job Application Portfolio activities were related with each other. The other reason was that Preparation of Job Application Portfolio activity consisted of four sub-activities and needed to include several examples and repetitions in relation to each sub-activity (Paul, 1996; Schirmer, 2000). In addition, in the activities, which were performed intensive classes, one another reason for being concurrent was the use of time effectively and preparation for the next activity. While the Internship Story activity was continuing, homeworks and research study, required for Interview with Graduates activity, began at the same time.

Enrichment and making repetitions for prepared documents were required in terms of the goals, terms and concepts in the semester. (Researcher diary and reflective evaluations of course plan, dated 30 March 2016 and 5 April 2016) This situation was due to the language limitations of hearing-impaired students. In language studies are done with hearing-impaired, students require intensive repetition (Paul, 1996; Schirmer, 2002; Karasu et al. 2016).

During the classes and at the end of the semester, in the study, in which opinions of the students were taken, it was defined by the students that they were pleased with the performing of the Professional Language and Language courses by supporting each other and wanted to all courses to be done this way. (Researcher diary and reflective evaluations of course plan, dated 24 March 2016 and video recordings)

RESULTS

In the research, it was observed that students were benefited from the courses that carried out through interdisciplinary studies with the cooperation of language courses, which the terms and concepts of Professional Language courses, the contents of the documents used in career planning, and the activities were supported. In the study, it was determined that regularly meetings of the members of trustworthiness committee, sharing course contents and materials systematically by the researchers, and openness to cooperation of the instructors contributed to the development of the students.

It is the fact that due to the language limitations of hearing-impaired students, they required intensive language support. With this respect, it is obvious that planning of the courses according to the language levels and professional needs is important. In Turkey, The School for the Handicapped, which provides university level education for hearing-impaired students, was established to provide hearing-impaired young people vocational education by collecting them as productive and independent individuals to society. Education in the school is provided by the programs and class settings, which are designed as suitable for the disability of hearing-impaired students and the instructors, who have experience in their professional fields and in the education of hearing-impaired. The cooperation of the instructors, who were the experts in their professional fields, with special education instructors, and supporting their courses with the strategies and techniques of special education were most important for the education of hearing-impaired students of the school. It was determined that hearing-impaired students of SfH were benefited from the research process that was carried out through intense cooperation between the instructors, who were responsible for Professional Language courses and the instructor, who was responsible for the Language courses.

It is expected that the research can be used as a model for different educational settings, in which hearing-impaired students will be educated, also it can be a model for educational programs of hearing-impaired in terms of cooperation, and it can provide a view point and guiding for the teachers of hearing-impaired and the instructors, who will educate the teachers of hearing-impaired.

ABSTRACT

One of the most important features of the 21st century is technological developments. Technological renewal every day has led to, the emergence of different occupational groups and/or the use of different programs. These developments also affected the accounting profession. Recording systems are also changing because of the inadequacy of providing information from the duties of professional accountants. Records now take place in electronic environment such as e-book, e-invoice. In addition, transactional diversity in business life has made e-transformation mandatory in financial data. For this reason, many different software programs are needed more and more. However, those who prepare these software programs are software engineers. These individuals do not have sufficient knowledge in accounting. Those with sufficient knowledge of accounting are not enough to prepare software programs. For this reason, those who have sufficient knowledge in both areas, produce complete, uninterrupted information and can develop software compatible with international accounting standards will be accounting engineers. How a business engineering, mathematical engineering has provided significant contributions to business life, we can say that accounting engineering will provide important contributions in the same way. Because accounting profession has left the traditional approach very much behind and now it has become a technology oriented model. To be able to catch up with the pace of knowledge in the globalizing world and not be back from this race, we can say that universities need to create an independent department of accounting engineering.

Keywords: Accounting, Accounting Engineering, Accounting Software

INTRODUCTION

People have to continue production in order to maintain their lifestyles. Therefore, many progresses have been made in the field of production from the first industrial revolution to the fourth industrial revolution. Production has increased along with the ever-increasing population, and enterprises have developed new and various production methods. Automation systems, internet usage, robots and cloud computing systems gained importance during the fourth industrial period that can still be seen at the present time, which has led to fundamental changes. The proper operation of the production line, and the ability of a business to make profit depend on making business decisions correctly. Businesses shape their decision based on the data, related to their expenditures. The importance of the accounting department shows itself at this point. The information given by the accounting department also affects business decisions.

The first function of accounting professional members that was recording gave place to reporting, analyzing, and auditing. However, all these functions fail to satisfy today's needs. Therefore, the accounting profession need to be renewed, and institutions that provide accounting education must update their programs. Developing software suitable for the fourth industrial revolution and the technical structure of accounting will create a new profession group in accounting. This occupational group can be called accounting engineering. Accounting engineering programs must be added to undergraduate programs in order to train the people who will apply the developed software.

Many accounting programs that have been developed by people who do not have enough knowledge on accounting have been used by businesses. But, these programs are not so easy to apply. However, an accounting engineer working in a business should have all knowledge about the business, and be equipped with accounting information.

THE ACCOUNTING PROCESS IN THE FIELD OF INFORMATION TECHNOLOGIES

When accounting history is examined, any exact information on where and how it first appeared cannot be found. Unless, it is thought to be as old as human history. It is assumed that accounting was also used in the 3400s B.C. with the initial use of numbers and writing in Ancient Egypt and Mesopotamia. It is seen that inventory records were created and but get was planned for the tracking of goods in ancient Egypt. More detailed accounting records

were reached by means of clay tablets in old Babylon. These tablets include information about the type and number of goods, names of the buyer and seller, and delivery date. The first written laws concerning accounting are seen in the Hammurabi Laws. Later on, it continued to develop in Iranian, Greek and Roman civilizations, and mobile accountants emerged in the middle age. A book similar to today's cashbook was used in Western Europe in the thirteenth century. Notary approval was needed for any change to be made on this book (Avder, www.muhasabetr.com).

Accounting development has gained a different dimension along with the double-sided recording technique developed by Luca Pacioli in the late 15th century. Academic disciplines have sought for a solution together since the creation of the double-sided recording system, a simple but important recording technique, to the present time. The accounting discipline also gains different perspectives by making use of different disciplines. Especially with the new Turkish Commercial Code adopted in 2011, the accounting registration system has entered into the process of globalization instead of the westernization process (Güvemli, 2015:5, Ertuna, 2015:7).

International Accounting Education Standards suggest that information technologies should be supported with accounting, finance and management courses. It is stated in the 7th AACSB standard that more importance should be attached to technology and business analytics in order to train professional accountants in the future because, the members of an accounting profession are no longer the people who use information systems. Furthermore, they have also come to the forefront in the software, evaluation, design and management of information technology systems. As a result of a study conducted on people who received business education at the undergraduate level, it was found that their educational level on the subjects such as bigdata, data analysis were insufficient (Kaya et. Al., 2017:170-176,180). Courses such as programming, software development, and database management, that should come into the forefront in our day shouldn't be kept at an insufficient level, the number of courses should be increased for these subjects.

ACCOUNTING ENGINEERING

Accounting is the collection of information about financial and monetary transactions, checking for accuracy, and recording, classification, and presentation in reports, analyses and interpretation. There are three basic points here. Firstly, it includes the transactions expressed in money. Secondly is the recording and classification of these transactions. Finally is the analysis and interpretation of the reported accounting information (Bayazıtılı et. al. 2015: 25). Any failure in any of these stages will cause the entire chain to break. Therefore, the accounting system should be regarded as a whole. The true and correct data in the system will enable decision makers to make correct decisions.

To be able to produce accurate, timely and real information; today's technology is has to be utilized. The complete and uninterrupted information flow can be provided by developing appropriate software, appropriate for the structure of the enterprises. Accounting engineering is needed to develop this software. Teraman defines accounting engineering as follows; 'accounting is a profession that enables the data ,forming the information system, to be recorded, classified, summarized and reported, and that produces and designs solutions that are suitable for the structure of every business' (<http://www.yorumymm.com>). Popescu and Nişulescu (2014) stated that the purpose of accounting is being able to make use of accounting information of businesses much more, to reveal their financial situations more clearly ,and the efforts towards to improve the results included in the financial tables, in parallel with increasing their performance positively.

The software engineering programs and the course contents of accounting and finance programs of universities were reviewed in our study, and the lessons taught are arranged as in the following table.

Table 1: Lessons Taught in the Departments of Accounting and Software Engineering

Accounting and Finance	Software Engineering
General Accounting	Software Engineering Foundation
Cost Accounting	Engineering Mathematics
Management Accounting	Logic Circuits
Audit	Programming Languages
Financial Statement Analysis	Data Structures
Project Evaluation and Management Techniques	Microprocessors and Programming
End-of-term Accounting Applications	Object Oriented Programming
Inventory and Balance Sheet	Digital Image Processing Management
Accounting Standards	Numerical Analysis
Mathematics of Finance	Linear Algebra
Accounting Information System	Information Systems and Security

Corporate Accounting	Web Design and Programming
Construction Accounting	Operating Systems
Forensic Accounting	Database Management Systems
Environmental Accounting	Statistics and Probability
International Financial Reporting	Network Systems
Accounting and Auditing Standards	Software Design and Architecture
Cost Systems	Formal Languages and Automats
Internal Audit-Internal Control	Algorithm Analysis
Accounting Valuation Transactions	Computer Graphics and Animation
Valuation and Financial Tables	Data Mining
New Financial Instruments and Accounting	Multimedia Software Development
Company Consolidation and Takeover	Bioinformatics
Cost Management	Database Design and Management
Accounting Information and Control Systems	Java Programming
Advanced Audit	Network Programming
Accounting Practices Based On The Integrated Systems	Artificial Intelligence and Expert Systems
Research Methods in Accounting	Software Quality Assurance and Testing
	Animated Software Development

When the departments of accounting and software engineering are reviewed, it is seen that the courses that can complement each other are taught. But, it is very difficult for accounting engineers to develop software programs and for software engineers to develop accounting software, suited to the needs of businesses. Therefore, creating an accounting engineering profession, with an undergraduate program covering both fields, will be very useful for businesses. We recommend the courses listed in Table-2 be taught in the department of accounting engineering.

Table 2: Courses Recommended to be Taught in the Department of Accounting Engineering

General Accounting	Software Engineering Foundation
Cost Accounting	Engineering Mathematics
Management Accounting	Programming Languages
Audit	Object Oriented Programming
Accounting Information System	Logic Circuits
Accounting Information and Control Systems	Data Structures
Advanced Audit	Microprocessors and Programming
Accounting Practices Based On The Integrated Systems	Information Systems and Security
Research Methods in Accounting	Operating Systems
Financial Statement Analysis	Database Management Systems
Project Evaluation and Management Techniques	Software Design
International Financial Reporting	Software Quality Assurance and Testing
Internal Audit-Internal Control	Software Architecture
Accounting Valuation Transactions	

When the courses suggested to be taught in the department of accounting engineering are reviewed, it is seen that these are numerical processing-oriented courses. Therefore, the students who will receive education in this department should have analytical thinking power, and be successful in terms of numerical operations. Today, accounting finance department students are admitted according to the point type of Turkish-Mathematics, and engineering programs according to the point type of Mathematics-Science. In consideration of the courses suggested for the Accounting Engineering program in Table-2, the student admission according to the point type of Mathematics-Science will be appropriate for the purpose of education.

It is expected that those who will successfully complete the accounting engineering program will have many acquisitions on behalf of accounting and engineering knowledge. We can list some of acquisitions as follows:

- To learn to program,
- To have basic knowledge about microeconomics,
- To gain economic problem solving knowledge,
- To have information about market structures,
- To learn the politics used in accounting,

- Ability to model and solve engineering problems,
- To identify, describe and formulate complex engineering problems.
- To acquire the skill of designing a system, process, realistic constraints and conditions and meet the required requirements,
- The ability to work effectively in disciplinary and multidisciplinary teams;
- To gain individual work skills,
- To have professional ethics awareness,
- To have knowledge about applications such as project management and risk management,
- Create awareness about entrepreneurship, innovation and sustainable development,
- Having knowledge about the effects of engineering applications on health, the environment, and safety in the universal and social dimensions and the problems of the age,
- To gain effective and efficient management skills,
- Having knowledge about statistical packages and applications of random sampling, data analysis, sample distribution theory, forecasting, confidence intervals, hypothesis tests, regression and correlation analysis, which are the basis of engineering statistics,
- Explain the strategic role of production planning and control,
- Ensuring execution of production planning and control with ERP,
- Selection and use of appropriate quantitative and / or qualitative techniques to assist in production planning,
- Having knowledge about the basic terms and basic financial tables related to general accounting and using these tables,
- To prepare the financial statements required by external users,
- Having knowledge about current and fixed asset management, short and long term debts and capital,
- To solve analytical finance problems,
- Having information about the financial institutions, tax authorities, shareholders, sellers, customers, and other circles of financial institutions,
- Having knowledge about how businesses operate, finance and current finance operations,
- Defining functional and non-functional features of software projects, processes and products for real life problems,
- Designing software architecture, components, interfaces, and other sub-components of the system,
- To develop software to include coding, validation, testing and debugging,
- Verify the software by testing the behavior of the program against the expected results,
- To be able to carry out maintenance activities due to changes in the working environment, new user requests and software faults during the operation of the software,
- To be able to monitor and control the changes made in the software, to ensure the integration of the software with other software systems, to systematically plan the new versions of the software,
- To be able to use various tools and methods in gathering software requirements, designing, developing, testing, and maintaining software,
- To apply software life cycle processes, to measure software quality, to define quality model characteristics and to analyze, design, promote, verify and test them.
- To learn operating system problems,
- Identify the best types of communication to support the coordination needs of a project,
- Testing and describing software measurement tools, and
- Determine the structural complexity of software.

In consideration of the qualifications mentioned above, it is seen that accounting engineering department graduates may have knowledge in many fields such as business, accounting, finance, basic engineering, and software development.

CONCLUSION

When we review the historical process of accounting, it is seen that we have rather proceeded. We have reached a point where we can access the financial data of a business on the other side of the world through internet, in contrast to the accounting records that were once made on clay tablets in the beginning. Robots will make production in a completely dark environment, and huge factories that can be managed by one person will be established with industry 4.0 in the future. This rapid and continuous change of technology obliges people to use current methods instead of conventional methods.

Using fast and active internet, developing current software, being able to use different programs, following the developments in the world, keeping pace with these developments, making quick, appropriate and accurate decisions, being a part of the business, not ignoring the ethics of profession, being able to provide contributions and efficiency in personal and group work settings, and speaking one or several foreign languages are several of the many obstacles that we will encounter in the employment process. When we also consider the competition that increases with the growing population every day, how important the selection of the profession will be in the future is very clear.

When these developments are reviewed in terms of accounting, it is inevitable that the profession of accounting engineering will emerge in the future. Accounting engineering in faculties can be regarded as a department that will emerge through the gathering of both accounting and software engineering departments. The purpose of this department is to satisfy the software development needs of the members of the accounting profession where they are not so competent in this area, and ensure that software engineers have accounting knowledge, thereby allowing them to see the missing points of the programs they have developed.

It may be more appropriate to admit students according to Mathematics-Science point type for this department, because accounting and engineering departments require more numerical processing and an analytical power of thinking. Along with the new education plans to be made at universities, the courses which are considered appropriate for the department can be determined. Based on the courses taught in the departments of accounting and software engineering (Table-1), the courses that may be included in the accounting engineering department were suggested in this study. The suggested lessons are included in Table-2.

Through having the accumulation of knowledge in different subjects, a person who graduated as an accounting engineer is expected both to produce correct ideas and make, and software programs, more functional. Using right programs ensures proper decisions will be taken, increasing business profitability and sustainability in the future.

THE PROPORTION OF THE VARIATION IN THE ACADEMIC PERFORMANCE FORM THE COURSES ACHIEVEMENT OF FOOD SCIENCE AND TECHNOLOGY STUDENTS

Naruemon Prapasuwannakul and Kanyarat Bussaban

Suan Sunandha Rajabhat University, 1 U-TongNok Road, Wachira, Dusit, Bangkok, THAILAND 10300

naruemon.pr@ssru.ac.th , kanyarat.bu@ssru.ac.th

ABSTRACT

The purpose of this paper is to construct a regression model for measuring the proportion of variation in the academic performance form the courses achievement of Food Science and Technology students. Data were collected from a sample of 215 online reports of science students graduating from Food Science and Technology Program, Suan Sunandha Rajabhat University from the academic year of 2011-2016. Variables used to construct a regression model were average grades of the subjects accordings to the curriculum which were categorized into seven groups: general education courses ,core courses, required major courses, elective major courses, professional English courses, management science courses, project and internship courses. The findings revealed that there is a positive significant the strength of the linear relationship between the courses achievement and academic success. Required major course and elective major course are quite strong relationship with academic success. The highest of the proportion of variation in the academic performance is form required major course.

INTRODUCTION

Higher education provides the skilled manpower needed for socio-economic and technological development of the country. Each curriculum is designed to produce specific skilled graduate in specified area. Success in higher education is measured by academic performance or how well a student meets standards set by ministry of education and the university. Academic performance is how a student performs or achieves in a certain exam measured by a grade point average or grades (Travis, Charles & Susan, 2015). Academic performance may depend on student, teacher or education materials (Irfan Mushtaq & Shabana Nawa Z Khan, 2012 and Bussaban K. & Prapasuwannakul N., 2016). Production of qualified graduates is the primary goal of higher education. Thailand has a framework for higher education that requires graduates of all levels to meet at least five learning outcomes which are moral skill, knowledge skill, intellectual skill, interpersonal relationship and responsibilities skill, and numerical analysis, communication and information technology skill. To achieve these learning outcomes, it is necessary to design courses in a curriculum for teaching and learning management. A curriculum design is an important mechanism that will lead to the production of qualified graduates according to the aspiration of each course. Food Science and Technology is a multidisciplinary branch of science developed with vision to prepare graduates with expertise in various areas related to Food Science and Technology. Therefore, Food Science and Technology program of Suan Sunandha Rajabhat University has designed its curriculum structure consisting of 8 different courses which are general education courses, core courses, required major courses, elective major courses, professional English courses, management science courses, project and internship courses, and free elective courses. However, there is no study reporting of how much each courses in the curriculum results in a successful completion of the course. Therefore, the objective of this study is to measure the proportion of variation in the academic performance form the courses achievement of Food Science and Technology students in Suan Sunandha Rajabhat University, Thailand. The results might be beneficial as a guideline for improving and developing curriculum leading to the production of qualified graduates with a high course achievement.

THE STUDY

The objective of this study is to measure the proportion of variation in the academic performance from the courses achievement of Food Science and Technology students. The online study reports of 215 graduates from Bachelor of Science in Food Science and Technology, Suan Sunandha Rajabhat University during an academic year of 2011-2016 were collected. The average score level in each courses (general education courses , core courses, required major courses, elective major courses, professional English courses, management science courses, project and internship courses) were calculated and were used as dependent variables while a Grade Point Average (GPA) was being assigned as an independent variable in regression analysis. Simple and multiple linear regression are used to construct models. Simple linear regression is a statistical method that allows us to summarize and study relationships between two continuous (quantitative) variables. In this study, the coefficient of determination or *r*-squared was used to determine the proportion of variation in GPA resulting from the learning outcomes in each subject group. The coefficient of determination (denoted by R^2) is a statistical method that explains how much of the variability of a factor can be caused or explained by its relationship to another factor. Pearson correlation and Partial correlation was also used to measure the relationship between the success rate of each group and the degree of success.

FINDINGS

Around 42.1 % of graduates with a bachelor's degree in Food Science and Technology had their grade point average (GPA) in the range of 2.00 - 2.50. The results of the correlation analysis between courses and GPA was presented in Table 1. It indicated that there was a positive significant and strong linear relationship between courses achievement and academic success. The subjects with the highest levels of academic achievement in the first three were required major courses, elective major courses and the general education course, respectively. Moreover, the relationship between required major course and academic success was quite strong. If we consider strength and direction of a linear relationship between courses achievement and academic success whilst controlling the effect of other courses, the relationship between required major course and the academic success was greatest among any relationship between other courses and academic success.

Table1 The relationship between courses and GPA

course	Pearson correlation coefficient	Partial correlation coefficient
general education	0.774	0.697
core	0.768	0.748
required major	0.959	0.872
elective major	0.808	0.691
professional English	0.554	0.466
management science	0.725	0.146
project & internship	0.201	0.022

The results of the simple linear regression analysis indicate that two courses including general education and management science can be used to construct models. The models are given by equation (1) and (2). Equation (1) is significant with $r_{adj}^2 = 0.991$, Durbin= 1.509 and P-value for normality of the error distribution = 0.200 and equation (2) is significant with $r_{adj}^2 = 0.522$, Durbin= 1.583 and P-value for normality of the error distribution = 0.200.

$$GPA = 0.935 * (\text{general education course}) \quad (1)$$

$$GPA = 1.029 + 0.595 * (\text{management science}) \quad (2)$$

The multiple regression model is given by equation (3). It is significant with $r_{adj}^2 = 0.955$ Durbin= 1.742, VIF (professional English) = 1.368, VIF (CT) = 1.368, Condition Index = 18.441, Eigenvalue = 0.009, Standard Residual=2.607 and P-value for normality of the error distribution = 0.200. The proportion of the variation of CT which controls the effect of other courses is 0.967. The proportion of the variation of professional English course which controls the effect of other courses is 0.255.

$$GPA = 0.131 + 0.970 * (CT) + 0.04(\text{professional English}) \quad (3)$$

Where CT represents the average of score in core, general education, required major, elective major and management science courses.

CONCLUSIONS

The findings of this study indicate that there are positive significant relationship between all courses and a grade point average. Required major, general education and elective major courses have a great influence on the academic performance than any other courses. Project and internship does not show any significant effect on the academic success. Both general education courses and professional English courses can predict a GPA. Core, general education, required majors, elective major and management science courses are highly correlated, and these courses account for 96.7% of the variation in achievement. Activity-based courses such as professional experiences and project courses do not show significant effect on academic success of graduates in Food Science and Technology. There may be other latent factors affecting the score of these course, which is interesting for further study.

ABSTRACT

Attachment is a strong emotional connection that an individual develops against an object or person. Attachment to the school is a basic psychological need in terms of feeling belonging to the group, believing that it is valued and respected as a member of the school. This study was carried out in order to examine the attachment status of high school students in terms of various variables. Relational screening model was used in the research. The study is composed of high school students studying in Niğde. The data of the study were obtained using the Personal Information Form and the Arrow Attachment Scale on the Adolescents and the Parent / Peer Attachment Inventory Short Form. The data were processed into the SPSS package program and the normality test was performed to determine the tests to be used in the study. As a result of the analysis made, it was understood that the data did not show normal distribution, so non-parametric tests were used. Within this scope; Mann Whitney U test for two categorical variables, Kruskal Wallis test for the analysis of variables with three or more categories, and Spearman correlation analysis for the analysis of the effects of variables. As a result of the analysis of the data, it was seen that there was a statistically significant difference between the levels of attachment to the school according to the gender variable, but there was a significant difference in favor of boys in terms of teacher attachment. While there was no significant difference in the attachment to friends sub-dimensions depending gender, it was seen that the average order of men was lower than women. The findings of the study showed that the level of attachment to the school significantly differed according to the level of satisfaction with the school. Accordingly, those who are satisfied with the school have less attachment to the school. Another area of attachment that high school satisfaction affects is the attachment to friends. Those who are satisfied with their high school they are studying are found to have a significantly lower level attachment to friends than those who are not. Satisfaction with school also affects the attachment to the teacher. For those who are satisfied with their school, the total scores of the teacher attachment sub dimension are found to be lower than those who are not satisfied. According to the results obtained in the research, the cohabitation status of the parents does not make a meaningful difference in terms of the attachment of the high school students to the school, friends, and teachers. The grade level influences the attachment to the school; there was a significant difference between the students in the first grade and those in the third grade. On the other hand, this situation doesn't affect the attachment level to the teacher. This result shows that there is a significant positive correlation between the total scores of the mother attachment scale and the total score of school attachment scale in the adolescents. There was a significant positive correlation between total scores of the father attachment scale and total scores of school attachment scale to adolescents.

INTRODUCTION

The school is one of the important carriers in social life, a tool that will contribute to the life routine of the individual. Education that aims to give terminal behaviors to individuals offers important opportunities for personal development. There may be differences in terminal behaviors that are different for each society and culture, as well as differences in the social belonging of the individual and the attachment to the education. Because the educational philosophy adopted by society and the aims of education can influence the type and number of terminal behaviors. At the same time, the school, which is seen as a unifying tool for social cohesion and social peace, has an important role in the development of the nation. Because of this reason, it is an important research topic to determine the students' attachment levels to school and at the same time to their parents.

Individuals live in different social contexts throughout their lives. As one of these social environments, the school is one of the basic environments that the individual has developed over many years and experiences in education and teaching. Turkish Language Institute (2017) defines the term 'school' as 'The educational institution where the kind of knowledge, skills, and habits are taught and gained regularly according to certain purposes; An education community consisted of students, teachers, and administrators; The name given to the trend, form, and opinion that have certain qualities and characteristics in the branch of science, philosophy, and art'.

The school is a realistic field that is intertwined with the society and the social life-related behaviors of the students are rehearsed. School and school experiences have a great place in the life and development of the individual. Yet processes and interactions in the school provide opportunities for individuals to gain different thoughts and behaviors. Yüksel (2002) points out that some students are generally unhappy about going to school and that negative attitudes such as hating some lessons are often placed on the education system. Educators are of the opinion that such negativities are largely due to the educational conditions and school conditions. The attitudes that students develop in this situation directly affect their attachment to school. Attachment to the school is defined as a basic psychological need in terms of feeling belonging to the group, believing that it is valued and respected as a member of the school (Akt. Savi, 2011).

Mouton, Hawkins, McPherson, and Copley (1996) indicate that students with low school attachment level are lonely and isolated in their school life, perceived themselves as outsiders from the school community, and receive low support and encouragement from school staff and peers. In addition, LeCroy and Krysik (2008) stated that academic achievement rises as the level of attachment increases, while students who receive support from their family and teachers have higher school attachment level and higher academic achievement. Zhang and Messner (1996) found that school attachment and school quality were inversely related to the risk of involving crime. These findings in the field indicate the critical importance of school and school attachment for individual development.

There are different theoretical explanations for attachment. According to the accepted attachment theory, the emotional ties between the child and the people who raised them affect the social, emotional and cognitive development of the child. According to Bowlby, these strong emotional ties in the attachment develop inner patterns involving the child's feelings, perceptions and expectations about herself and others. These patterns guide the child's interpersonal relationships throughout his or her life (Savi 2011; Günaydın and Ark., 2005). In a study conducted with pre-school children by DeMulder, Denham, Schmidt, and Mitchell (2000), it was observed that both boys and girls with less secure attachment in their mothers showed much more aggression in the pre-school period. Boys who are more securely attached to their mothers are more closely attached to their preschool teachers and are found to be more popular than their nursery-school peers.

Duchesne et al. (2009), in their study of 629 young adolescents, found that attachment to mother predicted teacher-academic worries of the young adolescent about the transition to middle school.

O'Connor, Collins and Supplee (2012) 1140 A longitudinal study of mothers and children shows that insecure attachment in early childhood is associated with late childhood exclusionary and internalizing behaviors; Having negative relationships with the teacher in childhood is related to outward orientation behavior in the following years; The effects of seclusion and insecurity on externalizing and internalizing behaviors in late childhood have been achieved through childhood teacher-child relationships and early externalization and internalizing behaviors. In a longitudinal study conducted by O'Connor, Collins, and Supplee (2012) with 1140 mothers and children, insecure attachment in early childhood was associated with late childhood exclusionary and internalizing behaviors; Having negative relationships with the teacher in childhood is related to outward orientation behavior in the following years; The effects of seclusion and insecurity on externalizing and internalizing behaviors in late childhood are due to childhood teacher-child relationships and early externalization and internalizing behaviors.

Individuals in high school are experiencing the crisis of sexual, social and ideological identity as well as some developmental problems. In addition, young people can experience confusion in the context of social expectations, generation conflict, search for autonomy and freedom (Akt, Ünal and Şahin, 2013). The relationship of adolescent students to their friends and teachers contributes to their satisfaction with their satisfaction of school and school performances. Likewise, secure attachment provides important support to young people to cope with the problems experienced during school years. For this reason, it is necessary to look into the attachment as both the social adaptations in the school environment and their interaction with their peers for their expectation from school life (Eken, 2010).

Parents are not only influential in childhood but also in other stages of life. The parental attachment has an important place in terms of the individual's social behavior and psychological health. The secure attachment also has vital importance in terms of the school experience. Since school life includes social patterns as much as academic activities. Relations with school, teachers, and friends have the power to influence the individual's academic and social life. From this point of view, success in school life can be considered a sign of successful completion of the individual's developmental tasks. The development of successful and supportive relationships in school life is thought to be a deterrent factor to risky behaviors in the process of depression during adolescence. In the light of the theoretical explanations above, the main purpose of this research is to examine the attachment levels of high school students to the school and their attachment levels to the parents.

THE STUDY

In this study, a relational screening model was used. Relational surveys are studies in which the relationship between two or more variables is investigated without changing the same variables (Karasar, 2000).

Research Population and Sample

Table 1. *Demographic Table Regarding Study Group*

Grade Level

	Gender	First grade			Second Grade			Third Grade		
		n	%	%	n	%	%	n	%	%
	Women	50	35,2	35,2	64	45,1	45,1	28	19,7	19,7
	Men	36	30,8	30,8	52	44,4	44,4	29	24,8	24,8

The study population consists of high school students in public schools in Niğde. The study group was selected by appropriate sampling method. A convenience sampling method is selected for the study. The convenience sampling method based on accessibility and suitability is the preferred method for gathering information quickly in some research subjects (Aypay, 2010). There is a total of 259 high school students in the study group determined by this method. Of the students in the study group, approximately 55% female and 45% male students, 86 are in the first grade, 116 are in the second grade and 57 are in the third grade.

Data Collection Tools

In addition to the personal information form developed by the researcher in collecting the data in the study, the Adolescent School Attachment Scale, and Parent and Peer Attachment Inventory Form were used.

The Adolescent School Attachment Scale: School Attachment Scale for Children and Adolescents (High School Form): "School Attachment Scale", developed by Hill (2005) to assess the attachment levels of children and adolescents to the school, consists of 15 items and three factors (attachment to teachers, peers, and school). The scale was adapted to Turkish culture by Savi (2011). According to the obtained fit index values, it can be said that the three-dimensional model gives sufficient harmony. In the reliability analysis, the Cronbach Alpha internal consistency coefficient of the scale was .91, and the reliability of the two half tests was .80 for the first half and .74 for the second half (Savi Çakar and Karataş, 2017).

Parent and Peer Attachment Inventory: "Parental and Peer Attachment Inventory" (PPAI) developed by Armsden and Greenberg (1987) was chosen to measure parental attachment. The scale consists of two sub scales that measure parental and peer attachment. Paternal attachment scales were used in this study. The scale consisting of 12 items is scored by five grades. (1- Never, 5- Always). Validity and reliability analysis of the parental inventory form of the scale were conducted on the samples of university (Günaydın, Selçuk, Sümer and Uysal, 2005) and high school (Bayraktar, Sayıl, and Kumru, 2009) and the internal consistency coefficient was found to be $\alpha = .84$ for high school sample.

Data Analysis

The data were processed into the SPSS package program and the normality test was performed to determine the tests to be used in the study. The Shapiro-Wilk normality test is used for groups with a large study group of 50 people. According to the Shapiro-Wilk normality test results, the data weren't the normal distribution. For this reason, nonparametric tests were used in the analysis of data. Mann Whitney U test for two categorical variables, Kruskal Wallis test for analysis of variables with three or more categories, and Spearman correlation analysis for analyzing the effects of variables.

FINDINGS

The findings of this research are given below.

Table 2. Levels of Parent Attachment by Gender Variable

	Gender	n	Mean Rank	Z	U	p
Total Mother Attachment Scale Scores	Women	142	130,92	-,217	8177,000	,828
	Men	117	128,89			
Total Father Attachment Scale Scores	Women	142	130,06	-,015	8298,000	,988
	Men	117	129,92			

$p > .05$

When Table 2 is examined, it is seen that there is no statistically significant difference in the levels of attachment to the mother according to gender ($p > .05$). When the mean rank is taken into consideration, it is seen that the total scores of mother attachment scale for women ($\bar{X} = 130,92$) is higher than that of men's ($\bar{X} = 128,89$). There was no statistically significant difference in the father attachment levels according to gender variable ($p > .05$). In the mean ranks, it is seen that the total scores of father attachment scale for women ($\bar{X} = 130,06$) is higher than the total scores of father attachment scale for men ($\bar{X} = 129,92$).

Table 3. Levels of School Attachment by Gender Variable

	Gender	n	Mean Rank	Z	U	p
Total Score of Attachment Scale in Adolescents	Women	142	135,22	-1,237	7565,500	,216
	Men	117	123,66			
Total Score of School Attachment Sub dimension	Women	142	138,88	-2,106	7046,500	,035
	Men	117	123,66			

Total Score of Peer Attachment Sub dimension	Men	117	119,23	-,462	8032,000	,644
	Women	142	128,06			
Total Score of Teacher Attachment Sub dimension	Men	117	132,35	-,877	7782,000	,380
	Women	142	133,70			
	Men	117	125,51			

When Table 3 was examined, it was found that there was no statistically significant difference between the school attachment scales for both women and men in terms of gender ($p > .05$). However, it is seen that the total scores of the school attachment scale for men ($\bar{X} = 123, 66$) are lower than the average scores of school attachment scale for the women ($\bar{X} = 135, 22$).

A statistically significant difference was found when the total scores of the school attachment sub dimension according to the gender variable were examined ($p < .05$). It is seen that the total scores of the school attachment for men are lower ($\bar{X} = 119, 23$) than female students' scores ($\bar{X} = 138, 88$).

There was no statistically significant difference when the total scores of peer attachment sub dimension were compared according to gender variable ($p > .05$). It is seen that the mean rank of the total scores of peer attachment scale for men ($\bar{X} = 132, 35$) are higher than female's ($\bar{X} = 128, 06$).

There was no statistically significant difference when the total scores of teacher attachment sub-dimension according to gender variable were examined ($p > .05$). It is seen that men's mean rank of the total score of teacher attachment sub dimension ($\bar{X} = 125, 51$) are higher than women's mean rank of the total score ($\bar{X} = 133, 70$).

Table 4. Parent Attachment by the High School Satisfaction Variable

High School Satisfaction		n	Mean Rank	U	Z	p
Total Score of Mother Attachment Scale	Yes	183	134,62	6108,000	-1,543	,123
	No	76	118,87			
Total Score of Father Attachment Scale	Yes	183	133,38	6335,000	-1,129	,259
	No	76	121,86			

$p > .05$

When Table 4 is examined, it is seen that the level of mother attachment did not show any statistically significant difference according to the high school satisfaction variable ($p > .05$). Looking at the mean rank, it is seen that those who are satisfied with their school have the higher total score of mother attachment scale ($\bar{X} = 134, 62$) than those who are not satisfied ($\bar{X} = 118, 87$). There was no statistically significant difference in the level of father attachment according to school satisfaction variable ($p > .05$). In the mean ranks, it is seen that those who are satisfied with their school have higher scores on the father attachment scale ($\bar{X} = 133, 06$) than those who are not satisfied ($\bar{X} = 129, 92$).

Table 5. Levels of School Attachment by the School Satisfaction Variable

	Satisfaction	n	Mean Rank	Z	U	p
Total Score of Attachment Scale in Adolescents	Yes	183	151,75	-7,256	2973,000	,000
	No	76	77,62			
Total Score of School Attachment Sub dimension	Yes	183	152,67	-7,575	2806,000	,000
	No	76	75,42			
Total Score of Peer Attachment Sub dimension	Yes	183	140,22	-3,429	5084,500	,001
	No	76	105,40			
Total Score of Teacher Attachment Sub dimension	Yes	183	145,35	-5,130	4145,000	,000
	No	76	93,04			

When Table 5 is examined, it is seen that there is a statistically significant difference in the school attachment levels according to the school satisfaction variable ($p < .05$). It is seen that those who are satisfied with their school have the higher mean of the total score ($\bar{X} = 151, 75$) of school attachment level than the students who are not satisfied with the study ($\bar{X} = 77, 62$).

When the total scores of the school attachment sub dimension scores were examined according to the school satisfaction variable, it was seen that there was a statistically significant difference ($p < .05$). It is seen that those who are satisfied with their school have the higher mean scores ($\bar{X} = 152, 67$) of school attachment sub dimensions than those who are dissatisfied ($\bar{X} = 75, 42$).

When the total scores of the peer attachment sub dimension of students are examined according to the satisfaction variable, there is a statistically significant difference ($p < .05$). It is seen that those who are satisfied with their school have the higher the mean of the peer attachment sub dimension scale ($\bar{X} = 140, 22$) than those who are dissatisfied ($\bar{X} = 105, 40$).

When the total scores of the teacher attachment sub dimension were examined according to the satisfaction variable, it is seen that there is a statistically significant difference ($p < .05$). It is seen that the mean of the teacher

attachment sub dimension scores of those who are satisfied with their school ($\bar{X} = 145, 35$) is higher than the those who are dissatisfied ($\bar{X} = 93, 04$).

Table 6. Levels of Parent Attachment by School Grade Variable

	Grade	n	Mean Rank	Chi Square	p
Total Score of Mother Attachment Scale	First Grade	86	136,26	,901	,637
	Second Grade	116	127,01		
	Third Grade	57	126,64		
Total Score of Father Attachment Scale	First Grade	86	136,65	3,365	,186
	Second Grade	116	132,81		
	Third Grade	57	114,25		

$p > .05$

When Table 6 is examined, it is seen that the levels of mother attachment are not statistically different according to the school grade variable ($p > .05$). When the mean ranks are taken into consideration, it is seen that the mean of the mother attachment scale of the first grade is higher than the mean of the second grade ($\bar{X} = 127, 01$) and the mean of the third grade ($\bar{X} = 126, 64$). There was no statistically significant difference in the level of the father attachment scale ($p > .05$). However, when you look at the mean rank; It is seen that the scores of the first grades are higher than the scores of the second grades ($\bar{X} = 132, 81$) and the third grades ($\bar{X} = 114, 25$).

Table 7. Levels of School Attachment by School Grade Variable

	Grade	n	Mean Rank	Chi Square	p
Total Score of Attachment Scale in Adolescents	First Grade	86	139,75	11,572	,003
	Second Grade	116	112,93		
	Third Grade	57	150,04		
Total Score of School Attachment Sub dimension	First Grade	86	140,94	6,839	,033
	Second Grade	116	116,52		
	Third Grade	57	140,93		
Total Score of Peer Attachment Sub dimension	First Grade	86	124,59	2,729	,256
	Second Grade	116	127,02		
	Third Grade	57	144,24		
Total Score of Teacher Attachment Sub dimension	First Grade	86	143,06	16,271	,000
	Second Grade	116	109,52		
	Third Grade	57	151,97		

When Table 7 is examined, it is seen that there is a significant difference in the school attachment level of high school students according to the class grade variable ($p < .05$). Accordingly, the total score of school attachment of the first grade ($\bar{X} = 139, 75$) and the total score of school attachment of the third grade ($\bar{X} = 150, 04$) was higher than those in the second grade ($\bar{X} = 112, 93$).

A statistically significant difference was also observed when the total scores of the school attachment sub dimension according to the school grade variable ($p < .05$). According to the results of the analysis, the total score of the school attachment of the first grade students ($\bar{X} = 140, 94$) and the total score of the school attachment of the third grade students ($\bar{X} = 140, 93$) are higher than the score of the second grade students ($\bar{X} = 116, 52$).

There was no statistically significant difference when the scores of the peer attachment sub dimension were compared according to school grade variable ($p > .05$). However, it is seen that the total scores of the peer attachment sub dimension of the first grade ($\bar{X} = 124, 59$) and the second grade ($\bar{X} = 127, 02$) are lower than those of the third grade ($\bar{X} = 143, 06$).

According to the school grade variable, there was a statistically significant difference when the total scores of the teacher attachment sub dimension were examined ($p < .05$). According to this, the total scores of teacher attachment sub dimension in the first grade ($\bar{X} = 143, 06$) and the third grade ($\bar{X} = 151, 97$) are higher than those of the second grade ($\bar{X} = 109, 52$).

According to the results of the Tamhaneposthoc analysis, it was found that the significant difference in the general dimension of the school attachment scale in adolescents originate from the relation between the second and third grades ($p < .05$). Likewise, the reason for the significant difference in the teacher attachment sub-dimension is the relation between the first and second grades ($p < .05$).

Table 8. Correlation between Attachment to the Parents and Attachment to the School

	1	2	3	4	5	6
1. Total Score of Mother Attachment Scale						
2. Total Score of Father Attachment Scale						
3. Total Score of School Attachment Scale						

4. Total Score of School Attachment Sub dimension	,163**	,237**	,873**	
5. Total Score of Peer Attachment Sub dimension	-	,198**	,682**	,462**
6. Total Score of Teacher Attachment Sub dimension	,209**	,227**	,804**	,565** ,346**

**p<.001

When Table 8 is examined, there is a significant positive correlation between adolescents total scores of the mother attachment scale and the father attachment scale ($p < .001$, $r = .436$). Again, there was a positive correlation ($p < .001$, $r = .201$) between total score of mother attachment scale and the total score of school attachment scale ($p < .001$, $r = .201$). According to the results of the analysis, there is a positive correlation between the total scores of the mother attachment scale and the total scores of the school attachment sub dimension scale ($p < .001$, $r = .163$). There is also a positive significant correlation between the total scores of mother and father attachment scale and the total score of teacher attachment sub dimension scale ($p < .001$, $r = .206$). As a result of the analysis, it was seen that there was no statistically significant relation between the total scores of the mother attachment scale and the scores of the peer attachment sub dimension scale ($p > .001$).

According to another finding obtained in the research, it was found that there is a positive correlation between total scores of father attachment scale and total scores of the school attachment scale ($p < .001$, $r = .271$). When we look at the other findings in Table 8, it is found that total scores of father attachment scale are positively correlated with total scores of the school attachment sub dimension scale ($p < .001$, $r = .163$) and total scores of the peer attachment sub dimension scale ($P < .001$, $r = .198$). According to the results of the analysis, there was a positive correlation between the total scores of father attachment scale and total scores of teacher attachment sub dimension scale ($p < .001$, $r = .227$).

According to another finding obtained from the table, there is a positive correlation between the total scores of the school attachment in adolescents scale and the total scores of the school attachment sub dimension scale ($p < .001$, $r = .873$). The same result was also observed between the total scores of the peer attachment sub dimension scale ($p < .001$, $r = .682$) and the total scores of the teacher attachment sub dimension scale ($p < .001$, $r = .804$).

CONCLUSIONS

As a result of the research, there was no statistically significant difference in adolescents' attachment to their parents in terms of gender variable. However, when we look at the mean ranks, it is seen that the total attachment score to parents of women is higher than the total scores of the men. There was no statistically significant difference in terms of attachment to the school according to the gender variable, but it was seen that the average scores of male attachment scale to the school were lower than the average scores of women. These results are similar to the findings of the research conducted by Savi (2011). In addition, these results are in agreement with the findings of the research carried out by Bellici (2015), Duy and Yildiz (2014), Özdemir and Kalaycı (2013).

According to another result obtained, the high school satisfaction of the students does not make a statistically significant difference in terms of the attachment level of adolescents to both mother and father. However, from the mean rankings, it is seen that those who are satisfied with their school have a higher average score of attachment level to parents than those who are dissatisfied. When the literature is examined, it is seen that there are different findings on this result. Indeed, a longitudinal study by O'Connor, Collins, and Supplee (2012) found that insecure attachment in early childhood was associated with late childhood exclusionary and internalizing behaviors, affecting the relationship between child and teacher in the years to come. In a survey conducted by LeCroy and Krysik (2008) with 7th and 8th-grade students, academic achievement increased as the school attachment level increased; it is reported that students who receive support from their parents and teachers have higher school attachment and higher academic achievement.

According to another result, the satisfaction of the student with their high school makes a statistically significant difference in the school attachment levels. According to this, the total school attachment scores by those who are satisfied with their school are higher than the scores of the ones who are not satisfied. When these results are compared with other studies in the field, it shows different results. For example, in a study conducted by Birch and Ladd (1997) with pre-school children, we found that teacher-child proximity is positively associated with the child's academic performance and teacher grades on school love and self-management of children. Another study conducted by Demanet and Van Houtte (2012) reported that students' emotional attachment to their peers, teachers, and colleagues was associated with poor school behavior rather than school collectivity. In addition, it is stated that perceived teacher support and the feeling of belonging to the school reduce the negative behaviors and high peer attachment inhibits abuse rates in schools. In the research conducted by Frey, Ruckhin and Schwab-Stone (2009) with adolescents, attachment to school has been associated with low levels of violent and aggressive beliefs as much as academic motivation. Perceived teacher support is associated with positive school environment and academic motivation.

It was observed that the class level variable did not show statistically significant difference between the high school students and the mothers in terms of the level of attachment to mothers and fathers but when the average of mothers was taken into consideration, it was found that the mothers 'and babies' attachment scores of the first graders were higher than the scores of the second and third grades. According to the class level variable of the high school

students, the level of attachment to the schools showed a statistically significant difference. According to this, in the first and third grades, the total scores of the attachment scale for the second grade are higher than the scores of the attachment scale for the second grade

It was observed that the School grade variable did not show statistically significant difference in regard to the attachment levels to parents but when the mean ranks were taken into consideration, it was found that the parental attachment scores of the first graders were higher than the second and third graders. It was observed that there was a statistically significant difference in the level of school attachment depending on the grade level variable of high school students. According to this, in the first and third grades, the total scores of the school attachment were higher than the scores of the second grade. These results partially coincide with the findings of the research that school attachment decreases as the class level increases (Wei and Chen, 2010).

When the results of the relationship between the parent attachment and the school attachment were examined, a positive correlation was found between the total scores of parent attachment scale and the total scores of the adolescent school attachment scale. On the other hand, as the level of parent attachment increased, the level of students' school attachment also increased. Similar results were obtained in a study carried out by Özdemir and Koruklu (2013). According to this, attachment to parents and teachers is considered as a predictive indicator for the life satisfaction of adolescents, and attachment to the school plays an intermediary role between attachment to parent and life satisfaction.

Based on these results, it can be argued that school guidance services can strengthen school attachment if they develop programs for adolescents and their parents. It may also be considered that such programs may be a preventive factor in the risky behaviors of the students.

THE RELATIONSHIP BETWEEN CULTURAL INTELLIGENCE AND WORK PERFORMANCE OF MALAYSIAN ACADEMIC LIBRARIANS

Mohamad Noorman MASREK

Sobariah Awang MUKHTAR

Shamila Mohd SHUHIDAN

Dang Merduwati HASHIM

Faculty of Information Management

Universiti Teknologi MARA Shah Alam Selangor Malaysia

ABSTRACT

The nature of an academic librarian's job requires them to deal with people of different races and culture. Because of this reason, a librarian needs to be emotionally and culturally intelligent. Studies have shown that cultural intelligence plays a significant role in employee's performance. However, past studies have not examined the situations of cultural intelligence among librarians. To this effect, a study was undertaken with the aim of exploring the level of cultural intelligence among Malaysian academic librarians. In addition, it was also aimed at examining the effect of cultural intelligence on librarian's work performance. Cultural intelligence was operationalized as comprising four dimensions, namely, meta-cognitive, cognitive, motivation and behavior while work performance was operationalized as consisting two dimensions, namely, task performance and contextual performance. A survey research method was used and the data was collected using an on-line questionnaire. A total of 166 usable responses was collected and analyzed using the PLS-SEM technique. The results showed that the level of cultural intelligence of the academic librarians as reasonably high. It was also found that all the four dimensions of the cultural intelligences were a significant predictor of work performance. The findings of this study further add to the body of knowledge on the importance of cultural intelligence in promoting work performance. Given the findings, it is crucial that cultural intelligence trainings should be integrated into the librarians' development programs.

INTRODUCTION

The library is considered the backbone of any universities of higher learning institutions. Besides supporting the teaching and learning activities, the main role and contribution of the library is to serve the students and researchers in their research and publications. However, the library will not function properly if the people who manage the library, simply known as the academic librarians (AL), are not equipped with the appropriate skills and competencies. To be an effective and competent AL, two sets of competencies is required, the professional competencies and the personal competencies. Professional competencies relate to the AL's "knowledge of information resources, access, technology and management, and the ability to use this knowledge as a basis for providing the highest quality information services" (SLA, 2014). In contrast, personal competencies represent a set of attitudes, skills and values that enable AL to work effectively and contribute positively to their organizations, clients and profession and these competencies range from being strong communicators, to demonstrating the value-add of their contributions, to remaining flexible and positive in an ever-changing environment (SLA, 2014).

The nature of the AL's job requires them to serve users of different ranks, races and culture. In a multi-racial country like Malaysia, the students, the teaching faculty as well as the working colleague of the AL are also multiracial, dominated by the Malays, Chinese, Indian, Iban, Kadazan and other ethnics. The international students who mainly come from Middle East and African countries adds more diversity of this already diversified library users of different races and nationalities. This situation necessitates the need of a new set of competency known as Cultural Intelligence (CQ). Kodwani (2012) stated that CQ is a "new complementary form of intelligence, which explains variability in coping and functioning with culturally diverse situation". Thomas & Inkson (2004) defined CQ as "being skilled and flexible about understanding culture, learning more about a culture from an individual's interactions with it, gradually reshaping how an individual thinks about culture to be more sympathetic, and changing how an individual behaves to be more appropriate during cross cultural interactions". In contrast, Earley & Ang (2003) defined CQ as "capability of an individual to function effectively in situations characterized by cultural diversity".

Studies have shown that CQ plays a significant role in employee's performance. However, past studies have not examined the situations of CQ among AL. Against this background, a study was undertaken with the aim of exploring the level of CQ among Malaysian AL. In addition, it was also aimed at examining the effect of cultural intelligence on librarian's work performance.

LITERATURE REVIEW & THEORETICAL FRAMEWORK

Measuring the work performance of an employee is one of the most researched topics in organizational research. Various models and framework have been developed and proposed by researchers for assessing the employee work performance. According to Koopmans (2014), “individual work performance is one of the key indicators for team and company performance, and consequently, it contributes to the productivity and competitive ability of companies”. Accordingly, the author developed an assessment model of work performance which comprises four components, namely, task performance, contextual performance, adaptive performance, and counter-productive performance. Task performance is defined as the proficiency with which an employee performs central job tasks (Campbel, 1990). Contextual is defined as employee behaviors that support the organizational, social, and psychological environment in which the central job tasks are performed (Borman & Motowidlo, 1993). Adaptive performance, is defined as an employee’s proficiency in adapting to changes in work roles or environment (Griffin, Neal & Parker, 2007). Counterproductive work behavior, is defined as the behavior that is harmful to the well-being of the organization (Rotundo & Sackett, 2002).

Along with the development of models or framework for assessing employee work performance, researcher also identified the corresponding determinants or predictors, which can be generally grouped individual factors, organizational factors and external factors. Individual factors are concerned with the individual traits such as gender, age, length of service, skills and competencies. Organizational factors are normally related to the work setting such as organizational process and working procedure, technological infrastructure, supervisor’s influence, working conditions and etc. External factors are those influences coming from external sources such as clients or customers, suppliers and competitors. Depending on the type of job or designation, the magnitude of effect or impact of the aforementioned factors on work performance may vary. However, at the individual level, the individual factors or traits are always found to be the strongest predictors of and individual work performance. CQ is one of the many individual traits that is found to have bearing on individual work performance.

Earley & Ang (2003) identified the dimensions of CQ as meta-cognitive, cognitive, motivation and behaviour. Metacognitive CQ is an individual’s cultural consciousness and awareness during interactions with others from different cultural backgrounds. Cognitive CQ is an individual’s cultural knowledge of norms, practices, and conventions in different cultural settings. Motivational CQ is an individual’s capability to direct attention and energy toward cultural differences. Behavioral CQ is an individual’s capability to exhibit appropriate verbal and nonverbal actions during interactions with others from different cultural background. Past studies examining the effect of CQ on work performance have provided an interesting result. Lee & Sukoco (2010) studied CQ and work performance of expatriate working in multinational companies in Taiwan. The result of the study suggests reveal that the positive effect of CQ needs to be mediated by cultural adjustment and cultural effectiveness before affecting expatriate performance. In another study, Isfahani, Joeghami & Azar (2013) found that all the four dimensions of CQ as identified by Earley & Ang (2003) were a significant predictors of work performance of 200 employees working in various business department. Nafei (2013) examined CQ and job performance of employees working in hospitals in the Kingdom of Saudi Arabia. The findings also showed that the former is a significant predictor of the latter. Rafie, Khosravi & Nasiri (2016) explored CQ and its effect on listening ability among students in Iran. Adopting the correlational analysis, the results revealed that there exists a statistically significant relationship between EFL learners’ CQ and their performance on IELTS Listening Module. Jyoti & Kour (2015) investigated CQ and task performance of managers working in nationalized banks in India. The results also confirmed that CQ is a significant predictor of task performance.

Figure 1 presents the theoretical framework of the study. Drawing upon the work of Earley & Ang (2003), CQ is divided into four components which are metacognitive, cognitive, motivation and behaviour. Adapting the work of Koopmans (2014), work performance is divided into task performance and contextual performance. Based on the finding of previous studies (i.e. Isfahani, Joeghami & Azar, 2013; Nafei, 2013; Jyoti & Kour, 2015; Rafie, Khosravi & Nasiri, 2016) the CQ of the academic librarians will have a significant relationship with work performance. Given the nature of work of the academic librarians that requires them to deal with different people of different rank and races, the need to have a strong level of CQ is very apparent. As their CQ level increases, the researchers also argue that their work performance will also increase sparingly. A librarian who has a strong command of CQ, will be able to deliver their job with great efficiency and effectiveness. On the basis of this justification, we hypothesized that CQ is a significant predictor of work performance. The details of the hypotheses are presented in Table 1.

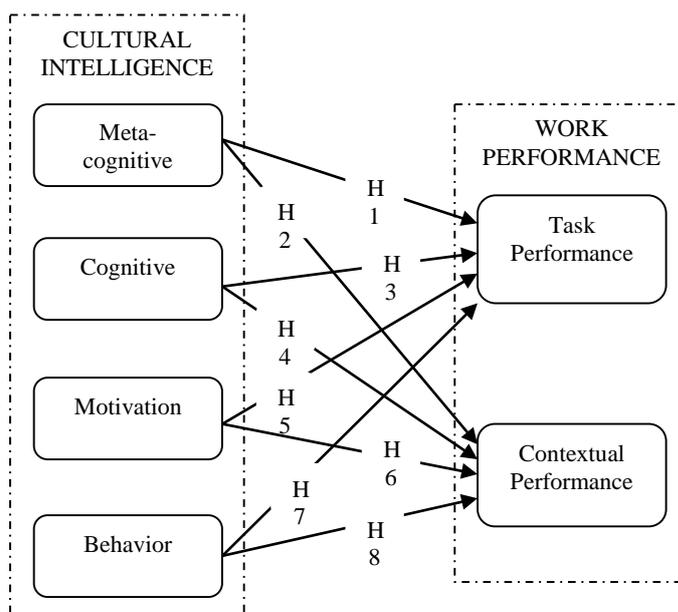

Figure 1: Theoretical Framework

Table 1: Variables, operational definition & hypothesis

Variables	Operational Definition	Hypothesis
Task Performance	The proficiency with which an employee performs central job tasks (Campbel, 1990)	Not applicable
Contextual Performance	The employee behaviors that support the organizational, social, and psychological environment in which the central job tasks are performed (Borman & Motowidlo, 1993)	
Meta Cognitive	Individual's cultural consciousness and awareness during interactions with others from different cultural backgrounds (Early & Ang, 2003)	H1: Meta cognitive significantly predicts task performance H2: Meta Cognitive significantly predicts contextual performance
Cognitive	An individual's cultural knowledge of norms, practices, and conventions in different cultural settings (Early & Ang, 2003)	H3: Cognitive significantly predicts task performance H4: Cognitive significantly predicts contextual performance
Motivation	an individual's capability to direct attention and energy toward cultural differences (Early & Ang, 2003)	H5: Motivation significantly predicts task performance H6: Motivation significantly predicts contextual performance
Behavior	An individual's capability to exhibit appropriate verbal and nonverbal actions during interactions with others from different cultural background (Early & Ang, 2003)	H7: Behavior significantly predicts task performance H8: Behavior significantly predicts contextual performance

RESEARCH METHODOLOGY

Following Noordin & Masrek (2016), this study used survey research methodology. A survey research methodology is a quantitative research approach that is mainly used for research that tests hypotheses. In this study, several hypotheses were developed and to be tested with the collected research data. The population of the study was academic librarians working in Malaysian university. As of December 2016, the total population was 600. Using the convenient sampling technique, an email was sent to targeted respondents. A total of 400 emails were sent out. Friendly reminders were again sent to the targeted respondents every two weeks following the first invitation emails. After two months, a total of 183 responses were received, equivalent to 45.75%. However, upon further scrutiny, 16 responses had to be eliminated because more than 50% questions were not answered, hence, leaving 166 for further analysis.

The questionnaire used in the study was developed based on the validated instrument used in past studies. However, to ensure that validity and reliability requirements are strictly met, the questionnaire was pre-tested with

several librarians and fellow researchers. The outcome of the pre-test showed that no serious issues or problems which needed appropriate revisions. Following the pre-test exercise, a pilot test was conducted. A total of 25 postgraduate students as well as academic librarians were engaged in the pilot test. Using SPSS version 22.0, a reliability analysis was executed and the results ranged between 0.613 and 0.789. This result indicated that the questionnaire was acceptably reliable to be used in the actual study.

Besides SPSS Version 22.0, this study also used another called Smart-PLS Version 3.0 (Ringle et al, 2015) for running the PLS structural equation modeling (SEM). SEM analysis involves two-stage analysis, the assessment of measurement model, followed by the assessment of the structural model. The assessment of measurement model will assess the factor loading of items, the convergent validity of items measuring construct and the discriminant validity distinguishing all constructs. The cut of value of the factor loading should be above 0.7 while for convergent validity, the criteria used was composite reliability and average variance extracted, which should be above 0.8 and 0.5 respectively. Discriminant validity is normally assumed when the square root of the AVE of the construct is less than the correlation value amongst construct. Before proceeding to the structural model assessment, it is imperative to assess the model fit. The criteria used for assessing model fit are Standardized Root Mean Square Root Residual (SRMR) and Normed Fit Index (NFI). The recommended value for SRMR should be less than 0.08 while for NFI the value should be more than 0.90.

FINDINGS

4.1 Assessment of Common Method Bias

In any research that uses single sources of data (i.e. single respondent answering all question in the questionnaire), the threat of common method bias is quite possible. Following Podsakoff et al. (2003), this study examined the possibility of this threats using Harman single factor test. The result showed that, when all items constrained to a single factor, the total variance explained was 43.1%, less that the cut-off value of 50% as suggested by Harman (1960). Given the result, it can be argued the data obtained from the study was free from common method bias.

4.2 Demographic Profiles of Respondents

Four demographic information were collected in the questionnaire. In terms of gender the majority was female (71.7%). Age group of 31 and 35 was the majority (43.4%) while the smallest was age group of 51 and 55 (3.8%). In the Malaysian academic librarian position scheme, the ranking is categorized into S41, S44, S48, S52, S54 and JUSA. The S41 is the junior level while senior levels are at the level of S54 and JUSA. The S54 or JUSA level is normally dedicated to the chief librarian post. In this study, the majority of the respondents indicated that they were at the S41 level (45.8%). In terms of length of service, the majority of respondents (35.5%) responded that they had work between 7 and 9 years.

4.3 Assessment of Measurement Model

Table 2 showcases the results of the assessment of the measurement model. The corresponding SmartPLS output is shown at Figure 2. As discussed in the previous section, all the criteria for assessment were fully fulfilled. The factor loading for all items was well above 0.7, the composite reliability for all construct was well above 0.7 and the AVE also surpassed 0.5. On the basis of this result, convergent validity can be assumed.

Table 2: Assessment of Measurement Model

	Items	Factor Loading	Cronbach's Alpha	rho_A	Composite Reliability	Average Variance Extracted (AVE)
Contextual Performance	CP1	0.839	0.749	0.75	0.857	0.667
	CP2	0.772				
	CP3	0.838				
Meta Cognitive	MET1	0.814	0.783	0.79	0.86	0.608
	MET2	0.854				
	MET3	0.714				
	MET4	0.728				
Cognitive	CO1	0.707	0.799	0.802	0.862	0.555
	CO2	0.779				
	CO3	0.746				
	CO4	0.753				
	CO5	0.738				

Task Performance	TP1	0.822	0.816	0.822	0.878	0.644
	TP2	0.764				
	TP3	0.777				
	TP4	0.844				
Motivation	MO1	0.778	0.821	0.824	0.875	0.584
	MO2	0.726				
	MO3	0.748				
	MO4	0.749				
	MO5	0.817				
Behavior	BE1	0.705	0.822	0.838	0.874	0.581
	BE2	0.735				
	BE3	0.743				
	BE4	0.817				
	BE5	0.805				

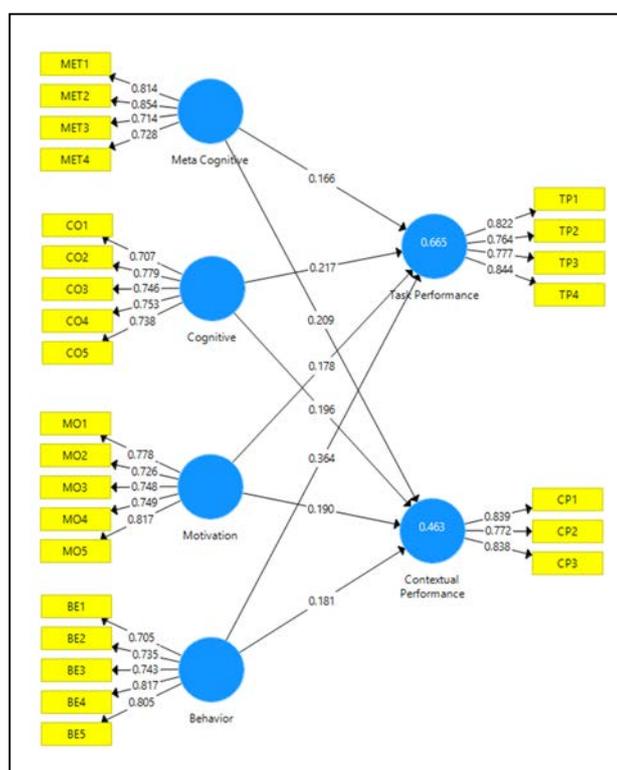

Figure 2.0 SmartPLS output of the Measurement Model

Table 2 presents the results of the assessment of discriminant validity. The bold and italicized numbers are the square root of the AVE of the construct. These values are well above the correlation values among constructs and this implied that discriminant validity was not an issue to be concerned with.

Table 2: Assessment of Discriminant Validity

	Behavior	Cognitive	Contextual Performance	Meta Cognitive	Motivation	Task Performance
Behavior	0.762					
Cognitive	0.677	0.745				
Contextual Performance	0.591	0.600	0.817			

Meta Cognitive	0.668	0.699	0.593	0.780
Motivation	0.722	0.713	0.599	0.764
Task Performance	0.750	0.707	0.730	0.802

The SRMR is defined as the difference between observed correlation and the model implied correlation. The RMR for saturated model is 0.068 while for the estimated model is 0.071. These values are less than the cutoff value of 0.08 which implied that the estimated model is fit, measured from the SRMR criteria. However, the NMI was 0.742 for saturated model and 0.732 for estimated model. These did not meet the fit criteria and the possible reason could be that the sample size of this study was relatively small. NFI is sensitive to sample size and a small sample just like in this study will have impact on the score.

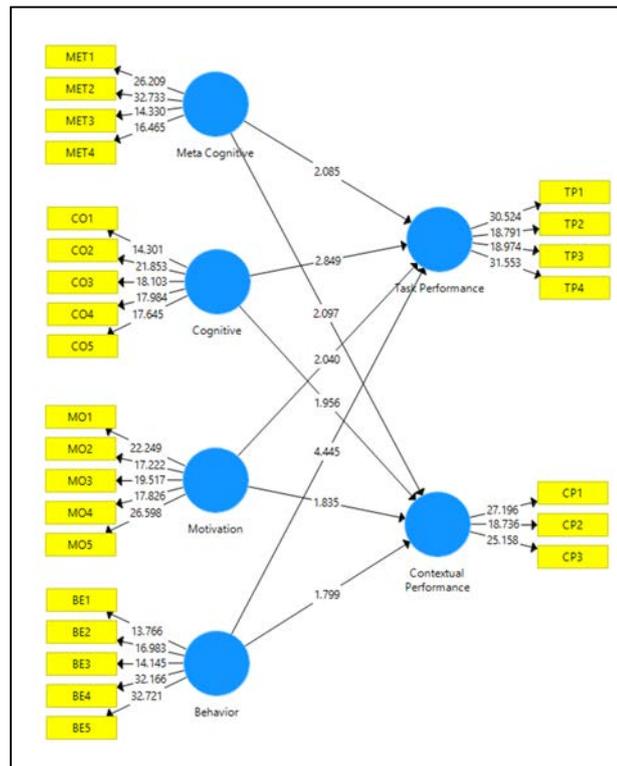

Figure 3.0 SmartPLS output of the Structural Model

4.3 Assessment of the Structural Model

The results on the assessment of the structural model showed that the R² values of task performance (0.665) and contextual performance (0.463) can be considered substantial. As shown in Table 3, all the four components of CQ have predicting effect on the two components of work performance. In terms of relative importance in predicting task performance, behavior (0.364) is the strongest predictor, followed by cognitive (0.217), motivation (0.178) and meta cognitive (0.166). For contextual performance, it was meta cognitive (0.209) that has strongest effect, followed by cognitive (0.196), motivation (0.190) and behavior (0.181).

Table 3: Path Coefficients

		Original Sample (O)	Sample Mean (M)	Standard Deviation (STDEV)	T Statistics (O/STDEV)	P Values	Decision on Hypothesis
H1	Meta Cognitive → Task Performance	0.166	0.171	0.079	2.085	0.019	Accept H1
H2	Meta Cognitive → Contextual Performance	0.209	0.213	0.100	2.097	0.018	Accept H2
H3	Cognitive → Task Performance	0.217	0.214	0.076	2.849	0.002	Accept H3

H4	Cognitive → Contextual Performance	0.196	0.193	0.100	1.956	0.025	Accept H4
H5	Motivation → Task Performance	0.178	0.177	0.087	2.040	0.021	Accept H5
H6	Motivation → Contextual Performance	0.190	0.184	0.104	1.835	0.033	Accept H6
H7	Behavior → Task Performance	0.364	0.364	0.082	4.445	0.000	Accept H7
H8	Behavior → Contextual Performance	0.181	0.186	0.101	1.799	0.036	Accept H8

Table 4 presents the outcome of the confidence interval bias and construct cross validated redundancy of the assessment of the structural model. As shown in the table, 0 does not straddle in between the confidence intervals bias results, hence suggesting that there is a significant result. Using the blindfolding procedure, the predictive relevance of the model was assessed. The predictive relevance Q^2 of contextual performance has a value of 0.283 and task performance has a value of 0.395, indicating that the model has a predictive relevance.

Table 4: Confidence Interval Bias

	Original Sample (O)	Sample Mean (M)	5.00%	95.00%	Q^2
Contextual Performance	0.463	0.482	0.376	0.589	0.283
Task Performance	0.665	0.679	0.609	0.745	0.395

To assess the relative impact of a predictor construct on an endogenous construct, the effect size (f^2) was examined. Cohen (1988) stated that substantial effect size happens when f^2 is 0,35 or greater. As shown in Table 5, except for one, effect size was small for all predictor variables. The behavior construct was found to have medium effect size (0.156) in producing R^2 for task performance.

Table 5: Assessment of Effect Size (f^2)

	Contextual Performance	Task Performance
Behavior	0.024	0.156
Cognitive	0.027	0.054
Meta Cognitive	0.035	0.035
Motivation	0.025	0.035

DISCUSSION

This paper discusses how CQ increases work performance of academic librarian working in Malaysian public university libraries. The study highlights, the importance of CQ in enhancing the librarian work performance. The results reveal that CQ is an important predictor of work performance and thus corroborates the findings of previous studies (Isfahani, Joeghami & Azar, 2013; Nafei, 2013; Jyoti & Kour, 2015; Rafie, Khosravi & Nasiri, 2016).

According to Crawford (2012) AL perform a variety of functions in the academy that comprise aspects of research, instruction, and service and require networking and influence in a variety of physical and virtual spaces. ALA (2016) describes that AL need to be responsive and this requires them to determine the situational context of the individual information needs of users when interacting with each user in person or through another communication channel. In addition, AL must also engage users in discussions about experiences related to their information needs and communicates interest in every user's experiences. ALA (2016) also explains that AL is a disseminator of knowledge and this requires them to teach classes in areas of expertise, prepares presentations in areas of expertise; discusses issues with colleagues; mentors colleagues through listening, coaching, and serving as a role model; and participates in professional discussions through meetings, videoconferences, mail lists via email and other available communication methods and forums.

ALA (2016) also highlights that AL should conducts research to determine what types of reference services to provide and to what types of users these services will be provided. This requires them to conducts surveys, within and beyond the library building, to address the needs of users in the area of reference services; conducts focus groups to meet and interact with users and to discuss and gather information about users' information needs;

consults with other libraries to network and brainstorm concerning the programs and services that are provided in the area of reference; and meets with community leaders to bridge the gap between the library reference service and the individuals and groups that make up the community that the service addresses. Additionally, ALA (2016) also highlights that AL should effectively communicate the nature of the reference and information services that are provided to users being served. One of the strategies for this task is by engaging users through lectures, programs, tours, school visits, departmental addresses, and press conferences to promote the reference services offered.

AL are also expected to consistently and systematically assesses the effectiveness of the marketing of reference and information services (ALA, 2016). This can be done through in-house meetings and training sessions to gather feedback from reference librarians regarding the success of the reference services being provided and products being offered and engaging users in focus groups, surveys, and feedback forms as a user follow up for reaction and perception of reference services. In terms of relationship, AL are also expected to work closely with colleagues to provide quality service to users; develops collaborative relationships within the profession to improve service to users; cultivates and maintains partnerships beyond the library and the profession to strengthen services to users (ALA, 2016).

It is quite apparent that all of the aforesaid tasks and activities require them to apply CQ. This is because, as stated earlier, the users as well as the colleague whom they will be dealing with, are of different races and cultures and thus, their needs and preferences are diversified. AL who is ill-equipped with CQ will not be able to effectively and efficiently perform all of these tasks.

CONCLUSION

The information and communication technology revolution has caused academic libraries and the profession of academic librarianship to change and will continue changing in many respects. These changes are directly and indirectly impacted the competencies needed by the AL. As shown in this study, CQ is another form of competency that is highly needed by the AL. CQ is essential in increasing the AL's work performance. Given the findings of the study, training focusing on enhancing the AL's CQ should be continuously conducted. As for universities or higher learning institution providing academic programs on librarianship, this finding should alert them on the importance on revising the curriculum so that CQ is also embedded or integrated into the teaching syllabus. From the research perspective, this research has developed an empirical based framework connecting CQ and work performance in the context of AL. This framework can be further validated in other setting involving other types of librarians.

The limitation of this study is in terms of the research design and methodology. While the researchers had tried their level best to collect the sufficient number of samples, the total sample involved was still considered low. Due to this, the finding of this study may not be possible to be generalized to all AL working in Malaysian academic libraries. Secondly, the data obtained through questionnaire may not be as rich or as in-depth as the data obtained through interview. It would be more enriching if future study can complement the data collection technique with a face-to face interview or focus group session.

ACKNOWLEDGEMENT

The researcher would like to express our thanks to Universiti Teknologi MARA for funding the research under the LESTARI grant scheme [600-IRMI/DANA5/3/LESTARI (0051/2016)]. Our thanks are also dedicated to Institute of Research and Innovation (IRMI) and the Faculty of Information Management for facilitating and providing other form of resources. Finally, our thanks are also dedicated to all those respondents who involved in this research.

ABSTRACT

This research was aimed at studying students' preconception in learning with Constructivist web-based learning environments, mental effort invested while learning, and relationships between preconception and the mental effort invested. The target group consisted of undergraduate students majoring in Secondary education of Faculty of Education, Khon Kaen University registered in the course 212300 Instructional media during the first semester of 2004. The results revealed as following: (1) Preconception of the students learning with the Constructivist web-based learning environments was at a high level in all of the 4 aspects, especially the expectation. (2) Self-report of the mental effort invested of the learners showed a high level for 3 aspects, especially learners' mental effort to understand while learning with the learning environments. (3) Relationship between preconception of the students in their preference to learn with the Constructivist learning environments and self-report in the mental effort invested while learning with the learning environments was significant at 0.5 level. There was no relationship between preconception of difficulty, expectation, and curiosity with self-report on other mental effort invested, namely, intention and cognitive load while learning with the Constructivist learning environments.

Keywords - Preconception, Constructivist web-based learning environments, Mental effort

INTRODUCTION

After the B.E.2542 National Education Act was enforced, changes of methods have been seen in the teaching and learning at the tertiary level. The former principles were based on the consumer society rather than the productive society (Sinlarat, 2000), forcing Thai people to accept foreign trends all the time. Changes of information sources and knowledge in society caused a shift from teachers to multiple information and technologies. Thus, instruction has to be modified to meet with the new learning paradigm so that university graduates will be able to inquire knowledge by themselves and use technology to the fullest extent to acquire knowledge. Graduates should also be able to criticize, analyze, construct knowledge, and appropriately present their ideas. Important strategies are necessary in developing the required traits for the knowledge-based society according to the 1999 National Education Act, which states that learners are entitled to develop their potential in the use of technology for continuous and life-long knowledge inquiry. It can be seen that the National Education Act 1999 in this respect correlates to the Constructivist theory which supports the learners' construction of knowledge on their own. The notion also coincides with the change of knowledge construction paradigm through cognitive processes that enhance learning and emphasize knowledge construction by thinking process. Former schema is connected with new knowledge and the cognitive structure enlarge. Teachers are not able to alter learners' cognitive structure, but they are able to help learners enlarge their cognitive structure by providing the learning environments that enhance knowledge construction by integrating both the principles and attributions of media and technologies (Chaijaroen, 2004).

It can be seen that web-base has become an innovation in education with characteristics that can serve to the new concept of knowledge construction of learners and collaborative learning. Web-base meet our needs in terms of their attributions and media symbol system through information and hypertext presentation. They are composed of information in major and minor nodes which are interconnected and called hyperlink. They efficiently help learners connect and support for their prior knowledge, and the connection can be made worldwide through web-based networks. Hence, learners have access to worldwide learning sources. The advantages of communication where

learners and the teacher can interact effectively enhance learners' thinking (Chaijaroen, 2004). Additionally, research on utilization of instructional media suggests that media attribution and learners' traits affect learning (Cennamo, 1993). Clark (1983, 1994) suggests that research should be conducted on attributions of media and belief of learners in media. Previous research showed that belief and expectation on media have impact on learners' motivation. An important variable is learners' preconception towards media. With these reasons, our study was on learners' preconception on media and their mental effort invested. The evidence and findings would be implemented in development of learners' cognitive processes that would in turn increase the efficiency of learning and hence future approaches for instruction at the tertiary level.

CONCEPT AND THEORIES

In this respect, the notion of student-centered approach has come into consideration. Instruction that meets the reform of education should accent knowledge construction by learners themselves with these following learning theories: Cognitivism and Constructivism. Appropriate media attributions, web base are also incorporated and designed as learning environments that enhance knowledge construction

Research on the use of media in teaching had suggested that media attribute and learners' characteristic would influence learning (Clark and Salomon, 1986). Clark (1983, 1994) proposed that future researches should begin by investigating variables that are connected with the attributions or beliefs on media. Preconceptions were seen as the most dominating factor from such variables. Several researchers have suggested that the learners' preconceptions of media are an influential factor in achievement (Salomon, 1983; (Salomon and Light, 1984; Krendl and Watkins, 1983; Krendl, 1986). In addition, the learners' beliefs and expectations influenced their motivation to learn. Cognitive theory assumes that motivation influence either engagement in task or the amount and quality of effort invested which in turn is presumed to affect learning. Prior research showed that the preconceptions affect mental effort invested (Cennamo, 1991) and achievement scores (Salomon, 1984; Cennamo, 1993). In addition, the research also indicated that the learners' preconceptions might be influenced by the characteristics of medium, the perceived task and past experience. Therefore, this study aimed to examine the relationship between four dimensions of the learners' preconceptions such as, preference, difficulty, learning expectancy and curiosity toward Constructivism web-based learning environments with the amount of mental effort invested.

RESEARCH PURPOSES

- 1) To explore the learners' preconception of Constructivism web-based learning environments.
- 2) To explore the learners' mental effort invested while learning with Constructivism web-based learning environments.
- 3) To examine the relationship between preconception and mental effort while learning with Constructivism web-based learning environments.

TARGET GROUP

The target group consisted of 11 undergraduate students majoring in Secondary education of the Faculty of Education, Khon Kaen University registered in the course 212300 Instructional media during the first semester of 2004.

RESEARCH VARIABLES

The independent variable in this research was instruction of the course 212300 Instructional media, with the Constructivist web-based learning environments. The dependent variables consisted of: (1) Students' preconception in the Constructivist learning environments of the course 212300 Instructional media, with Constructivist web-based learning environments. (2) Students' mental effort invested while learning the course 212300 Instructional media, with the Constructivist web-based learning environments. (3) The relationship between preconception and mental effort invested while learning with the Constructivist web-based learning environments.

RESEARCH INSTRUMENTS

- 1) The experimental instrument was the Constructivist web-based learning environments of the course 212300 Instructional media designed and developed as follows: The Constructivist web-based learning environments were designed and developed from document analysis and synthesized into the designing framework. The concept and principle of Constructivism was employed as the design basis, integrated with web-based learning where media attribution and media symbol system was taken into account. Major principles of Constructivism including Cognitive Constructivism and Social Constructivism were taken into consideration when designing the web-based learning

environments. Following were the main components: (1) problem bases, (2) learning resources, (3) discovery learning, (4) scaffolding, (5) collaborative learning, (6) coaching. The efficiency was found as following details (Chaijaroen, 2003).

a) Assessment of product – This involved evaluation of the quality of the Constructivist web-based learning environments by experts in the fields of content, Constructivism-based design, web-based design, and evaluation. The researchers then improved the Constructivist learning environments according to the experts' suggestions.

b) Assessment of the utilization context – In order to determine appropriate and efficient context for the use of Constructivist web-based learning environments. The researchers studied the contexts related to the most efficient number of members in a group for collaborative problem solving on the Constructivist web-based learning environments. The result showed that there should be 3 members per group to obtain maximal efficiency of collaboration in problem solving and in learning process.

c) Assessment of opinions of students toward the Constructivist web-based learning environments – using the opinionnaire and interview conducted in three dimensions: quality of web-based design, contents, and instructional design based on Constructivism. The findings showed that students thought that learning with the Constructivist web-based learning environments provided opportunity for them to inquire and construct the knowledge on their own. In addition, certain findings led to improvements, for example, the screen design or some interactions that had been complicated, etc.

d) Evaluation of students' cognitive ability – In this study, the researchers examined the students' mental model while learning with the Constructivist web-based learning environments. It was found students' mental model in declarative knowledge. Their cognitive structure falls into 3 levels: complex, general, and abstract; which could be a conceptual model, plan or script, or a causal model. The procedural knowledge was constructed through action.

2) Data collection instruments

a) Questionnaire asking information on students' preconception of Constructivist web-based learning environments. The questionnaire was 5 rating scale based on Cennamo's (1993) study comprising as following: (1) difficulty in learning, (2) preference of learning, (3) expectation in learning, and (4) curiosity for learning.

b) An self-report form for the mental effort invested while learning with the Constructivist web-based learning environments. This was 5 rating-scale self-report, of Cennamo's (1993), which included 3 aspects: (1) intention while learning, (2) cognitive load used while learning, and (3) mental effort invested for understanding.

DATA COLLECTION

Data were collected as following: (1) The students' preconception questionnaire on the Constructivist web-based learning environments were administered two week before the experiment. (2) Students learned the course 212300 Instructional media with the Constructivist web-based learning environments. Students were divided into small groups of 3 persons and learned about the types of media and educational innovations. The lessons started with the teacher introducing each lesson by linking with students' prior knowledge on the topic so that they would interconnect their cognitive structure with the new knowledge. The students: 1) studied the problem base and 2) analyzed the situation and collaboratively found a means to solve the problem within their groups. They searched and inquired data from information sources provided on the Constructivist web-based resources and others. They were able to ask and exchange their idea or experiences with their teacher, teaching assistant and experts. They could also ask or study other groups' posts on the web board. These were the approaches used in linking nodes of knowledge that led to solution for their group and enlargement of perspectives. 3) When students found the answer or conclusion for their group, they typed their answers on the web board. An expert then checked the answer. Students could be encouraged to think, find a means to solution, or expand their thinking. If any group misunderstood, or misconception they could be advised until they formed accurate concept. Students were able to contact and ask other students, the teacher or experts all the time, both in the class or out of class by web-board or e-mail. 4) Students, the teacher, the teaching assistant drew conclusion together after each group presented their solutions. The teacher and teaching assistant acted like a coach pointing at the learning concepts and encouraged students to articulate the knowledge or their opinions. They instructed students when the latter had problems and framed students' experiences in terms of contents and thinking all through the learning steps. (3) After the lessons, students took an achievement test and answered the self-report on their mental effort invested while learning.

DATA ANALYSIS

1) Mental effort invested while learning with the Constructivist web-learning environments. The rating scale on students' mental effort completed by the students themselves were analyzed by using means (\bar{x}) and standard deviations (S.D.).

- 2) Preconception–The rating scales Preconception questionnaire were analyzed by using means (\bar{x}) and standard deviations (S.D.).
- 3) Relationships between preconception and mental effort were analyzed by using Pearson Correlation.

FINDINGS

The study of students' preconception, mental effort while learning, and the relationships between preconception and mental effort invested in their learning with the Constructivist web-based learning environments showed the following results:

- a) Students' preconception on the Constructivist web-based learning environments. The questionnaire asking students' preconception was conducted before the lessons. The results were as follows:

TABLE I. Means, standard deviations and levels of students' preconception towards the Constructivist web-based learning environments

Lists of preconception towards the Constructivist web-based learning environments	Levels of opinions		
	\bar{x}	S.D.	Level
1) Difficulty to learn with the Constructivist web-based learning environments.	3.90	.30	High
2) Preference to learn with the Constructivist web-based learning environments.	4.18	.40	High
3) Expectation from learning with the Constructivist web-based learning environments.	4.27	.46	High
4) Curiosity to learn with the Constructivist web-based learning environments.	4.18	.60	High

Table 1. illustrated that the students' preconception of the Constructivist web-based learning environments was at a high level for all aspects, especially in their expectation that they would learn from the Constructivist web-based learning environments

- b) Students' mental effort invested while learning with the Constructivist web-based learning environment. The rating scale for students' self-report on their mental effort invested while learning was administered after the students completed their lessons with the Constructivist web-based learning environments. The result was shown in Table 2.

TABLE II. Means, standard deviations and levels of students' mental effort invested while learning with the Constructivist web-based learning environments

Lists of mental effort invested when learning with the Constructivist web-based learning environments	Self-report levels		
	\bar{x}	S.D.	Level
1) Intention to learn with the Constructivist web-based learning environments	3.63	0.50	High
2) Cognitive load used in learning with the Constructivist web-based learning environments	3.81	0.40	High
3) Mental effort invested for understanding from learning with the web-based learning environments	4.09	0.30	High

Table 2. Showed that the students evaluated themselves in terms of mental efforts invested for all of the 3 aspects at a high level, especially in mental efforts invested for understanding while learning with the Constructivist web-based learning environments

c) Relationships between the students' preconception and mental effort while learning Pearson Correlation was used to analyze the relationships between students' preconception and mental effort while learning with the Constructivist web-based learning environments. The results were shown in Table 3

Table III. Correlations between students' preconception and mental effort invested while learning with the Constructivist web-based learning environments.

List of Preconception	List of Mental effort		
	<i>Intention</i>	<i>Cognitive load</i>	<i>Mental effort invested</i>
1) Difficulty to learn with the Constructivist web-based learning environments	.41	-0.15	0.10
2) Preference to learn with the Constructivist web-based learning environments	-.13	0.22	0.67*
3) Expectation from learning with the Constructivist web-based learning environments	.04	0.29	-0.19
4) Curiosity to learn with the Constructivist web-based learning environments	-.90	0.15	-0.10

*Significance level = .05

The analysis shows, as can be seen in Table 3, that students' preconception related to preference to learn with the Constructivist web-based learning environments and their self-evaluation on mental effort invested to learn with the learning environments correlated significantly at .05. Preconception of difficulty, expectation, and curiosity did not show any correlation with self-evaluation in intention and cognitive load used while learning with the web-based learning environment.

DISCUSSION

The findings indicate the following: (1) Correlation with preconception and learning from the Constructivist web-based learning environments. The study of the effects of preconception on learning from the Constructivist web-based learning environments was conducted by surveying students' opinions before intervention. It was found that students' preconception was at high levels in all of the 4 items surveyed, namely: 1) difficulty to learn with the Constructivist web-based learning environments; 2) preference to learn with the Constructivist web-based learning environments; 3) expectation from learning with the Constructivist web-based learning environments; and 4) curiosity to learn with the Constructivist web-based learning environments. Students' expectation in particular, could be congruent with Chaijaroen Sumalee (Chaijaroen, 2003) found that Grade 5 students learning Thai language were eager to learn from web-based lessons on the computer. However, we found that Grade 9 students were eager to learn from the computer, but they expected that they would learn the best from their teacher. Krendl (1986) performed a study in the US and found that learners liked to learn from the computer most of all. It can be concluded from our study that students' preconception towards the Constructivist web-based learning environment was very difficult, but they still wanted to learn with this learning environments. They also expected that this learning environments would enable them to learn more. Their curiosity to learn from the Constructivist web-based learning environments was also high. Students might think that the Constructivist web-based learning environments is an innovation they had never learn with it before. They enjoyed and wanted to learn any content by using the computer, since it is challenging and new. This can be support by students' interview result as follows: Students said, "We are able to search new knowledge from many sources. There are also experts who encourage us to have access to new sources, enabling us to inquire more knowledge. Traditional learning is not the same, for we had to receive knowledge from the teacher." From the findings of research studies and evidences above, it is possible to support suggestions from educators like , Salomon (1983), Salomon and Light (1994), Krendl (1986) and Cennamo (1993) that preconception of students on instructional media has impact on learning achievement. They also stated that belief, preference, opinions on difficulty, curiosity, and expectations of students can lead to learning motivation. Motivation is accepted as a major item in learning. Moreover, Cognitivism states that motivation supports learning, quantity and quality of mental effort invested in learning, all of which affect learning and learning achievement Krendl (1986), Cennamo (1993), Clark (1994), Salomon (1983), Salomon and Light (1994), Krendl (1986), and Cennamo (1993) (2) Self-report on mental effort invested while learning with the Constructivist web-based learning environments and preconception of students on the learning environments. The study of students' self-report on mental efforts invested during the learning process that were based on the Constructivist web-based learning

environments showed that students invested their mental efforts at high levels for all of the three aspects, namely 1) intention to learn from the Constructivist web-based learning environments, 2) cognitive load used in learning, and 3) mental effort invested made to understand when learning with the Constructivist web-based learning environments, especially the last aspect.

Furthermore, this study found preconception of students related to their preference to learn with the Constructivist web-based learning environments correlated significantly at .05 level. Preconception of the difficulty, expectation, and curiosity was not found to correlate with the self-report on other mental effort invested, which included intention and cognitive load while learning with the Constructivist learning environments. Literature also showed that research work by Chaijaroen Sumalee (Chaijaroen, 2004) did not find correlation between students' preconception and difficulty level, expectation and curiosity when Grade 9 and Grade 11 students evaluated themselves on their mental effort invested. This study, however, found correlation between preconception and self-report on mental effort invested while learning with the Constructivist web-based learning environment.

ACKNOWLEDGMENT

This research was supported by Ph.D. Program in Educational Technology, Faculty of Education, Research Group for Innovation and Cognitive Technology, Khon Kaen University, and Research and Technology Transfer Affairs Division, Khon Kaen University which hereby giving the thankfulness all through this.

ABSTRACT Hemodialysis patients are more likely to have higher depression, anxiety and stress levels compared to healthy individuals. We conducted a research in order to see that whether self-compassion levels of patients affect this phenomenon. *Depression/Anxiety/Stress Scale (DASS)* and *Self-Compassion Scale* were applied to 142 hemodialysis patients. It is found that there is a negative relationship between DASS and *self-kindness, common humanity, and mindfulness* components of Self-Compassion Scale whereas *self-judgment, isolation and over-identification* components of Self-Compassion Scale correlate positively with DASS. Furthermore, present relationship between components of Self-Compassion Scale and DASS differs for gender, education and marital status of patients.

Keywords: *Hemodialysis, self-compassion, depression, anxiety, stress*

1. INTRODUCTION

There are approximately 70.000 dialysis patients in Turkey. It's well known that majority of them suffers from the adverse effects of the disease in their everyday lives along with both their education and private lives. Depression, anxiety, and stress symptoms are common for dialysis patients as for all chronic patients.

Self-compassion is a newly-emerging phenomenon in the field of psychology. Yet, studies concerning self-compassion increase gradually. Basically, self-compassion is related to individuals' easy-going and merciful attitudes towards themselves without judging after they experience challenging events. Furthermore, it is related to individuals' realization of their distress and sorrow and in the end, eventual acceptance of these unfavorable experiences as parts of human life (Neff, 2003).

Most of the studies about self-compassion focus on the relationship between self-compassion and DAS (depression/anxiety/stress). One of the recent researches indicated that as self-compassion levels of individuals increases with training, their depression/anxiety/stress levels reduce (Karakasidou & Stalikas, 2017). Another research conducted with a Turkish sample showed that there is a negative correlation between individuals' self-compassion scores and DAS scores (Özyeşil & Akbağ, 2013).

In this research, effects of self-compassion levels of hemodialysis patients on their mental status, and the changes due to the treatment process are studied. It is presumed that high levels of self-compassion may help hemodialysis patients to reduce their mental disturbance over the course of their treatments.

2. METHOD

2.1. Participants

142 hemodialysis patients (96 men and 46 women) from private clinics in Adana participated in the study. All patients who filled out the questionnaires are included in the study. Mean age of participants is 58 with the SD value of 14.35. Further demographic information about participants is presented in Table.1.

Table.1

Socio-demographic variables of hemodialysis patients in the study

		#	%
GENDER	Men	96	67,6
	Women	46	32,4
	TOTAL	142	100
EDUCATION	Illiterate/Elementary School	105	73,9
	Middle School or Above	37	26,1
	TOTAL	142	100
MARITAL STATUS	Married	113	79,6
	Single	13	9,2
	Divorced	4	2,8
	Widowed	12	8,5

INTERNET USAGE	User	52	36,6
	Not-User	90	63,4
	TOTAL	142	100

2.2. Assessment

2.2.1. Self-Compassion Scale

The Self-Compassion Scale is used to assess the self-compassion levels of patients. The scale contains 26 items that are scored on a five-point scale (range: 1=never to 5=always). Rating of the scale is assessed independently for each component. Moreover, it can be summed up to an overall self-compassion rate. Thus, Self-Compassion Scale assesses information about not only the components of self-compassion such as self-kindness, self-judgment, common humanity, isolation, mindfulness, over-identification but also self-compassion as a whole.

2.2.2. Depression/Anxiety/Stress Scale (DASS)

DASS consists of three factors named as Depression, Anxiety, and Stress. The scale contains 42 items that are scored on a four-point scale (range: 0=do not apply to me at all to 3=applied to me very much). The items are designed to rate depression, anxiety and stress independently.

2.3. Procedure

Self-Compassion Scale and DASS are given to patients individually. Patients are assessed during the time of treatment process.

3. RESULTS

There is a negative correlation between self-kindness, common humanity, mindfulness components of Self-Compassion Scale and depression/anxiety/stress separately whereas self-judgment, isolation, over-identification components of Self-Compassion Scale correlates positively with DASS (all $ps < .05$). Correlations are presented in Table.2.

Table.2

Correlations between depression, anxiety, stress and self-compassion

Self-compassion	Depression	Anxiety	Stress
Self-kindness	-,476**	-,470**	-,732**
Self-judgment	,479**	,397**	,427**
Common humanity	-,168*	-,246**	-,459**
Isolation	,370**	,224**	,186*
Mindfulness	-,183*	-,264**	-,500**
Over-identification	,416**	,419**	,554**

*** $p < .01$

** $p < .05$

Furthermore, present relationship between components of Self-Compassion Scale and DASS differs for gender, education and marital status of patients.

3.1. Gender differences

Independent samples t-test showed that men ($M = 10.90$, $SD = 3.23$) scored higher on common humanity component of Self-Compassion Scale than women ($M = 9.52$, $SD = 2.97$), $t(140) = 2.43$, $p = .16$. On the contrary, women ($M = 17.54$, $SD = 6.67$) feel more anxious than men ($M = 13.81$, $SD = 7.08$) according to DASS, $t(140) = -2.99$, $p = .003$.

3.2. Education level differences

There is a significant difference between patients who graduated from at least middle school and patients who took less education in self-judgment component of Self-Compassion Scale, $t(140) = 2.08$ and depression/anxiety/stress scales; $t(140) = 4.11$, $t(140) = 3.11$, $t(140) = 2.43$ respectively (all $p < .05$). Patients who had less education scored higher than patients graduated from at least middle school ($MD = 1.98$, $MD = 7.04$, $MD = 4.12$, $MD = 5$ respectively).

3.3. Marital status differences

There is a significant difference between married patients and other patients (single, divorced and widowed) in self-judgment component of Self-Compassion Scale, $t(140) = -1.97$, $p = .51$. Comparisons showed that married patients ($M = 9.86$, $SD = 4.91$) scored lower on self-judgment component than other patients ($M = 11.90$, $SD = 5.26$).

3.4. Internet usage

There is a significant difference between internet-user patients and patients who don't use internet in isolation component of Self-Compassion Scale, $t(140) = 3.07$, $p < .01$; and stress component of DASS, $t(140) = -2.30$, $p < .05$. Internet users feel more isolated than non-users ($MD = 1.44$) whereas they get stressed less than non-users ($MD = -4.34$).

4. DISCUSSION

The present study sets out to examine the relations between self-compassion and depression/anxiety/stress among hemodialysis patients. The aim of the study corresponds to one of the previous researches concerning different diseases. That research shows the relationship between self-compassion and resilience/stress in adults with spina bifida, (Hayter & Dorstyn, 2014).

The present theory indicates that self-kindness, common humanity, and mindfulness components of self-compassion may help patients with chronic diseases in order to produce more positive responses to the adverse

effects due to bad experiences. Cross-sectional and experimental studies showed that there is a certain relationship between self-compassion and stress. As mentioned above, studies about self-compassion with patients suffer from chronic illnesses are limited. Nevertheless, studies conducted not only with non-clinical individuals but also with patients who get treatment for chronic diseases point out to the link between lower stress and higher levels of positive components of self-compassion (Sirois & Rowse, 2016; Soysa & Wilcomb, 2013).

Correlational analysis based on the present study shows that self-kindness, common humanity, and mindfulness components of self-compassion are negatively correlated with depression, anxiety, and stress. On the other hand, further correlational analyses showed that self-judgment, isolation, and over-identification components of self-compassion correlate positively with DAS. These findings are consistent with the meta-analysis that shows self-compassion is a very explanatory phenomenon while one tries to understand mental health (MacBeth & Gumley, 2012).

Over and above, the present study indicates the differences in relationships between each component of self-compassion and DAS for men and women, among with people who have different educational background and marital status, in separate sections.

As a consequence, the proof of the link between positive components of self-compassion and psychological health may be a great guiding light for the authorities to develop training programs that would enhance one's self-kindness, common humanity, and mindfulness senses in order to cope with the feelings of depression, anxiety and stress which spring during treatment. Furthermore, these training programs should not only be applied to patients with chronic illnesses but also to physically healthy individuals in order to make them more ready for the struggles of daily life.

ABSTRACT

The main purpose of the study is to examine the relationship between stress, stress coping strategies and attention deficit hyperactivity disorder symptoms among adults. Research was conducted with 221 students from Toros University Vocational High School; Justice, Child Development, Graphic Design, Construction Technology, Occupational Health and Safety and Logistics departments. According to research findings, the indication of attention deficit hyperactivity disorder of students varies depending on stress levels. However, there was no correlation between ADHD symptoms and stress coping strategies.

Keywords: Perceived stress, stress coping strategies, attention deficit hyperactivity disorder

INTRODUCTION

Stress, which is an indispensable fact of everyday life, is taken up in many scientific fields along with psychology. Since it is a subject of life, it has preserved its existence since history and is the subject of scientific studies.

While Selye treats stress as a physiological response to the body only in changing situations; According to Lazarus and Folkman (1984), stress is considered as a situation that occurs between the individual and the environment, where the resources of the individual are constrained and the state of well-being is in danger (Lazarus, 1993). In the light of definitions, the results of the factors that cause the individual to experience stress may sometimes be of a quality that will affect the whole life. These results are antagonized under various headings. The lack of attention is one of them. Attention deficit manifests itself in a number of obstacles in executive functions, including the difficulty of focusing on a subject, the inability to complete tasks assigned, the ability to initiate, sustain, suppress, prioritize, organize, and use strategies, such as limited attention span and distraction (Semerci ve Turgay, 2014).

Attention Deficit Hyperactivity Disorder (ADHD) is one of the most important psychiatric problems of childhood with regards to family, school and society. The role of genetic factors in the formation of Attention Deficit Hyperactivity Disorder is accepted as 80-90%. It is defined as a disease that causes neurobiological disorders as a result of the combination of genetic characteristics and environmental biological agents (Ercan, 2015).

Additionally, it is anticipated that Attention Deficit and Hyperactivity Disorder are affecting 5-10% of children and 4% of adults worldwide (Kessler et al, 2010). In our country, this rate is 5% in children and 3-4% in adults (Semerci ve Turgay, 2014). Attention Deficit Hyperactivity Disorder features distraction, extreme mobility, impulsive behaviors and creates problems in the individual's social life, relationships, education and work life. Approximately 70-85% of children with impaired attention deficit hyperactivity has full of symptoms in their adulthood. Clinical observations and studies suggest that more than half of the cases of attention deficit hyperactivity disorder persist in adulthood. Behavior, mood and anxiety disorders, antisocial features and substance abuse, family conflicts, cognitive, psychosocial and academic functions are more common in adolescents without diagnosis and treatment (Öner ve Aysev, 2003).

Types of stress experienced by the individual, the social stresses that the individual may encounter under stress heading form the most frequently encountered psychosocial features; daily stresses, developmental stresses and life stress crisis. Daily stress is the stress that the individual faces in daily life, is limited to a short time, and does not affect the whole of life. Developmental events cause developmental stresses. The fact that children have fixations during their developmental periods is the basis for further adversely affecting stresses that may arise in the coming years. Stresses created by the events that change the family structure and which will shape the life of the family and the individual are defined as the stresses of life crises (Baltaş, 2015). It is emphasized that impaired family structure, parental attitudes, parental problems and some psychosocial features such as being single or being first child are believed to be related to the emergence of ADHD in Attention Deficit

Hyperactivity Disorder (ADHD) cases. Children staying in orphanages were found to be short and overactive due to long-term emotional deprivation. As a result of the adoption, the symptoms improved (Doğangün; Yavuz, 2011).

There are psychological, sociological, environmental and health related variables that are influenced by the individual who is constantly evaluating the changes that take place around him and his life. These variables shape the process of stressing the individual stress (Gök, 1995).

Excessive life stresses and ineffective ways of coping may also lead to display of attention deficit symptoms. These individuals may exhibit carelessness and may fail to use their abilities effectively in their everyday lives. By studying the relationship between stress level and usage of stress coping strategies and exhibition of ADHD symptoms, may give indications and suggestions of how to increase the quality of life of these individuals.

The purpose of the study was to examine the relationship between the degree of attention deficit hyperactivity display and stress levels and ways of coping with stress in junior college students.

METHOD

The sample of the study consists of 221 vocational junior college students, 57 % of whom are female (n=126) and 43 % of whom are male (n=95). The age range was 17 to 29 (X = 20.96, S s= 3.541).

Assessment Instruments

Demographic Information Form: It was prepared by the researcher to determine the various demographic characteristics of the participants. Data on gender and age of the sample was collected through the demographic information form.

Perceived Stress Scale (PSS): This is a self-assessment scale designed to measure the stress level of individuals based on how they assess their stress level being unpredictable, uncontrollable and overloaded (Cohen, Kamarck and Mermelstein, 1983). Participants are asked to rank specific emotions or thoughts in past month from 1 (never) and 5 (very often). The scale's internal consistency coefficient (Cronbach's alpha) is .84. The test-retest reliability coefficient following two measurements conducted in two day span is .85. The Perceived Stress Scale (PSS) was adapted into Turkish by Bilge, Öğce, Genç ve Oran (2007). The internal consistency reliability of the scale is .81.

Stress Coping Styles Scale: This 66-item, 4-point Likert-type scale, was developed by Folkman and Lazarus (1985). As a result of abbreviations made by Şahin and Durak (1995), the scale was reduced to 30 items. In three separate studies conducted by Şahin and Durak (1995), stress coping Cronbach Alpha internal consistency coefficients for the subscales "optimistic approach" between .49 and .68, for a "self-confident approach" between .62 and .80, between .64 and .73 for the "helpless approach" and between .47 and .72 for the "submissive approach" between .45 and .47 for "social support search".

Adult Attention Deficit Hyperactivity Disorder Self-Report Scale (ASRS): The scale was developed by the World Health Organization for the screening of ADHD (Kessler et al., 2010). Doğan et al. (2009) conducted Turkish validity and reliability studies. In the reliability analysis, the internal consistency of the scale was 0.88 (Cronbach alpha = 0.88). The Cronbach's alpha value calculated for the subscales was 0.82 for 'attention deficit' and 0.78 for 'hyperactivity / impulsivity'.

FINDINGS

1. In terms of Perceived Stress Scale, is there a significant difference between the Arithmetic Mean of the Adult Attention Deficit Hyperactivity Disorder Self-Report Scale (ASRS) scores?

Table 1. Relationship between stress level and attention deficit hyperactivity

	Attention Deficit				Hyperactivity/Impulsivity						
	n	X	S	F	n	X	S	F	P		
	3	41	14,72	1,09	41	15,01	1,04				
	1	44	14,23	1,05	44	14,76	1,00				
	1	41	10,49	.99	41	11,39	.94				
Perceived Stress	2	139	12,24	.61	4,16	.01	139	13,50	.58	3,51	.03

Perceived Coping	2	119	12,74	.66	4.20	.01	119	13.05	0,63	2,08	.12
	3	58	10,48	.91			58	12,10	.86		

As seen on the Table 1 , there is a significant difference in attention deficit subscale scores according to arithmetic mean ($F = 4.16, p < .05$) in terms of perceived stress levels of students. In terms of perceived stress levels of students, hyperactivity subscale scores showed significant differences in arithmetic mean ($F = 3.51, p < .05$). For perceived coping levels of attention, attention deficit subscale scores showed significant differences according to arithmetic mean ($F = 4.20, p < .05$); On the other hand, the hyperactivity / impulsivity subscale scores of the students were not significantly different according to the arithmetic mean ($F = 2.08, p > .05$) in terms of perceived coping levels.

The Scheffe test was used to determine the difference in between perceived stress levels between the students according to their scores of attention deficit and hyperactivity / impulsivity scores.

According to this, it is seen that students with a low level of perceived stress , scores have lower arithmetic average of attention deficit subscale scores ($\bar{X}=10.49$), than students with high score of perceived stress scale ($\bar{X}=14,72$).

Therefore, the hyperactivity subscale scores of the students with a low level of perceived stress level scores are lower than the arithmetic mean ($\bar{X}= 11.39$) and the arithmetic mean of students with high perceived stress score ($\bar{X}= 15.01$).

Findings revealed that as Perceived Stress Scores increase Attention Deficit Scores also increases. As participants' Perceived Stress Scores increase, their Hyperactivity Scores increases .

2. Is there a significant difference between the Arithmetic Mean of the Adult Attention Deficit Hyperactivity Disorder Self-Report Scale (ASRS) scores in terms of the Stress Coping Strategies Scale levels?

2.1. Is there a significant difference between the level of Stress Coping Strategies Scale and Attention Deficit subscale?

Table 2. Relationship between stress coping styles and attention deficit subscale

		Attention Deficit		
		n	\bar{X}	S
Self Confidence Approach	1	24	10,49	1,48
	2	165	12,02	0,94
	3	32	9,61	1,29
Helpless Approach	1	25	8,85	1.39
	2	159	10,65	0,96
	3	37	12,61	1,25
Submissive Approach	1	29	10,36	1,33
	2	160	11,11	0,85
	3	32	10,65	1,34

Optimistic Approach	1	30	11,04	1,35
	2	155	11,39	0,90
	3	36	9,77	1,30
Social Support	1	41	10,33	1,18
	2	152	10,85	0,84
	3	28	10,93	1,37

As seen in Table 2 , the arithmetic mean of the students with the mean of the subscale of self-confident approach subscale ($\bar{X} = 10,49$), arithmetic mean of those at the highest level ($\bar{X} = 9,61$); The arithmetic mean of the students who are at the lower level of the average scores of the helpless approach subscale ($\bar{X} = 8,85$), The arithmetic mean of those at the highest level ($\bar{X} = 12,61$); The submissive approach subscale mean scores of the students at the lower level ($\bar{X} = 10,36$), The arithmetic mean of those at the highest level ($\bar{X} = 10,65$); The arithmetic mean of the students whose mean scores of the optimistic approach subscale scores were lower ($\bar{X} = 11,04$), The arithmetic mean of those at the highest level ($\bar{X} = 9,77$); The arithmetic mean of the students who are in the lower level of the social support subscale point averages ($\bar{X} = 10,33$), Arithmetic mean of the highest level ($\bar{X} = 10,93$).

Table 3. Analysis of stress coping styles and attention deficit subscale variance analysis

Source of Variance	Sum of Squares		Squares Average	F	p
Self Confidence Approach	150,16	2	75,08	1,83	.16
Helpless Approach	176,91	2	88,45	2,15	.11
Submissive Approach	16,26	2	8,13	.19	.82
Optimistic Approach	57,45	2	28,72	.70	.49
Social Support	9,27	2	4,63	.11	.89
Error	8610,62	210	41,00		
Total	42139,00	221			

As seen in Table3, there is no significant difference between attention deficit scores and arithmetic mean scores ($F = 1.83$, $p > .05$) in the subscales of stressor coping style. There was no significant difference between attention deficit scores and arithmetic mean scores according to the desperate approach levels ($F = 2,15$, $p > .05$); There was no significant difference between attention deficit scores and arithmetic mean scores according to the submissive approach levels ($F = .19$, $p > .05$); There was no significant difference between attention deficit mean scores and arithmetic mean scores according to the optimistic approach levels ($F = .70$, $p > .05$); No significant difference between attention deficit scores and arithmetic mean scores ($F = .11$, $p > .05$) was found.

2.2. Is there a significant difference between the Stress Coping Strategies Scale and Hyperactivity subscale?

Table 4. Relationship between stress coping styles and hyperactivity / impulsivity subscales

		Hyperactivity/Impulsivity		
		n	\bar{X}	S
Self Confident Approach	1	24	9,82	1.39
	2	165	12,81	.88
	3	32	13,74	1.21
Helpless Approach	1	25	11,42	1.31
	2	159	11,05	.90
	3	37	13,90	1.17
Submissive Approach	1	29	13,47	1.25
	2	160	12,06	.80
	3	32	10,83	1.26
Optimistic Approach	1	30	11,76	1.27
	2	155	13,22	.84
	3	36	11,38	1.22
Social Support	1	41	12,20	1.10
	2	152	12,80	.79
	3	28	11,37	1.29

As shown in Table 4, the average of self-confident approach subscale scores; The arithmetic mean of the lowest level ($\bar{X} = 9,82$), Arithmetic mean of those at the highest level ($\bar{X} = 13,74$). Mean of helpless approach subscale scores; Arithmetic mean of the lowest level ($\bar{X} = 11,42$), The arithmetic mean of those at the highest level ($\bar{X} = 13,90$), The submissive approach subscale scores average; Arithmetic mean of the lowest level ($\bar{X} = 13,47$), The arithmetic mean of those at the highest level ($\bar{X} = 10,83$), The optimistic approach is based on the mean of the subscale scores; Arithmetic mean of the lowest level ($\bar{X} = 11,76$), Arithmetic mean of those at the highest level ($\bar{X} = 11,38$), The average of social support subscale scores; The arithmetic mean of the lowest level ($\bar{X} = 12,20$), The arithmetic mean of those at the highest level ($\bar{X} = 11,37$).

Table 5. Variance analysis of hyperactivity / impulsivity subscale with stress coping styles

Source of Variance	Sum of Squares		Squares Average	F	p
Self Confident Approach	182,95	2	91,48	2.53	.08
Helpless Approach	179,16	2	89,58	2.47	.08
Submissive Approach	90,82	2	45,41	1.25	.28
Optimistic Approach	115,53	2	57,76	1.59	.20

As shown in Table 5, there is no significant difference between the scores of hyperactivity / impulsivity and arithmetic mean scores of the students according to the levels of self-assurance of the Stress Relief Scale subscales ($F = 2.53, p > .05$); There was no significant difference between hyperactivity / impulsivity scores and arithmetic mean scores according to helpless approach levels ($F = 2.47, p > .05$); There was no significant difference between hyperactivity / impulsivity scores and arithmetic mean scores according to Submissive approach levels ($F = 1.25, p > .05$); Hyperactivity / impulsivity scores and arithmetic mean scores were not significantly different from the optimistic approach levels ($F = 1.59, p > .05$); There was no significant difference between hyperactivity / impulsivity scores and arithmetic mean scores according to Social support levels ($F = .68, p > .05$).

DISCUSSION AND CONCLUSION

Research concerning Attention Deficit Hyperactivity Disorder, reveal that most of the relevant hypotheses refer to disorders that occur in brain functions for a variety of reasons during genetics, birth or postpartum, and some emphasize psychosocial reasons.

Attention deficit hyperactivity disorder symptoms support the hypothesis that the high frequency of cases are seen at low socioeconomic level, neglected or exploited, exposed to stressful adverse life events, traumatic environment, and inadequate. As an example, the children staying in orphanages were found to be short and overactive due to long-term emotional deprivation. However measures taken after adoption, showed that the symptoms improved (Doğangün; Yavuz, 2011). Compulsive life events, deterioration in family unit and other anxiety-producing factors may be effective in the emergence and persistence of ADHD symptoms. Reasons for ADHD symptoms include the child's temperament, genetic-familial causes, and expectations about the behavior and achievement of the community (Taylor 1986, Weiss 1993).

The environment in which the individual grows is considered as a factor that accelerates the preparation and emergence of attention deficit hyperactivity disorder due to family members, deteriorated family structure, parental attitudes and stress level caused by these factors. In ADHD cases, it is reported that these factors are seen more frequently than healthy controls (Doğangün; Yavuz, 2011).

In a study conducted with early adolescents who grew up in institutional care until about 4 years of age and adopted later, were assessed for ADHD when they were 6 and 11 years old, and the onset of ADHD at the age of 11 was associated with deprivation at early childhood (Şenol, 2008).

Attention deficit hyperactivity disorder was associated with lower parental temperament and higher depression and anxiety, intense stress, inconsistent and aggressive parental involvement when compared with healthy controls in studies with parents of children diagnosed with attention deficit hyperactivity disorder (Durukan et al., 2009).

In the light of the studies done, it seems that, the stress the individual has experienced for various reasons affects his life negatively from the beginning of childhood and that the negative effects, lack of attention and extreme mobility can accompany these symptoms.

Findings of this study support the views in related literature. Stress can cause ADHD symptoms to be observed in an individual's life.

Results revealed that attention deficit hyperactivity disorder symptoms of students varies depending on their stress levels. However, no correlation was found between ADHD symptoms and stress coping strategies.

Results also revealed that; students with low stress level had lower attention deficit scores; whereas students with high stress level had high attention deficit scores. In addition, students with low levels of stress had low hyperactivity/impulsivity scores; it is also seen that hyperactivity/impulsivity scores are high in students with high stress levels.

In addition, students with low levels of stress had low hyperactivity/impulsivity scores; it is also seen that hyperactivity/impulsivity scores are high in students with high stress levels.

The main purpose of this study is to explore the relationship of knowledge and a sense of wonder in Education. Then this study discusses their educational meaning in modern education. A sense of wonder is associated with mystery, strange and awe. According to Egan(1997), All knowledge which include a sense of wonder is human knowledge. Knowledge is considerably related to people's life and wonder. The wonder can help student's interesting, curiosity, mystery and imagination in knowledge. But in the education of modern society, this emotion increasingly waned. Knowledge of a curriculum is a part of the textbooks, not our life, so one becomes detached from it and it is distant from real life. From this perspective, the value of wonder in education needs to be

THE RESULT OF THE LEARNING MODEL TO ENHANCE COMPUTER PROGRAMMING COMPREHENSION BY VISUAL PROGRAMMING ENVIRONMENT AND ADVICE SYSTEM

Pensri Amornsinlaphachai
Department of Computer Education, Faculty of Science and Technology,
Nakhonratchasima Rajabhat University, Thailand
kokkoy@hotmail.com

ABSTRACT

Four purposes of this research are 1) to design and develop a learning model to enhance computer programming comprehension by visual programming environment and advice system 2) to compare learning achievement between students studying in the conventional way and students studying by using the learning model 3) to compare computer programming comprehension between students studying in the conventional way and students studying by using the learning model and 4) to study the correlation between compare computer programming comprehension and learning achievement. The results are revealed as follows. Firstly, the learning model comprises of 6 components that are advice module, resource, experts, collaboration, quiz module and evaluation module which are designed based on educational theories. Secondly, in the experiment at Nakhon Ratchasima Rajabhat University, the average scores of learning achievement and computer programming comprehension derived from students studying by using the learning model are higher than the average scores derived from students studying in the traditional way. In addition, the result shows that there is a positive correlation between computer programming comprehension and learning achievement. Thirdly, the results derived from the experiments at Wongchavaritkul University and Nakhon Ratchasiam Rajabhat University are correspondent. This insists the reliability of the learning model.

Key Words: Learning achievement, learning models, computer programming

INTRODUCTION

Computer programming is extremely important to the students in this field since computer programming is the foundation of computer education in the higher level; moreover those who are professionals in the computer must be able to write computer programs. However, from our teaching experience and the preliminary survey for students at faculty of Science and Technology at Nakhon Ratchasima Rajabhat University, we have found that most students can not write a computer program. From students' opinion, computer programming is difficult because they do not understand the logic and algorithm of computer programming; furthermore the workflow of a computer program is an abstraction. Thus Students can not see clearly how the program works. Moreover at present, most of learning environments in the real world still focus on knowledge transmission instead of knowledge construction; thus several researchers encourage students to build their own knowledge (Spiro, R., Feltovich, P., Jacobson, Michael J., & Coulson, Richard L., 1995; Mayer, R. E., 1996; Atherton, J. S., 2013; Amornsinlaphachai, P., 2016; Deejing, K., 2016). This conforms to Thai National Education Act 1999 and Amendment Act (No. 2) 2002 stating that the education should be based on the principle that all students can learn and develop themselves according to Constructivist theory (Vygotsky, L. S., 1962).

For the reasons mentioned above, we are interested to develop a learning model to enhance computer programming comprehension by visual programming environment and advice system. To design this model, media attribution and media symbol system (Salomon, G., 1979) are used to design academic content to represent the content in a conceptual model used to express the relationship of the content in terms of cause and effect (Frederiksen, J., White, B., et al., 1999; Winn, W., 1982). This will help students understand the content more easily (Mayer, R. E., 1996). Furthermore, visual programming environment will be used in teaching and practicing so that students can visualize the workflow of a computer program, clearly. In addition, the model will provide an advice system based on Bloom's Taxonomy principle (Bloom, B. A., 1956) and discovery learning (Bruner, J.S., 1961) to indicate students' weakness and offer a variety of learning resources that are correspondent to the weakness and suitable to each student. Moreover, internet technology is used as a mediator between teachers and students, including the students themselves. This is the source of knowledge in accordance with the theory of Social Constructivist (Vygotsky, L. S., 1962) and Collaborative Learning (Johnson, D. W. and Johnson, R. T., 1987).

THE PURPOSES OF RESEARCH

Four main purposes of this study are as follows.

1. To design and develop a learning model to enhance computer programming comprehension by visual programming environment and advice system
2. To compare learning achievement between students studying in the conventional way and students studying by using the learning model
3. To compare computer programming comprehension between students studying in the conventional way and students studying by using the learning model and
4. To study the correlation between computer programming comprehension and learning achievement.

METHODOLOGY

Target group

Target group utilized in this research is as follows.

1. The 20 first year students in computer education field at Nakhon Ratchasima Rajabhat University studying with the learning model.
2. The 25 second year students in education technology and computer education field at Nakhon Ratchasima Rajabhat University studying in the traditional way.
3. The 22 second year students studying in education technology and computer education field at Wongchavartikul University used to insist the integrity of the learning model.

Scope of content

The content utilized in this research is a part of the computer programming subject at Nakhonratchasima Rajabhat University, Thailand. The content of this subject corresponds to computer programming and algorithm subject at Wongchavartikul University, Thailand.

Research variables

Research variable studied in this study are as follows.

1. Independent variables are two types of learning that are the typical learning without the learning model and the learning with the learning model.
2. Dependent variables are as follows.
 - 2.1 The learning achievement derived from the students studying in the conventional way and the students studying with the learning
 - 2.2 The comprehension scores derived from the students studying in the conventional way and the students studying with the learning
 - 2.3 The correlation between the learning achievement and the comprehension scores derived from the students studying in the traditional way and the students studying with the learning

Research instruments

The research instruments used in this research are as follows.

1. The learning model to enhance computer programming comprehension by visual programming environment and advice system
2. The assessment forms to confirm quality and usability of the learning model
3. The learning achievement tests for typical learning and learning with the model
4. The comprehension tests for typical learning and learning with the model

Data collection and analysis

The data are collected and analyzed as follows.

1. The learning model is evaluated by the experts. Three facets of assessment are (1) learning content, (2) design based on theories and principles and (3) media and technology. The result is analyzed by summarizing interpretation.
2. The students' achievement and students' comprehension are collected and analyzed by using mean (\bar{x}) and percentage (%).
3. The correlation between compare learning achievement and computer programming comprehension is analyzed by using Correlation coefficient of Pearson

RESULTS

The result of this study can be summarized as follows.

1. The result for developing the learning model

The design of the learning model to enhance computer programming comprehension by visual programming environment and advice system comprises of 6 elements that are advice module, resource, experts, collaboration, quiz module and evaluation module as shown in the framework of a design of the learning model in Figure 1. An example of developing the learning model is shown in Figure 2.

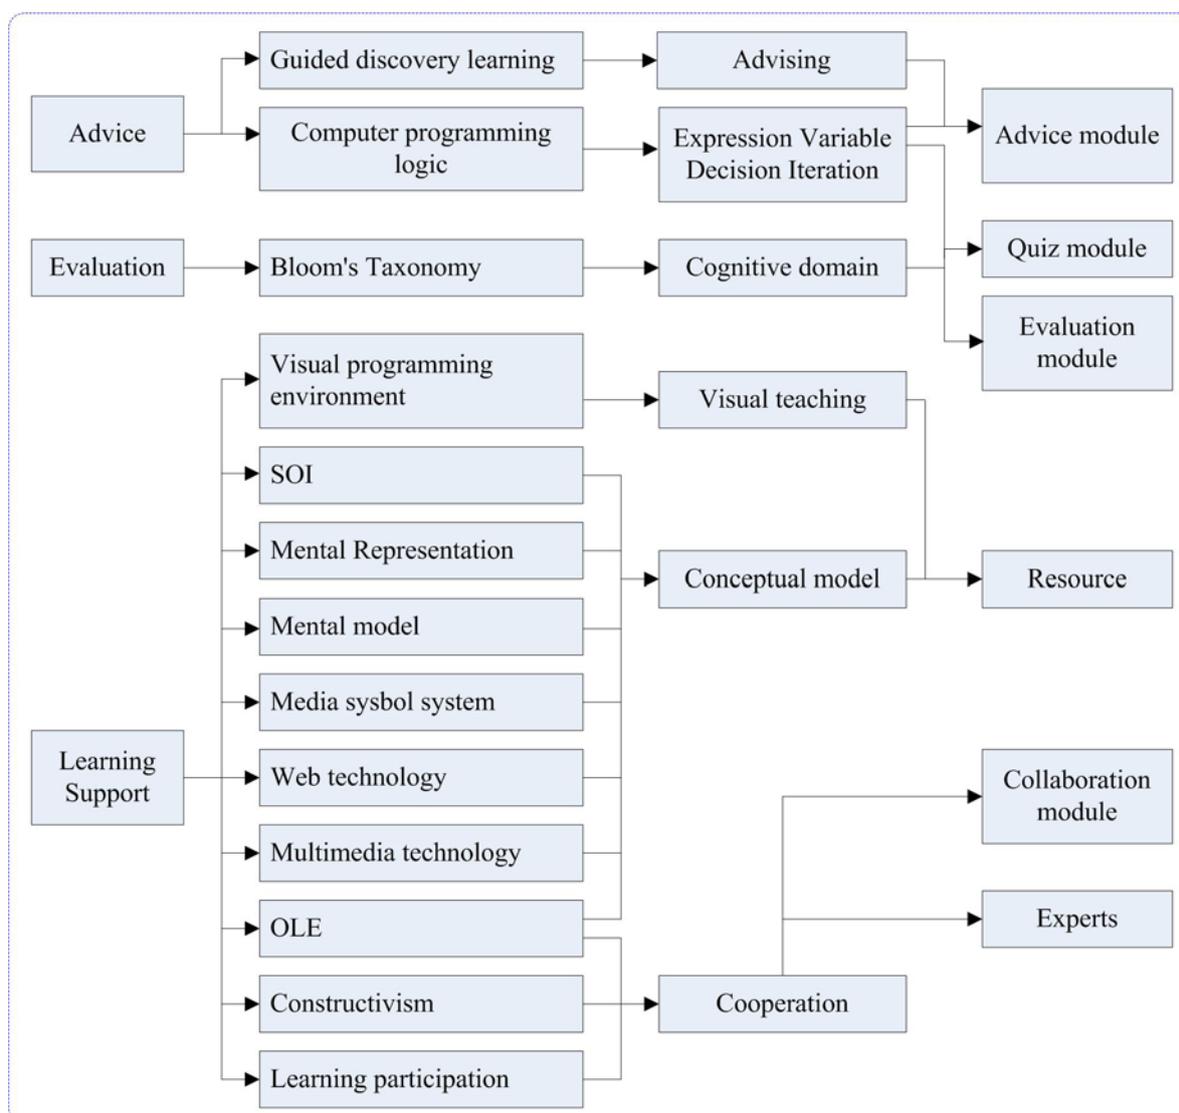

Figure 1. The framework of a design of the learning model

The results derived from evaluating the learning model by four experts are disclosed as follows. Firstly, the learning content is modern and proper for the computer field. Secondly, the theories used for developing the learning model point to the appropriateness of media using; furthermore the social network utilized in the learning model is fashionable and easy to understand. Finally, the components of the learning model conform to learning principles and academic theories.

2. The results derived from comparing learning achievement

The percentage of score of learning achievement derived from learning with the model is 70.80% while the one derived from typical learning is 65.52%. This shows that the learning achievement derived from learning with the model is higher than traditional learning.

3. The results derived from comparing computer programming comprehension

The percentage of score of computer programming comprehension derived from learning with the model is 71.10% while the one derived from conventional learning is 64.72%. Thus the average score of comprehension derived from studying with the model is higher than the average score derived from typical studying.

4. The results of correlation between comprehension and learning achievement

The correlation between computer programming comprehension and learning achievement is experimented at Nakhon Ratchasima University and Wongchavaritkul University. The results derived from the experiments at both University are correspondent. That is there is a positive correlation between computer programming comprehension and learning achievement

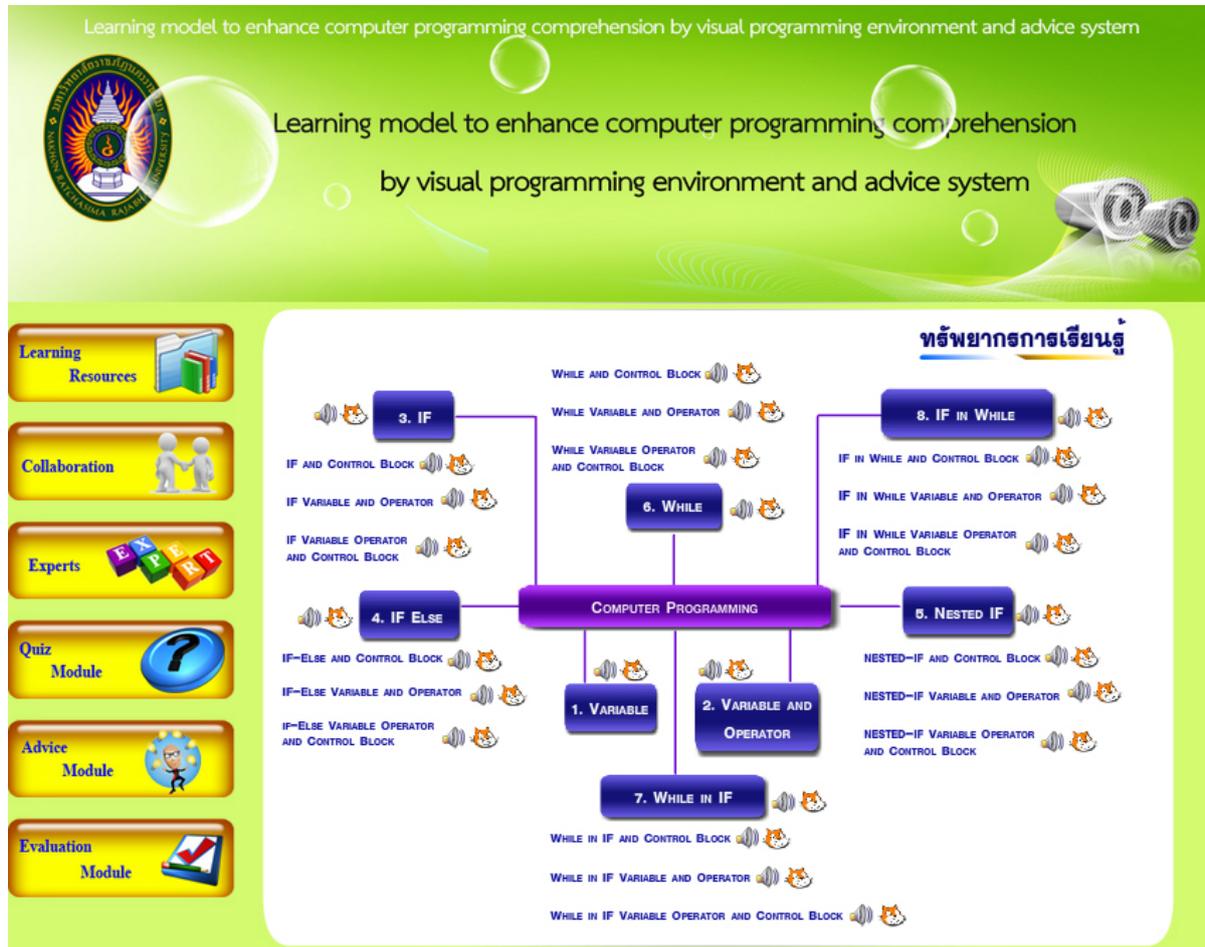

Figure 2. An example of developing the learning model

CONCLUSIONS

In this research, a learning model to enhance computer programming comprehension by visual programming environment and advice system are developed and the model consists of 6 elements that are advice module, resource, experts, collaboration, quiz module and evaluation module which are designed based on educational theories. The model is used to perform experiment at Nakhon Ratchasiam Rajabhat University and Wongchavaritkul University. The results derived from the experiment at Nakhon Ratchasiam Rajabhat University are revealed that the average scores of learning achievement and computer programming comprehension of students studying with the learning model are higher than the average scores of students studying in the typical way. Furthermore computer programming comprehension and learning achievement are correlated in the positive way. In addition, the experiments at Wongchavaritkul University insists the reliability of the learning model that are the results derived from these two universities are correspondent. In the future work, data mining will be used in the advice system to predict learning media that is suitable for each student.

ACKNOWLEDGEMENTS

This research was supported by Nakhonratchasima Rajabhat University, Thailand via the consent of National Research Council of Thailand and the publication of this work was supported by Nakhonratchasima Rajabhat University.

ABSTRACT

The objective of this study is to examine the role of motivational self-talking and life satisfaction on determining the flow experience of athletes. 146 female (Mean_{age}= 24, 35 ± 3,51), 204 male (Mean_{age}= 24,80 ± 3.38) and totally 350 athletes (Mean_{age}= 24,61 ± 3,43) participated in the study voluntarily. The study sample consisted of athletes from different branches, different sport levels and backgrounds. Athletes who participated in the study had a sport experience of 11,15 ± 4,78 years. The study objective was achieved by using “Flow State Scale-2” that was developed by Jackson and Eklund (2002) and adapted into the Turkish culture by Aşçı et al. (2007), “Self-Talking Questionnaire” that was developed by Zervas et al., (2007) and adapted into the Turkish culture by Engür (2011) and “Life Satisfaction Scale” that was developed by Diener et al. (1986) and adapted into the Turkish culture by Köker (1991). Socio-demographic information about study participants were collected via Personal Information Form, which was developed by the researcher. The acquired data were analyzed by using descriptive statistics methods, independent samples t-test and Multiple Stepwise Regression Analysis. Analyses were conducted in the SPSS package software and the significance level was taken as P<0.05 in the study. As a consequence, it was determined that motivational self-talking and life satisfaction levels of athletes positively determined their flow experience. Besides, it was observed that motivational self-talking, life satisfaction and flow experience differed on behalf of female athletes in terms of the variables of gender, sport experience and being a national sporter.

Keywords: Self talk, flow experience, undergraduate athletes

INTRODUCTION

The number of studies conducted to explore effects of psychological factors on performance in sport settings has been gradually increasing in recent years. Among these psychological factors which are believed to influence performance, the mood of the athlete is perhaps the one that receives the most interest from researchers.

Flow experience, which has been extensively studied by researchers in the field of sport and exercise psychology using different scientific approaches for its effects on various aspects of performance, is known to be an important psychological factor (Jackson, Thomas, Marsh & Smethurst, 2001; Kivikangas, 2006).

As noted by Moneta (2004), the flow experience occurs when the performer experiences the feeling that he has the necessary skills to overcome challenges. Also defined as the balance between the individual’s skill level and the difficulty of the task at hand (Jackson & Eklund, 2004), the flow experience is positive experiential experience. Positive changes are observed in the task performance of the individual/athlete in this positive experiential experience (Csikszentmihalyi, 1990).

It is important to reveal factors associated with flow experience within a sample of athlete in order to explore how this experience where positive changes occur is achieved. Motivational self-talk is one of the factors believed to be associated with flow experience and examined in this study. As previously stated by Bayköse (2014), motivational self-talk is one of the predictors of flow experience.

As well as motivational self-talk, life satisfaction levels of athletes were added to the model within the scope of this study.

Therefore, the purpose of this study is to determine the role of motivational self-talk and life satisfaction in determination of flow experience.

METHOD

In this section, research group, measurement tools and statistical methods utilized in this research were exhibited.

Research Design

The relational screening model was used in the study. Relational screening models are research models which aim to identify the presence or the degree of covariance between two or more variables (Karasar, 2007). It was aimed in this study to reveal the determining effect of life satisfaction on flow experience of athletes. In this context, the study had a relational screening property. On the other hand, the relational screening model was also used to determine whether flow experience, motivational self-talk, and life satisfaction of athletes vary depending on the gender variable (Karasar, 2007).

Participants

A total of 350 athletes (Age: 24.68 ± 3.469), 146 female and 204 male, from different disciplines (football, basketball, volleyball, handball, taekwondo, wrestling, judo, athletics, etc.) continuing their active sport life and attending different universities volunteered to participate in the study. The average sport experience of the athletes in the study was 10.73 ± 5.048 years.

Measuring Instruments

In addition to the personal information form developed by the researcher for the purpose of the study, the Flow State Scale, the Motivational Self-talk Questionnaire, and the Satisfaction with Life Scale were used in the study. Detailed information regarding the data collection tools can be found below.

Flow State Scale

The Flow State Scale was developed by Jackson and Eklund (2002). The purpose of Dispositional Flow Scale and the Flow State Scale developed by Jackson and Eklund (2002) is to evaluate physical activity and flow state in sport setting. As noted by different researchers, flow state consists of nine dimensions. Csikszentmihalyi lists nine dimensions of flow state as follows: Challenge-Skill Balance, Action-Awareness Merging, Clear Goals, Unambiguous Feedback, Concentration on The Task at Hand, Sense of Control, Loss of Self-consciousness, Transformation of Time, and Autotelic Experience (Aşçı et al. 2007, Ersöz 2011, Kelecek 2013, Carter 2013). Based on the idea that optimizing each of the nine dimensions during a single activity may lead to optimal arousal, the flow state theory suggests that this will influence performance positively (Carter 2013). The scale was adapted to Turkish by Aşçı et al. (2007). The Cronbach's Alpha internal consistency coefficient of the scale varies from 0.42 (Unambiguous Feedback, Sense of Control) and 0.87 (Loss of Self-consciousness) (Aşçı et al. 2007).

Life Satisfaction Scale

The Satisfaction with Life Scale was developed by Diener et al. (1985) to determine life satisfaction levels of individuals and adapted to Turkish by Köker (1991). The scale consists of 5 items: "In most ways my life is close to ideal", "The conditions of my life are excellent", "I am satisfied with my life", "So far I have gotten the important things I want in life", and "If I could live my life over, I would change almost nothing". Each item is marked from 1 "strongly disagree" to 7 "strongly agree".

Motivational Self-Talk Questionnaire

The Self-Talk Questionnaire (S-TQ) (Appendix 1) was developed by Zervas, Stavrou, and Psychountaki (2007) to reveal individual differences in self-talk according to cognitive and motivational functions. The questionnaire was adapted to Turkish culture by Engür (2011:24). It includes 11 items marked in a Likert scale (1 Never, 2 Rarely, 3 Sometimes, 4 Often, 5 Always) and 2 functions, namely the Cognitive Function and the Motivational Function. Engür (2011) found the Cronbach's Alpha value of the motivational function to be .93. The Cronbach's Alpha value of the cognitive function was found to be .87. The reliability coefficient of the overall questionnaire was found to be .95 (Engür 2011). Only the Motivational Self-talk Function of the questionnaire was used in the present study.

Data Analysis

The data obtained was analyzed using descriptive statistical methods, the Independent Samples T test, and the Stepwise Multiple Regression Analysis. SPSS package program was used for analysis and $P < 0.05$ was accepted as statistically significant.

FINDINGS

Table 1. The Relationship between Flow Experience, Motivational Self-talk, and Life Satisfaction

		Flow experience	Motivational Self-Talk	Life Satisfaction
Flow experience	r	1		
	p			
	n			
Motivational Self-Talk	r	0,418**	1	
	p	0,000		
	n	350		
Life Satisfaction	r	0,466**	0,413**	1
	p	0,000	0,000	
	n	350	350	

** p<0,001

As shown in Table 1, flow s experience had a positive correlation with motivational self-talk and life satisfaction levels. Also, a positive correlation was observed between life satisfaction and motivational self-talk.

Table 2. Results of The Regression Analysis Performed to Determine The Role of Self-talk Level and Life Satisfaction Levels in Predicting Flow Experience

	β	T	P
Motivational Self-Talk	0,353	7,053	0,000
Life Satisfaction	0,272	5,427	0,000

R=0,527 ; R2=0,278; Adjusted R2=0.274; F(2,347)=66.842; p=0.000

According to the results of the stepwise multiple regression analysis, factors of motivational self-talk ($\beta=0.35$; $p<0.05$) and life satisfaction ($\beta=0.27$; $p<0.05$) entered into the model. Analysis results showed that motivational self-talk and life satisfaction levels had a significant correlation with flow state level ($R=0.28$; $F(1,128)= 12.352$; $p<0.05$). The correlation of motivational self-talk and life satisfaction levels with flow state level was found to be statistically significant and positive ($p<0.05$). It can be said that this was a moderate correlation. Motivational self-talk levels and life satisfaction levels of the athletes participated in the study explain 28% of the total variance in their flow state levels ($R^2=0.278$; $p<0.05$).

Table 3. T Test Results of the Athletes Related to Motivational Self-talk, Life Satisfaction, and Flow Experience Levels by The Gender Variable

	Gender	n	Mean	Std. Deviation	t	p
Motivational Self-Talk	Women	146	4,2084	,80150	5,297	0,000
	Men	204	3,6275	1,13830		
Life Satisfaction	Women	146	4,6164	1,16773	5,018	0,000
	Men	204	4,0010	1,07886		
Flow Experience	Women	146	4,0805	,57649	5,446	0,000
	Men	204	3,7350	,59701		

Table 3 shows the difference between genders in terms of motivational self-talk levels of the athletes. Analysis results showed a significant difference between genders in terms of motivational self-talk levels ($t=5.297$; $p<0.05$). The findings showed that the difference was in favor of the female athletes.

Analysis performed to explore whether life satisfaction levels of the athletes varied depending on the gender variable showed a significant difference between genders in terms of life satisfaction levels ($t=5.018$; $p<0.05$). The findings showed that the difference was in favor of the female athletes.

Analysis performed to explore whether flow experience levels of the athletes varied depending on the gender variable showed a significant difference between genders in terms of flow experience levels ($t=5.446$; $p<0.05$). The findings showed that the difference was in favor of the female athletes.

CONCLUSIONS

Flow experience was found to have a positive correlation with motivational self-talk and life satisfaction levels. Also, a positive correlation was observed between life satisfaction and motivational self-talk.

It was found that motivational self-talk and life satisfaction levels had a significant correlation with flow experience level. The correlation of motivational self-talk and life satisfaction levels with flow experience level was found to be statistically significant and positive. It can be said that this was a moderate correlation. Motivational self-talk levels and life satisfaction levels of the athletes participated in the study explain 28% of the total variance in their flow experience levels. A similar study was conducted by Bayköse (2014). In a previous study, Bayköse (2014) found both motivational self-talk and cognitive self-talk had positive effects on determination of flow experience. In this context, findings obtained in the study conducted by Bayköse (2014) support our findings. Findings of our study showed a significant difference between genders in terms of motivational self-talk levels. The findings showed that the difference was in favor of the female athletes. Reviewing the literature in the light of this information, the findings obtained in the study conducted by Katsikas et al. (2009), who found that male athletes had a higher self-talk level, are not consistent with our findings. In parallel with our findings, Engür (2011) found that female athletes had a significantly higher motivational self-talk level compared to male athletes.

Analysis performed to explore whether life satisfaction levels of the athletes varied depending on the gender variable showed a significant difference between genders in terms of life satisfaction levels. The findings showed that the difference was in favor of the female athletes. Analysis performed to explore whether flow experience levels of the athletes varied depending on the gender variable showed a significant difference between genders in terms of flow experience levels. The findings showed that the difference was in favor of the female athletes. In the relevant literature, Jackson et al. (2001) and Russell (2001) found no significant difference between genders in terms of flow experience. In this context, studies in the literature do not support our findings. However, the results of the study conducted by Bayköse (2014) were in favor of female athletes in Loss of Self-consciousness subdimension of flow experience. In another study, findings obtained by Ersöz (2011) in Challenge-Skill Balance, Unambiguous Feedback, Autotelic Experience, Action-Awareness Merging, Clear Goals, Concentration on The Task at Hand, and Sense of Control subdimensions of flow experience support our findings.

In conclusion, it can be said that motivational self-talk and life satisfaction levels of athletes are positive predictors of flow experience.

Authors' Disclosures of Potential Conflicts of Interest

The authors indicated no potential conflicts of interest.

ABSTRACT

The objective of this study is to examine the role of self-talk and self-efficacy levels of athletes studying at faculties of sport sciences on predicting mental toughness. The study group consisted of totally 277 (Mean_{Age}:24,40±3,57) athletes, 93 female and 184 male, studying at faculties of sport sciences. The study objective was achieved by using Self-Talk Questionnaire that was developed by Zervas, Stavrou and Psychountaki (2007), Self-Efficacy Scale that was developed by Riggs et al., (1994) and Sport Mental Toughness Questionnaire that was developed by Sheard et al., (2009). In order to prove the power of the two aforementioned predicting variables upon predicting stepwise mental toughness, the technique of stepwise regression analysis was applied and the results were explained. The significance level being used in the study was accepted as .05. Examining the study findings; it was observed that motivational self-talk and self-efficacy levels of athletes significantly predicted the lower dimension of control, which is among the lower dimensions of mental toughness, whereas only motivational self-talk predicted the lower dimension of self-efficacy, which is also among the lower dimensions of mental toughness. On the other hand, the lower dimension of toughness, which is among the lower dimensions of mental toughness, was only predicted by cognitive self-talk. As a consequence, the fact that the lower dimensions of mental toughness are predicted by different lower dimensions of self-talk signifies that mental toughness is supported by different psychological mechanisms. According to our study findings, while continuity that is among basic structures of mental toughness is mainly supported by cognitive structures; self-confidence that is also among basic structures of mental toughness is supported by self-efficacy and motivational structures. Control mechanism, the last basic structure of mental toughness is positively supported by motivational self-talk.

Keywords: Mental toughness; self-talk; self- efficacy

INTRODUCTION

Self-talk (also known as internal dialog, self-speech, internal monolog) is accepted as one of the most effective strategies used by athletes and coaches to enhance and improve sports performance (Thelwell, Weston, Greenlees, and Hutchings, 2008; Hardy, 2006). Although extensive studies show that self-talk is correlated with performance and variables related to performance (Hatzigeorgiadis, Zourbanos, Galanis, and Theodorakis, 2011; Tod, Hardy, and Oliver, 2011), a comprehensive self-talk model which can guide systematic research has not been developed yet (Hardy, Oliver, and Tod, 2009).

Studies on self-talk show that self-talk contributes to the improvement of the athlete in terms of skill acquisition and sports performance (Neck and Manz, 1992). Also, studies have revealed that there are different types of self-talk (instructional and motivational), which may be more effective in different sports performances (precision or strength) (Vealey, 2007).

Athletes use self-talk to reconstruct their cognitive condition and transfigure irrational thoughts which do not fit the setting. Self-talk is also used for self-reward and increased effort (Hardy et al., 2007). Participants in the fields of sport and exercise use self-talk for many different purposes. For example, individuals may use self-talk to correct bad habits, focus attention, modify intensity level, build and maintain confidence, and encourage and maintain exercise participation (Williams and Leffingwell, 1996). In this context, mental toughness is another type of psychological skill which researchers focus on in sport settings. To the best of our knowledge, there is no study in the literature which reports that athletes use self-talk to improve mental toughness. Moreover, we have not been able to find a study on the relationship between self-talk and mental toughness as well.

Therefore, this study aims to determine whether self-talk and self-efficacy levels of students in faculties of sport sciences predict their mental toughness levels.

METHOD

In this section, research group, measurement tools and statistical methods utilized in this research were exhibited.

Research Design

In this study, survey method (Büyüköztürk, Çakmak, Akgün, Karadeniz and Demirel, 2008; Karasar, 2009) and relational survey method were utilized (Büyüköztürk et al., 2008; Karasar, 2009; Büyüköztürk, 2014). According to Fraenkel and Wallen (2006), the purpose of relational researches is to investigate the relationships among two or more variables without interfering them. In the meantime, existence and degree of the relationships among dependent and independent variables were tried to be revealed based on the model (Crano and Brewer, 2002). Karasar (2009) describes purpose of relational survey models as determining existence and degree of relationships among two or more variables. On the other hand, survey model is the approach which tries to describe a past or present status as it is. Research subject, which could either be an event, a person or a subject, is tried to be defined within their unique conditions and as is (Karasar, 2009). In the present study, relational research, one of the quantitative research methods, was employed and this constitutes an example of a research conducted based on survey model.

Participants

The research group consisted of 277 students, 93 female and 184 male (Mean_{age}:24.40±3.57), attending faculties of sport sciences of various universities and continuing their active sports life.

Measuring Instruments

The Self-Talk Questionnaire developed by Zervas, Stavrou, and Psychountaki (2007), the Self-Efficacy Scale developed by Riggs et al. (1994), and the Sports Mental Toughness Questionnaire developed by Sheard et al. (2009) were used for the purposes of the study. Information regarding measuring instruments can be found below.

Sports Mental Toughness Questionnaire

The questionnaire was developed by Sheard et al. (2009) to measure mental toughness levels of athletes and adapted to Turkish by Altıntaş (2015). The questionnaire consists of 14 items under three factors Confidence as “belief in one’s abilities to achieve goals in tough situations and thinking that one is better than one’s opponents”, Constancy as “one’s willingness to take responsibility, ability to concentrate, and readiness to strive”, and Control as “one’s keeping composure and being controlled and relaxed under pressure or in unexpected situations”. As well as aforementioned factors, the questionnaire provides information about overall mental toughness as well (Altıntaş, 2015). The subject marks statements given in the items in a four-point Likert scale. The questionnaire contains reverse items. The internal consistency coefficient of the questionnaire was calculated using the Cronbach’s Alpha Technique and was found to be 0.81 for the Confidence factor; 0.74 for the Constancy factor; 0.71 for the Control factor; and 0.81 overall (Sheard et al., 2009; Altıntaş, 2015).

Self-Talk Questionnaire

The Self-Talk Questionnaire (S-TQ) (Appendix 1) was developed by Zervas, Stavrou, and Psychountaki (2007) to reveal individual differences in self-talk according to cognitive and motivational functions. The questionnaire was adapted to Turkish by Engür (2011). It includes 11 items marked in a Likert scale (1 Never, 2 Rarely, 3 Sometimes, 4 Often, 5 Always) and 2 functions, namely the Cognitive Function and the Motivational Function. Ergün (2011) reported that the Cronbach’s Alpha Internal Consistency Coefficient was .93 for the Motivational Function and .87 for the Cognitive Function. The reliability coefficient of the overall questionnaire was found to be .95.

Self-Efficacy Scale

The instrument was developed to measure the individual’s belief in his own capacity. The scale developed by Riggs, Warka, Babasa, Betancourt, and Hooker (1994) was adapted to Turkish by Öcel (2002). The scale consists of 10 items aimed at determining the subject’s beliefs in his own capacity. The subject marks statements given in the items in a five-point Likert scale. The scale contains both regular and reverse items. The internal

consistency coefficient of the scale was calculated using the Cronbach's Alpha Technique and reported to be .86 (Riggs et al., 1994). In the Turkish adaptation study of the scale, a factor analysis was performed and it was decided to use items with at least .30 factor load. It was seen in the analysis that the scale showed a factor load in the .32 and .85 range and had a uniform construct. The Cronbach's Alpha Internal Consistency Coefficient of the scale was found to be .61 (Öcel, 2002).

Data Analysis

SPSS 22.0 was used in the study for data analysis. Descriptive statistics, the Internal Consistency Reliability Coefficient (Cronbach's Alpha), and the Independent Groups T-test were performed in the study. Moreover, Stepwise Multiple Regression Analysis was used to determine whether self-talk level is a predictor of mental toughness level. Also, tolerance and variance inflation factors (VIF) were examined to explain the multilinear relationship between independent variables to determine the fitness of the data for analysis. According to Tabachnick and Fidell (2007), it is necessary to examine sample size, normality, linearity, homoscedasticity, autocorrelation, multicollinearity, and outliers to perform a Standard Multiple Regression analysis. Once these assumptions are satisfied, the analysis was performed and the findings given below were obtained. $P < 0.05$ was accepted as the statistical significance level.

FINDINGS

Table 1. The Results of the Regression Analyses Concerning the Effect of Athlete's Self talk and Self Efficacy Level on Predictors Their Control (Mental Toughness Sub Scale).

	<i>B</i>	<i>T</i>	<i>P</i>
Motivational Self Talk	0,103	3,869	0.000
R=0,227; R ² =0,052; Adjusted R ² =0,048; F=14,967; p=0,000			

The stepwise multiple regression analysis showed a significant relationship between the motivational function of self-talk and the control factor of mental toughness ($R=0.23$; $F=14.967$; $p < 0.05$). While there was a significant and positive relationship between the motivational function and the control factor of mental toughness ($\beta = 0.10$; $p < 0.05$), the cognitive function of self-talk and self-efficacy were not in the model. Motivational self-talk scores were found to explain 5% of the total variance in mental toughness ($R^2=0.052$; $p < 0.05$).

Table 1. The Results of the Regression Analyses Concerning the Effect of Athlete's Self talk and Self Efficacy Level on Predictors Their Constancy (Mental Toughness Sub Scale).

	<i>B</i>	<i>T</i>	<i>P</i>
Cognitive Self Talk	0,079	3,257	0,001
R=0,193; R ² =0,037; Adjusted R ² =0,034; F=10,608; p=0,000			

The stepwise multiple regression analysis showed a significant relationship between the cognitive function of self-talk and the constancy factor of mental toughness ($R=0.19$; $F=10.608$; $p < 0.05$). While there was a significant and positive relationship between the cognitive function of self-talk and the control factor of mental toughness ($\beta = 0.09$; $p < 0.05$), the motivational function of self-talk and self-efficacy were not in the model. Cognitive self-talk scores were found to explain 4% of the total variance in mental toughness ($R^2=0.04$; $p < 0.05$).

Table 1. The Results of the Regression Analyses Concerning the Effect of Athlete's Self talk and Self Efficacy Level on Predictors Their Confidence (Mental Toughness Sub Scale).

	<i>B</i>	<i>T</i>	<i>P</i>
Motivational Self Talk	0,064	2,407	0,017
Self Efficacy	0,219	3,919	0,000
R=0,300; R ² =0,090; Adjusted R ² =0,084; F=13,529; p=0,000			

The stepwise multiple regression analysis showed that both the motivational function of self-talk and self-efficacy had a significant relationship with the confidence factor of mental toughness (R=0.30; F=13.529; p<0.05). While there was a significant and positive relationship between the motivational function of self-talk and the confidence factor of mental toughness ($\beta=0.06$; p<0.05) and between the motivational function of self-talk and self-efficacy ($\beta=0.22$; p<0.05), the cognitive function was not in the model. Motivational self-talk and self-efficacy scores were found to explain 9% of the total variance in mental toughness (R²=0.09; p<0.05).

CONCLUSIONS

This study was designed to determine whether self-talk and self-efficacy levels of students in faculties of sport sciences predict their mental toughness levels. The research group consisted of 277 students, 93 female and 184 male (Mean_{age}:24.40±3.57), attending faculties of sport sciences of various universities and continuing their active sports life.

According to our findings, while constancy, one of the building blocks of mental toughness, is mostly supported by cognitive constructs, confidence, another building block of mental toughness, is mostly supported by self-efficacy and motivational constructs. Control, the last building block of mental toughness, is supported positively by motivational self-talk only. Reviewing the literature in the light of these findings, Gülşen (2016) conducted a study with a sample consisting of athletes and found a positive correlation between motivational and cognitive self-talk and self-efficacy. Findings obtained in Gülşen's (2016) study showed a high correlation between motivational self-talk and self-efficacy, whereas a low yet considerable correlation between cognitive self-talk and self-efficacy. Given the information above, our findings showed a positive correlation between motivational and cognitive self-talk and self-efficacy. Therefore, findings obtained by Gülşen (2016) support our findings.

In another study, Akılveren (2016) investigated the correlation between mental toughness and motivational self-talk and reported a positive correlation between mental toughness self-talk and mental toughness factors. It can be said that the findings of this study support our findings as well.

In conclusion, the fact that different mental toughness factors are predicted by different self-talk functions indicates that mental toughness is supported by different psychological mechanisms. According to our findings, while constancy, one of the building blocks of mental toughness, is mostly supported by cognitive constructs, confidence, another building block of mental toughness, is mostly supported by self-efficacy and motivational constructs. It can be said that control, the last building block of mental toughness, is supported positively by motivational self-talk only.

Authors' Disclosures of Potential Conflicts of Interest

The authors indicated no potential conflicts of interest.

THE ROLE OF SOCIAL ADVERTISING IN CONTINUITY WITH THE SYSTEM OF VALUES OF ADOLESCENT YOUTH

PaedDr. Marcela GÖTTLICHOVÁ
 Faculty of Multimedia Communications
 Tomas Bata University in Zlin
 Czech Republic
 gottlichova@utb.cz

ABSTRACT

One of the most complex and most demanding life stages, speaking about the attitude and coping, is the adolescent age. In each stage, the adolescent youth is a bit different and copes with different troubles with themselves, as well as with the inclusion within the society, the characteristic feature of which becomes not only weakening authority of family and school, of the primary socialization factors, but mainly strengthening role of the media, or the advertisement, with the omnipresent presentation of values of the modern consumer society reflecting in the growing consumerism. The aim of the study is not only to determine the preference of values of today's adolescents, specifically in their teenage years, but to discover what the role of advertising messages is in the particular stage of life, and especially what the impact of social advertising is.

Keywords: adolescent youth, consumer behavior, system of values, authority of family and school, social advertising.

1 INTRODUCTION

Adolescence may be considered to be one of the most demanding stages associated with the necessity of healthy building up of the individual personality of a child. According to Erikson (1999), adolescence represents an identity crisis with its characteristic feature in the growing doubts of the adolescent about their self-perception in continuity with the value of the family, school, and other “automatically” accepted authorities. What becomes the priority are efforts leading to creating a new identity, which would be based on a qualitatively different level, whereas the starting point is not only the need of self-knowledge and self-acceptance, as well as the search for one's own values, opinions, attitudes, and the search for the proper position within the contemporary society. Within the society with the sign of the ever-increasing destruction of the authority of family and school, of the primary socialization factors, and particularly the increasing power of the media, or advertising messages, with the omnipresent presentation of values of the modern consumer society reflecting in growing consumerism.

2 THE STUDY

2.1 Problem formulation

As the Introduction of this paper has already suggested, the primary task at the time of adolescence is for the adolescent to try to build up a new identity qualitatively different in continuity with exploring and accepting new values, opinions, and attitudes - with the aim to become “well-accepted” within the society. What is the contemporary society like, and what are the values it prefers and offers for the creation of a new identity for adolescents? Bauman (2002) says that the identity is not a gift, it is not unchangeable. It is something which gets constructed by various ways and is a task to be done, a task, which cannot be avoided. Questioning of one's identity stems from the feeling of dislocation of one's existence, of its “manipulability”, the feeling of “indeterminacy”, indistinctness and indefiniteness of all forms, which have been so far accepted. Paul Ricoeur (2000) specifies two interconnected problems of the question of identity, whereas the first introduces the distinctness of one's own personality with their specific features constituting the particular distinction from others. The other problem is the continuity of the personality itself, the duration of its characteristic features independent of time and the changing circumstances of life. Coping with these questions has become the essential condition of the life in the modern society.

The early philosophical reflections on the search for the identity of an individual, represented by Descartes, Kant, or the French Enlightenment thinkers, had presented identity as something for a person to be **discovered**. It was supposed to be a journey leading to the discovery of “human nature”, which one only may find through false and everyday experiences which “take him to a false and pseudo way” and “deceitfully lead them to blind alleys”. Only the reason could be the only indicator of the genuine knowledge. (Bauman, 2002, p. 28) And what about today? Is the search for one's own identity and for the self-knowledge for the modern youth easier, or is it vice versa? Are family and school able to maintain its historically proved authority in the eyes of the adolescent, and are the values presented by these primary institutions within the process of socialization still regarded as the

predominant ones? What is then the role of i.e. the media, specifically advertising messages which on an everyday basis penetrate the minds of the adolescent to tempt them with their “artificial” consumer worlds to cross the aforementioned “false and untruly path” and “to deceitfully take them to the blind alleys”? Do they become an effective instrument for the manipulation of their psyche, as they offer their own description of the world; with the use of prescription they “prescribe” or covertly “order” what must be accepted, and how to behave? Are the youth on their road to adulthood capable of discovering the genuine values which would bring them to the proper way of life? It often happens that they “lose their way” and they need help to get back to their path. Can it be here that advertising, as we know it, may be considered to be one of the most crucial socialization factors for its continuous attacks as well as consequent impacts, and may it show its positive face and thus participate in building values and attitudes of adolescents? This is only a few questions we should not close our eyes against, but for which answers need to be found.

2.2 Conceptual framework

Adolescence, or the stage of pubescence, starts between the 11th and 13th year of life, and ends at the age of 14 or 15, whereas the duration of the individual stages is highly individual, as is the entire course and intensity. The identity is created, the status of “a child” is transferred into “an adult”. It is a period of significant changes in the development of an insightful personality and of considerable problems within the family and school education.” (Čáp, Mareš, 2007) The theory claims that a pubescent child does not regard as absolute what their parents or school (teachers and educators) tell them, but they speculate with the presented opinions, criticize them, define themselves against them, and try to find their own attitude to the particular matter. They need to feel acknowledged and accepted, take on some responsibility for their lives, and not to relate only to the truth of the family (parents, grandparents) and school (teachers, educators). A significant qualitative change occurs in thinking and experiencing, which reflects in the effort to know oneself and at the same time to define in a certain way. This is not easy as they stand in a specific situation - somewhere between their childhood and adulthood. On one hand, the dependence on parents is apparent (existential dependence) and on other authorities, when teachers, educators, supervisors, the elderly, etc. must be obeyed. On the other hand, the pubescent is required to think as an adult, and they themselves often feel to be (mentally) independent. A conflict of roles occurs, which may bring obstacles. Adolescence thus becomes a great test of confidence in the world, of the feeling of security, positive perception of oneself and their relatives, who they relate to in tough times. (Langmeier, Krejčířová, 2006; Piaget, Inhereldová, 2001; Vágnerová, 2008)

If an adolescent child feels lonely in the world, misunderstood, or feels they do not grasp the world, and that the current society does not provide them with a good place for life, it might be at this moment when they can acquire the feeling of being “lost” on their way. They feel unconfident and view themselves only in bad light. It is low self-esteem reflecting in the feeling of uncertainty, insecurity, insufficiency, misunderstanding, and loneliness that stand behind various troubles in the adolescent stage. A pubescent child copes with these feelings in different ways, being it a persisting attack, escape, or making up of miscellaneous masks and compensation behavior patterns. The child becomes weakened against the external impacts, and finds themselves in a labyrinth struggling to get out. (Macek, 2003; Žaloudířková, 2013) A significant role is played by the contemporary medialized world opening to the adolescent the access to various information, symbols, interpretations, and lifestyles, which considerably exceed possibilities that those which may be provided by their parents and teachers. (Šeďová, 2007) The position of the authorities respected in the past thus gradually assume the ideals (models) presented in the media. (Vysekalová, 2012)

And it is here, where the space for the intentional incidence of the media and advertising, as their primary goal is the effort to achieve by persuading, manipulating, and suggesting certain preset changes in attitudes or behavior of an individual in any spheres of private as well as public life. It was Ball-Rokeach and DeFleur (1976, 1996) who focused their attention on the critical research of the media and their audiences, and they thus became the founders of “a dependency model”, i.e. the model of dependence of the audience on the media, whereas they utilized the situation in which the dependency of the audience on the media is given by providing irreplaceable functions important for the audience. They are e.g.: 1. addressing ambiguity and elimination of uncertainty by narrowing the number of interpretations of individual situations; 2. setting up the topics; 3. enlarging the system of “truths” belonging to the general conviction; 4. forming attitudes; and 5. suggesting conflicts of values and explaining the validity of values within the society. They offer a large number of behavior patterns corresponding to numerous situations with which individuals may identify in hope for a successful inclusion within the society.

Let us go back to the characteristic of today’s society. The contemporary postmodern world removes the difference in the perception and acceptance of ideas and values. These then acquire their identical validity and none is rejected. Lipovetský (2003) characterizes the postmodern society as the “democracy of hedonism,

victory of “anti-morality” and “anti-institutionalism””; for Petrussek (2007), it is the society of “late times“, “the society of rapid social changes”, “the society of risks” in connection with the inevitable reduction of fear suppressing hecticness of the contemporary lifestyle in an individual in continuity with the number of changes. From technological innovations entering our households and reflecting in so-called mobilizing of the social life replacing the “authentic communication burdened with the existential context” - to uninterrupted stream of ever-changing goods with its reflection in the development of new patterns of consumer behavior and the rise of new “life forms”. An individual becomes a part of two parallel worlds, the world of everyday and then so-called simulated world in continuity with a significant change in the value patterns, a so-called fall of the authority, etc., which reflects in the establishment of a new “postmodern mentality” in an everyday behavior, especially in the adolescent youth. (Kohák, 2004)

An opportunity opens for advertising representing one of “the oldest, most visible, and the most important marketing tool of the communication mix”. (De Pelsmacker, 2003, p. 203). It epitomizes “the impersonal form of communication, when different subjects through different media address their existing and potential customers with the aim to inform them and persuade about the usefulness of their products, services, or ideas“. (Přikrylová, Jahodová, 2010, p. 66) Its strong manipulative power increasingly allows to intentionally form attitudes and opinions of an individual, to create their value system, influence their lifestyles, and thus to become an eminent source of model behavior. Fromm (1994) points out inducing with the tendency to orient on the values of owning at the expense of the values of existence. The orientation on the “to have” values, marginalizes, challenge, and discriminate the values of being, which shows in one of the basic forms of alienation of an individual from themselves, from their own “me”. The commercial advertising has its characteristic feature in the presentation of a so-called socially inadequate values, for its primary goal is to lead an individual to accept value attitudes required by consumerism. “The world of mass production and mass consumption cannot be imagined without advertising. However, at the same time, ethical requirements mount on the content of advertising messages.” (Vysekalová, Mikeš, 2007, p. 24)

So-called social advertising is the opposite. Should we follow the traditional typology of marketing communication, i.e. marketing communication mix, the term of social advertising will mean the media communication through the television, radio, press, Internet, etc., which have the aim to create moral values in accordance with the modification in behavior of recipients in any sphere of human activities. Its efforts tend to “positive changes in social attitudes and value orientation, to the awakening of the feeling of responsibility for oneself and others, and to the stimulation of the recipient to do something for themselves or for others who imminently need their help.” (Göttlichová, 2005) Recipients of social advertising are those, who are addressed by the problem directly (or those who may be regarded), and therefore it becomes necessary to correctly define the target groups towards the intention of the advertising message, as well as the proper choice of the particular media in continuity with the corresponding form of addressing in the perspective of achieved efficiency. It is then a vital aspect for “the social advertising to present positive values of the modern contemporary life style more than ever, without diminishing the importance of negative appeals showing the unquestionable efficiency”. (Harantová, 2014)

2.3 Problem solution

As was already mentioned, the problem comes together with a number of questions to which answers must be found. The primary aim of this study is to answer the question *What value scale is preferred by the contemporary young generation in the stage of adolescence?*, also to verify the supposed weakening of the intentional socialization aspects (i.e. family and schools) at the expense of enhancing the functional aspects, specifically advertising messages, particularly with the orientation at the possible influence on values and attitudes of a given target group in continuity with social advertising.

An extensive quantitative research with a questionnaire form was carried out (2016) to answer the preset questions (153 open, semi-closed, and closed questions) at the participation of the implementers and educators of given subjects, i.e. social sciences. 27 schools in 9 regions of the Czech Republic took part in the research survey (the Moravian-Silesian Region, the Region of Pardubice, the South Moravian Region, the region of Olomouc, the Zlín Region, the Central Bohemian Region, the Region of Hradec Králové, the Vysočina Region, Prague). The total of 1,080 pubescents participated - those attending the 8th year of primary schools (PS), i.e. 360 pupils and 9 town schools; 360 pupils and 18 countryside schools (the reason for a double number is a small amount of classes and pupils in a given year in individual schools in the countryside, therefore two schools per a region had to be involved), and 360 corresponding grades at secondary schools (SS), i.e. 9 8-year grammar schools (or gymnasium; for the non-existence of this type of secondary schools in the countryside, the number is inclusion of towns and countrysides where pupils commute, 40 students were addressed from one school per a region).

The methodology of the scale of values worked with the battery of values on which the respondent could comment with a five-level scale, whereas level 1 corresponded to the value with the least importance, level 5 with the greatest importance. For every value, indices based on the frequency were determined as weighted arithmetic means, and a chart was established based on the size of the indices.

3. FINDINGS

3.1 Socializing factors – family and school

Bearing in mind the aim of the study, the attention will be focused on the presentation of the resulting values of the survey leading to the achievement of the preset goal. To be able to assess the extent of the ability of family and school to maintain their authority in the eyes of an adolescent, and whether the values, suggested by these primary institutions in the course of socialization, remain regarded as the key ones, it is fundamental to focus our attention firstly to ascertain the level of the relationship of pubescents to family and school.

Table 1: Model/authority

	Absolutely yes	Absolutely no	Rather yes	Rather no	No answer
Father	358	93	379	216	34
Mother	353	56	430	226	15

Source: Göttlichová

How do the pubescent youth see their parents? We may say that according to the results of the survey [Table 1], parents still keep on being models with some authority for their children. The proof of this is the unequivocally positive total evaluation of the person of a father from the point of view of his authority (**737; 71%**) significantly exceeding the negative perception (309; 29%). An equal situation may be observed in the evaluation of a mother where the positive evaluation (**783; 74%**) overtops, although it had been slightly more than in father, which corresponds to the lower number of negative responses (282; 26%). In the question of trust, 998 (x77) respondents trusted their mothers, 940 (x112) trusted their fathers; mother's advice was trusted by 910 (x166) and father's advice by 820 (x236) respondents. The particular outcomes were confirmed also by the question assessing who is the closest to the particular set of respondents, as next to grandparents, siblings and other members of family and friends, the mother occupies the first place unambiguously (427; 39%), the father remains taking the second place (173; 16%). It is here where we can notice a significant difference in the evaluation of both parents.

Table 2: Relationship to father/mother

	Neutral relationship	Rather close relationship	Rather distant relationship	Close relationship	Distant relationship
Father	112	390	41	470	34
Mother	84	343	25	600	17

Source: Göttlichová

So what is the relationship of the adolescent in the puberty stage to their closest relatives? As the results suggest [Table 2], young people at the beginning of adolescence do not hesitate to confess their close relationship to their mothers (56%) or fathers (44%), which in continuity with the responses presenting rather a close relationship to mother (32%) or father (38%) is a proof of the positive perception of the mother, when the entire **88%** of the respondents identifies with the perception, for the father it is **82%**. Rather distant relationship may be noted in 4% of the respondents, and neutral relationship was quoted by 8%. For the father, the values were 7% and 11%. And we could go further in the line, as the responses to one of the following questions absolutely convincingly presents the order of those from the close surroundings of the pubescents to whom these come with finding solutions to their problems most frequently. In regards of the fact that some respondents used the option to choose multiple responses, the fundamental base (N=1650) is increased. The resulting values unambiguously prove that it is the mother again who stands in the front for the pubescents to solve their troubles, who is the person to whom pubescents come for help and advice (588; 36%), followed by friends (419; 25%), and the father (257; 15%), whereas in comparison with the responses preferring the mother, almost a 50% decline occurs; a considerable decline may be seen also in comparison with the group of peers. The modern times reflection is then a low position of grandparents (80; 5%), which may prove the eliminated authority of the elderly generation as regarded by the adolescent. Particularly alarming is the weakening in the position of schools/teachers, to whom only a tiny percentage of pubescents would come for help (4; 0,2%).

The option to choose multiple responses was also applied in the questions focused on the assessment of the

parents' most powerful influence on pubescents. The responses showed that it is parents who plays an essential role in the lives of adolescents, speaking about their influence on adolescent behavior in relation to others (571), in career choice (475), or in impacting opinions of pubescents on the life in general (462). The main finding was also the fact that 538 respondents confirmed that it is their parents who influence immensely their shopping behavior, 324 responses revealed reliance merely on their own opinion, then it was friends (156), Internet (118), siblings (111), and they were least influenced by grandparents (57). If we get back to parents, the least impact was revealed in the response to friend's selection, where only 77 respondents were inclined to be advised in this area. Friends, as shown by the responses to other questions, unequivocally stand at the forefront of the influence on spending leisure time (338), which was supported in the response to the question of in what extent do parents organize pubescents free time, where 766 respondents claimed a negative answer, 293 a positive answer, and 21 did not respond. On the other hand, 923 respondents wrote that their parents are interested what they do in their free time, and 150 responses led to claim that their parents are not interested in what they do, only 4 respondents did not provide any answer. For 1,011 respondents, home means a pleasant and safe place (1,044).

Graf 1: Association with the school (Source: Göttlichová)

Nevertheless, another position may on the contrary be seen in another one of the primary socialization factors, i.e. the school, even though the resulting values in the principal question concerning the popularity of school in pubescents, did not show any significant differences (606 positive and 477 negative responses), however, they were particularly the reasons presented which supported the thesis of the destruction of school [Graf 1]. Out of the larger list of presented response options directing at the justification of what evokes school in the eyes of respondents, the primary response stated the preference of friends (871) who they meet in continuity with entertainment (437), however, no educational benefit. From the educational perspective, **stress (540)** and **the accumulation of a huge amount of theory (475)**, or **boredom (474)** stood at the forefront of school-related responses. For 67 respondents, when it becomes to school, an image of a highly hostile environment was described, 174 responses warned about abusive behavior. What can be encouraging was a positive aspect of 284 responses which referred to the acquisition of practical skills, simultaneously with the responses preferring kind and likeable teachers (437) to those unpleasant ones (287). Despite the fact that the responses discovered some negative attitudes, which should be worth considering, they revealed which way school should engage and which approach educators should choose so that the authority does not decline, on the other hand 685 respondents quoted they prepare for school on daily basis, in comparison with those who do not devote their time to school preparation (384). The finding that 988 respondents care about their school results, which very much exceeds the number of those who do not (79) shows as equally beneficial, which also is evidenced by the fact that 386 pupils stated that with their school results they rank above the average, 584 are average students, and 100 respondents confessed to have poor results. Even though teachers do not become confidants for their students, and even though it could be said that they do not fully enjoy their authorities, which may be caused by for instance an inappropriate education leading to boredom or stress, the fact that pubescents care about their studying results. And they are not alone who care, as 1,021 (x59) respondents pointed out that their parents are interested in their children's school results, and 586 (x488) respondents confirmed parents regularly checking whether their children prepare for school.

3.2 Advertising as a socialization factor

At the beginning of the paper, we have raised the question of the extent to which the pubescent youth becomes affected by advertising, and whether besides the "negative" effect of advertising, it can also play the role of a

"positive" impact. The aim is therefore to find out what pubescents think about advertising messages, and whether they are aware of their manipulative power. They have not yet been ashamed of admitting their positive attitude towards their parents, and they have also unequivocally presented a negative relationship to advertising in continuity with shopping behavior. A negative attitude was expressed by **926** respondents, 136 responded positively, and 18 respondents did not answer. 328 respondents said they do not notice any advertising, whether it be a television or a radio, and always switches to another program, some admitted they switch to another program only occasionally, but definitely do not watch advertising (299), 340 respondents admitted they sometimes watch advertisements. Only 74 respondents said they still watch advertisements, and 39 did not comment on the issue at all. When purchasing an unknown product, 131 respondents are affected by advertising, 41 admitted they are significantly influenced, and 21 are subject to advertisement unconditionally. On the other hand, 820 in this case reject the impact of advertising.

However, what about **social advertising**? Are adolescents capable of understanding the passed message of the given form of advertising? And is social advertising able to "open the imaginary door" for the particular target group with regard to their age? The question whether pubescent children watch advertising (social), the aim of which is a behavioral and attitudinal change (no smoking, no alcohol, follow safety instructions, sort waste, etc.), was responded positively (**508**) as well as negatively (**501**) - i.e. almost equivalently, where **388/1** respondents confirmed that they are aware of its **positive benefit and necessity of its existence**, which means roughly a double (**181/5**) contradictory answers (175/2; 200/3; 80/4), where **259/1** (+181/2) think it would be advisable for this form of advertising to be **more widespread** among the target group, this time, on the contrary, almost by half lower number of respondents (**131/5**; 181/4) consider the current state to be sufficient. A prevailing number of respondents (325/3) took the neutral stand. From advertisements, most frequently the respondents named the area of road safety (BESIP, You do not think, you pay), health protection (anorexia, cervical cancer, alcohol, smoking), and the third place for environment protection (sorting and recycling of waste). If they could be creators of advertisement with the particular topic, they most often stated advertising portraying: **no smoking, no alcohol and no drugs, health protection and life style (x anorexia, bulimia)**, protection of animals and the environment..., respect for the elderly generation, interpersonal relationships, child abuse, anti-war advertising, ..., areas in which they see the primary issues necessary to be solved,

Table 3: May social advertising replace/complement family/school by its effect? (I agree- 1)

	1 family/school	2 family/school	3 family/school	4 family/school	5 family/school
Replace	237/192	153/152	311/367	137/156	159/125
Complement	191/ 95	139/131	380/407	117/117	165/150

Source: Göttlichová

As shown by the resulting values of the previous chart [Table 3], also in this case, a considerable number of responses (311, 31%; 367, 37%) presents that the respondents are not quite sure and take rather a neutral stand. Despite this, it is interesting to find that **273** (27%) respondents are fully convinced that social advertising might replace in certain cases the potential insufficiency of families when dealing with an issue falling within the competence of a family, and simultaneously also into the thematic areas of social advertising (e.g. advertising x smoking in a family which smokes), i.e. totally 390, 39% (x296, 30%); in school, the number of responses is lower (344, 35% x 281, 28%). Although the lowest number (**95**, 11%) of responses represents the vision of social advertising in the form of complementing education, there still appears a large space for a neutral stance, which the school may beneficially utilize. And even here, as had already been shown by another research carried out in secondary school youth (Göttlichová, 2016), it should be teachers who should change their approach towards the adolescent youth as they often do not manage to efficiently and persuasively explicate issues connected with the growing problems of our times continuously attacking younger age, being it e.g. anorexia, alcoholism, smoking, drugs, AIDS and STD prevention, domestic violence. The reason may be a generation gap, as well as the ever-persisting impersonal and strict theoretical form of education. To prove this statement, the fact that the most frequently quoted means of the media where the respondents meet with the social advertising was the TV, then the Internet, and consequently printed media, only occasionally it was school, even though media education has become an important part of education. The school could appropriately include social advertising (campaigns) into the educational program of primary schools within family or social education, in biology classes, or even in the media education classes and with the analysis of the issue of the advertisements with the aim to identify with the topic and to take part in its solution, but inform, educate, attract and entertain by specific cases.

3.2 System of values of the pubescent youth

The last part of this paper deals with the last of the questions: *What value system is preferred by the contemporary generation in the pubescence?*

Table 4: Preview of preferred values

Values	Index	Order
Health	4.46	1
Friendship	4.42	2
Freedom	4.30	3
Education	4,29	4
Family and children	4,18	5
Success at work	4.15	6
Developing of own personality	4.14	7
True, knowledge	4.12	8
Peace	4.09	9
Good salary	4,05	10
Hobbies	4.01	11
Being useful for others	4.00	12
Environment	3.99	13
Love	3.94	14
Good position in society	3.92	15
Property	3.83	16
God	2.45	17

Source: Göttlichová

As shown by [Table 4], the forefront of the preferred values, **health** ranked as the first one, which corresponds also to the proposal of an area the respondents would like to pay attention to in the first place if they had the possibility to create a social advertisement. At the same time it is health which pubescents perceive as one of the most significant option in the case of complementation or replacement the influence of their families or schools, as at this age they already realize the consequences of drug abuse, alcoholism, etc. **Friendship** follows fully corresponding to the target group as friends are those who gradually play more important role in the lives of pubescents, and whose presence in their lives was confirmed by 1,053 respondents. With that, preference of **freedom** comes, which verifies the effort for autonomy, again characteristic for the particular age. **Education** considerably enhanced its position in comparison of the surveys carried out at the end of the 20th and at the beginning of the 21st century (Sak, 2004), which becomes evident also from the interest of pubescents in their study results or school preparation under the influence (or supervision) of parents, even though the authority of school/teachers has been being diminished. The **environmental area**, as well as the question of **faith**, has declined significantly since the after-revolutionary era, and this fully corresponds with the character of the contemporary "atheistic society". Whether it be the relationship to the environment (13), or the help to others (12), the effect of social advertising, based on the responses, would have its well-founded place. The results also show that to know how to integrate oneself into the society, does not yet belong at this age to highlighted priorities. And here we again come to media education, whose important priorities within the curriculum, among other things, include instructing pupils to be aware of the value of their own lives (especially their free time) and the responsibility for its fulfillment; the development of the awareness of prejudices and simplified judgements of the society (especially the minorities) and individuals, and helping to realize the possibility for free expression of one's own attitudes and responsibility for the way of their formulation and presentation.

CONCLUSIONS

As shown by the results, we may regard the expression of positive relationships to parents as a positive information, which proves that the authority of family, particularly the mother's position, remains the key role for the adolescent in the pubescence stage even in today's "over-medialized" world, as in crucial life events and decisions and steps directing these children into the life of adults, parents remain those who determine their direction, to whom they can trust, and who they can lean onto. Home evokes the notion of a pleasant and safe place. Friends enjoy an increasing importance, demonstrated in the preferred value of friendship, reflecting in the strong impact on the leisure time. And here it is important to focus enough attention on the part of the family and the school. Although the research has revealed only minimal values of occasional or regular intake of alcohol, drugs, and smoking in the particular target group, the number of answers for those who have already tried alcohol and cigarettes and those who have avoided this experience is high and almost identical. For example, in the "fight" against smoking, alcohol consumption, drug abuse, etc., we could see a significant contribution of

social advertising. It should be the school that should strive to maintain its diminishing authority in the eyes of adolescents. As shown by the research, social advertising can play the role of a prominent partner (not just of a school but also of families) in all four areas as specified by Kotler, Roberto, Lee (2002), in terms of health, safety and health prevention, environmental protection (with regard to the placement in the scale of values) or social engagement. **Its influence on the values of adolescents at the threshold of adulthood can thus be seen as a positive one, in a direct continuity reflected in changes in attitudes and behaviors** (Cheng, Kotler and Lee, 2011) to which they aim, be it the adoption of a new way of behavior (e.g. focusing on environmental issues and enhancing them), rejecting a potentially dangerous behavior (such as drinking alcohol, drugs), changing current behavior (e.g. less water consumption for washing and showering), or leaving the old behavior (e.g. smoking). As a conclusion, we can acknowledge the contribution of social advertising, which in the form of one of the most important socialization factors hand in hand with the family and the school is capable of helping young people on the threshold of adolescence to direct the presentation of the "proper" values through the "proper" way of life.

THE ROLE OF THE MUSICAL LEARNING IN THE DEVELOPMENT OF THE SOCIO AND COGNITIVE ABILITIES. A REVIEW

Giuseppina TOTO
University of Foggia
Foggia
Italy
giusy.toto@unifg.it

ABSTRACT

Over the last decades, brain research has shown the essential role played by the diving in stimulating experiences during the first years of life in developing both multiple neural connections and networks and cognitive abilities. In this direction, Perry affirmed that the exposure to visual, sound, tactile stimuli contributes to the development of motor, emotional, behavioral, cognitive and social skills. In fact, the early experiences are crucial to the development of the architecture of a young brain and, in particular, in this process the music has a fundamental role. These empirical evidences are subject of a debate that has even invested the educational policies of teaching syllabus in the primary/secondary schools, where the teaching of the music seems to assume an important role in promoting the learning process of language and socio-emotional skills. In light of these premises, the current paper aims to provide a review of the recent empirical studies, which have explored the contribution of musical learning in the development of the cognitive and social skills.

INTRODUCTION

Research in neurosciences has meaningfully contributed to the science of education. In particular, brain research has shown that diving in stimulating experiences during the child's early life is crucial for the formation of multiple neural connections, thus promoting the development of multiple abilities (Olsho, 1984). Previous studies have also shown that approximately 50% of the brain is well structured between 7-11 years and between 9-13 years, and that brain undergoes an elimination process of unnecessary associations, while maintaining those networks used (Thompson & Nelson, 2001). Conversely, other studies found a certain scarcity of neuronal connections in children that were in a state of cultural deprivation and whose brain appears 20-30% smaller than peers (Harris, 2009). This last aspect implies a dual value in research, as several studies have shown that music education in childhood is positively associated with non-musical skills, thus ignoring socio-economic variables, such as parenting and family incomes, which could affect children living in cultural contexts rich in stimuli (Schellenberg & Mankarious, 2012).

Although Perry has recently noted that the exposure to stimuli (visual, sound, tactile) contributed to the development of motor, emotional, behavioral, cognitive and social skills (2000), early studies on musical learning and its effects on cognitive abilities seem to appear in the early 90s. These studies focused the attention on children's exposure to exercises or simply listening to music that would have affected their musical intonation and language development (for a review, Kliuchko, et al. 2015). Gordon has promoted that early musical experiences are fundamental to the development of the architecture of a young brain, thus emphasizing the fundamental role of music in this process (Gordon, 2003). Contemporary studies, however, have overcome correlation results concerning the association between musical (or artistic) learning and other types of school learning, such as mathematics. The focus of research has shifted to cognitive sciences paying attention to modularity, plasticity, and skills transfer (Peretz, 2012). Starting from this consideration, if neuronal connections are responsible for any kind of intelligence, the question that arises is how music can facilitate these connections.

THE STUDY

The first link between music and learning emerges in the acquisition phase of the language that is an articulation of sounds blended into words and phrases. Such language skills will be directed to the written and read form. Gordon's schematization of language and music learning is composed of the following phases: listen-speak-read-

write (Gordon, 2003). As it can be seen, both learnings follow a formally similar pathway, but they differ by content. It should be mentioned that studies on lateralization of the brain have shown that linguistic stimuli are processed by the left hemisphere, while the musical stimuli by the right one. However, a recent review has shown that music education produces not only good listeners, but also better performance in verbal skills tests, including vocabulary, phonological awareness, reading and spelling (Schellenberg & Weiss, 2012). According to this study, music education is also positively associated with performance on space capacity tests and non-verbal reasoning. The specificity of this study is that by taking into account demographic variables music education is positively associated with performance on the tests of hearing and visual memory (Degé, et al. 2011a) and with Intellectual Quotient (Schellenberg, 2011a).

Another area of research deals with the development of social skills related to music learning. The main objective in children by playing and singing is to have fun: therefore, it has been shown that music is not only a form of social interaction, but also it facilitates implicit acquisition of social skills and behavioral rules. Music, in fact, plays a fundamental role in the construction of social relationships since early childhood, period in which children establish relationships with caregivers through sounds or melodies, too (Deasy, 2002). If there is such a consensus on the association between music learning and social skills, more controversial is the link between musical intelligence and math or sciences learning. An idea that is commonly 'naïvely' shared is that music can be linked to mathematical abilities thanks to the real presence of mathematical properties in architectures and organization of patterns and to musical rhythms. Such research has shown the transferability of rhythmic-musical skills and competencies to the scientific field, although these results are still contrasting and unsatisfactory (Scripp, 2002). On the contrary, from these studies a positive association between musical attitude and general intelligence has been found, so that 'Musical Aptitude' becomes an Indicator in predicting general intelligence (Robinson, & Aronica, 2015).

Furthermore, other studies have indicated that specific melodies produce emotions, such as anger, joy, and sadness. Anger, for example, is evoked by complex melodies in conjunction with very powerful sounds; joy, instead, through simple melodies accompanied by a fast pace; sadness through complex melodies and a slow pace (Harris, 2009). Partially overlapping with the emotional construct, the side of emotional intelligence should take into consideration, given that a heated debate has been arisen since the '90s. Indeed, emotional intelligence is characterized by four skills: the emotional discrimination, the access to emotions to generate thought, the understanding of emotional knowledge and the reflection for emotional and intellectual growth. An interesting research field is related to how to find out connections between the language inflections (the stamp) and outcomes on emotional intelligence, as well as the meaning of the song aroused in listeners and its effects on emotional intelligence (Trimmer & Cuddy, 2008). A study carried out by Gleason (2014) has hypothesized that effects on emotional intelligence are related to innate musical abilities rather than to repeated musical training sessions. According to these findings, the musical capacity, stimulated by musical composition tests, mediates the effect of musical formation on the dimensions of emotional intelligence. Supported by this model, emotional intelligence overlaps with the construct of musical intelligence in terms of emotional reasoning and competence, and of the development of social skills underlying the intersubjective nature of emotions.

In this direction, Thompson et al. (2004) hypothesized that music lessons would accelerate improvements in perceiving age-related emotions. This hypothesis raises the possibility that aspects of emotional intelligence are mediating factors in a relationship between musical formation and sensitivity to emotional prosody. A partial disconfirmation comes from two surveys (Resnicow, et al. 2004; Schellenberg, 2006) conducted in different periods and contexts, reporting no differences between musicians and non-musicians on the Mayer-Salovey-Caruso Emotional Intelligence Test (MSCEIT, Mayer, et al. 2002). This test is based on the ability that requires judgments in four main branches of emotional intelligence: to perceive emotions, to facilitate the thought of emotions, to understand emotions, and to manage their emotions. These results of the absence of any relationship between musical formation and emotional intelligence are important, because they show no mediating effect of emotional intelligence, although the nature of the relationship between musical formation and sensitivity to emotional prosody has not been described.

FINDINGS

Based on these premises, studies have unequivocally demonstrated that musical education correlates positively with prosocial behavior in early childhood (Schellenberg, et al. 2015). As far as social skills are concerned, an important study has explained that the main activities of music training are carried out to socialize or to be

performed together with other people, or to express one's ego. Consequently, based on these results, music education has a fundamentally social matrix and it can play an important role in promoting interpersonal skills, teamwork, and co-operation' (Hargreaves, et al. 2003, p.160). This study is also fundamental, because it stressed the social aspects of music by placing order among all the knowledge in social skills, by tracing the cognitive aspects that trigger such processes, such as cooperation, communication (both verbal and non verbal), positive peer interactions, peer collaboration, responsibility, attention, impulse control, delayed gratification, and accepting consequences (Hargreaves, et al. 2003).

Starting from this assumption, subsequent research has shown that musical experiences not only have effects on socialization processes, but also it represents a tool that stimulates further learning (such as positive changes in social behaviors), structures positive peer interactions, stimulates nonverbal expression, facilitates self-expression, develops interpersonal skills and group cohesion, facilitates social play, and improves on-task behaviors (Juchniewicz, 2014).

A recent review (Holochwost, et al 2017) underlines some benefits in subjects undergoing various musical treatments to different age ranges and provided for different durations (Schellenberg, 2006). The benefits of these programs are attributable to specific characteristics of musical education such as progressive difficulty and multimodal sensory integration (Bugos, et al. 2007). Within this theoretical framework, the review proposes various explorative hypotheses about the value of musical education on the various aspects of cognition: a very fascinating aspect is the fact that music education offers advantages to conative skills, such as motivation of accomplishment or self-esteem. While the existence of a correlation between musical education and the motivation has been proved (Santos-Luiz, et al. 2015), future research should deepen this hypothesis, focusing on two main research paths: (1) it should be demonstrated unequivocally if musical education produces higher levels of motivation, if this motivation remains constant over time or even decreases. (2) The times of maintaining the motivation, the effects of students' interaction on its levels, and, finally, what effects of the acquired or lost motivation on both the musical and the non-musical formation.

Other positive effects of music education on academic achievements is supported by the mediation of another important mechanism, i.e, executive functions (Schellenberg & Peretz, 2008). On this topic, the empirical investigations have shown different results (Degé, et al. 2011a). Although the question of the mediating role of the executive functions between music learning and academic success has not been unanimously defined, the influence of music on the executive function have also been studied. It has been hypothesized and empirically supported that the repeated and sustained engagement in music, if associated with better effectiveness of the components to executive functions (work memory, cognitive control or cognitive flexibility, etc.) can go on progressively by influencing the parasympathetic nervous system to a configuration that supports the cognitive processes of the executive functions. The empirical evidence of this hypothesis is based on the assertion that the acoustic characteristics of music - especially experienced in social groups - can promote a higher parasympathetic nervous system activity, defining a safe environment for subjects, who report a state of calm (Porges & Lewis, 2009). Although some scholars suggested the role of executive functions in building and training specific skills (Hannon & Trainor, 2007; Schellenberg & Peretz, 2008), results differed in this regard, with obvious associations with some executive function measures, but not with others (Moreno, et al. 2011; Schellenberg, 2011a).

One of the greatest inconsistency emerges from findings on social skills related to artistic education showing partially contradictions. Indeed, some studies revealed that drama lessons improved social skills, but at the same time music lessons will not have effected on such skills (Schellenberg, 2004), and that piano lessons (Costa & Giomi, 2004) and the learning of musical instruments (Portowitz, et al. 2009) were not associated with self-esteem improvements. Although the links between musical formation and cognitive skills are relatively consolidated, the association between musical formation and executive function can not be neglected in research. These results do not support the hypothesis the mediating role of an executive function in the association between music formation and IQ. When considering this topic in depth, Sala and Gobet (2017b) do not share this association, suggesting that children with higher IQs are more geared towards taking music lessons (even at the suggestion of their parents) than peers with lower IQ, and that consistent with their IQ results these children perform good levels in cognitive ability tests,. However, the same study does not explain and investigate the value and role of the executive function.

Musical training is also positively associated with performance on spatial capacity testing and non-verbal reasoning. Because these associations extend into different cognitive domains, they involve general domain

processes (it is hypothesized of general intelligence). In fact, even after having taken into account demographic variables, musical formation is positively associated with performance on the tests of auditory and visual memory (Jakobson, et al. 2008; Degé, et al. 2011b) and with IQ (Schellenberg, 2006, 2011a, b; Schellenberg & Mankarious, 2012). These data were basically accepted in almost all studies.

There are interesting studies about the ability to acquire a second language related to music education, or better to say who perceives proper music education can achieve better results in acquiring a second language; in two consecutive studies, Milovanov and Tervaniemi, reported that Finnish children and adults, who have good results in music aptitude tests, tend to have good pronunciation in English. In children musical attitudes have been positively correlated with the visuospatial component of intelligence tests, while in adults, the association between musical attitude and pronunciation of English has remained constant, even when individual differences in musical training, intelligence and the ability to discriminate phonemes have been kept constant. (Milovanov & Tervaniemi, 2011). This once again demonstrates the effectiveness of music training at an early age. These studies show that good foreign language learning presupposes greater musical attitudes in elementary school children, but poses the possibility, during experimental testing, that musical and linguistic skills may in part be elaborated on shared neural mechanisms.

As above-mentioned, a common assumption based on the presence of mathematical properties in patterns and musical rhythm architectures is that music learning is cognitive-related to mathematical skills, Anvari et al. (2002) found a correlation between basic math skills and musical attitudes in 4-year-old children, but not in 5-year-olds. Associations between music education and mathematics, however, are very controversial compared to clearer associations with other aspects of cognition. Only a meta-analysis of correlational studies concluded supported a mild positive association between musical education and mathematical abilities (Vaughn, 2000). Although Bahr and Christensen, (2000) reported a modest positive association between musical education and math skills among high school students in their experimental study, Sala and Gobet (2017a) explained this association in terms of individual differences: children with more intellectual skills are more likely to follow music lessons and thus to have better performance in math tests than other children. Conversely, Southgate and Roscigno (2009) demonstrated that performance on a standardized math test was independent of music training among more than 7,000 second-year high school students.

Finally, other research dealt with the role of personality in music education. The first scholar who defined the musical temperament as a series of character attributes of the artist's personality was Anthony E. Kemp (Kemp, 1997). According to this author, the fundamental dimensions of musical temperament are Introversion, Independence, Sensitivity, Anxiety and Superior Intelligence. Moreover, introversion in musicians is related to the tendency to live, interiorize and symbolize the musical experience. Independence is linked to non-conformity, to individualism and to the eccentricity of artistic life. Sensitivity describes the reflection on the inner dimension of things, rather than on the material dimension. The anxiety of musicians emerges within a sensitive and restless personality characterized by internal concerns, dilemmas, and search for perfection. The trait of intelligence shows that the general intellectual skills of the musician are beyond the average. This fascinating interpretative hypothesis has recently been partially confirmed by further studies (Coffman, 2007; Mihajlovski, 2016), according to which the expression of the personality of the musician is not only determined by musical education, but emerges from many external factors that would affect individuality, perception and the personal identity of a musician. Moreover, these studies confirmed all the dimensions studied by Kemp, except for a higher level of general intelligence in musicians than non-musicians. The artistic personality of musicians would in fact be the result of motivation, self-control, and cognitive constructions needed to create a strong professional devotion to music as well as a high level of musical skills (search for perfection) to be exercised daily.

CONCLUSIONS

The purpose of this study was to find out empirical evidence to the hypothesis according to which music education is involved in the transfer of skills not only in the educational field, but also in the workplace and in everyday life too. The starting point for this study was the examination of two contemporary reviews conducted by Sala and Gobet (2017b), and Holochwost (2017), who point out different views on this subject. Of all the areas investigated, the major of the studies reported that music education has positive effects on general intelligence and memory. To this purpose, it should be remind that from historical point of view Thorndike and Woodworth (1901) defined the transfer of skills, as a shift of learning-based associations into new situations that

share common elements with past learning experiences. This general idea guides researches and research designs are based on the affinity between the areas of the investigated skills.

The current research has dealt with the complexity of the topic, reviewing the observed correlations between music formation, intelligence and memory, and the association between music and other cognitive abilities. The explored studies have showed that music education improves general intelligence that is related to many cognitive abilities and academic skills, such as second language learning or math, thus confirming the hypothesis that music education can improve overall cognitive abilities in children and adolescents, and may have secondary effects on all the other investigated skills and competences.

Another explanatory hypothesis dealt with the influence of education on executive functions as the basis of the transfer of skills, since studies have shown that early-adolescence and early-stage music treatment are positively correlated with work memory, cognitive control or cognitive flexibility. Moreover, when considering the education of music in relation to the study of an instrument, the specificity of the training involves various executive functions.

Music learning is intersecting with language, communicative, and social skills, although specialists are still struggling if there are correlations with mathematical learning and other kinds of understudied skills, as suggested by some researchers. In adolescence, music education has effects not only on brain development but also on the acquisition of various cognitive abilities. Finally, a fruitful field of research focuses on the link between emotional and musical intelligence and how they influence each other in order to explore future implications in the educational field.

A highly accredited and shared hypothesis concerned the possibility that some aspects of emotional intelligence are mediating factors in the relationship between musical formation and emotional sensitivity. Although musical treatment is related to the age in which it is performed, it can affect emotions, facilitates emotional thinking, permits to understand the emotions transmitted by a musical track and, ultimately, to handle one's emotions.

The success of all these researches has many explanations: studies, in fact, question whether music education was associated with better performance on measures of good academic success, to reformulate didactically the teaching programs in the school. The international context presents a strong interest from a teaching point of view on music education in study programs. In the United States, some extracurricular music education programs are generating great interest from those who deal with educational policies for learning centered on the individual and positive effects on school leakage for their continuation over lesson hours. These programs produced, at a first glance, an educational success in terms of recovering students at risk (Houlahan & Tacka, 2015), and, like sport discipline and subject matter, in terms of the decreasing of aggressive behaviors (Monacis, et al., 2014; 2015).

Within the Italian context, the current educational policy and politics are affirming that children and teenagers have been undoubtedly become the major scholars in music education. These concepts are nowadays subjected to debate concerning the general school planning and the introduction of new experimental musical secondary school courses (Toto, 2015). This new kind of educational opportunity could address future research to better understanding of the role of music in learning and in general intelligence. On the other side, if the validity of the causal relationships between music education and general learning will be tested, then important implications will be implied in terms of rethinking the didactic methodologies with new learning objects (Blacking, 2017).

ABSTRACT

Pain is a public epidemic affecting millions of people worldwide, increasing health care expenses, diminishing work performance and increasing lost productivity. This study it has as objective describe the role of the rehabilitation nurse in pain management. One is about a bibliographical revision based in the literature specialized selected scientific articles through search in the data bases, specially MEDLINE. Although no restrictions were made on the articles language, most of them were written in English. Abstracts and titles from references of the used articles were analyzed in order to choose possible eligible studies useful in this review. The studies found on the role of the rehabilitation nurse, pointed out that this professional has a very important intervention in the prevention and control of pain.

Key words: Rehabilitation, Nurse, Pain Management, Health

INTRODUCTION

Pain is a public epidemic affecting millions of people worldwide, increasing health care expenses, diminishing work performance and increasing lost productivity (IOM, 2011 cited by Williams, 2017). Nurses can play a key role in pain management, using best practices in the assessment and management of pain under a holistic approach where the person plays a proactive role in addressing the disease progression (Morales-Fernandez, et al. 2015). This current pain management includes pharmacological and non-pharmacological measures. Additionally, nurses, in collaboration with additional healthcare personnel, must select an appropriate method for the treatment of pain and adjust it appropriately to the subject's preferences and values. Nurses can make recommendations on medication, due to their pharmacological training, and help implement complementary non-pharmacological procedures (Registered Nurses' Association of Ontario, 2007 cited by Morales-Fernandez, et al. 2015).

According to the Association of Rehabilitation Nurses (ARN, 2014), rehabilitation nurses play an important role in assessing and managing acute and chronic pain. In this role, they assist as a manager of care and as a patient advocate to enable a self-management plan. Additionally, provides pain management information and instructs patients and families to encourage wellness, with the intention of improve functional capabilities. Rehabilitation nurses have a scientific understanding of physiology, pathophysiology, psychosocial factors, and also uses pharmacological and non-pharmacologic approaches to prevent, identify and alleviate pain. In addition, these healthcare professionals may pursue further education and accreditation in areas of pain management. Specialized advanced practice nursing roles in handling pain, can encourage and educate greatest practices for rehabilitation nurses.

Definition of pain management for rehabilitation populations

In 1974, the International Association for the study of Pain defined pain as "an unpleasant sensory and emotional experience associated with actual or potential tissue damage, or described in terms of such damage". This description constitutes imperative advances in the conceptualization of pain, viewing it as subjective, granting importance to the subject's verbal expression in defining the disorder and presenting it as a complex experience. This concept comprises sensory, cognitive and motivational dimensions and consequently, a multidimensional method is required (Morales-Fernandez, et al. 2015). The rehabilitation nurse's role is to respond to individuals affected by pain with appropriate patient-centered interventions and empathy (ARN, 2014).

Importance of controlling pain

The patient suffering will have various consequences in their life and in their relationship with others. Physical and psychological wellbeing are greatly dependent of the degree of pain they are feeling. Physically, pain will reduce patient's mobility, which may lead to serious consequences such as pneumonia, deep vein thrombosis, or pulmonary embolus, which have to be addressed in time and successfully by nursing care to prevent even worse outcomes (Wells et al, 2008). The stress these patients are daily subject, due to their pain, may also lead to temporary impairment of gastrointestinal function and increase in risk of ileus. Immune functions may also become suppressed, including natural killer cells, which can be especially harmful in patients with metastatic cancers (Pasero, et al. 1999; Liu, et al. 1997; Page & Ben-Eliyahu, 1997 cited by Wells et al. 2008). These facts will lead to psychological issues. Psychologically, the lack of response in reducing or eliminate patient's pain will lead to their frustration and disbelief in medical care. In more sensitive cases, this can lead to states of anxiety or

depression, which can become chronic if the pain remains unwell addressed and the patient begins to feel hopeless. In ultimate cases, patients who feel they can't pursue the life they once had, pain-free, that can't maintain a job because of the suffering they're in, or have successful relationship with others, may, in despair, turn to suicide. Ultimately, if not well addressed and relieved, acute pain can become chronic at a later date (Hampton, 2005; Opstelten, 2004 cited by Wells, et al. 2008).

Chronic pain is most often complex and caused by different reasons, such as physical, social, psychological and spiritual factors, affecting one in five individuals worldwide, according to IASP and EFIC. In Europe alone, the prevalence of chronic non-cancer pain is 19% (Breivik et al., 2006 cited by Morales-Fernandez, et al. 2015). Individuals with severe diseases, as cancer patients, hospitalized or outpatients, describe an ongoing moderate to severe pain, revealing that these don't receive the optimal pain management and care (Rustoen et al, 2008). The presence of metastases and breakthrough pain increase exponentially the pain scores in these people (Holtan, et al., 2007; cited by Rustoen et al, 2008).

It leads individuals in search of various solutions and treatments, often leading to none or limited improvement of the degree of pain, being a common reason for patients to seek medical care (Teets, 2010; Hillinger, 2017). Chronic pain is described as one that does not improve with time, and that exists continuously for more than 3 months or intermittently so for 5 or more days per week. Half of the people with chronic pain are thought to suffer from severe pain, and 1 in 3 patients with chronic pain have reduced ability to live an independent life (Mayo Clinic, 2006; Morales-Fernandez, et al. 2015). This persistent pain can affect only a specific part of the body, for instance a low back pain, or several regions, like fibromyalgia and osteoarthritis. Musculo-skeletal disorders, although most of the times being associated with self-limiting pain, are the leading cause of temporary absence from work or permanent work disabilities across Europe in working adults (Bevan, 2015 cited by Cochrane et al, 2017). At this stage, pain becomes an illness itself, and not only a symptom of a disease or injury (Mayo Clinic, 2006).

Establishing goals for pain management with people in rehabilitation

According to ARN (2014), improving the quality of life and maximize the level of functioning of patients with pain, are the primary goals for rehabilitation patients undergoing pain management. As an ultimate goal, these individuals are expected to return to their normal day-to-day activities, with increased strength, flexibility and less use of pain drugs. They will acquire stress management techniques and learn how to minimize pain behaviors, which will grant them a more independent life, reducing their necessity of healthcare professionals. There for, pain management will allow these patients to work efficiently, improve their personal relationships and enjoy recreational activities (Mayo Clinic, 2006).

Assessment of pain

The successful management of pain is above all related with its correct assessment, which is a basic step to reach a stable and comfortable pain control (Wells et al, 2008). The evaluation and description of the pain felt by the patient himself is often not accurate due to various facts such as erroneous beliefs or a culture of fatalism. This will influence the addressing of pain by healthcare professionals, which most of the times aren't fully prepared and/or don't have the necessary equipment (Consejería de Salud. Junta de Andalucía, 2011 cited by Morales-Fernandez, et al. 2015). Nurses are crucial in the assessment and management of pain, which is a nursing sensitive indicator (Brant et al, 2017). Sometimes, the difficulty relies in finding a treatment plan to handle an acute and punctual pain, over a preexistent and chronic pain (Keen et al., 2017).

Pain intensity can be measured in a numeric rating (e.g., visual analogue scale, numeric rating scales), verbal rating (mild, moderate or severe pain), or using scales with draws/pictures for patients with limited cognitive-ability. These scales were developed and validated in order to measure the intensity of pain in a standard, simple and brief way, and should be used in all cases to improve the success of the treatments. Adding to this scales, location and quality of pain are also important elements to remember in this process. The positioning of the patient during a procedure or the padding used may cause some pain, which needs to be differentiated from chronic pain the individual may suffer from. Therefore, the quality of pain changes accordingly with the underlying etiology (Wells et al, 2008). The process of determine the origin and type of pain is an important assessment performed by the rehabilitation nurse, which has to be able to differentiate between several different types of pain (orthopedic, neurologic, surgical, musculoskeletal, oncological, among others) (ARN, 2014).

Treatment disciplines

During decades, pain was badly handled by healthcare professionals, including nurses. This was due to the lack of knowledge or wrong notions on how to manage pain, that were then perpetuated. This is demonstrated in several researches available in the literature (Brant, et al. 2017).

Treating pain is often a challenge due to various factors, such as social stigma about pain itself, fear of addiction, and the difficulty of healthcare personal to find the adequate response to the specific pain (Institute of Medicine, 2011; Meeker et al, 2011; Oliver et al, 2012 cited by Brant et al, 2017).

Nowadays, addressing pain and its management is a required field in any healthcare setting, which makes rehabilitation nurses a vital staff in every scenery. They are the first people in contact with the patients' complaints, in areas so different as at school nursing, home care, nursing homes, and numerous others places, being able to act in the prevention and care of pain (Hanks-Bell, et al, 2004 cited by Williams, et al, 2017). Rehabilitation nurses guide themselves by the validated guidelines and standards for pain management (ARN, 2014). Besides these guidelines, these professionals also have to take in account the patients beliefs and phycological state, to help them set and achieve individualized rehabilitation goals. They have to stablish a relationship of collaboration with the patient's family, along with others healthcare professionals, as well (ARN, 2014).

Rehabilitation nurses have to be able to follow the right path to treat the patient's pain, choosing between the various paths and therapies currently known to be helpful in managing pain. If the treatment doesn't have the expected results in controlling pain to an acceptable level or, preferably, end it, these professionals have to be able to direct the treatment to a more suitable and effective plan (ARN, 2014).

Drug techniques to manage pain

Controlling pain is greatly associated with the use of pharmacological strategies, which normally is very cost effective. Several medications are not subjected to medical prescription, like analgesics, which are specially used by elderly people, normally to reduce chronic musculoskeletal pain. This self-management of pain may have serious consequences to this population, probably contributing to an under treatment of pain. (American Geriatrics Society, 2009; Hanlon, et al. 2001 cited by Nawai, et al. 2017).

The diversity of underlying mechanisms involved in persistent pain makes it multifaceted, along with the need to use and vary several pharmacological approaches in order to restrain it (Pasero & McCaffery, 2011 cited by Keen, et al. 2017). Sometimes the method used may not be the most efficient and/or lack to deliver the fast reply the patient is expecting, persuading providers to prescribe, unconsciously, an increasing amount of pain killers to give patients the illusion of a stronger and faster pain control (Bandstra, 2016 cited by Keen, et al. 2017). Statistically, 64% patients believe that the pharmacological treatment they're receiving is inadequate (Morales-Fernandez, et al. 2015). Along with this statistic, another study done with older adults subjected to treatments and medications for their pain, attests that these patients suffering from moderate to severe pain only report a relief of 41-70% in their degree of pain. Based in this study, we can deduce that medical treatments usually aren't sufficient to entirely relieve individuals from their chronic pain (Nawai, et al. 2017).

In the other hand, there are innumeros studies attesting the success of pharmacological treatments in individuals suffering from pain. The difference stands in the correct use of analgesics at the right time, which attests the importance of a correct assessment, prescription and administration of analgesics by healthcare personnel (McCaffery, 2002 cited by Wells, et al. 2008).

Rehabilitation nurses play a vital role at this matter. They will decide what is the correct analgesic to administrate, in what dose, at what time, and that will make all the difference in the patient's pain relieve. Desirably, there has to be the sensitivity to anticipate the need to control the patients' pain, before implementing therapy activities (ARN, 2014).

The fact that moderate to severe pain can be anticipated, based on clinical practice along with supportive evidence, is a great help in doing so. According to these evidences, a rapid reaction, a correct analgesic management, at a fixed-dose schedule will be crucial to control activity-related pain. When talking about the use of opioid drugs, several steps have to take into account in order to guarantee their safety for the patient. It's very important to start the treatment with a lower dose, and carefully assess the outcomes of that administration, always remembering the onset of action of the drug administered (ex. IV or oral opioids). To maintain or alter the analgesic administration plan, healthcare personnel need to compare the pain intensity described by the patient before and after the administration of the medication, and any side effect the individual may be attest. If rehabilitation nurses come to the conclusion that the used drug isn't the better plan to follow with the patient, they can turn to another in the same class of drugs, based on the fact that each patient respond differently to different analgesics (opioid or nonopioid) (Wells et al, 2008).

Sometimes, there's a need to raise the home regime of the opioid, when inpatients who suffer from persistent pain simultaneous experience acute pain, in consequence of procedures or a punctual disease, for instance (Pasero &

McCaffery, 2011 cited by Keen et al, 2017). The high and continuous use of opioid will make patients develop a certain tolerance to that drug, which obliges to a constant increase of the concentration to obtain a comfortable pain relieve for the patient. Taking this into account, healthcare personnel usually don't feel comfortable increasing the dose of the drug right away. Sometimes this developed tolerance by the patients may cause the healthcare professionals to doubt the constant apparent need to increase the dose, and lead to patient discrimination, based on individual characteristic (Lewis, 2015). Besides this stigma, the continuous use of opioid is associated with sometimes tough side effects, like diminishing of one's functioning or mobility. All of these facts make the use of opioids a complex and sometimes controversial matter. There is medication available that relatively successfully controls individual's pain with fewer side effects, depending on the patient response to them. In addition, regularly there's the need to control other illnesses associated with chronic pain, like depression. Appropriate medication can help manage these conditions (Mayo Clinic, 2006).

Thus, there are several alternatives to achieve a comfortable pain control, most of which are intrinsically attached to opioids, who are the most used prescribed analgesics to control different types of pain (Wells, et al. 2008). There's still a need to improve knowledge about analgesics in general, opioids and nonopioids, in order to dismiss fears about this medication. This will help nurses improve pain management with their patients at a safer and more successful way (Brant et al. 2017).

Nondrug techniques to manage pain

Due to the complexity and usual side effects associated with the use of drugs on managing pain, the use of alternative and non-pharmacologic therapies is uprising. Regularly, in their day-to-day life, people use some of these strategies in order to relieve their own pain (Wells, et al. 2008).

There are several complementary and noninvasive strategies that can and are normally used by rehabilitation nurses to control pain and improve functional status, like therapeutic massage, application of cold and heat, acupuncture, among others. These types of technics belong in the group of physical practices, helping alleviate pain by altering physiological processes involved in it. Along with these, homeopathic and holistic strategies, like relaxation, music and pet therapy are also used by nurses to manage pain on a free-drug manner. These kinds of cognitive approaches are very important, since there are proofs that there is a significant relief in patients' pain, when their attention is turned to other subjects. Expectably, the meddling these techniques do with the patients' mental functions, will help them experience a momentary feeling of well-being. (ARN,2014; Wells et al, 2008).

Stress management and Relaxation

An important interaction to have in mind when we are talking about people with chronic pain is their physical condition along with their mind status. The way patients face their illness will have a strong impact in their healing process, and in the way, they'll learn to manage their pain. These people are subjected to a continuous stress that will consequently lead to an increase of the patients' degree of pain, caused by, for instance, muscular tension. This increase in the felt pain will, consequently, augment patients stress, being a harmful and ceaseless cycle. Rehabilitation nurses, throw stress management, will teach their patients the skills to break this vicious cycle, throw exercises of relaxation, among others. This will allow patients to fell more in self-control, less anxious and ultimately and desirably with diminished muscle tension (Mayo Clinic, 2006).

Relaxing is very important in managing chronic pain, but also in episodes of acute pain. Different kinds of exercises should be used for each case, differing in their complexity and time of training needed. For acute pain episodes, there are simple techniques patients can use to help them relieve their pain, live rhythmic breathing or jaw dropping. In persistent pain, the time dispended has to be greater and the exercises are more complex, usually needing primary training and practice. During 15-30 minutes, the patient has to do exercises that include progressive, systematic or autogenic training. This is a common path to follow when the goal is muscle relaxation, for instance (Wells, et al. 2008).

Music

It's well known the positive effects music brings to people, awakening senses that relaxes and improves physical, cognitive and emotional aspects of one's life. Throw music, patients experience a momentary relief in their pain and anxiety, probably by the fact that their mind is somewhat distracted (Dunn, 2004; Vaajoki, et al. 2012 cited by Hsu, et al. 2016). Not all kinds of music are good pieces to achieve this goal. They have to be soothing and bring a feeling of peace to the patient, like instrumental and rhythmic music. During 20-30 minutes people will be exposed to a single or multiple exposure of slow jazz, synthesizer, harp, piano or orchestral (Good, et al 1999 cited by Wells, et al. 2008). There's a study done with burn patients that proves that playing crystal music, originated from a crystal piano (60 dB), during dressing changes, begging 15 min before until 30 minutes after, leads to an expressively relief of the patients' pain (Hsu, et al. 2016).

Cognitive Behavioral Therapy (CBT)

CBT has been the base of study of several recent researches which states that this therapy is very useful when dealing with chronic pain. Although, these researchers came to the conclusion that it's a therapy more successful in easing mind illnesses, more than to relieve pain itself (Williams et al, 2012; Knoerl et al, 2016 cited by Hillinger et al, 2017). It is often integrated in rehabilitation programs in order to treat chronic pain, being the most used in behavioral treatment approaches, with given proof to be the most effective of the psychodynamic and behavioral therapies (Turk, et al. 2008 cited by Teets, et al. 2010). In this therapy, nurses teach their patients about pain, setting goals, measuring to stimulate self-confidence, training in coping skills, relaxation technics, among others (Richardson, et al, 2006, Ortega et al, 2009, cited by Morales-Fernandez, 2015).

Massage therapy

Massage therapy is a very important procedure when it comes to rehabilitation, acting in unpleasant stimuli, pain, anxiety, insomnia, fatigue and stress. In hospitalized patients, who are subjected to a more wearing environment, these massages, besides helping these individuals physically, will as well relief these patients emotional suffering. This kind of therapy can be ordered or simply be part of a consistent nursing care (Hellstrom & Willman, 2011; Richards, et al. 2000 cited by Westman & Blaisdell, 2016). The all set that is created in order to perform a therapeutic massage, will create or improve the patient-nurse relation, which is very important for the healing process in an inpatient (Westman & Blaisdell, 2016).

Massage is defined as the systematic manipulation of soft tissue by mechanical or manual means implemented by trained therapists for therapeutic purposes (Beck, 1999 cited by Wells, et al. 2008; Field, 1998 cited by Raymon, et al. 2010). Is usually applied as a complementary therapy before an intervention or exercise (Furlan, et al. 2002 cited by Raymon, et al. 2010). Massage therapy act by stopping or at least slow down the transmission of noxious stimuli competing with pain messages sent to the brain from the injured area of the body. This happens in both chronic or acute episodes of pain. Proves of this have been gathered by researchers using the gate control theory of pain, in an acute care setting (Adams, et al. 2010 cited by Westman & Blaisdell, 2016). Besides knowing how massage works biologically, still there's the need to quantify it's results in a practical matter, measuring the real decrease in the patients' degree of pain. This can be done by several methods, like habitually through changes in stress hormone levels, vital sign measurements and pain scores (Westman & Blaisdell, 2016).

Massage has an undiscussable positive effect on patients' pain relief (Wells, et al. 2008). However, the real effect on each patient depends greatly on the therapy styles and dosage given to the patient, to their specific chronic pain condition. This makes it hard to study this process and come to a general conclusion (Hillinger, et al. 2017). Massages can usually last from 5 to 20 minutes. There are studies claiming that the recommendation should be 20 minutes of therapeutic massage in order to relief efficiently patients' pain. Nevertheless, there's not enough conclusive studies done in this matter to make this a solid recommendation. (Wong & Keck, 2004 cited by Wells, et al. 2008).

In rheumatoid arthritis, reflexology has been used as a complementary therapy to relieve pain and fatigue, together with a special kind of massage: aromatherapy massage. In this specific disease, it's proven these techniques result in a short term and successfully reduction of the patients' pain (Metin & Ozdemir, 2016). Aromatherapy is defined as the use of essential oils extracted from plants to produce physiologic or pharmacologic effects through the sense of smell or absorption through the skin (Steflitsch & Steflitsch, 2008 cited by Metin & Ozdemir, 2016). In reflexology, it's used specific hand and finger techniques to apply pressure to individual body parts and organs at specific reflex points on the hands and feet to stimulate endocrine glands. Other studies reported that reflexology has been found to reduce migraine, neck and arm, and low back and muscle-associated pain, and to improve muscle strength and tone (Wang, et al. 2008 cited by Metin & Ozdemir, 2016).

Physical Therapy

This kind of therapy involves a greater effort on the patient's part, who will have to learn how to make baseline exercises like stretching, strengthening trainings and aerobic conditioning. During this therapy individual's will also learn how to improve their posture, to let go of pain behaviors, learn about lifting techniques and proper body mechanisms. The goal of the physical therapist when teaching all these methods is that the patient will learn how to live his day-to-day life alongside with his pain. All these techniques will make it easier by teaching the patient how he should move to escape his pain and by improving his shape (Mayo Clinic, 2006). It's a common technique used with neck and pelvic floor pain (O'Riordan et al., 2014 cited by Hillinger et al., 2017).

Heat/Cold Therapy

This technique is commonly used in nursing care and by patients themselves to reduce pain. Still, there's little investigation concerning the utility of heat or ice in the process of pain (Wells et al., 2008). Specifically, cold

therapy can be useful in musculoskeletal dysfunctions, inflammatory processes, traumas and acute pain episodes (Florentino et al., 2012). Heat therapy helps managing pain by a process of vasodilatation. It promotes muscular relaxation, improves metabolism and local circulation, the extension of soft tissues and decreased inflammation. Heat therapy can be done using thermal bags, paraffin baths, contrast baths, infrared, among others (Sampaio et al, 2005 cited by Florentino et al., 2012).

Promotion of successful living

Rehabilitation nurses are very important during all the process of rehabilitation and in every area involved. The relation these professionals develop with their patients will be crucial, helping along the process as they observe and easily understand the patients' verbal and non-verbal pain signals. This relation will also permit the establishment of a tangible goal for the patient, but that at the same time that empowers maximal function. One of the most difficult things is dealing with the constant pain. Rehabilitation nurses can teach patients how to go around the negative feelings this persistent agony can bring. To be able to do this, patient's will need all the support they can get, specially from their family, which can gather information next to the patients' nurse in how to better help the patient at home. One of the most important things is taking the prescribed drugs correctly and on time, and when the patients go home, is their obligation and their families to guarantee the medication correct use. It's also the nurses job to educate them about this matter.

If applicable, these professionals may also give recommendations concerning the patients return to an active and working life, or simply to community reintegration activities. Rehabilitation nurses must always be present to smooth the transition of the patient, throw, per instance, the coordination of a follow up plan (ARN, 2014).

ABSTRACT

As social beings, humans are involved in different communities throughout their lives. These communities meet the need of socialization for human beings and make them get united around common values. The most effective one of these communities is the school community within which each individual takes part in one way or another. Each individual takes part in the school community in a certain period of his/her life and the experiences he/she has got there affect his/her life. Students are an important part of the school community. At school sense of community (SOC) is defined as a student's feeling of being known by, accepted by, valued by, and having influence with their teachers and classmates (Schaps, Lewis & Watson, 1997). It is also described as feeling connected to, engaged to, belonging to, and committed to school. The quality of students' social relations with each other, with teachers and with administrators contributes to an enhanced school environment. The benefits of community building in schools depend on the school's efforts (Sheers, 2010). The main purpose of this study is to reveal the sense of community of the university students by making the Turkish adaptation of the 'Sense of Community' scale developed by Chavis, Lee and Acosta (2008). The study examined the university students' perception of the sense of community and it was determined that students' perceptions of the sense of community were at medium and higher levels. When the results of the analysis made according to the variable of the department are taken into account, it is observed that the students' opinions show significant differences in all dimensions. When the arithmetic averages related to the sense of community are examined, it is observed that the students of the department of psychological Counselling and guidance have the lowest scores. In this study, only the opinions of students studying at a single university were examined. It is thought that examination of other universities in the future studies could be useful.

Keywords: School sense of community, Undergraduate School Students, the Sense of Community scale

ÖZET

Toplumsal varlıklar olarak, insanlar hayatları boyunca farklı topluluklara karışırlar. Bu topluluklar, insanlar için toplumsallaşma gereksinimini karşılar ve ortak değerler etrafında birleşmelerini sağlar. Bu toplulukların en etkili olanı, her bireyin içinde ya da birlikte yer aldığı okul topluluğudur. Her birey, hayatının belirli bir döneminde okul camiasına katılır ve orada yaşadığı deneyimler hayatını etkiler. Öğrenciler okul toplumunun önemli bir parçasıdır. Okullardaki topluluk duygusu (SOC), bir öğrencinin öğretmenleri ve sınıf arkadaşları tarafından bilinen, kabul edilen, değer verilen ve öğretmenleri ile etkileşime girme hissi olarak tanımlanır (Schaps, Lewis & Watson, 1997). Bağlanma duygusu, meşgul olma, ait olma ve okul tahammül hissi olarak da tanımlanır. Öğrencilerin birbirleriyle, öğretmenlerle ve yöneticilerle olan sosyal ilişkilerinin kalitesi, gelişmiş bir okul ortamına katkıda bulunur. Okullarda topluluk yapısının faydaları okulun çabalarına bağlıdır (Sheers, 2010). Bu çalışmanın temel amacı, Chavis, Lee ve Acosta (2008) tarafından geliştirilen 'Topluluk Duygusu' ölçeğinin Türkçeye uyarlanmasıyla üniversite öğrencilerinin topluluk duygusunu ortaya çıkarmaktır. Araştırmada, üniversite öğrencilerinin topluluk duygusu algılamalarını incelemiş ve öğrencilerin topluluk duygusu algılarının orta ve üst düzeyde olduğu saptanmıştır. Bölümün değişkenine göre yapılan analiz sonuçları dikkate alındığında, öğrencilerin görüşlerinin her boyutta önemli farklılıklar gösterdiği gözlemlenmiştir. Topluluk duygusu ile ilgili aritmetik ortalamalar incelendiğinde, Psikolojik Danışma ve Rehberlik bölümünün öğrencilerinin en düşük puanları aldığı görülmektedir. Bu çalışmada, yalnızca bir üniversitede okuyan öğrencilerin görüşleri incelenmiştir. Gelecekteki çalışmaların diğer üniversitelerin incelenmesinin yararlı olabileceği düşünülmektedir.

Anahtar Kelimeler: Okul Topluluk Duygusu, Lisans Öğrencileri, Topluluk Duygusu Ölçeği

THE STORY OF YOUNG PEOPLE TOLD THROUGH PHOTOVOICE : I BELIEVE THE PRESENCE OF KOREAN INDEPENDENCE ACTIVISTS HAS NOT ENDED

Heejin Lee

leeheemac7@naver.com

Jinhee Kim

pedakim@naver.com

The independence movement of Andong-si, Gyeongsangbuk-do started in 1894 and has the highest number of independence patriots of 356 in the whole country as a single region. Although it is the most conservative region, unlike the city's impression of emphasizing tradition, it was a shrine of the very first independence movement that carried out justice(義) and was vigorously active during the period before independence movement in 1951. It was a region in which intellectuals called "sun-bee" and the region's youth led to establish education. The purpose of this study is to observe in which form the Korean independence movement is remembered and represented in photographs taken by young people in a region that participated in an education program on the Korean independence movement. To achieve this, the study utilized photovoice, a method of participatory action research. An education program on the Korean independence movement was conducted for 5 days at University A, which consisted of 6 hours of classes a day, 4 days of lectures, and a one-day field trip to historic sites of the Korean independence movement. During the field trip, the participants were instructed to take photographs related to the Korean independence movement and to submit 3 to 5 photographs with descriptions. The participants were informed that the photographs would be used in an exhibition for local residents in the future. The data collected were 9 photographs submitted by 3 participants. 1 to 2 interviews per participant, of around 1 hour in length, were then conducted using a semi-structured method. The interviews were recorded with prior consent from the participants, and the transcripts of the interviews were read several times in order to analyze their contents.

The following paragraph outlines the results of this study. First, independence activists in the selected participants' photographs were expressed as living figures in the present. In other words, the activists were still alive in the photographs, continuing the independence movement, living the everyday life they had lost, and waiting for those who never returned. Second, the young people placed importance on the microscopic impression of the Korean independence activists, escaping the historical framework of a macroscopic Korean independence movement, which is regarded as a stereotypical viewpoint. This demonstrates that young people are more focused on the independence activists' individual lives, choices, justice, and honor within the Korean independence movement, which is different from the results of learning in the framework of ideology. This also raised the question "What would I have done?" among the participants, thus creating a point of contact between past and present. Third, the photographs are the products of their thoughts, and serve as a pathway to connect thoughts. This study demonstrated that individual actions and the history of the Korean independence movement can be discussed beyond the past through one's appearance and attitude in the present by sharing memories of Korean independence activists with other people, using photographs as a medium.

As such, the act of representing and sharing an individual's memories is interpreted as an act of resistance to history. Breaking the mold of thoughts constructed by traditional learning, speaking an individual's language about the Korean independence movement, and expressing this through photography or words are representations of memories and resistance to history. This practice is a cultural action, and it is significant that the action itself has an impact.

The Teachers' Satisfaction In Higher Education Institutions as Key Factor Of The Strategic Management and of the Organizational Competitiveness

ABSTRACT

Currently Higher Education Institutions (HEIs) are operating in the massively competitive international environment. The present society asks important challenges to current HEIs in several issues: technological, managerial, academic and economic. Consequently, organizations define and adopt strategies that support high performance and organizational competitiveness, with particular attention to human resources as a key factor in the efficient implementing of its strategy. In this regard, professional satisfaction adopts a growing interest in understanding quality of professional life and its influence on strategic management and organizational competitiveness. High job satisfaction contributes to the professional finding meaning in his professional activity and to adoption positive attitudes towards organizational performance. In this perspective, the article purposes to verify if there are differences in socio-demographic, professional, training and labour variables related to the level of satisfaction of the teachers that belong to the HEIs of the Kwanza South Province (Angola). As well as to know the level of satisfaction of those professionals. The results show that the level of teachers' satisfaction is positive and allows understanding the determinants of teachers' satisfaction and their mastery in strategic management and competitiveness of the HEIs of Kwanza South Province.

Keywords: Satisfaction; Higher Education Institution; Strategic Management; Competitiveness.

INTRODUCTION

The sustainability and organizational performance are getting more and more taking on greater relevance for currently organizations, which compete in a global and extremely dynamic market. Phenomenon as Globalization, international competition, changing customers' demand, innovation and technology advancements incite rapidly and dynamic changing in the economic environment forcing organizations to adopt strategies that improve competitiveness and organizational sustainability. Consequently, to compete and retain in a global environment so competitive and dynamic, the organizations need to continually and systematically improve their performance by innovating their products/services and processes, reducing costs, enhancing quality and productivity. According to several studies (Allui & Sahni, 2016; Brito & Oliveira, 2016; Besma, 2014; Bontis, 1996; Dahie & Mohamed, 2017; Hasani & Sheikesmeili, 2016), human resources may be the first sustainable competitive advantage that an organization has in the ever globalized environment. Moreover, Hasani and Sheikesmeili (2016) completes that, more than ever before, human capital is more important than new technologies or financial and material resources. Indubitable, the Human resources are the main factor for keeping the organization in the market. Aware that human capital is the key element of organizational competitive advantage, it is important to define and implement a strategy that effectively involves the organization's professionals in improving the organizational performance. In short, it is extremely necessary to implement human resources strategic management and adapt and coordinate this human capital strategy with organizational strategy.

Furthermore, Human capital is considered one of the most important resources of currently organizations. Strategic management of human resources is more essential than other competitive assets because these people use other resources in organization, build productivity, competitiveness and achieve objectives. Thus, the human resources management discharges a core role in organizations' success by having great effect on organizational performance.

Therefore, organizations need to know and comprehend the expectations of their professionals to attain the greater performance. The concretization of workers' expectations will allow the desired behaviour of the work forces in the organization. A few the organization's desired outcomes in managing its workforce are: competence; employee cooperation among them; employee cooperation with managers; showing the capabilities of employees; employee behaviour; motivation, commitment and satisfaction; attitude and presence (Cania, 2014)

The management of human resources is based on the affectation of the behaviour of the people and their correlation with the institutional objectives. The management of the employees, their planning, their direction and leadership, and their control are closely related to the dimensions perceived by the workers. Validating dimensions that promote job satisfaction is construction a set of determinants that can be evaluated in the context of Human Resource Management in order to maximize value for the professional and for the institution. This study was carried out for teachers of the Public Higher Education Institutes (HEIs) of Kwanza South Province (Angola). Tries to observe the job satisfaction of these professionals, and to relate the variables associated to this condition (sociodemographic, professional context, training context and labour context).

Job activity occupies most of the time of workers, and undoubtedly takes on a remarkable importance in the life of the active population. To this extent, it is extremely relevant that the workplace provides well-being, since this satisfaction exhibits a direct connection with the other spheres of workers' lives. According to Graça (1999), job satisfaction comprises an attitude or an emotion that assumes concrete meaning in behaviours and opinions expressed. Barros and Cunha (2010) affirm that it is the activity that determines the set of all the actions (thoughts, feelings and emotions) that characterize human behaviour at work. There are several studies that show that job satisfaction has an effective effect on the productivity of organizations, on the well-being of employees and also on the various dimensions that are directly or indirectly associated with people, both in the labour and personal fields. Several dimensions were indicated in order to ascertain professional satisfaction: working and health conditions, job security, achievement, autonomy, relationship, prestige and remuneration. Professional satisfaction can be assessed by different approaches and in different environments. Job satisfaction has become increasingly important because it is pointed out as a variable, implicitly and explicitly, that is linked cumulatively to the productivity and personal fulfilment of workers. Greater professional satisfaction contributes to the professional finding meaning in their work activity and adopting positive attitudes towards institutional development. Research at the global level suggests that good socialization practices lead individuals to understand their role more clearly, getting more involved in work and organization, leading to greater satisfaction, since according to Gomes et al. (2008). In the initial stages of the individual's life in the organization, it is important that the new employee have good opportunities to interact and socialize with his peer and leaders.

In spite of the existence of a multiplicity of studies that deal with the subject of professional satisfaction, there are a few studies that study the professional satisfaction of teachers, particularly in Angola. It is intended, therefore, to contribute in some way to the widening of knowledge and to the enrichment of the Angolan and international bibliography. In this sense, the main purpose of this research is to examine the determinants of Public HEI job satisfaction and understand which aspects are more valued by these professionals in their work environment. The present study supposes a reflection about the way in which the sociodemographic variables, of professional context, of training context and of labour context influence the level of professional satisfaction of the teachers of the Public HEIs of Kwanza South Province, namely: Institute Superior Polytechnic of Kwanza South (ISPKS) and Higher Institute of Education Sciences of Sumbe (ISCED). Therefore, it is crucial that ISPKS and ISCED understands what its teachers expect and have a duty to promote such measures, evidently within the parameters admissible and practicable by the institution. The realization of this research on the job satisfaction of teachers makes it possible to understand the perception of these professionals about this reality, to know what motivates them and what their expectations, and through this knowledge to improve their productivity and efficiency, as well as quality of education. Lobos (1978) argues that so many managers and social researchers believe that if labour dissatisfaction were reduced, human barriers to production would be eliminated and transformed into a force that would promote improved performance and consequently productivity. With regard to the professional of the higher education, the way in which he feels and faces his work, determine categorically the success and the quality of the education. Because it is a profession that is dynamized particularly in the field of human relations, the satisfaction in the workplace becomes essential. In fact, teaching is a profession that has undergone changes and restructurings in the sense of achieving excellence in teaching. With the growing development of communication and information technologies, education professionals need constant updating so as not to compromise professional competence and the quality of teaching and service delivery to students and the community.

This article is organized in 5 sections. In addition to the present introduction, there is a section with the theoretical framework, another with the supporting methodology of the whole study. Following is the section where the results achieved with the teacher's satisfaction of the Public HEIs of Kwanza South Province are displayed and analysed. Finally, the main conclusions and contributions of the present study are highlighted. It is hoped that this study will contribute to a better understanding of the job satisfaction of higher education teachers in order to allow ISCED

and ISPKS to define strategies and adopt intervention measures that favour the well-being, the expectation of teachers and promote simultaneously, the better institutional competitiveness and the quality of education.

THEORETICAL BACKGROUND

In the current context of globalisation, the work environment has undergone profound and significant changes around the need to systematic adaptation of the organizations to the new market challenges (Lawler, 2005). As a consequence, organizations have implemented an organizational culture that favours high performance, with particular attention to human resource management as an essentially strategic issue. The growing interest in strategic management of human resources reveals the progressive concern with people, considered as the key resource for organizational success, whether private or public organizations (Mendes, 2012). When it comes to strategic human resource management, it refers to “designing and implementing a set of internally consistent policies that ensure that the company's human capital contributes to achieving business objectives” (Huselid, Jackson & Schuler, 1997:172). This view states that not only the different human resources management practices and policies must be closely interlinked, but also aligned with the organization's overall strategy. One of the great and current requirements of organizations is to use the range of knowledge in a strategic and integrated way, rather than simply need to retain the best professionals. In this sequence, according to Handel (2005), professionals considered more satisfied, who perceive greater autonomy and decision-making freedom in the pursuit of their activities, tend to become more involved with their work and to perceive it more in function of the designated ones rewards intrinsic, related to their interests, demands and needs, which most impact on their performance and inherently in organizational performance.

Thus, not only firms such also organizations like HEI have begun to invest in strategic management and particularly in human resource management, which reveals the progressive concern with people, regarded as the key factor for excellent performance and organizational competitiveness. In addition to the usual sources of competitive advantage, people have come to be seen not as a mere organizational resource that should be managed like other resources but rather as the strategically most important "resource" for gaining competitive advantage. In the search for this advantage, the contribution requested for the human resources management is in the capacity of production of added value, representing this capacity, the implementation of certain strategic activities of human resources management (Mendes, 2012). The systematic and continuous adaptation of organizational practices to environmental changes and the adoption of leadership styles that stimulate the proximity between goals and interests shared by professionals and organizations undoubtedly lead to the improvement of sustainable organizational performance. To this extent, organizations such as HEI must implement a human resources management that is closer to professionals, which verifies the impact of their actions on their performance, with special incidence on measuring of the level of the satisfaction of their employees.

Some studies investigate the supposed relation between the job satisfaction and his professional performance. Locke (1976) understands job satisfaction as an emotional state, pleasant or positive, which necessarily results from work-related experiences. Such an emotional state is determined by agents (such as relationships with bosses and colleagues, organizational policies and procedures, etc.) and events (such as physical conditions in the industry and recognition by others) related to the work, capable to promote such satisfaction. Tsang and Wong (2005) define job satisfaction as a positive emotional state or pleasure sensation resulting from assessment of a work or related aspects simultaneously. Several studies (Locke, 1969; Cura & Rodrigues, 1999; Judge, Thoresen, Bono & Platten, 2001; Aiken, Clarke & Sloane, 2002; Martinez, Paraguaya & Latorre, 2004; Marquez & Moreno, 2005; Santos, Spagnoli, Ramalho, Passos & Caetane, 2010; Moura, 2012; Azevedo, 2012; Leite, 2013) point to an implicit link between job satisfaction and the high performance of its professionals. According to Lu, Barribal, Zhang and While (2011) workers' expectations play a role in the traditional model of job satisfaction and, in turn, job satisfaction is related to performance. Mezomo (2001) points out that an organization with satisfied employees has a potential advantage, since, as a rule, it attracts the best, reduces staff turnover, increases productivity, reduces costs, improves image in the community and gains competitiveness. The senior works of a higher education institution has an important role in creating job satisfaction, identifying which factors cause satisfaction and / or dissatisfaction, and to use those data to identify strategies that lead to improved situations that are less satisfactory, and to use this data to identify strategies that lead to improving less satisfactory situations, since they are crucial aspects since job satisfaction has a significant impact on employees' commitment to organizations, work performance and motivation (Noordin & Jusoff, 2009; Machado-Taylor, Soares & Gouveia, 2010; Machado-Taylor, et al., 2016).

According to the two-factor theory developed by Frederick Herzberg there are two types of factors that affect the satisfaction of human needs, classified as hygienic factors and motivational factors. Hygienic factors are factors related to the working environment or living conditions; the motivational factors are those that can promote active attitude and job satisfaction (Alpay & Verschoor, 2014; Wei & Junyan, 2015). The motivation and the particular interest in this subject were triggered, above all, by the supposed relationship between teacher satisfaction and

professional performance. In this paper it will be present the results of a studies (Locke, 1969; Cura & Rodrigues, 1999; Judge, Thoresen, Bono & Platten, 2001; Aiken, Clarke, Sloane & Caetano, 2010; Moura, 2012; Azevedo, 2012; Leite, 2013) that point to an implicit link between job satisfaction and the high performance of its professionals.

The top management of a higher education institution has a central role in creating job satisfaction, identifying which factors cause satisfaction and/or dissatisfaction, and use those data to identify strategies that lead to improved situations that are less satisfactory. As a result, job satisfaction has a major impact on employees' commitment to organizations, work performance, and motivation (Machado-Taylor, Soares & Gouveia, 2010; Machado-Taylor et al., 2016). Furthermore, job satisfaction is a critical condition for improving the functioning of organizations, and educational managers have a decisive role, through the promotion of strategies that lead to increase the satisfaction of the workers, with a view to achieving results in terms of creativity, commitment and productivity (Alpay & Verschoor, 2014; Castro et al., 2011, Machado-Taylor et al., 2016, Wei & Junyan, 2015).

METHODOLOGY

This research deals with the job satisfaction of the teachers who work in Public HEIs of the Kwanza South Province, namely ISCED and ISPKS, and intends to understand some of the determinants that influence, how the teacher feels in the workplace and how he perceives his profession. In order to answer to the main objective, the following research hypotheses (HI) were established:

HI₁: There are differences in the average values of job satisfaction for sociodemographic characteristics;

HI₂: There are differences in average values of job satisfaction for the level of training;

HI₃: There are differences in average values of job satisfaction for professional category;

HI₄: There are differences in average values of job satisfaction for the labour characteristics;

HI₅: There are differences in average satisfaction values in each leadership practice for each leadership style;

HI₆: There is a direct positive relationship between satisfaction dimensions and overall satisfaction.

In order to answer to the main objective of the present study, an anonymous and confidential questionnaire survey was applied to ISCED and ISPKS teachers, divided into two parts. First part, consisting of a previous questionnaire, the questions were elaborated by the researchers, including sociodemographic, professional, training and labour variables, among others. A second part consists in the CAF Model 2006, Common Framework for Quality Assessment of the Common Administrations of the European Union. After data collection, the database was constructed, processed, analysed and interpreted.

Initially, in order to describe and characterize the study sample, an exploratory descriptive analysis of the data was performed according to the nature of the variables under study. Statistical measures were used: absolute frequencies, relative frequencies, mean, standard deviation, bar graphs, in order to describe the characteristics: sociodemographic, professional, labour and satisfaction manifested by the respondent. Subsequently, in order to perform the necessary inferential analysis, it was applied the parametric tests, to understand the differences between means and the relationship between variables, whenever possible, and when the assumptions for their application were not violated, and when this is not possible non-parametric tests.

The relationship between variables of the first part of the questionnaire with the dimensions of the Satisfaction with Work scale, namely: Overall satisfaction of employees with the institution (SGFI); Satisfaction with management and management systems (SGSG); Satisfaction with working conditions (SCT); Satisfaction with Career Development (SDC); Levels of motivation (SL); Satisfaction with leadership style (SEL); Satisfaction with top leadership style (SELT); Satisfaction with leadership style of intermediate level manager (SELI); Satisfaction with hygiene, safety, equipment and service (SCHSES); Satisfaction with the current remuneration system (SSRV) will allow to establish the predominant determinants of satisfaction with work in these professionals.

FINDINGS

Sociodemographic characterization

The sociodemographic characteristics of the respondents under study are presented in Table 1. The sample size is composed by 75 teachers, who carry out teaching duties at ISCED and ISPKS. Based on the information in the below table, 78.7% (59) of these work at the ISPKS institution and 21.2% (16) work at the ISCED institution. Regarding the gender, 62.7% (47) of the respondents are male and 37.3% (28) female. As for age, 17.3% (13) of the individuals were aged up to 30 years, 45.3% (34) were between 31 and 40 years old and 37.3% (28) were over 40 years old. In terms of nationality, 62.7% (47) of the respondents are Angolan, 33.3% (25) of the respondents

are Cuban, one is Portuguese and two are Vietnamese. Regarding marital status, 46.7% (35) were unmarried, 46.7% (35) were married / de facto, two were divorced and three were widowed. The majority of children (77.3%) had children, of whom 46.6% (27) had a child, 31.0% (18) had two children and 22.4% (13) had three To five children. Regarding the qualifications, it was verified that 37.3% (28) of the respondents were licensed, 58.7% (44) finished the master's degree and three respondents had the doctorate. Regarding the employment relationship, 50.7% (38) stated that they were effective and 49.3% (37) were employees.

Table 1 Sociodemographic Profile.

Variables		n	%
Institution	ISPKS	59	78,7%
	ISCED	16	21,2%
	Total	75	100%
Gender	Male	47	62,7%
	Female	28	37,3%
	Total	75	100%
Age	Up to 30 years old	13	17,3%
	From 31 to 40 years old	34	45,3%
	Greater than 40 years old	28	37,3%
	Total	75	100%
Nationality	Angolan	47	62,7%
	Cuban	25	33,3%
	Vietnamese	1	1,3%
	Angolan	2	2,7%
Total	75	100%	
Marriage Status	Not married	35	46,7%
	Married/Union in fact	35	46,7%
	Divorced/Separated	2	2,7%

	Three to five children	13	22,4%
	Total	58	100%
Educational Qualifications	Licensed	28	37,3%
	Master	44	58,7%
	Doctor	3	4,0%
	Total	75	100%
Job link	Effective	38	50,7%
	Collaborator	37	49,3%
	Total	75	100%

Results of the Sociodemographic Dimension

This section presents the results obtained regarding the satisfaction of ISCED and ISPKS teachers in the dimensions assessed by the CAF scale. In this subchapter, we present the results of the dimensions of the CAF scale according to the sociodemographic dimension. Regarding the gender of the respondent, it is verified that in all dimensions of the CAF scale, the average values obtained for women are higher than the average values obtained for men. The following stand out: SGFI, female with mean value of 3.62 and male with mean of 3.26; SEL, with a mean in the female of 3.93 and a mean of 3.40 in the male; SELT, with a mean of 3.85 in the female and 3.34 in the male, Overall satisfaction with a mean in the female of 3.64 and a mean of 3.19 in the male. The differences observed between men and women are statistically significant, with the women being the most satisfied.

The results of the CAF scale dimensions according to the age group of the respondent revealed that, the employees aged between 31 and 40 years had higher mean values of satisfaction in SGFI (3.49), SGSG (3.31), SDC (3.29), SCHSES (2.73) and SG (3.38). In general, it is verified that the results are very close between different age groups, so that the application of the ANOVA test concludes that the observed differences are not statistically significant in all dimensions, except for the SSRV dimension, highlighting the oldest teachers with greater satisfaction with younger teachers.

Regarding the nationality of the respondent, the results obtained show that in all dimensions the average values obtained for employees with a nationality other than Angolan are higher than the average values obtained for Angolan employees. The following stand out: SGFI, non-Angolan with an average value of 3.68 and Angolan with an average of 3.22; SCT, with a mean of 3.71 in non-Angolan and of 3.12 in Angolan; SDC with a mean of 3.57

in non-Angolan and 3.07 in Angolan; SCHSES with an average of 2.99 in the non-Angolan and of 2.43 in the Angolan; SSRV, with an average of 3.79 in the non-Angolan and of 2.65 in the Angolan. The SGFI, SGSG, SCT, SDC, SCHSES, SSRV and SG dimensions show that the observed differences between Angolans and non-Angolans are statistically significant, with non-Angolan officials being the most satisfied.

The results of the dimensions of the CAF scale according to whether or not the child has children shows that the institution's teachers who have children were, on average, more satisfied in the dimensions: SGFI (3.41), SGSG (3.24), SCT (3.41), SDC (3.29), SCHSES (2.73), SSRV (3.24) and SG (3.38). In the remaining dimensions the employees without children presented the highest results. By the application of the t-test we conclude that the observed differences are statistically significant in the SSRV dimension, and the children-less respondents were significantly more satisfied. In the other dimensions, the observed differences are not statistically significant. Based on these results the first hypothesis was partially validated.

Dimension Training Results

The results of the dimensions of the CAF scale according to the literary qualifications of the respondent revealed that employees with literary qualifications at the master's/doctoral level had higher average satisfaction values in all dimensions. It is observed that the results are considerably different among the respondents with different literary qualifications, so that by applying the appropriate statistical test it is concluded that the observed differences are statistically significant in the dimensions: SGFI, SGSG, SCT, SEL, SELT, SELI and SG. With regard to the results of the dimensions of the CAF scale according to the facility that the institution offers to make the respondent frequent training, it is verified that in all dimensions the average values obtained by the respondents who stated that they are easy to attend training were higher than respondents who stated that they have not an easy time attending training. The SGFI, SGSG, SCT, SDC, SEL, SELT, SELI, SCHSES and overall satisfaction dimensions were highlighted, for which it was concluded that the observed differences are statistically significant. In other words, respondents who feel that the institution is easy to attend training in their area of work are clearly more satisfied. Thus, the second hypothesis of research was confirmed.

Results of the Professional Dimension

With regard to the results of the dimensions of the CAF scale according to the HEI where the teacher interviewed performs his/her duties. The ISCED teachers were, on average, more satisfied in all dimensions. However, at a significance level of 5%, it is concluded that the observed differences are statistically significant in the SGSG, SCT, SEL, SELI, SCHSES and overall satisfaction dimensions. The results of the dimensions of the CAF scale as a function of the teachers' work link show that in all dimensions, with the exception of SCHSES, the average values obtained for the employees are higher than the average values obtained for the employees. However, at a significance level of 5%, it is concluded that the differences are not statistically significant. The third hypothesis of research is not validated since there was insufficient statistical evidence to corroborate it.

Results of the Work Dimension

The results of the dimensions of the CAF scale according to the reasons that led the teacher interviewed to work at the institution show that the teachers who invoked the interest/experience reasons to work at the institution had higher average satisfaction values in the dimensions SGFI (3.47), SGSG (3.36), SDC (3.36), NM (3.94), SEL (3.75), SELT (3.65), SELI (4.11), SCHSES (2.68) and SG (3.46). In the remaining dimensions were the employees with other reasons to work in the institution that presented higher satisfaction results, with the exception of the SGSG dimension. By the application of the ANOVA test it was concluded that the observed differences are statistically significant in the dimensions: SEL and SELI, in the remaining the differences observed were not statistically significant. With regard to the results of the dimensions of the CAF scale depending on the possibility of re-choosing the same institution to work. Teachers who stated that they would choose the same institution to work showed the highest average levels of satisfaction in all dimensions of the scale. On the other hand, teachers who stated that they would not choose the same institution to work had the lowest average levels of satisfaction in all dimensions. By the application of the ANOVA test it was concluded that the differences are statistically significant in all dimensions, with the exception of NM and SSRV. As regards the fourth hypothesis of investigation, it can be said that it is validated once enough statistical evidence has been recorded to corroborate it.

Result of management practices for the different leaderships

It was noted that in general the focused initiatives are identified by the majority of respondents at both top-level and intermediate levels. At the top leadership stand the initiatives: "Demonstrates commitment to the process of change" and "Delegates competencies and responsibilities"; which showed levels of agreement slightly higher than the intermediate leadership. In the remaining initiatives, the agreement of its existence is slightly superior in the intermediate leadership. The table below (Table 2) shows the characterization of the satisfaction with the leadership practices (top and intermediate) of the ISCED and ISPKS institution's teachers. It was observed that for all the focused initiatives the average levels of satisfaction are close between top leadership and intermediate

leadership, and there are no statistically significant differences between the two types of leadership. With the exception of the "Accepts constructive criticism" initiative in which the respondents were significantly more satisfied with the interim manager. The initiatives: "Delegates competences and responsibilities"; "Ensures the development of a culture of change"; "Accepts constructive criticism"; "Demonstrates engagement in the change process" and "Accepts improvement suggestions" present the highest average levels of satisfaction in both types of leadership. In this sense, the fifth hypothesis of research was not corroborated.

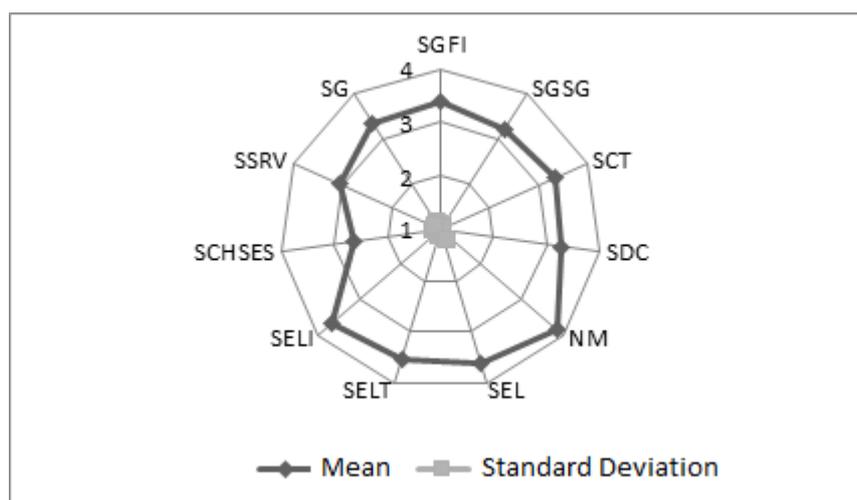

Table 2 Characterization of satisfaction with the leadership practices (top and intermediate).

Dimensions	Activity	Mean	Standard deviation	t-Student Test	p-value
Lead through example	Top Manager	3,56	1,12	-1,143	0,257
	Intermediate manager	3,71	1,01		
Demonstrates commitment to the process of change	Top Manager	3,53	1,11	-0,426	0,671
	Intermediate manager	3,57	1,12		
Accepts constructive criticism	Top Manager	3,36	1,15	-2,314	0,023
	Intermediate manager	3,60	1,12		
Accepts suggestions for improvement	Top Manager	3,57	1,07	-1,685	0,096
	Intermediate manager	3,75	1,05		
Delegates powers and responsibilities	Top Manager	3,84	1,09	0,252	0,801
	Intermediate manager	3,81	1,05		
Stimulates people's initiative	Top Manager	3,57	1,13	-0,618	0,539
	Intermediate manager	3,64	1,09		
Encourages mutual trust and respect	Top Manager	3,52	1,18	-0,823	0,413
	Intermediate manager	3,63	1,18		
Ensures the development of a culture of change	Top Manager	3,49	1,20	-1,026	0,308
	Intermediate manager	3,61	1,11		
Promotes training actions	Top Manager	3,72	1,23	-0,790	0,432
	Intermediate manager	3,83	1,02		
Recognizes and rewards individual and team efforts	Top Manager	3,31	1,17	-1,905	0,061
	Intermediate manager	3,56	1,09		
It suits the treatment given to people, needs and situations	Top Manager	3,39	1,24	-1,616	0,110
	Intermediate manager	3,61	1,14		

Characterization of the Job Satisfaction Scale

The results obtained for the dimensions of the CAF scale are presented in this section. For each dimension its average was calculated based on the number of items that integrate each dimension. The scale used to measure the items was Likert's 5-point, where 1 corresponds to Very dissatisfied and 5 to Very Satisfied. Theoretically the expected average in each dimension is 3 points. Through the analysis of figure 1 it is possible to observe the average level of satisfaction of the respondents in all dimensions as well as the dispersion of results. It is verified that, with the exception of the SCHSES and SSRV dimensions, the average satisfaction recorded was close to or higher than 3.5 and that the dispersion values in all dimensions are small. It can be said that the employees of the institutions under study are generally satisfied. This conclusion of general satisfaction of the professionals under study, extracted from figure 1 is complemented and reinforced by Table 3.

Figure 1 Summary of global mean and overall standard deviation of dimensions.

SGFI - Overall satisfaction of employees with the institution; SGSG- Satisfaction with management and management systems; SCT - Satisfaction with working conditions; SDC- Satisfaction with career development; NM - Levels of motivation; SEL - Satisfaction with leadership style; SELT - Satisfaction with top leadership style; SELI- Satisfaction with the managerial style of intermediate level manager; SCHSES - Satisfaction with hygiene, safety, equipment and service conditions; SSRV - Satisfaction with the current remuneration system.

Table 3 presents the results of dimension characterization. It is observed that in terms of internal consistency this varies from good to very good, since the lowest Cronbach coefficient is 0.863 and the highest is 0.980. It can be observed that in all dimensions the highest value of satisfaction (5 points) was reached and that the average values obtained were higher than the theoretical average value, except for the dimension Satisfaction with hygiene, safety, equipment and service conditions (SCHSES) (Average of 2.64 points). And in the dimension Satisfaction with the current remuneration system (SSRV) the average obtained (3.07 points) is slightly higher than expected. It can be stated that, considering only the average values obtained, it is possible that the respondents are minimally satisfied in the dimensions: Overall satisfaction of employees with the institution (SGFI), Satisfaction with management and systems of management (SGSG), Satisfaction with the conditions of (SCT), Satisfaction with Career Development (SDC), Levels of Motivation (NM), Satisfaction with leadership style (SEL), Satisfaction with top leadership style (SELT) and Satisfaction with leadership style of Manager (SELI). Regarding the dispersion of the responses among the respondents, it is verified that this one exists (values of standard deviation of at least 0,75 points) and is more evident in the dimensions: NM, SDC and SSRV.

Table 3 Characterization of the dimensions evaluated in the CAF questionnaire

Dimensions	Alpha Cronbach	Empirical minimum	Mean	Standard deviation
SGFI	0,909	1,44	3,39	0,84
SGSG	0,938	1,11	3,23	0,92
SCT	0,903	1,13	3,34	0,89
SDC	0,870	1,00	3,26	0,96
NM	0,916	1,25	3,85	0,98
SEL	0,965	1,27	3,60	0,87
SELT	0,949	1,00	3,53	0,94
SELI	0,948	1,45	3,67	0,92
SCHSES	0,909	1,00	2,64	0,94
SSRV	0,863	1,00	3,07	1,07
Satisfaction	0,980	1,75	3,36	0,75

SGFI - Overall satisfaction of employees with the institution; SGSG- Satisfaction with management and management systems; SCT - Satisfaction with working conditions; SDC- Satisfaction with career development; NM - Levels of motivation; SEL - Satisfaction with leadership style; SELT - Satisfaction with top leadership style; SELI- Satisfaction with the managerial style of intermediate level manager; SCHSES - Satisfaction with hygiene, safety, equipment and service conditions; SSRV - Satisfaction with the current remuneration system

In order to complement the study, we analysed the correlation between all dimensions and also the weight of each dimension in the overall satisfaction (Table 4). It was necessary to recourse to Spearman's correlation coefficients because the normality assumption in all dimensions was not verified. All the coefficients presented are statistically

significant at a significance level of 1% and are positive indicating a relationship in the same sense between the different dimensions. Table 4 shows the coefficients with values greater than 0.70, which shows a strong association. Thus, it can be said that the associations between: SGFI and SGSG; SCT and SGSG; SDC with SGFI, SGSG and SCT; SEL with SCT and SDC; SELT with SGSG, SCT, SDC and SEL; SELI with SEL and SELT are at least strong. Regarding the overall satisfaction, the strongest contributions are of the dimensions: SEL, SGSG, SDC, SCT, SELT and SGFI, with correlation coefficients above 0.80. In this sense, it can be said that there is a direct positive relationship between the dimensions of satisfaction and overall satisfaction, so the sixth research hypothesis is confirmed.

Table 4 Spearman's correlation coefficients.

Dimensions	SGFI	SGSG	SCT	SDC	NM	SEL	SELT	SELI	SCHSES	SSRV	Satisfaction
SGFI	1	0,828	0,704	0,754	0,550	0,703	0,641	0,613	0,649	0,646	0,855
SGSG		1	0,817	0,818	0,411	0,816	0,831	0,655	0,694	0,496	0,933
SCT			1	0,755	0,360	0,777	0,774	0,650	0,707	0,450	0,880
SDC				1	0,360	0,820	0,800	0,695	0,689	0,430	0,894
NM					1	0,434	0,396	0,346	0,249	0,306	0,487
SEL						1	0,913	0,906	0,665	0,326	0,925
SELT							1	0,688	0,652	0,304	0,877
SELI								1	0,542	0,270	0,800
SCHSES									1	0,540	0,778
SSRV										1	0,523
Satisfaction											1

SGFI - Overall satisfaction of employees with the institution; SGSG- Satisfaction with management and management systems; SCT - Satisfaction with working conditions; SDC- Satisfaction with career development; NM - Levels of motivation; SEL - Satisfaction with leadership style; SELT - Satisfaction with top leadership style; SELI- Satisfaction with the managerial style of intermediate level manager; SCHSES - Satisfaction with hygiene, safety, equipment and service conditions; SSRV - Satisfaction with the current remuneration system; Satisfaction - overall average satisfaction. a - significant correlation coefficient at 5%; b - significant correlation coefficient at 1%. Spearman correlation coefficient.

DISCUSS AND CONCLUSION

This paper investigated the job satisfaction in HEI of the Kwanza South Province (Angola), concretely how the sociodemographic, professional, training, labour and leadership variables related to the level of satisfaction of teachers that belong to the HEIs (ISCED and ISPKS). The findings show that variables studied influence the level of job satisfaction in HEIs, both the sociodemographic and the leadership initiatives. Currently, Angolan HEIs are facing major challenges surrounding the development of human capital, especially of the Institute members and need to devote more attention to their Human Resources Management practices. The performance evaluation and compensation system can be successfully used for directing and motivating academic staff in their activities and seeing that their activities are in accordance with the strategic planning and human resource management of the HEI. As the HEI evolves and systematically adapts to the rapid changes in the social and economic environment, it is necessary implement changes in the organization mean there could be a drastic increase in the workload of academic staff. It is therefore crucial to implement specific motivation systems and work out the united and fair performance evaluation and compensation system, since that only thus will their evolution be successful. The study also showed that the existence of information about the job satisfaction, it is an appropriate and important instrument to assist HEI in finding an excellent performance and competitiveness. Distortion or lack of information can result in ineffective plans intended to improve job satisfaction. As a result of this study, higher education institutions which focus on improving job satisfaction with strategic human resource management alignment might have more successful results.

Moreover, such as final considerations, it is intended to summarize the information discussed in previous sections, also explaining the limitations of the study as well as the possible directions for future research. According to Almeida (2003), any organization is a result of its human capital and, of course, does not exist if there are no people. In this sequence, the strategic management of human resources has been adopting new roles, from a management of only administrative and bureaucratic personnel, with concerns centered only on compliance with the legislation, a management of human resources with more strategic orientations, focused on Valuation of human capital, motivation and job satisfaction (Mendes, 2012). In this research it can be said that meet the view of Mezomo (2001), who argues that no organization is successful, that is, it achieves objectives without the effort and reciprocal commitment of all workers, who must work as a team, in the search for and operationalization of the objectives, which are added to improve organizational performance. Any organization with satisfied employees has the potential to add benefits, as it typically attracts the best, reduces staff turnover, increases productivity,

reduces costs, improves image vis-à-vis the community, and gains competitiveness. The present study was based on a reflection on how sociodemographic variables, professional context, training context, work context and leadership context determine the level of job satisfaction of ISCED and ISPKS of the teaching professionals. At the same time it provided the knowledge of the image that the teachers perceive of the HEI where they carry out activity. This knowledge allows identifying the reasons for mismatches and nonconformities and their consequences in order to implement measures that promote the desired transformations and satisfaction.

This research proposes, regarding sociodemographic variables and job satisfaction, that: female teachers always declared a superior satisfaction than male teachers; professionals are 31 to 40 years old had higher satisfaction than those of the highest age groups, except for satisfaction with the current remuneration system (SSRV), which showed higher satisfaction among older teachers; teachers with children showed higher satisfaction than those without children and Non-Angolan teachers presented greater satisfaction than Angolan teachers.

Respecting the professional variables in job satisfaction, it can be concluded that: teachers with ties to the institution were slightly less satisfied than the collaborators, although the differences observed in each dimension were not statistically significant and Teachers that work in ISCED presented higher levels of professional satisfaction than the teachers that work in ISPKS. Concerning the variables of training in job satisfaction, it can be concluded that: teachers with higher academic qualifications presented greater satisfaction; professionals who stated that they were able to attend training were more satisfied than those who did not have the opportunity to attend training.

Regarding labour variables and job satisfaction, it can be concluded that: teachers who invoked the interest/experience reasons to work at the institution showed higher satisfaction values and teachers who stated that they would choose the same institution to work showed the highest average levels of satisfaction in all dimensions of the scale. About variables leadership and job satisfaction, it can be concluded that: teachers satisfaction levels are close to top leadership and intermediate leadership

Teachers performing HEI of the Kwanza South Province functions were moderately satisfied (empirical average of 3.36 and standard deviation of 0.75). Given the results obtained, it can be affirmed that it was possible to relate sociodemographic variables with the degree of professional satisfaction of ISCED and ISPKS teachers and thus contribute to a better understanding of the influence of satisfaction on improving the competitiveness and performance of this institution. The results obtained aim to highlight the relation between age and job satisfaction, where it was observed that the group of subjects over 40 years of age showed the highest degree of job satisfaction in the SSRV dimension. The statistical analysis applied to the data of this study with respect to the age group proves that the hypothesis is only validated in the SSRV dimension, because in this dimension the results obtained showed significant differences being the teachers between the ages of 31 and 40 which were significantly different from the others (less satisfied). In the remaining dimensions, the observed differences between age groups were not statistically significant. The results achieved converge with satisfaction theories, particularly with the pyramid theory of Maslow's needs, which identifies one of the needs as security (stable employment, social protection), which in this study can be observed in the determinant of the link with the organization. Which allows to conclude that although the satisfaction of individuals with fixed-term contracts is slightly higher than the actual teachers, the differences observed in each dimension were not statistically significant. It is believed that the labour bond factor did not present the clearly superior result in favour of the effective state because the collaborating professors are foreign professionals with remunerations much higher than the salaries earned in their countries of origin (Cuba and Vietnam). This raises the discussion about considering this fact in the design of policies and strategies of Management and more specifically Human Resources Management (HRM). The purpose of the reflection is to impose flexibility, adaptability and availability, without there being a compromise between the employee and the organization in the long term. In recent years, there has been a growing choice of organizations for forward contracts and services, in a clear adaptation to the demands of global society and to internal and external policies that affect organizations economically and socially.

Additionally, it is crucial that human resource managers remain alert to employee signals. In this research, it can be concluded that the professionals pay particular attention to the values and attitudes of their managers and leaders, both intermediate and top. To this extent, it is believed that this study can contribute to a reflection on how to contribute to the construction of a better and healthier society, inside and outside the organizations, where the values that identify the professionals as human beings, dignified, respectful, ethical, supportive, and do not get run over by negative attitudes such as selfishness, egocentrism, rivalry. It is assumed that this scenario is possible since greater job satisfaction contributes to the employee finding meaning in their professional activity and adopting positive attitudes towards institutional development. Successful organizations are known to take pride in practicing excellent HRM and for their part, the professionals are proud and "wear the jersey of the organization" leading these organizations to success.

This study reveals that academic staff of the Public HEI of the Kwanza South Province are globally satisfied and this satisfaction has contributed directly to improving the teaching quality and competitiveness of this institution, covering these professionals, enhances a better communication and institutional valuation. The results from this research are mainly important to a several of stakeholders. Primarily, this is especially relevant since higher education institutions are answerable for the effective use of resources. Besides, the administration that governs each HEI might be able to further identify the variables and the initiatives que enhanced a greater job satisfaction that may offer a better method in their work efficiencies and effectiveness. Similarly, the teachers in Angolan HEI, may be better able to understand the situation of their HEI, their management and how effective they are in developing the knowledge, skills, and abilities of their human capital. Lastly, organizations (regional and international) wishing to form alliances with Angolan HEI may benefit from understanding their strategic human resource management initiatives. Education administrators should implemented outcome oriented performance evaluation systems and they should also encourage the participation of teachers in decision making processes which can increase their knowledge and skills. To this extent, the HEI need to establish performance assessment and compensation systems in order to show clearly defined causality between compensation and performance of academic staff. A good and well-functioning performance evaluation system would help the educational managers to make their mark in the organizational setting of their faculty. As implications to education managers, it is suggested a closer cooperation between institute and the human resource department in order to establish more unified and adequate evaluation processes. Moreover, it is recommended to the management, particularly to HRM, a greater participation and involvement of the teachers in the institutional decision, especially in the decision making related to the teaching, so that this involvement, stimulates a greater satisfaction and consequently, to promote a better performance in the teaching. A greater commitment of the management bodies and the intermediate directors. Thus, the study gives rich and important findings to the scope of strategic human resource management in the HEI. As HEI include better strategic human resource management practices and initiatives, they will be better prepared to handle with a quickly changing environment and external competition.

As with all studies, this study has some limitations. The main limitation of the study is related to the sample size. Although the collection of data has not proved easy, it is intended that future research may involve larger samples, extended to other professional categories and institutions, comparing professional satisfaction between teachers and non-teachers, national and Countries.

ABSTRACT

This qualitative study focuses on unregistered services provided to the target group of seniors in the Czech Republic. The aim of the research carried out through semi-structured interviews was to identify the reasons leading the seniors, or their family members, to make use of services that are not properly registered in accordance with the current legislation (Act no. 108/2006 Sb. on Social Services). A partial goal was to discover the reasons for not using the registered social services. The data showed that the main reason for not using duly registered social services is their current unavailability in difficult social situations (primarily associated with the worse health condition of the seniors or the persons taking care of them) that the seniors are unable to deal with using their networks of social relations. Another reason is the insufficient time availability of the registered providers of social services, e.g. at night or at weekends. The research showed that the existing social services are not fully capable to meet the current needs of the seniors and their families.

INTRODUCTION

At present, the demographic aging of the population is affecting all countries and is becoming a global social challenge (Loužek, 2014; Sokačová, 2014; Sak, Kolesárová, 2012; Jeníček, Foltýn, 2010; Tomeš, 2005; United Nations, 2002). According to the available statistics (Czech Statistical Office, hereinafter ČSÚ, 2017), people aged 65+ constituted 18.9% of the European population and persons over 80 5.3%. In the Czech Republic, on the given date there were 1,932,412 persons over 65, which accounted for 17.8% of the population. People over 80 accounted for 4% of the Czech population. The percentage representation of the elderly in the countries of the European Union is shown in detail in Chart 1.

Chart 1: The percentage of 65+ and 80+ population in the EU population in 2015

The source: ČSÚ, 2017, modified by the authors

It is clear from the chart above that Ireland has the lowest percentage of the population aged 65+ (13%), and on the contrary, Italy has the highest percentage (21.7%). The share of the people aged 80+ is the lowest in Ireland and Slovakia (3.1% in both countries) and the highest in Italy (6.5%). The Czech Republic is just below the European average in both categories. Demographic aging is becoming an important socio-economic and political issue. The developed countries have an increase in the proportion of the older people in the population and a decline in birth rates, which is one of the main reasons for the aging process of the population. National

strategic documents declare preparation for the aging of the population (see the National Action Plan to Promote Positive Aging for the Period of 2013-2017; the 2014 Report on the Implementation of the National Action Plan to Promote Positive Aging for the Period of 2013-2017) as do the international ones (see the 2002 Madrid International Action Plan on the Issue of Aging). In the field of social work with the elderly and in particular in the field of social services for the target group of seniors, measures are and will be taken to promote the dissemination of forms and ways of providing services. In the European countries, the basic elements of care for the elderly include field social services which enable the client to be able to solve the situation according to his or her individual needs in order to stay as long as possible in his or her natural social environment (Musil, Hubíková, Kubalčíková, 2003).

Due to the fact that in the Czech Republic in the last decade we have seen the trend of the so-called unregistered social services for the target group of seniors, i.e. such services that are provided without due authorization (see, for example, Vávrová, Doříčáková, 2016; Janebová, Celá, 2015; Klímová Chaloupková, 2013), we decided in the following study to find out the reasons why the families of the seniors still use them. The clients of these services do not have a regular contract with the provider, their provision is negotiated on the basis of an oral agreement that does not guarantee a stable price or the quality of the services provided. The provider can be anyone regardless of his/her education or practice achieved, without the position of a social worker as a quality guarantor. At this point, it should be noted that in the Czech Republic social services can be provided only on the basis of registration pursuant to Act No. 108/2006 Coll., On Social Services (hereinafter "the Act") and in compliance with other implementing regulations (Decree No. 505/2006 Coll., which implements some provisions of the Act on Social Services). This situation is caused by the demand for services for the elderly. It exceeds the offer of registered social services, which opens a space for "business". In the open market, the competitive offer of unregistered services could theoretically lead to an increase in quality, but in fact quality is not taken into account as it is not guaranteed, let alone "enforceable" by law. Within the market changes, there appears a sort of marketization of services, which, according to Malík Holas (2014), can, on the one hand, be a positive contribution, in particular to making the system services more effective, and to increasing its flexibility, transparency, or bringing operational savings. On the other hand, according to Šimfková (2015) this may also have a negative impact, especially on low-income clients who will not be able to afford services for financial reasons, which can lead to the exclusion of certain target groups for whom social services are difficult to provide.

THE STUDY

The breakdown of traditional family links, the later retirement, the uncertainty of permanent employment, and many other aspects are frequent reasons that do not allow the families to look after their loved ones in their senior age. The care of the aging family member has gradually moved from the family to the state or private providers of social services where the State has no longer the principal position. If an individual is not able to take care of himself/herself, the family often faces a decision whether to take care of them by themselves or to use any of the registered services (field, outpatient, residential) that are subsidized by the State through care allowances and other forms of support. However, there is often a situation where the family is unable to secure the service, for one or another reason. This is especially true in the case of overloaded registered social services, a long distance from the seat of the service provider, or the absence of social services in the given location. In such a case, the family gets into a helpless situation facing the decision whether to make use of unregistered services taking on the risk associated with the absence of their license to provide services.

The aim of the research of the presented study was **to uncover the reasons for the seniors, or their family members, to decide to make use of services that are not properly registered in accordance with the valid legislation.** For our research, the use of constructivist paradigm (Lincoln et al., 2014) seemed to be the most appropriate, as we wanted to understand the perception of the persons and their interpretations. The main research question we asked was: **What are the reasons for using unregistered outpatient and field services for the elderly?** For the research question a **qualitative research strategy** has been chosen, as the abductive way of exploration enables insight into as many dimensions of the given social problem as possible. The main components of the conducted qualitative research were data from interviews, observation and legislative documents, and analytical and interpretative procedures through which we came, in accordance with Strauss, Corbin (1997), to certain conclusions and theories. The data collection was carried out using **semi-structured interviews** with family members and those close to clients who are using unregistered services for seniors. Family members and close persons were chosen as the research object because the clients using the services without registration are most often the recipients of care allowances in the 4th degree and their state of health in most cases did not allow participation in the research, i.e. providing relevant information in an interview. The interviews were recorded, and the recordings were literally transcribed (Moorse, 2009). **The criterion of selecting the informants** for the research was the fact that they **knew about the absence of registration of the service provided to the senior.** We gained the informants by a deliberate choice using the snowball sampling technique. At the beginning, on the basis of informal relationships, we approached four family members about

whom we knew that their relative was making use of an unregistered service. The advantage of getting the informants was that one of the interviewees had previously worked in field social services in the given region, so she knew some of the family members of the users of unregistered services. These subsequently referred us to other users of unregistered services. In total, we received statements from 25 people. In the research we complied with all ethical principles (voluntariness, confidentiality, anonymity, neutrality, authorization of the received statements and consent to their disclosure; at the same time, we had no interest in data that could identify the unregistered service providers). The interviews were conducted in a secure environment to allow the informants to be open. Everyone was then made aware that he/she could anytime interrupt or end their participation in the research. The socio-demographic characteristics of the informants are shown in Table 1.

Table 1: The socio-demographic characteristics of the informants: family members

The informant code	The relationship of the informant and the client of the unregistered service	The sex of the client of the unregistered service	The age of the client of the unregistered service	The type of the service used	The type of agreement with the unregistered service provider	The length of the used service in months

The data source: the authors' own survey, 2016-2017

Table 1 also shows the age of the people using unregistered services. Except for one client, they were 80-year-olds whose average age was 86.

THE DATA ANALYSIS AND FINDINGS

To meet the set goal a qualitative method of an established theory, or a well-grounded theory (a grounded theory method, hereinafter GTM), was used, and on the basis of that theory the data were analysed (Padgett, 2017). The goal of the grounded theory is to create a theory that explains the subject of the area under study. GTM strives to create a theory based on established data, which makes it different from other theories that are created intuitively (Glaser, Strauss, 1973). The acquired transcripts were repeatedly read and analysed using the open encoding procedures and notes containing ad hoc interpretations and conceptualizations (Howard, Berg, 2016). The transcribed material was thus analysed in accordance with the approach known as the generic inductive qualitative model (Hood, 2014) or as a general coding paradigm (Maxwell, 2005). The established theory used to

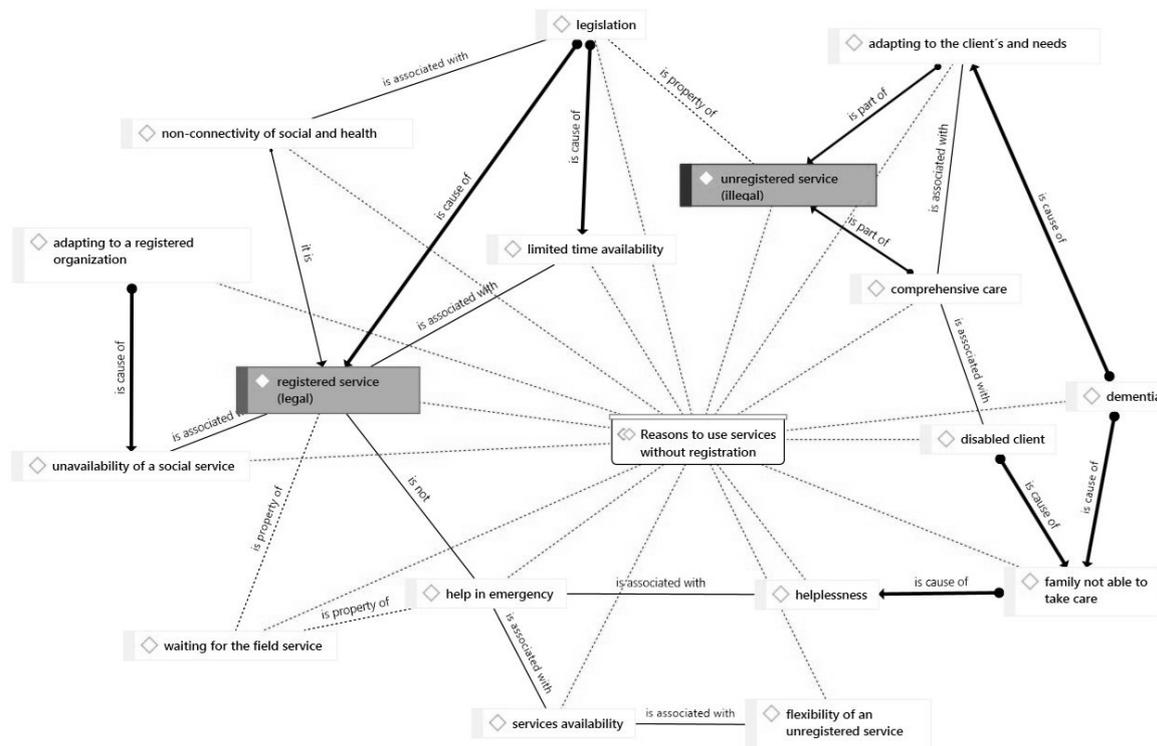

analyse the data copies the Charmaz approach drawing on an interpretative paradigm and constructivist principles (Hubík, 2006). The data were analysed in the ATLAS.ti8 program which allows to reveal the complex hidden data structure and their mutual meanings.

The 98 codes found were grouped by content relationship into five significant groups:

1. **Reasons to use services without registration**
2. Advantages of the service without registration
3. Disadvantages of the service without registration
4. Benefits of the registered service
5. Disadvantages of the registered service

Taking into account the set main goal, we present an analysis within the first group of reasons for making use of services without registration.

Figure1: Reasons for making use of unregistered services

The data source: the authors' own survey, 2016-2017

The main reasons for making use of unregistered services, given by the family members of the clients using them, include **current unavailability in the event of a sudden difficult social situation** (mainly associated with a **deterioration in the state of health of the elderly or the caregiver**) which the senior is unable to deal with while making use of the network of the existing social services and his/her relationships. The statements of people giving the **unavailability of a field service** as the reason: *I needed someone to do it and I did not manage to secure the service (R1). We needed to take care of Mother who we moved to our home. With horror, we found out that there was no service to take care of her. We got a contact to a lady providing these services. She immediately came to our place and assigned us a lady who now takes cares of Mother on a daily basis (R17).*

In many cases, however, the reason was the **lack of time of a registered social service** linked to the limited time of their operation, i.e. non-availability in the afternoons, on weekends and holidays: *We do not have enough employees, we do not work on Saturdays, we do not work on Sundays, we do not work in the afternoons, well, I think these were always excuses, I think they did not want to work, because we demanded the care in the morning and also in the afternoon, differently according to our needs, when there was no family member at home, and on Saturdays and holidays (R8). We make use of the care service people who come to us, but on important days, like Christmas and holidays, we are turning to a lady with whom we have good experience and about who we know that she can bring delight and joy to life. Those care service people do not have time for that. They do what's needed and dash on... (R12). Well, there was no other option, the charity did not offer*

*service in the evenings, and I do the shifts (R20). Family members and close persons also experienced the **local inaccessibility** of the care service that did not operate in remote areas: *the Charity could not provide service to us because they are so far away, so we were looking for anyone to help us (R18)*. Those who were refused by the care service because of **insufficient capacity** got in a situation when they would **have to wait** for the service: *the Charity and the Diaconia did not have capacities and put us on the waiting list and we could not wait (R9). The Charity refused me claiming they had no staff (R13). A lady comes to my mum and also provides service because the Charity has a waiting list and could not help us. Mom was taken from the hospital so we were looking for help (R16). Father could no longer be in the hospital and no one in the family could take care of him. I did not manage to get the nursing service because they did not have any available staff (R19)*. Another frequently mentioned reason was the **lack of staff**: *The charity could not help us saying they did not have enough staff (R23). The hospital did not help us, either. The lady phoned to all the service providers and nobody had free staff. So we managed to secure a certain lady (R24). The Charity refused me saying they had no staff and I failed to make an agreement with a lady... She could not hear properly and did not work on Saturdays and Sundays. I go abroad and I need someone to take care of my mother every day, so I turned to a lady who goes to help the elderly people in the neighbourhood and she agreed to help me (R18)*.*

The lack of staff was often combined with other aspects - flexibility and the clients' preferring to be cared of in their natural social environment. *Because we did not manage to get anyone, as the Charity has a waiting list. I have small twins and my mom does shift work. So a lady comes to our place according to mom's shifts and we did not have to place our grandmother in a nursing home. She would not have forgiven us that (R21). Our children go to work and we did not want to place her in a nursing home (R22)*.

The informants also justified their making use of **field unregistered services** by mentioning the **lack of willingness of registered services in the case of users with specific needs**. These were often **disabled clients**: *Grandmother, she could not make it at all, at her age, because she is 85, so she was out of question, and when Grandfather came from the hospital he was disabled (R1), or clients with **dementia** ... because my father-in-law was demented, so it was very hard to deal with him, he had to be helped with getting dressed, with hygiene, he had to be fed, all the things they had to do (R6)*, which was linked with the fact that the family was unable to **adapt to the conditions of the registered service**: *We refused the Charity because they wanted Father to behave decently. We could not guarantee that because he had a dementia. So we turned to a lady who was experienced and we had confidence in her (R11)*. Another reason was **inflexibility of a registered service provider**: *The existing services were not able to deal with our situation, they could not provide services to the required extent (R6)*.

One of the reasons was also the **non-connectivity of social and health care services** when the client needed a **comprehensive care**: *She gave him the medication and washed him a little (R3) ... she did not loathe anything, he was in such a terrible state and she was ready to help him ... he spilt his urine-bag, it was terrible, like, I just could not deal with him by myself because I was not able to hold him and so on, and she handled that perfectly, she knew how to hold him and not to break his hand, for example, because he had very thin bones and she did not flinch, so she just took him under arms, and she knew how to handle him (R5). There is a problem that there (in the Charity), when we wanted to give him medication, it had to be given by a nurse, and if we wanted our father-in-law to be cleaned and fed, so there had to be another person, oh, and there must be a paper for everything (R6)*.

The reason for making use of a **field unregistered service** was in two cases the **unavailability (lack of capacity) of registered residential social services** in the given region. *I had no other option, I had to go to work, and the nursing home would not accept her until in half a year (R14). I was glad she agreed to take care of my mom, I had no other option, and there was no place in the nursing home (R15)*. In two cases a field unregistered service became a suitable **alternative to family care** which its members could not provide by themselves. *Because I have a certainty that she will really take care of my Mom, like, in all respects, well, I do not know, any kind of washing, food, just services as such, including the intimate ones, simply what she provides is just benefits that were not in the retirement home where Mom was, there was not all like that (R7). You know what, I'm having trouble with my back, I'm going to rehabs and hospitals. The children go to work and we did not want to give her to a nursing home. So she's in a house with other women and we come to visit her. We can also take her out whenever we wish (R22)*.

As we have already mentioned, **all the informants were aware of the fact that the service was not registered, and at the same time that it was not in accordance with the valid legislation**. They commented on these facts as follows: *Well, the unregistered one, really O.K., like, she also gave him a massage, and other things, actually, she rubbed an ointment on his body one more time in the evening, like the whole body, so it was, it was not so rushed, actually (R1). Actually, there was no difference between a nursing service and a private individual (R2) ... we did not have experience with a registered one, either (R5). So I can see the benefits of a service without registration in the fact that they have fully adapted to our conditions (R6). I did not make use of registered services, they did not have capacity, so I contacted an unregistered service (R8). ... but the users of registered services have problems, too (R9). With horror, we found out that there was no such service to take care of our*

relative. We got a contact to a lady providing these services (R17). ... we were looking for anyone to help us ... (R18). That's how we managed to secure it through one lady (R24).

From the statements of the informants we compiled a comparison of advantages and disadvantages of social services, i.e. those with valid registration and those without registration, for the target group of seniors (see Figure 2).

Figure 2: Advantages and disadvantages of services with registration and without registration

SERVICE	UNREGISTERED	REGISTERED (i.e. social service)
ADVANTAGES	quick help, carelessness, accessibility, flexibility, relaxed provision of care, comprehensive care, quality service, lying client, human approach, non-loathing anything, giving medication, adaptation to the client's conditions and needs, the family has an unlimited contact with the client, satisfaction, reliability, finding the client's needs, experience	the future of services, hygiene, uniform conditions, legislation, identical acts, diet, cleaning, substitutability, multi-source financing
DISADVANTAGES	price, one employee, costly care, low quality service, no car, dissatisfaction, profit-only service, bad behaviour, charging without giving bills, oral agreement, no substitutability, no record of provided hours of service and acts, no sympathy	helplessness, bureaucracy, waiting for the field service, legislation, many clients with a registered service, costly care, unavailability of social services, non-comprehensive services, non-connection of social and health care services, inadequate service, being rejected by a registered service provider, limited time availability, preferential treatment, adapting to the registered service provider, termination of a registered service

The data source: the authors' own survey, 2016-2017

THE CONCLUSION

The results of a qualitative research study showed that the main reason for not making use of properly registered field social services is their **unavailability in the event of a difficult social situation**, which is most often associated with a **deterioration of the health state of the senior or the caregiver**, and which the senior is unable to cope with, not even with the assistance of his/her family or with the help of a network of his/her social relationships. In addition, these are often clients with reduced cognitive functions, such as dementia, and with specific needs. The lack of capacity was often combined with **insufficient flexibility of registered social services**, and with preferences of being cared of in the client's natural social environment. The insufficient flexibility and availability of properly registered social services was mainly associated with their non-provision of services in after-work hours and in the evenings. Another reason was **non-connectivity of social and health care services** in the person of a registered service provider. In the Czech Republic, social services are coordinated by the Ministry of Labour and Social Affairs and the clients pay for them by themselves using care allowances. These services can only be provided by registered service providers. The health care is then managed by the Ministry of Health and is paid for by the health insurance companies directly to the health service providers. That is, if the client needs both social (e.g. hygienic care) and medical (e.g. medication) care, he/she must apply for both services. He/she can find the social service by themselves, but the medical care can only be prescribed by a doctor or a healthcare facility. This system, which is not interconnected, is demanding for the client, but also costly for the state budget. The research results clearly show that the existing social services cannot meet the current social health needs of seniors, due to the complexity of the existing legislation and the conditions established by it. The research also revealed that all clients (except for one) who made use of unregistered services were over 80. This group of elderly people is often the most vulnerable due to their reduced self-sufficiency and poor health. In connection with the demographic development, it may be expected that the number of citizens aged 80+ will not only increase in the Czech Republic but also elsewhere in the world, also due to the advanced health care system and generally better living conditions. Therefore, it is necessary to start to look at how the State will guarantee the provision of the necessary social and health care for the target group. It is obvious that the registered social services are not able to meet sufficiently the current demand and respond flexibly to extraordinary difficult life situations, which is one of the reasons for the institutionalization of unregistered services.

ABSTRACT

This study was aimed to analyze the benefits of wikis to enhance the skills of collaborative reading and writing on the training of pre-service teachers of English as a Foreign Language (EFL). The research was conducted in an Ecuadorian academic context during a six-month period in which 30 pre-intermediate students participated; furthermore, 4 EFL professors of an English major were involved. A mixed-method approach was used starting with the application of a diagnostic survey aimed at identifying the technological skills of students and their experience in the use of wikis. Students worked in pairs in a collaborative way using PBWorks to carry out reading and writing activities that started with the analysis of texts in which they identified main ideas, supporting details and conclusions. At the end of the intervention, a survey was conducted to know the students' perceptions about the use of the tool. The results showed that PBWorks had a positive impact for enhancing reading and writing skills because it allowed students to benefit from collaborative learning and feedback given by both, peers and teachers.

Keywords: English as a Foreign Language, reading and writing, wikis, collaborative work, feedback.

INTRODUCTION

The development of new technologies offers different ways for language teachers to promote and enhance collaboration in foreign language education (Aydin and Yildiz, 2014). Furthermore, the emergence of Information and Communication Technologies (ICTs) has extended new opportunities in assisting language learning at all levels of education, especially through the use of Web 2.0, which implies that information is meant to be shared and provides the necessary tools for its creation and distribution (Pelet, 2014). Additionally, "Web 2.0 is highly relevant because it represents the Web shifting from being a medium in which information was transmitted and consumed, into being a platform, where content is created, shared, repurposed and passed along" (Dowes, 2006, p. 4 as cited in Payne, 2009, p. 9). This new Web provides the tools and technologies that can help teachers in creating collaborative learning atmospheres in their online classrooms (Lightner, Bober, and Willi, 2007 as cited in West and West, 2009, p. 2). In fact, according to West and West (2009, p. 1), "Web 2.0 tools, such as blogs, wikis, social networking software, media sharing, and others, have been instrumental in shifting the Web to its new identity as a collaborative work space, or digital commons, where we can all meet to read and write".

In this study, wikis were the most suitable tools to work with the skills of reading and writing; for this purpose, the Web service PBworks was selected because it offers a broad set of collaboration to work more efficiently and effectively; additionally, it encourages student-centered learning and real-time creative collaborative editing. Furthermore, this tool enables teachers and students to co-construct knowledge through the generation of interlinked pages, and allows the implementation of constructivism when designing classroom activities (Zheng, Niiya & Warschauer, 2015). In this regard, the study followed a constructivist approach where the students acted out as constructors in a way that new information was linked to the prior knowledge they had. Regarding this approach, Vygotsky (1978) mentions that learning is a socio-cultural construction and meaning negotiation achieved through language. For this reason, all the learning activities used to enhance reading and writing skills involved a social negotiation of knowledge.

Traditionally, in foreign language learning, two of the skills that deserve to be researched are reading and writing because, even in the native language, they are challenging for any learner. In this respect, Alfassi

(2004, p. 171) considers that “reading is a complex cognitive activity that is indispensable for adequate functioning in society” and for obtaining information. In the same way, “writing is a complex process that requires learner’s skills and ability to successfully combine different components of language” (Pysarchyk and Yamshynska, 2015, p. 78).

Given the importance of teaching reading and writing skills in the digital era, wikis were used in this study as a powerful tool to provide more opportunities for students to strengthen these skills collaboratively. Thus, this paper will shed light on the effectiveness of integrating collaborative work and technology to successfully enhance EFL students’ reading and writing skills.

LITERATURE REVIEW

Collaborative Reading and Writing

Reading is one of the essential skills for the successful acquisition of language and knowledge. In this regard, Silberstein (1994, p. 12) states that “reading is a complex information processing skill in which the reader interacts with text in order to (re)create meaningful discourse”. In addition, Nation (2009, p. 49) states that “reading is a source of learning and a source of enjoyment”; furthermore, he considers reading as a goal and also as a path to get other goals. In the same way, writing is often considered an indispensable skill that enables students to develop an appropriate level of linguistic competence (Cabrera et al., 2014). Therefore, “being able to write is a vital skill for speakers of a foreign language as much as for everyone using their own first language. Training students to write thus demands the care and attention of language teachers” (Harmer, 2004, p. 3-4).

The reading and writing skills in EFL have a strong relationship with each other. Reading is connected to writing, and reading and writing work in synergy (Tierney, 1992). Numerous researchers have shown the worthiness of connecting reading and writing. Moreover, Tierney and Pearson (1983, p. 568) argue that reading and writing are both “essentially similar processes of meaning construction. Both are acts of composing”. For ESL learners, Krashen (1982) believes that reading materials are an important source for the development of writing. Tierney and Shanahan (1991) also demonstrate from their research that good readers are good writers, and found a correlation between these two skills. Carson and Leki (1993, p. 1) point out that “reading can be, and in academic settings nearly always is, the basis for writing”.

Learning a language implies developing reading and writing skills which can be better achieved when they are learned in collaborative environments. Regarding collaborative learning, Smith and MacGregor (1992, p. 11) state that “it is an umbrella term for a variety of educational approaches involving joint intellectual effort by students, or students and teachers together”; additionally, they highlight that collaborative learning involves students working in groups in order to search for mutual understanding, look for solutions, decode meaning, and create a product.

Storch (2005, p. 154) points out that in order to develop writing skills students should work collaboratively; thus, learners have joint responsibility over the production of a text. This might generate a sense of co-ownership and encourage students to contribute to the decision making of all aspects of writing such as content, structure, and language. Additionally, Ghaith (2003) asserts that through social work, EFL students’ reading performance and academic self-esteem improve and their feeling of school alienation decreases.

Wikis in the EFL Classroom

Solomon and Schrum (2010, p. 135) define wikis as “Web pages that students can use to write, edit, and add elements, such as images and video, or to create collaborative projects”. In addition, Wheeler and Wheeler (2007, p. 2) define them as “one of the most useful tools available for collaborative online writing on the Web since teachers are discovering that they provide a dynamic new set of tools to facilitate collaborative learning”. These tools offer a shared environment where students can actively participate in the integration and co-construction of knowledge (West and West, 2009). In fact, “within a wiki, learners possessing little or no knowledge of HTML can collaboratively use, create, and modify Web content” (West and West, 2009, p. 2); these three interesting possibilities favor the creation of a dynamic learning and teaching online

environment in EFL classrooms. Moreover, wikis allow teachers and students to keep track of everyone's individual entries since they retain previous versions that writers can revert. As noted, the built-in features of wikis are very useful for fostering collaborative learning of both reading and writing skills in the EFL classroom, as with any instructional technology, the use of wiki tools alone does not guarantee successful collaborative learning outcomes unless there is good planning, design and pedagogical support from a well-addressed constructivist approach.

With the advent of wikis, numerous studies have been conducted on their use to promote writing skills in EFL contexts; however, a few of them have focused their attention on combining both reading and writing skills. For example, Aydin and Yildiz (2014) investigated the use of wikis in collaborative writing projects in foreign language learning classrooms with 34 intermediate university students. They were asked to work in groups of four to accomplish three different wiki-based collaborative writing tasks, (argumentative, informative and decision-making). The results revealed that the argumentative task promoted more peer-corrections than the informative and decision-making tasks. In addition, the informative tasks yielded more self-corrections than the argumentative and decision-making ones. The results also suggest that students paid more attention to meaning rather than form regardless of the task type and they had positive experiences using wikis in foreign language writing.

In another study, De paiva (2008) investigated on a creative way of enabling learners to benefit from writing by using peer-correction through wikis. Learners were empowered with technological tools as a means of promoting a student-centered approach, which contributed to their being less dependent on the teacher, fostering autonomous learning. Data was collected and analyzed by means of qualitative and quantitative methods to determine whether students' writing skill would be improved if collaborative learning strategies were applied through the use of wikis. Findings reveal that an increasing interest in belonging to an online community emerges from students altogether with higher degrees of motivation. Apart from maximizing opportunities related to writing, learners accurately developed their social skills in the sense that they cooperated instead of competing. The results also suggested that wikis provide learners with many benefits in developing their writing skills.

Wichadee (2010) examined and compared students' English summary writing ability before and after they were taught through wiki. The participants were 35 students enrolled in a fundamental English course at Bangkok University. The study included a group of students who were administered a pre and post-test. Students designed a wikispace and worked together during eight weeks in order to produce five pieces of summary written work that included the edition and revision of information on Web pages until getting and submitting a final paper to the teacher for evaluation. The instruments included: summary writing tests, a questionnaire surveying students' attitudes toward this instruction, and a reflection on cooperative learning through wikis. Findings demonstrated that after being part of this learning experience, students' English summary writing mean score of the posttest was higher than the one of the pretest and their attitude towards the use of wikis was positive, even though, it was a new experience for them.

Coniam and Lee (2008) conducted research to explore how wikis may be used in a group writing task. This study was conducted in a post-secondary institution in Hong Kong where groups of ESL students produced a report based on survey data they had collected during a month. The results evidenced that the project was successful because learners felt engaged in such a collaborative writing project and enjoyed working on the computer rather than in a pen-and-paper format. Even though this study took place in a post-secondary institute, the authors suggest that the use of wikis has major implications for being applied at different educational levels.

STUDY

Method and Participants

The total number of participants involved 30 EFL pre-service teachers enrolled in two Reading and Writing pre-intermediate courses in an Ecuadorian university, and 4 teachers. The students were Spanish native speakers who ranged in age from 17 to 20 years old. Both groups were quite heterogeneous as far as their English proficiency level is concerned. When it comes to reading and writing, some students had a better

command of the language while others needed more support.

Procedure

In this study, a mixed-method approach was used to determine the participants' perceptions about the use of wikis to enhance collaborative reading and writing on the training of pre-service EFL teachers. The main focus of this approach is that combining qualitative and quantitative methods grants a more complete understanding of a research problem than using them separately (Creswell, 2014). This process comprised the following steps.

1. A diagnostic survey was applied at the beginning of the academic term in order to get an overview of students' technological skills as well as to identify their previous experience on the use of collaborative tools to learn reading and writing skills.
2. The participants were organized in pairs considering their strengths and weaknesses in reading and writing skills.
3. Students worked collaboratively by using PBworks to develop reading and writing tasks in a computer lab. The reading tasks consisted on identifying topic sentences, supporting details and concluding ideas. On the other hand, the writing activities dealt with using the correct grammar, punctuation and structure of paragraphs.
4. Students carried out different collaborative writing activities which were performed during the six-month period. Activities started from writing paragraphs that varied in length (100-300 words) to writing different types of essays; students were also asked to read different sorts of passages in which they had to identify topic sentences, supporting details, and concluding sentences. For each one of the activities, students provided feedback to their peers, and then got suggestions from their teachers.
5. At the end of the intervention, all the participants were administered a survey to identify their perceptions about the effectiveness of using PBworks to learn reading and writing collaboratively.

RESULTS AND DISCUSSION

The results of the diagnostic survey evidenced students' perceptions in relation to the use of technological tools and previous experiences in activities involving collaborative work. Regarding the use of the computer, 74 % of participants mentioned that its use was easy and 23% had a neutral perception. In relation to students' previous difficulties on the use of collaborative tools in academic activities, 52% mentioned that the main barrier they had faced was time constraint. Concerning the use of collaborative tools in academic activities, 90% of the students affirmed that they have used them for learning reading and writing, being social networks, wikis, forums and blogs the most popular ones. With respect to reading comprehension in English, 77% asserted that they are good at this skill. With reference to writing, 68% qualified themselves as good writers. As for the activities that strengthen students' reading and writing, 45% said that the use of technology favors collaboration and prepares them for their future professional roles.

After an intervention period of six months, a survey was conducted to determine the benefits of using wikis to enhance the skills of collaborative reading and writing. The results revealed that 74% of students considered PBworks easy to access and 77% evaluated it as an easy-to-use tool. The types of material students shared through the wiki included images, Internet links, videos, text, and photographs as illustrated in Figure 1. These results could be explained by the fact that wikis often allow users to store versions after each edit and compare different text drafts. This build-in version control protects against unintentional errors or deletion of content (West and West, 2009).

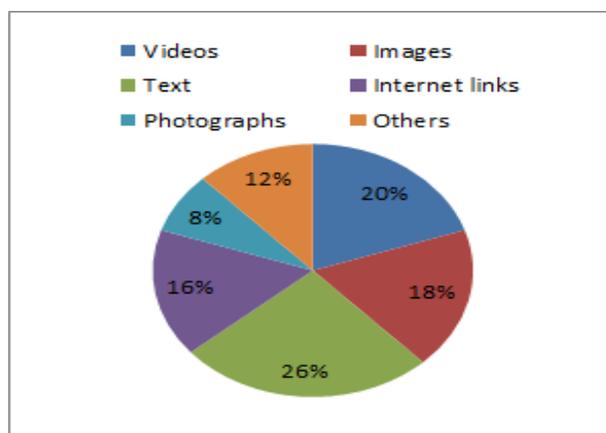

Figure 1: Type of material students shared through wiki

With respect to the interaction and collaboration activities promoted through PBworks, all the participants qualified them as beneficial. Regarding the most helpful activity for strengthening reading skills through the wiki, 61% of the students mentioned that working in pairs to develop reading comprehension tasks helped them reach this objective; other significant activities involved collaborative reading and peer feedback. Dealing with pair work activities that promote students' collaborative writing, slight differences were evident among the participants' perceptions; the results showed that 29% correspond to activities in which students express opinions about specific topics, 32% refer to reading comprehension tasks, 23% belong to collaborative writing, and 16% to peer feedback.

After the intervention, 93% of students highlighted that the use of the wiki promotes collaborative learning, while only 7% of them expressed that it does not promote that kind of learning. Likewise, teachers confirmed this result because they observed that PBworks enhanced students' interaction and co-construction of knowledge; thus, improving reading and writing skills.

All the students mentioned that the feedback they received from their peers in relation to their contribution in the reading and writing collaborative activities was beneficial, as shown in Table 1. According to the teachers, the use of PBworks allowed them to give timely feedback and contributed to involve students actively and consciously in the learning process. This finding is aligned with Lin and Yang (2011) who affirm that wiki learning communities allow meaningful interaction and provide an effective environment for peer feedback.

Table 1: Students perceptions when receiving classmates' feedback by means of PBworks

Students' perceptions	<i>f</i>	%
Very motivated	7	23%
Motivated	20	67%
Scarcely motivated	3	10%
Nonmotivated	0	0%
Total	30	100%

At the end of the intervention, 77% of the participants asserted that they would recommend the use of wikis in order to improve reading and writing skills because they promote collaborative work when there is commitment, contribution, motivation and empathy; while, 23% would not recommend its use because they prefer traditional instruction in which the textbook is exclusively used. It is important to highlight that both students and teachers believed that time constraint, finding an agreement among classmates, and the type of activities planned by the teacher were challenging aspects in this research.

CONCLUSIONS

The use of wikis allowed pre-service EFL teachers to enhance the skills of collaborative reading and writing because they promote social interaction and create opportunities for constructivist learning. The use of these

tools was favorable because students felt more motivated and engaged when carrying out activities collaboratively, which had a positive impact on students' academic performance.

The use of technology enhanced students' participation and interaction in doing reading and writing collaborative tasks due to the fact that more skillful learners supported weak students and worked together to construct the final products. In fact, working in pairs to develop reading comprehension activities, collaborative reading, and peer feedback were extremely helpful and positively welcomed by students for strengthening reading and writing skills through the wiki.

Wikis offer enormous advantages and facilities for enhancing writing skills since they allow both teachers and students to edit, re-write, write and comment on each others' works more effectively than doing that by using pen-and-paper format.

Although it was challenging for teachers to monitor students' progress in reading and writing skills, the use of PBworks allowed them to give timely feedback according to the specific students' needs. This helpful tool thus contributed to make students reflect on their own learning outcomes and progress.

ACKNOWLEDGEMENTS

The authors take this opportunity to acknowledge Universidad Tecnica Particular de Loja authorities for promoting and supporting research and pedagogical innovation projects through the EFL Learning, Teaching and Technology Research Group. The collaboration of the principals, teachers, and students of the English major was also fundamental for conducting this research.

ABSTRACT

Since the acceptance of teaching as a profession, teacher education has been a debatable issue. Especially recently, it has been expected from preservice teachers to have high level of competency of special education in addition to their own discipline. Within this context, it is considered that the preservice teachers studying at different departments should have a common and basic competencies regarding their attitudes towards the students with special educational needs. The aim of this study was to investigate the views of preservice teachers studying at undergraduate programs or receiving pedagogical formation regarding the students with special educational needs and the inclusion. In this study, descriptive screening model was used. The participants were composed of a total of 383 preservice teachers studying at two faculty of education or receiving pedagogical formation education at two state university in Turkey during the 2016-2017 academic year. "My Thoughts on Inclusion Scale", which was developed by Stoiber, Gettinger, and Goetz (1998) and adapted into Turkish by Dalğar (2011), was used as the data collection tool. The data obtained from the scale were analyzed using SPSS 18.0 software. As a result of the analyses, it was found that participants studying at undergraduate programs had positive opinions regarding the inclusive education while the participants receiving pedagogical formation education had negative opinions. Moreover, participants scores didn't differ significantly in terms of gender, grade level, and having a handicapped person in the family ($p>.05$); however, it differed significantly in terms of the program and having received a special education course ($p<.05$). Finally, it was determined that participants' scores differed significantly in terms of the department.

Key words: Preservice Teachers, Inclusion, Pedagogical Formation Students.

INTRODUCTION

The main goal of special education is to ensure the individuals with special educational needs to live as independently as possible and integrate with the society. This goal depends mostly on providing qualified educational opportunities to these students. Today, it is accepted that the students with special education needs should be educated in inclusive classrooms, which is the least restricting education environment. Inclusion can be defined as including exceptional students into regular classes with providing support services to exceptional children and/or regular teachers when necessary (Kırcaali-İftar, 1992). With the growing body of research and the domination of humanistic psychology, it is accepted by most that these exceptional students shouldn't be separated and should be included in environments with their normal peers (Gottlieb, 1978). As a result of this view, exceptional children were begun to be included in regular classrooms. With the notion of social state, the inclusive education is implemented in every educational steps. Although the inclusive education is ensured with the law, some problems related to inclusive education are observed (ERG, 2011:7). When the literature is reviewed, it can be seen that the teacher is the most important element in the success of inclusive education (Temel, 2000, Lindsay, 2007). Within this context, the attitudes of teachers towards exceptional children with special educational needs are considered to directly affect the quality and success of inclusive education. The studies in the literature about inclusion, teachers have generally negative views regarding the inclusive activities (Altun and Gülben, 2009; Ceylan, 2015, Güner, 2010; Metin, 2013; Vural and Yıkıms, 2008). In these studies, the common problems asserted by teachers are presented as:

- The teachers aren't equipped with the required skills for the education of exceptional children (Altun and Gülben, 2009),
- They have troubles with implementing the curriculum in accordance with the needs of exceptional children (Vuran and Yıkıms, 2008),
- They are inadequate in terms of classroom management (Ceylan, 2015, Güner, 2010).

The source of these problems encountered in each step and each branch is considered to be teachers' attitudes towards inclusion. Although there are a number of factors affecting the teachers' attitudes towards inclusion, it is considered that the quality of the courses related to special education during the teacher education process, the program that was graduated, and how the formation education was received have an effect on the attitudes towards inclusive education. When the teacher training models of today are reviewed, it is seen that two models are dominantly used (Yüksel, 2011):

1. Traditional Model: it involves the four-year undergraduate education given in education faculties.
2. Professional Model: it was developed by the educators who thought that the content knowledge should be emphasized in teaching.

Both models are based on two main components, pedagogical knowledge and content knowledge. Therefore, whichever model they graduate, the teachers should have common basic competencies. When these basic competencies are examined, it is seen that one of the competencies of a good teacher is related to their approaches to inclusive education and the students with special educational needs. In order to meet this need, Higher Education Council made it obligatory to receive the course of special education in all branches of teaching and in pedagogical formation education (Çelikten, Şanal, and Yeni, 2005). Among the competencies determined by MONE (2008), those related to special education and individuals with special educational needs are presented as:

- They prepare suitable environments for students with special educational needs by determining learning goals.
- They know about the laws and regulations related to handicapped individuals' learning and education, and behaves accordingly.
- They make effort to take the measures foreseen in current law and regulations about handicapped students.
- They take the individual differences into consideration while preparing lesson plans.
- They know about the legal bases about those with special problems.
- They make individual learning plans.
- They diversify the measurement and evaluation techniques by taking the individual difference into consideration.

Within this context, when it is considered that not only the graduates of education faculties but also the graduates of other faculties can become teachers after receiving the pedagogical formation education and that these teachers may have students with special educational needs in their classrooms, it is important to examine the attitudes of preservice teachers studying at education faculty and receiving pedagogical formation. When the literature was reviewed, it was observed that although many studies focused on preservice teachers' views regarding the inclusive education (Altun and Gülben, 2009; Ceylan, 2015, Güner, 2010; Metin, 2013; Vural and Yıkımsı, 2008), no study was observed to focus on views of preservice teachers receiving pedagogical formation. Many of those studies were observed to be conducted using particular attitude scales or interviews. Another way of determining the individuals' attitudes and perceptions of a topic or concept is to use metaphors. The metaphor concept can be defined as explaining a concept with a better known concept or to take qualities from one level to another one (Mutlu, 1998: 106). In other words, metaphors are the strong mental devices used to understand and explain a highly abstract and complicated phenomenon by comparing it with more concrete phenomenon (Saban, Koçbeker, and Saban, 2006). When considered in terms of education and teaching, metaphor is defined as making decisions about one phenomenon's characteristics with reference to other phenomenon's known characteristics by comparing these two phenomena. These definitions show that metaphor is a simple and effective way of determining the attitudes which constitute the bases of behaviors. Therefore, both "My Thoughts on Inclusion Scale", which was developed by Stoiber, Gettinger, and Goetz (1998) and adapted into Turkish by Dalğar (2011), and metaphors were used in this study to reveal preservice teachers attitudes towards inclusive children.

The aim of this study is to investigate the views of preservice teachers studying at undergraduate programs or receiving pedagogical formation education regarding the students with special educational needs and inclusive education. The following research questions were formulated:

1. What are the views of preservice teachers studying at undergraduate programs or receiving pedagogical formation education regarding the inclusive education?
2. Do their views regarding the inclusive education differ significantly in terms of some variables (gender, program, grade level, having received special education course, having a handicapped person in the family, and department)?

METHOD

In this study, descriptive screening model was used in order to determine the views of preservice teachers studying at undergraduate programs or receiving pedagogical formation education regarding the inclusive education. Screening models aim at describing a past or present situation as it is. It is tried to describe the research object or individual in its own conditions and as it is (Karasar, 2002).

The participants of this study were composed of 383 preservice teachers studying at undergraduate programs or receiving pedagogical formation education in two state universities during 2016-2017 academic year. Purposive sampling technique was used in the selection of participants because they were selected based on their programs. 278 of the participants were female and 105 were male. 180 participants were studying at an undergraduate program while 203 were receiving pedagogical formation education. Other characteristics of participants can be seen in Table 1.

Table 1. Demographics of Preservice Teachers

Characteristics		N	%
Preservice teachers	Female	278	72.6
	Male	105	27.4
Program	Undergraduate	180	38.9
	Pedagogical formation	203	61.1
Special Education Course	Received	169	44.10
	Not received	214	55.90
Field	Science	73	19.20
	Social	181	48.00
	Equally weighted	127	32.80
Handicapped person in family	Yes	22	5.7
	No	361	94.3

Moreover, the metaphors regarding the inclusion were asked to be created by the same participants in the study. A total of 213 participant took part in this phase, 144 of whom were female and 69 were male. 102 of them were studying at an undergraduate program while 111 were receiving pedagogical formation education.

“My Thinking About Inclusion Scale”, which was developed by Stoiber, Gettinger, and Goetz (1998) and adapted into Turkish by Dağar (2011), was used as the data collection tool. In the adaptation study, the Cronbach’s alpha coefficient was estimated to be .73. According to Özdamar (2004), a Cronbach’s alpha coefficient between $0.60 < \alpha < 0.80$ indicates a highly reliable scale. Therefore, it can be stated that My Thinking About Inclusion Scale was a reliable tool. Moreover, it was found to be .69 in this study. The scale is composed of 20 items. The highest score that can be obtained from the scale is 100 while the lowest score is 20. The lower scores indicate positive views while higher scores indicate negative views.

The descriptive screening model was used in the study and the data were analyzed by two authors using statistical analysis methods. The responses of preservice teachers studying at an undergraduate program or receiving pedagogical formation to the My Thinking About Inclusion Scale were entered into SPSS 18.0 software. The items 2, 6, 8, 11, 14, 17, 18, 19, and 20 were reverse items. Therefore, the scores obtained from these items were reversed and preservice teachers’ total scores were obtained. In order to decide which analysis to perform, the normality of the data was checked. The analysis result showed that the data wasn’t normally distributed. The results of Kolmogorov- Smirnov test can be viewed in Table 2.

Table 2. Test of Normality

Views regarding inclusion	Kolmogorov-Smirnov		
	Statistic	sd	p
	.13	383	.02

According to the results of Kolmogorov-Smirnov test in Table 2, non-parametric tests were used to respond the research questions.

FINDINGS AND CONCLUSIONS

When the responses given to the My Thinking About Inclusion Scale by the preservice teachers were analyzed descriptively, the mean scores can be seen in Table 3.

Table 3. The Mean Scores of the Items of My Thinking About Inclusion Scale

	My Thinking About Inclusion Scale	n	Ort.	sd
1	Students with special needs have the right to be educated in the same classroom as typically developing students.	383	2.20	1.12
2	It is difficult to maintain order in a classroom that contains a mix of children with exceptional education needs and children with average abilities.	383	2.34	1.21
3	Children with exceptional education needs should be given every opportunity to function in an integrated classroom.	383	1.52	1.36
4	Inclusion can be beneficial for parents of children with exceptional education needs.	383	1.80	1.10
5	Parents of children with exceptional needs prefer to have their child placed in an inclusive classroom setting.	383	2.27	1.13
6	The individual needs of children with disabilities CANNOT be addressed adequately by a regular education teacher.	383	3.44	1.1
7	Most children with exceptional needs are well behaved in integrated education classrooms.	383	2.55	1.15
8	We must learn more about the effects of inclusive classrooms before inclusive classrooms take place on a large scale basis.	383	1.55	1.21
9	It is feasible to teach children with average abilities and exceptional needs in the same classroom.	383	2.54	1.30
10	Inclusion is socially advantageous for children with special needs.	383	1.80	1.20
11	Children with special needs will probably develop academic skills more rapidly in a special, separate classroom than in an integrated classroom.	383	3.36	1.12
12	The presence of children with exceptional education needs promotes acceptance of individual differences on the part of typically developing students.	383	2.14	1.11
13	Inclusion promotes social independence among children with special needs.	383	2.27	1.13
14	Children with exceptional needs are likely to be isolated by typically developing students in inclusive classrooms.	383	2.49	1.10
15	Inclusion promotes self-esteem among children with special needs.	383	2.16	1.10
16	Children with special needs in inclusive classrooms develop a better self-concept than in a self-contained classroom.	383	2.20	1.21
17	Children with exceptional needs monopolize teachers' time.	383	3.20	1.12
18	The behaviors of students with special needs require significantly more teacher-directed attention than those of typically developing children.	383	1.77	1.06
19	Parents of children with exceptional education needs require more supportive services from teachers than parents of typically developing children.	383	1.74	1.09
20	A good approach to managing inclusive classrooms is to have a special education teacher be responsible for instructing the children with special needs.	383	1.95	1.11

According to the findings presented in Table 3, it can be seen that the attitudes of preservice teachers studying at an undergraduate program or receiving pedagogical formation education ($X = 2.26$) are at medium level. These findings are consistent with the studies reporting that the teachers have medium or negative attitudes towards inclusion (Diken, 2006; Güven ve Önder, 1995; Okyay, 2006; Temel, 2000).

The variables investigated in this study were gender, program, grade level, having received special education course, having a handicapped person in the family, and department. In order to determine whether the participants' scores differed significantly in terms of gender, program, grade level, having received special education course, and having a handicapped person in the family, Mann-Whitney U Test was performed. As for the department variable, Kruskal- Wallis Test was conducted. The results of Mann-Whitney U test is presented in Table 4.

Table 4: Mann-Whitney U Test results regarding gender, program, grade level, having received special education course, and having a handicapped person in the family

	n	Mean Rank	\bar{X}	Sd	p
Gender					
Female	180	203.53	58.54	6.93	.06
Male	201	179.78	56.60	7.37	
Program					
Undergraduate	203	228.33	60.30	6.72	.00
Pedagogical Formation	180	159.79	55.99	6.82	
Grade Level					
Third Year	22	228.50	59.45	6.08	.16
Fourth Year	360	189.24	57.94	7.16	
Special Educ. Cour.					
Yes	169	174.20	55.68	6.91	.00
No	214	206.05	59.85	6.71	
Handicapped in Family					
Yes	22	186.57	58.13	7.93	.81
No	361	192.33	58.01	7.05	

When the findings in Table 4 is examined, it can be observed that preservice teachers' views regarding inclusion didn't significantly differ in terms of gender, grade level, and having a handicapped person in the family ($p > .05$). This finding is consistent with the results of some studies (Artan and Uyanık-Balat, 2003, Varlier, 2004; Altun and Gülben, 2009; Gök, 2009; Şahbaz and Kalay, 2010; Özdemir, 2010; Okyay, 2006); whoever, it contradicts with the results of studies which concluded that individuals having a handicapped person in the family obtained more positive attitudes (Ceylan, 2004; Çulhaoğlu-İmrak, 2009; Gözün ve Yıkmış, 2004; Orel, Töret ve Zerey, 2004; Seçer vd., 2010, Sünbül ve Sargin, 2002). According to results in Table 4 showed that participants who received a special education course had more positive attitudes towards inclusion ($p < .01$). This finding is consistent with the studies which found that preservice teachers who received special education course had more positive attitudes towards inclusion (Gözün ve Yıkmış, 2004; Kayılı, Koçyiğit, Yıldırım Doğru ve Çiftçi, 2010; Orel, Töret ve Zerey, 2004); however, it contradicts with the results of studies which found that special education course had no effect on the attitudes towards inclusion (Fazlıoğlu ve Doğan, 2013; Kayılı vd., 2010). Moreover, participants studying at an undergraduate program had more positive attitudes than the participants receiving pedagogical formation education. This finding is considered to be of great importance for the literature about the pedagogical formation.

Another variable was the department. It was composed of three groups, which were science, social, and equally weighted. In order to reveal whether the participants' scores significantly differed in terms of department, Kruskal-Wallis Test was performed. The results are presented in Table 5.

Table 5. Kruskal Wallis Test Results Regarding The Department

	Views towards Inclusion	n	Mean Rank	sd	X^2	p
Departments	Science	73	186.54	2	37.93	.00
	Social	181	224.33			
	Equally weighted	127	146.06			

When the findings in Table 5 is examined, it can be observed that the participants' scores significantly differed in terms of their departments ($X^2=37.93$, $p < .01$). According to this data the scores of the equally weighted students have more positive attitudes than the others towards the inclusion. These findings are consistent with study (Öztürk et al, 2014) reporting that attitudes towards inclusion differ according the field of the teachers.

To sum up the findings, the participants studying at an undergraduate program had positive attitudes towards inclusion while those receiving pedagogical formation education had negative attitudes. The participants' scores didn't significantly differ in terms of gender and having a handicapped person in the family ($p > .05$); on the other hand, they differed significantly in terms of having received a special education course and the program ($p < .05$). Moreover, the participants' scores differed significantly in terms of their departments.

In future studies, it is recommended for researchers to focus on the reasons and solutions ways of pedagogical formation students' negative attitudes towards inclusion. Moreover, the needs of teachers having received pedagogical formation and their attitudes towards inclusion are recommended to be investigated.

ABSTRACT

Phrasing is one of the most important features shared by music and a movement-oriented subject such as dance, or any sports routine that involves a choreography. As a pilot study to investigate the perception of inexperienced viewers, this study investigates whether an increased level of congruence between music and movement will enhance the visual perception of phrasing in a Tai Chi routine. A Tai Chi practitioner, who was expert in the exercises and a medallist in numerous reputed competitive events, was engaged. A competitive sword routine with the original music accompaniment used by the practitioner was selected in this experiment and the performance of the routines was recorded. A new accompaniment was composed for the same routine where the congruence between music and movement was increased from a musical perspective. Thirty viewers (N=30) without any background in music, sports or dance were invited to participate in the survey, and asked to rate the level of phrasing quality of the two videos, one with the original accompaniment and the other with the new composition. Although the survey did not show a significant difference between the perceived phrasing in the two videos, the video with the new accompaniment still recorded a higher rating on overall phrasing and sword movements. This correlates with the previous report (Loo & Loo, 2015) from the same project where viewers with a musical background significantly rated the video with new accompaniment as having a better quality of phrasing.

INTRODUCTION

The synchronization, parallels and congruence between music and movement has been examined where the combination of the two entities have brought significant insight into different fields such as in sports (Karageorghis & Terry, 2009 ; Loizou, Karageorghis, & Bishop, 2014); instrument playing (Davidson, 1993; Davidson, 2001; Broughton & Stevens, 2009); dance (Hodgins, 1992; Mason, 2012) and multimedia (Lipscomb, 2005; Eitan & Granot, 2006). Of the many parallels such as rhythm, tempo, accent, dynamics and more, phrasing appears to be a key aspect to be addressed as it provides a sense of direction and structure. Phrasing was chosen to be highlighted in this paper as not only is it shared by music and movement sequence, but it also serves as a fundamental unit in language that has been much studied (Speas, 1990; Selkirk, 2000) and shared by the majority. Phrasing has also been studied scientifically and the perception of phrase boundaries in music detected in the human brain (Knösche, Neuhaus, Haueisen, Alter, Maess, Witte & Friederici, 2005). As explained in the perception of phrase boundaries that are marked by specific acoustic cues (Riemann, 1900), this is closely associated with sequences of movement, particularly those which are structured or have a choreography such as dance.

In the field of sports, while music is used in many repetitive movement exercises to enhance ergogenic effects, sports routine is another category for which music is compulsory in competitive events such as rhythmic gymnastics, synchronized swimming, figure skating, martial arts and so forth. These routines have a close similarity to dance, since they are all choreographed with designated movements. Often, there is a tendency for the general public or even experts to consider music as only a background supplement to the actual acrobatic movement of the athletes. However, many studies and regulations emphasize that the music should not be considered as merely background accompaniment but should harmonize with the choreography or movements (Harman, Garbato, Forberg, 2009; Loo & Loo, 2012a). This reinforces the importance of music in sports routines as it does more than provide a 'flow' to the movement. In addition, each aspect of the music (audio) and movement (visual) affects the perception of the viewers, as studied in cross-modal relation of different shared

parameters. This article reports one of the experiments on the level of congruence in music and movement affecting the phrasing quality of a tai chi routine. Unlike a previous study (Loo & Loo 2015), respondents in this report had no background or training in dance, sports or music. Another difference is that the video used in the current study was a live performance of the practitioner both with the original music and with the new accompaniment. This differs from the previous video where both sets of music were edited to the video track to avoid background noise, thus maintaining the actual intention of the composer but resulting in live performances using the new music not being tested. The article reports a pilot study based on a survey to examine if the increased phrasing can be perceived by inexperienced viewers.

PHRASING IN SPORTS, MOVEMENT AND MUSIC

Discussing the parallel between music and sports, Karageorghis and Terry (2009, p.15) define synchronous music as 'rhythmic and temporal aspects of music used as a type of metronome that regulates movement patterns' while asynchronous music is 'played in the background to make the environment more pleasurable and where there is no conscious synchronization between movement patterns and musical tempo'. It is noteworthy that a prominent parallel that relates very closely to both music and sports is tempo and rhythm as pace or speed is the ultimate goal for many sports, especially those with repetitive action. The effect of tempo has been studied widely (Edworthy, & Waring, 2006; Karageorghis, Jones, & Stuart, 2008); for example, it was found faster music provided better endurance, motivation and training (Waterhouse, Hudson & Edwards, 2010).

Looking at another aspect, in a sports activity that involves choreography and 'planned' movement the phrasing that contributes to the flow and structure of the entire routine requires much attention. As sports routine is closely related to dance, in which music is used extensively, one of the important parameters that is established in Hodgins' (1992) choreomusical analysis is phrasing. Under the fourth group of the intrinsic category, phrase/period was established as a subunit under 'structural' which serves as a correspondence of a structure (Hodgins, 1992, p.27). The fundamental relationship between phrasing of movement and music can be found in the gestures of an instrumentalist. In the study of phrasing judgement, it was found that participants could identify the underlying phrasing of the performer from a 'visual-only' stimulus (Wanderly and Vines 2006, p.183). Movement also increases together with the ratings of phrasing, dynamic, rubato and overall performance in the movement of instrumentalists (Juchniewicz, 2008, p.424). In an experiment analysing the gestures of pianists, it was found that the motion profiles demonstrated the underlying phrasing structure of all pianists (MacRitchie, Buck & Baily, 2013). These studies demonstrate that phrasing can be perceived from an instrumentalist's physical movement which indirectly conveys other aspects of interpretation.

TAI CHI AND PHRASING

The many forms of tai chi which involve choreography are, as in rhythmic gymnastics, also closely associated with dance. The concept and philosophy in the movements generated in this exercise in relation to music was studied (Loo & Loo, 2012b; Loo & Loo, 2013a). The attainment of continuity in generating circular movement in the concept of *li duan yi bu duan* (力斷意不斷) 'a halt in force but not in the intention' is applicable to the phrasing continuity and connecting phrasing in music (Loo & Loo, 2013a). Identification of music interpretation within a routine was also analysed, where it was found that the perception of athlete and music was rather different (Loo & Loo, 2013b). A further study showed that the increased matching of music and movement in a tai chi routine also increased the ratings for congruence in phrasing for both entities from the perception of viewers who had a musical background (Loo & Loo, 2015). Although not detailed in musical terms, the importance of matching music and movement was mentioned in the Rules of International Wushu Taolu Competition (2005), the guidelines for judging various competitive routines in Wushu. It was stated that that 'superior' marks would be given for 'accord between movement and accompanying music' (Rules of International Wushu Taolu Competition, 2005, p.32).

METHOD

Routine Selections and Video Stimuli

A routine of *taijijian* (tai chi sword) was performed by a tai chi expert who has been practising for more than ten years and is a medallist from numerous international competitions. The familiarity of the routine with the music used was confirmed as the practitioner had performed it in numerous competitive events. The performance of this routine was recorded a few times and the best video was used in this experiment. The original music of the routine was edited with a new accompaniment to enhance the level of congruence, focusing on the aspects of phrasing, accent, tempo, rhythm, articulation and so forth. Two videos were prepared for the survey, one where the practitioner performed with the original music and the other with the new accompaniment.

Participants

Thirty respondents (N=30) who were postgraduate students at a university were involved in this study. Aged from 23-27, they were all inexperienced in music, dance and sports. These respondents were chosen because one

of the purposes of the study is to examine the perception of viewers who have no expertise in any of the three subjects.

Procedure and Questionnaire

Respondents were presented with the two videos, one with the original music (V1) and the other with the new accompaniment (V2). Fifteen respondents viewed V1 followed by V2 and another fifteen respondents viewed V2 first to avoid any irrational primacy effect. After watching each video the respondents were asked to rate the synchronization between movement and music by answering three questions: a) how well does the music in this video provide a clear phrasing for the sword movement? b) how well does the music in this video provides clear phrasing for the steps in this routine? and c) what is the overall level of congruence (match) between the phrasing of the music and each movement/element? A five-point Likert scale was used in the ratings, where 1 = poor and 5 = excellent. The difference between the ratings for both videos was analysed using paired sample T-test with a significant level of $p < 0.05$.

RESULT AND DISCUSSION

With reference to table 1, although the mean for all three aspects was rated higher in V2 it was statistically not significant in the T-Test. For the first question, rating the level of congruence in phrasing between the music and sword movement, the mean score for V2 ($M=4.07$, $SD=0.868$) is higher than V1 ($M=3.83$, $SD=0.986$); but yielded a non-significant level at $t = -1.070$, $p = .293$. This applies similarly to the perceived phrasing between music and step movement with a mean score of V1 ($M=3.70$, $SD=0.988$) and V2 ($M=4.03$, $SD=0.809$) but was statistically not significant at $t = -1.439$, $p = .161$. The mean score for the perceived phrasing of music and overall movement recorded a higher rating in V2 ($M=4.20$, $SD=0.714$) than V1 ($M=3.93$, $SD=0.828$) but again, did not reach a significant level at $t = -1.490$, $p = .147$.

Table 1 Phrasing perception between both videos (V1 and V2) using paired sample *t*-test

Video	Mean	SD	<i>t</i>	sig- <i>t</i>
<i>Music and Sword Movement</i>				
V1	<u>3.83</u>	<u>0.986</u>	<u>-1.070</u>	<u>.293</u>
V2	<u>4.07</u>	<u>0.868</u>		
<i>Music and Steps Movement</i>				
V1	<u>3.70</u>	<u>0.988</u>	<u>-1.439</u>	<u>.161</u>
V2	<u>4.03</u>	<u>0.809</u>		
<i>Music and Overall Movement</i>				
V1	<u>3.93</u>	<u>0.828</u>	<u>-1.490</u>	<u>.147</u>
V2	<u>4.20</u>	<u>0.714</u>		

In general, although the results were not significant, the higher means in V2 thus suggest a positive outcome similar to other surveys in the same project where the increased congruence between music and movement in video 2 was perceived to have better phrasing (Loo & Loo 2015). However, the differences between these surveys should be noted. Although the music stimuli for both video 1 and 2 were the same throughout all surveys, in the current survey both videos are live recordings of the practitioner performing with different music. Unlike previous models, the intended congruence between music and movement in Video 2 projected a more accurate version as the music accompaniment was edited towards the routine, in which there was more control in terms of the composer's intention. In this survey, although the practitioner performed live with the music, the intended congruence was not perfectly delivered as the practitioner was more familiar with the original music.

This survey also varies in terms of the respondents' background as novices in music, dance and sports. Since the core subject in this audio-visual stimulus is a sports routine, the intention of the project is to identify the perception of different individuals with various backgrounds in the given experiment. This issue similarly applies in related studies. In phrasing, it was found that experts in dance could recognize structured or unstructured movement better than novice dancers (Starkes, Deakin, Lindley, Crisp, 1987). It was also found that general traits and characteristics in a dance were perceived both by professional and novice dancers but details

were only noticed by the professionals (Brownlow, Dixon, Egbert & Radcliffe, 1997). In analysing perceived tension in music, Fredrickson (2000) discusses that, based on their experience, musicians could perceive a higher level of detail than non-musicians. The research of Granot and Eitan (2011) revealed that dynamics influenced both types of participant regardless of their training, while register affects non-musicians and pitch contour affects musicians. Again, it was stated that detail of musical elements, such as pitch in comparison to register, was better perceived by musicians may be due to their training and 'wider exposure to diverse expressive possibilities in art music' (*ibid.*, p.240). To evaluate the perceived musical parameters in a listening experiment, Friberg, Schoonderwaldt, & Hedblad, (2011), also suggested that a less consistent result would be expected from non-expert listeners, but looking at the 'intermediate perception level' (*ibid.*, p.237) the more naïve listening by laymen should be taken account of due to their experience of sound and music.

CONCLUSION

This article reports a pilot study on the congruence in phrasing between movement and music in a tai chi routine as perceived by novice viewers who were inexperienced in music, dance and tai chi. The current survey closely relates to a previous study in the same project, but this survey examined a different level of audio-visual aspect as the practitioner recorded a live performance using both the original music and the enhanced music accompaniment with increased congruence. Limitation occurred due to the familiarity of the practitioner with the original music although a time frame was given for understanding and interpreting the new accompaniment. The importance of the actual employment of the new accompaniment by the practitioner was also taken into consideration. While the mean scores of the survey was higher for the video with intended increase of congruence in phrasing between audio-visual elements, it was not statistically significant. It is hoped that an increased sample size in a future experiment will prompt a positive result.

ACKNOWLEDGEMENT

The research was funded by Universiti Putra Malaysia under the Fundamental Research Grant Scheme (FRGS/1/2016/SS107/UPM/02/2).

w Lee Yi-Ping

yipinglee@hotmail.com

A semi-ethnographic approach was used to describe the production and transmission of knowledge in medical center of National Cheng Kung University, which is one of Taiwan's top universities. There were two objectives of this study: 1) to identify modes of rhetoric and scientific judgement of graduate students in biomedical research institute, 2) to access the change of communication pattern during training. Voluntary and with fully-informed consent students and teachers were enrolled in this study. The media (verbal/written text) for scientific presentation and discussion were collected by three ways: 1) video recording the seminars for graduate students, 2) classroom sit-in and taking notes about the dialogues between speaker and audience, 3) deep interview. Multi-dimensional analysis of collected data was done focusing on epistemic activities and articulation (finding, identifying, and representing problems). We found that 70% of the critiques of experienced scientists (teachers) on a specific finding are concerned about the reliability of materials and methods, adequacy of experimental design with proper control, significance of comparative results, and sufficiency of evidence. While, questions raised by the students were much about methodology and data interpretation. The results provide a foundation to set training program for newcomers of bio-research and suggest that practice in normal science is still needed to achieve constructive dialogue in bioscience.

THEORY WITH PRACTICE BINDING INSTRUCTIONAL GROUP ACTIVITY GAINS IN THE EYES OF TEACHER CANDIDATES

ABSTRACT

There is no doubt that one of the most targets of teacher education is that teacher candidates gain experience by implementing their theoretical knowledge they gained related to their fields and thus prepare themselves for the teacher's profession. It is important for the professional equipment of teacher candidates that they conduct instructional implementation activities in courses suitable for developing this purpose. In this context is Instructional Group Activities Design (IGAD) developed regarding the professional development of teacher candidates is applied and their opinions with regards to the gains of these applications are obtained at the study. The Instructional Group Activities (IGA), conducted within the scope of the study, is performed during the implementation hours of the course 'Special Teaching Methods I'. With these attributes, it can be said that the research is a qualitative study conducted with 56 teacher candidates. The opinions of the teacher candidates related to the gains of instructional group activities are obtained by a questionnaire form with open and closed end questions and face-to-face interviews. The teacher candidates have stated that they had more gains in the implementation part of the course compared with its theoretical part and noted that the application activities they performed during the course was beneficial with regards to the professional qualification and development. The participants to the study have expressed that they enjoyed the Instructional Group Activity applications and assessed their instructional experiences related to the applications in question as 'quite good'. In addition, the candidates, who stated that these activities indicated that they gained diverse skills like using the research stages, cooperative learning, creativity, undertaking responsibility and expressing oneself, lead by critical, thinking through the Instructional Group Activities Design. Setting off from these results, the usability of instructional group activities design for teacher's education is discussed and some suggestions are made.

Keywords: instructional group activities; teacher education; instructional design; teacher candidates

INTRODUCTION

According to the Council of Higher Education (CoHE) [YÖK] (2007), to which teacher training is affiliated in Turkey, teacher training curricula aim to raise teachers who solve problems and teach to learn, and not technician teachers who do what they are told to do (CoHE, 2007). Obviously, it is necessary for teacher candidates to gain experience by applying the theoretical knowledge they have obtained in relation to their fields, learn to learn and therefore get ready for the teaching profession in order to realize this purpose. In addition to this, according to Lockhorst (2004), who states that teaching training curricula have entered a transition process towards the social constructivist approach, a strong bond should be formed between theory and practice. Active and authentic learning takes place in this way. According to Ruys, Van Keer and Aelterman (2010), who put forth a similar approach, active learning and cooperation with peers, are the main qualities in the new paradigm. One of the four main standards emphasized by the National Science Education Standards (National Research Council [NRC], 1996:58-70) on professional development programs is 'to help teachers integrate the content knowledge with pedagogic knowledge', and the other is 'to lead the teachers to life-long learning'. The way to ensure these two standards is to develop and use the educational designs that combine theory and practice and develop life-long learning skills. Such educational experiences should support active learning and be arranged in the form of group works to ensure the cooperation with peers. The IGAD (Instructional Group Activities Design), which aims to ensure this, was developed in this study and it was assessed from the point-of-view of teacher candidates.

We should better understand how we will develop curriculum, teaching and evaluation approaches that students will consider as a model when entering the teaching profession (Kluth and Straut, 2003). To this end, it will be

suitable to try new educational models and activities that will increase their professional development and evaluate its results. Nevertheless, teacher training programmes should allow teacher candidates to receive training in being a teacher with the skills required by the modern time, and develop their own teaching curriculum. According to Yanpar Yelken (2009), teacher candidates must possess the high living and thinking skills required by the modern day, such as communication, creative and critical thinking, problem solving and innovation. According to the author, these skills may only be developed with practical training. The practical training in question is called student-centered lesson designs.

Student-centered lesson designs will contribute to rising more adaptive, self-controlling (planning one's own works) students who are better at managing informal and real learning situations (Lizzio, Wilson and Simons, 2002). The outputs of these lesson designs are interested in what students can do among the expected qualifications at the end of the program or teaching design applied. Therefore, this approach is also generally called the achievement-centered approach. In this context, the achievements of teacher candidates, especially on the IGAD, applied in the study were questioned. Various programmes and teaching designs that attribute more importance to practices and student-centered teaching than theory were developed and used. The DAIP (Developmentally Appropriate Instructional Practice) is a programme developed by the NAEYC (National Association for the Education of Young Children). The programme emphasizes the importance of the teaching approaches centered around the student, and not on the teacher. According to Alford, Rollins, Padro'n and Waxman (2016) conducting studies on the outputs of this programme, while students who are taught by teachers who frequently use the DAIP instruction are more prone to kinesthetic works, their probability to answer the questions asked by the teacher and learn by discovering freely is also higher. The Group Learning Activities (GLAs) design that is addressed as an important component of the lesson designs in higher education was developed by De Hei, Strijbos, Sjoer and Admiraal (2016). The authors created a general framework by combining different group learning studies and stated that the framework they created is aimed at guiding teachers in higher education to designing, applying and assessing different group learning activities.

In their studies, De Hei, Sjoer, Admiraal and Strijbos (2016) developed and used the Group Learning Activities Teaching Design (GLAID). The authors compared the group learning activities they used in their classes with the GLAID framework and analyzed it. According to the results of this study, teachers stated that they used all the components of the framework, but they faced difficulties in the structuring of group learning activities. The authors say that the design they have developed as a result of the study may be beneficial as a guide in teacher training for those educators who want to design, apply and assess their own group teaching activities. De Hei, Admiraal, Sjoer and Strijbos (2017) investigated the relationship between primary school teacher candidates and group learning activities and perceived learning outcomes. According to the results of the studies of the authors, to what extent learning outcomes contribute to positive learning perceptions is mostly related to how students assess the design components applied, and group learning activities can be used in higher education to improve the learning outcomes.

Instructional Group Activities Design (IGAD)

The IGAD means the activities, which aim to increase learning skills, and professional development, in which a learning-centered teaching process is adopted, and students work together in small groups to achieve learning targets. The IGAD framework consists of six design components: (1) learning targets and their results, (2) task features, (3) the process when the theory is connected to practice, (4) guidance, (5) group structuring and interaction, (6) assessment and feedback.

In the 'learning targets and results' component that aims to achieve the content achievements of the lesson and develop the teaching skills, it is expected to take the IGAD to the desired learning results. The achievements of the lesson dimension include the acquisition of skills such as interaction, communication, taking responsibility, expressing one's thoughts and critical thinking that group studies bring about with the acquisition of phenomenal, procedural and metacognitive information. The tasks given by the teaching staff to ensure that students achieve the learning targets make up the 'task features' component. These tasks may include the tasks at different levels from creating a simple scenario to developing a comprehensive project. The 'connecting theory to practice' component qualifies the application process in which the processes take place in the general sense. It

includes the operational procedure and application of the activities. Furthermore, cooperating in application activities was accepted as the first central concept, while the operational procedure of the IGA to be applied in practices was accepted as the second central concept. What is meant by the operational procedure is that possible activities necessitate both the field knowledge, i. e. theoretical information, and includes its practical application/applications. The guidance, coaching and support provided to students by the teaching staff in the whole design process explain the 'guidance' component. This component includes the ability to use the right search engines on the internet regarding any subject when necessary together with verbal guidance, or the hardware guidance such as providing the materials of any laboratory experiment. The component that includes the group composition in addition to group size and in the cooperation process when students try to achieve the learning targets is the 'group structuring and interaction' process. With interaction, a multi-dimensional interaction is in question, these being the interaction with the group friends of students, the interaction with other group members in the classroom, and the interaction of students with the teaching staff. The measurement procedures used for assessing the achievement of learning targets and the feedback given on the group activities that connect theory with practice make up the 'assessment and feedback' component. In this component that not only includes focusing on the product but also the process, there is also peer assessment feedback.

After explaining all the components, it is definitely necessary to indicate that the decisions taken in the design of each of six components are related to the design of other components, and the compliance of all steps in the design with one another is important. For example, the component of connecting theory to practice includes asking questions to students on the process of cooperation. This is related to the component of group structuring and interaction. Again, in the process of connecting theory to practice component, the teaching staff provides support in stimulating students' inquisitive attitudes and creating ideas on the content, and this is also closely related to the guidance component. Many examples can be given showing that the components that make up the IGAD are correlated.

The main problem of the study was expressed as 'What are the assessments of teacher candidates on the achievements of the IGA, which is prepared based on the IGAD and applied in the Special Education Methods-I course?'. The sub-problems related to these problems are as follows: (1) What are the assessments of teacher candidates on the achievements of the theoretical and application parts of the course?, (2) What are the assessments of teacher candidates on the learning of the IGA?, (3) What are the assessments of teacher candidates on liking the IGA?, (4) What are the assessments of teacher candidates on the educational experiences related to the IGA?, (5) What are the assessments of teacher candidates on the effects of the IGA on their professional development?, (6) What are the assessments of teacher candidates on the effects of the IGA on their skill development?

METHOD

The study is a qualitative study. As it is known, the meaning attributed by people to incidents, situations, phenomena, etc., i. e. how they qualify them, gains importance. This study is also qualitative in that it investigates the assessments of teacher candidates on the achievements of the IGAD implemented.

Participants

56 science teacher candidates participated in the study. The candidates study in the 3rd grade of a middle sized university in the Aegean Region of Turkey. 30 of the participants are female, and 26 are male. A purposeful sample was used in the study that is based on volunteering because the main objective is to obtain in-depth information on the thoughts and assessments of teacher candidates, which make up the subject of the study, on the achievements of the IGA. According to Fraenkel and Wallen (2009), the purposeful sample is to select rich situations in terms of giving information and allow in-depth research according to the aim of the study. Moreover, one of the main criteria that are important for the researcher in this sampling method is to reach the individuals who are experienced in the subject to be investigated. Therefore, this sampling method was used based on volunteering as the participants must have taken part in the practices in question. The participants who were interviewed face-to-face are also 8 teacher candidates who have gained the IGA experience, once again selected among these 56 individuals based on volunteering. 4 of them are male, while 4 of them are female.

Data collection

The first tool used for data collection in the study is the opinion form that consists of open-ended and closed-ended questions. The form was applied to 56 individuals in total. Expert opinion was used together with the national and international literature in the process of developing the questions in the opinion form, and the questions were put into final form after making the necessary corrections and additions in line with their suggestions. Furthermore, the opinions on the questions asked by 3 teaching staff (science teaching) in this process that aims to increase the content validity were assessed as necessary, not necessary and should be changed. According to Lizzio, Wilson and Simons (2002), the perceptions of university students of the learning outcomes (in this study, achievements) are not only about the satisfaction of students but also the development of their skills and different components of educational designs. Therefore, questions aimed at determining the satisfaction of teacher candidates (questions on the state of liking-not liking and their educational experiences) as well as skill achievements (the question on the contribution of activities to skill achievements) and professional development achievements (questions on the contributions of activities to their learning and their contributions to their professional development) were focused on in taking the opinions of teacher candidates on the achievements of the design. Interviews were used in the study as another data collection tool. According to Crano and Brewer (2008), the interview is a data collection tool that allows for determining the behaviors, thoughts or emotions of participants by means of answering the questions posed by the interviewer. The interviews were also used in the study as the thoughts and assessments of teacher candidates who participated in the IGA practice on the acquisitions of the practice.

Data analysis

The content analysis among qualitative analysis techniques was used in the analysis of the opinion form questions applied to teacher candidates. The repeating frequency of the codes from the analyses was used, and the themes were achieved by determining their common points. The results were expressed and tabulated as frequency and percentage frequency values. Voice recorder was used in the recording of the interview data. Then, the records were assessed by being transcribed by the researcher. The data in the study were coded twice every other month. Then, the consistency between these two coding was calculated. The percentage of compliance was investigated by comparing the number of repetitions of the codes for each question (Miles and Huberman, 1994). No difference was found, and full compliance was observed in closed-ended questions due to their structure. As for open-ended questions, the percentage of compliance was found to be 0.91 as the average of all questions. When the coding of the researcher was compared, the concepts gathered under specific themes were revised in terms of the fitness for that theme. At this stage, very few concepts were placed under another theme that was considered as suitable, and the last assessment was made. There are not previously determined structures for the codes or themes; they were all created following the analyses made according to the expressions of the students. In face-to-face interviews, the participants were asked the questions in the opinion form because the interviews in the study were used to support the data obtained from the opinion form and to present a realistic picture by defining the important findings. Therefore, the descriptive analysis of the interview questions was assessed with the analysis of the interview form questions, and these findings were mostly used by providing examples from student answers. The real names of 8 students who were interviewed were not used. Instead, the students were coded as 'Student A', 'Student B', 'Student C'....

Procedures

When developing the IGAD applied in the study; certain main factors to which CoHE (2007), responsible for raising teachers in Turkey, attaches importance in relation to raising teachers, program development designs in the literature about the application and content structure of the lesson, and teacher training policies were based on. While many studies were investigated in the study, it can be expressed that the studies of De Hei, Sjoer, Admiraal and Strijbos (2016) and De Hei, Strijbos, Sjoer and Admiraal (2016) on group learning activities were used, and these studies were accepted as guides.

The process of application can be summarized as follows: (1) giving teacher candidates information on how the application will be made, (2) separation of teacher candidates into groups of 5-6 people, (3) the tasks given by the teaching staff, i. e., group activities in a suitable way for the theoretical lesson content (while educational group activities last for 10 weeks, the applications of the design together with other activities such as information

giving, mid-term exams and course book examination lasted for 14 weeks in total), (4) taking the assessment of teacher candidates using the data collection tools of the IGAD. In order to explain the performance of group activities with an example; if the teaching staff taught the mind maps the previous week, teacher candidates presented the activities they prepared in accordance with the activity preparation guide and task shared with them at the beginning of the term by the teaching staff based on mind maps in the practice hour of that week. The group activity task given to teacher candidates in the week in question is that they prepare a hierarchic, a spider and a chain mind map that fit the subject and achievements selected from 5th, 6th, 7th and 8th-grade levels. While teacher candidates presented these in the practice course hour, the teaching staff taught the concept cartoons, which are the subject of the next week, in the theoretical lesson. The process continued like this for 10 weeks. The presentations were made by a different student each week on behalf of the group, but the student who would make the presentation was determined by the teaching staff right before that lesson. The aim of this is to support group works by ensuring that teacher candidates fulfill their responsibilities effectively each week. Hence, each group member represented the activities of their groups 3 or 4 times by the end of the term. To give a few more examples for educational group activity tasks; teacher candidates were asked to prepare scenarios in the problem-based learning week, while they were expected to develop a project in the project-based learning week. While they were asked to prepare a V diagram example in the V diagrams week, they shared the results they obtained by using the method (drawing, interview, etc.) for determining the pre-information and misconceptions to their choice in certain science subjects chose. Furthermore, it is necessary to indicate that self, peer and teaching staff assessments were made after each IGA application, and feedback was given.

FINDINGS

Teacher candidates were primarily asked the question ‘From which part of the lesson did you benefit more? The theoretical part or practice part? Why?’ Hence, it was primarily tried to determine their general perceptions of the IGAD.

The assessments of teacher candidates on which part of the lesson, whether the theoretical and practice part, they benefit most are given in Table 1.

Table 1. Assessments of teacher candidates on the achievements of the theoretical and application parts of the lesson

Theme/Category	Codes	f*	%*	
Practice	Since we prepare/do our activities ourselves	8	16.7	
	Since practices ensure permanence	8	16.7	
	Since we use what we have learnt in theory	6	12.6	
	Since it consolidates what we have learnt in theory	5	10.4	
	Of course, practice (n=2)	3	6.4	
	Definitely, practice (n=2)	2	4.1	
	Since it provides the recognition of my profession	2	4.1	
	Since we see our shortcomings	2	4.1	
	Since there are feedbacks after practices	2	4.1	
	Theoretical (n=2)	Since the examples given in the lesson are permanent/informative	2	4.1
Both	Both (n=11)	Since I realize what I learn in theory in practice	6	12.6
	Both theoretical and practical (n=3)	Since I rehearse the theory while practicing	2	4.1

n: means the number of teacher candidates. All numbers shown in letter “n” mean the number of individuals in the study.

f: The frequency of the assessment made by teacher candidates. I. e., while a student may have stated more than one opinion, some students may not have made any explanation on the “why” despite having answered the

question. Therefore, the sum of the frequencies in question means the frequency of the assessment and not the number of the students. This also applies to tables' no. 2, 5 and 6 in the study.

% is the frequency of the assessment made by teacher candidates. This also applies to tables' no. 2, 5 and 6 in the study.

As it is seen in Table 1, the majority of teacher candidates (71.4%, n=40) stated that they obtained more achievements in the practice part of the lesson. Candidates stated that they applied the practices themselves and practices ensured permanence at a frequency of 16.7% (f=8) as the reason for this. Furthermore, when the assessments of teacher candidates were examined, the other two reasons for their obtaining more achievements from the practice part were stated as using what they learnt in theory in practice and that the practices reinforced what they learnt in theory. Similar answers were also received in the interviews held. Student E stated his/her opinion on the subject by saying *'Of course, in practice. We made what we had learnt permanent by applying and doing what we had learnt with the practices. I believed that we obtained more achievements from the practice part as we designed and applied how the approaches should be applied and implemented.'* The answer given by another student to the question in the interview is: *'I believe that I get the necessary achievement from both, but I obtained more achievements from the practice part because learning by doing-living is possible through practices'* (Student A).

Only 2 of the teacher candidates stated that they obtained more achievements from the theoretical part of the lesson, and justified it by saying that the examples given in theoretical lessons increased permanence. One of the students interviewed stated his/her assessment on this as follows: *'The theoretical part was more effective because the examples in the theoretical lesson were informative'* (Student H).

At the same time, 25% of the science teacher candidates (n=14) stated that they obtained achievements in both parts of the lesson and stated that these were equal. They justified it by saying that they realized what they had learnt in theory in practice at a frequency of 12.6% (f=6). Similar results were also obtained from the interviews. Student C explained his/her thoughts by saying *'Both. I realized what I had learnt in theory in practice. I wouldn't be able to do practice without knowing the theory. But the theoretical information is insufficient without practice. Theory is a prerequisite for practice.'*

Another question asked to teacher candidates is: *'Did the instructional group activities you performed during the period contribute to your learning? Why? /How?'* The assessments of science teacher candidates for this question are presented in Table 2.

Table 2. Assessments of teacher candidates in relation to the contributions of the IGA to their learning

Theme/Category	Codes	f	%	
Positive	By practising/applying our theoretical knowledge	20	22.3	
	By ensuring permanence	13	14.5	
	By seeing/performing different activities/ideas/materials	7	7.8	
	By learning through doing-living	7	7.8	
	By teaching to search for information	6	6.7	
	Yes (n=12)	By requiring to prepare well/do planning for the subject	5	5.6
	Yes, it contributed (n=12)	By ensuring that I realize/correct my mistakes	4	4.4
	It contributed (n=11)	By teaching to present the information/make presentation	3	3.3
	It did (n=6)	By gaining professional skills	3	3.3
		By teaching how to make the lesson attractive/interest taking	3	3.3
		By teaching how to use the alternative evaluation methods	2	2.2
		By developing my creativity/imagination	2	2.2

Very positive	Definitely contributed (n=7)			
	Yes, sure (n=2)	Being actively engaged in the activity of teaching	7	7.8
	Of course, it did (n=2)	By ensuring that I learn the subject/by reinforcing	4	4.4
	It contributed significantly (n=2)	By producing/driving to do unique works	2	2.2
Partially positive	Partially contributed (n=2)	By ensuring that I realize my deficiencies/misconceptions	2	2.2

As it is seen from Table 2, science teacher candidates included in the study express highly positive opinions on the contribution of the IGA to their learning. While 73% (n=41) of the candidates stated that the activities in question made a contribution, they emphasized that the contribution was made especially by practising the theory. Apart from this, there are opinions stating that the IGA contributes by ensuring permanence (f=13), performing differing activities and/or materials (f=7) and by learning by doing-living (f=7). One of the examples of the interviews that yield similar results is as follows: *'It contributed to my learning. We experienced the most effective learning experiences by doing, thinking and trying to produce something by ourselves with many practices performed'* (Student F).

Whereas some of the teacher candidates stated some certainty expressions in this respect and said that the IGA contributed to their learning, these answers were evaluated as a separate theme. Considering the assessments made in this direction, it is observed that 23% of the total participants (n=13) make emphasis by saying "definitely", "for sure" and "of course", and express this. Upon considering the assessments on how and by which means this happens, it is understood that the opinion of taking an active part in learning activities is especially presented (at a frequency of f=7). Among the students who were interviewed, Student G stated his/her opinion on this by saying *'It has contributed significantly. Since I have done practice in relation to the methods and techniques I have been taught, I can apply and give information about these methods and techniques not even opening my notebook. However, it is hard to say this about the lessons in which we haven't done such practice.'* At the same time, 2 of the teacher candidates in the study stated that the IGA made a partial contribution, and explained this by saying that the IGA made them realize their deficits and misconceptions in relation to the subjects.

Furthermore, the answers given by the teacher candidates to the 'why' part of this question of the opinion part, but not included in the table because they were repeated only once are as follows: *'By developing our skills', 'By associating the subjects with daily life', 'By teaching how making experiment will be evaluated', 'By teaching the ways of ensuring student success', 'By developing my critical thinking skills', 'By developing my social skills', 'By giving cooperative learning opportunities', 'By developing my skills of self-expression', 'By providing feedback'*. As can be understood from the answers given, these students also think that the IGA contributes to their learning.

Another point that is investigated in the study apart from the contributions on the learning of teacher candidates who had IGA experience is to determine their opinions on this experience in affective terms. The proposition that makes up one of the closed-ended questions asked to the teacher candidates to this end is as follows: *'I liked these practices performed in the special teaching methods course.'* The assessments of the teacher candidates on their state of liking the IGA regarding this proposition are presented in Table 3.

Table 3. Assessments of teacher candidates on their state of liking the IGA

Codes	n	%
Totally agree	24	42.9
Agree	25	44.6
Partially agree	7	12.5
Neither agree nor disagree	0	0.0
Disagree	0	0.0
Partially disagree	0	0.0
Totally disagree	0	0.0

As can be understood from Table 3, it is observed that science teacher candidates who participated in the IGA liked this application very much. 87.5% (n=49) of the candidates in total answered this question as 'totally agree' and 'agree'. There is no teacher candidate who expressed negative opinions.

Thereafter, the candidates were asked to specify how they assess their educational experiences in relation to the IGA. Another question that makes up another closed-ended question posed to the candidates is as follows: 'Could you assess your educational experience in this lesson in general?' The assessments of teacher candidates on the IGA regarding this question are presented in Table 4.

Table 4. Assessments of teacher candidates on their educational experiences regarding the IGA

Codes	n	%
Perfect	4	7.1
Quite good	32	57.2
Good	18	32.1
Limited	2	3.6
Low	0	0.0

Upon examining Table 4, it is observed that more than half of the teacher candidates (57.2%, n=32) put the educational practices in question in the 'quite good' category. In general, it is observed that there are positive assessments and only 2 teacher candidates are of the opinion that they have gained 'limited' experience.

The open-ended question asked to teacher candidates in the next step is 'Did the practice activities in this lesson contribute to your professional development? Why? /How?'

50 (89.3%) individuals in total answered the first part of this question with answers such as 'yes (n=36)', 'it did (n=8)', 'it contributed (n=5)' and 'it made a contribution (n=1)'. While 10.7% of the teacher candidates gave answers as follows by adding certainty to their positive assessments: 'Definitely it did (n=4)', 'definitely, yes (n=1)' and 'it did for sure (n=1)', none of the science teacher candidates in the study gave an answer to this question that can be considered as negative.

The assessments of the science teacher candidates on the questions 'Why? /How?' in terms of the contribution of the IGA to their professional development are presented in Table 5.

Table 5. Assessments of teacher candidates on the contributions of the IGA to their professional development

Theme/Category	Codes	f	%
Methodological gain	By learning the learning methods we will use in our professional life in practice	19	16.5
	By teaching alternative measurement/evaluation	10	8.8
	By learning how the subjects can be taught permanently/effectively	5	4.4

	By making me adopt the methods I will use when I become a teacher	4	3.5
	By teaching how to make the subjects interesting	3	2.6
	By teaching how I will present/teach the subjects when I become a teacher	3	2.6
	By teaching how to assess students	3	2.6
	By showing how to teach the experiments	3	2.6
	By showing how the subjects can be taught using different methods	2	1.7
	By giving an idea of how to approach the student	2	1.7
	By teaching different/new teaching methods	2	1.7
Skill gain	By teaching to criticize/being open for criticisms	6	5.2
	By developing our application skills	5	4.4
	By learning how to design/apply an activity	5	4.4
	By teaching how to make a presentation	4	3.5
	By learning how to prepare/present a material	3	2.6
	By increasing my creativity/allowing me to use creative ideas	3	2.6
Developmental gain	By ensuring experience	5	4.4
	By giving the opportunity to try/teaching how to use the information	5	4.4
	By urging to develop myself/developing myself	4	3.5
	By giving the opportunity to learn by doing-living	3	2.6
	By showing our deficiencies	2	1.7
	By teaching how to practice teaching	2	1.7
	By making me planned/teaching to make a lesson plan	2	1.7
Affective gain	By developing my sense of responsibility	3	2.6
	By ensuring that I repress my excitement when making a presentation/activity	3	2.6
	By developing my self-confidence/by learning to trust in myself	2	1.7
	Making me feel like a teacher	2	1.7

As can be understood from Table 5, science teacher candidates said that the IGA has significant effects on their professional development from various ways. Certain themes were achieved by examining the codes of the answers given by the candidates to this question. The theme with the most repeated opinions among these is the “methodical achievement” theme. The most repeated codes under this theme are “By learning the learning methods we will use in our professional life in practice” with a frequency of 16.5% (f=19), and “By learning alternative measurement/evaluation” with a frequency of 8.8% (f=10). As for the skills achievement theme, teacher candidates especially emphasized the achievement of making criticism and being open to criticisms (f=6), the skill of doing practice (f=5) and designing and/or applying activities (f=5). The teacher candidates in the study provided developmental achievement examples with such answers as ensuring experience (f=5) and giving the opportunity to try on the use of the information (f=5). Apart from this, the answer that is repeated most by teacher candidates in the affective achievement theme is the achievements of contribution to the development of the sense of responsibility (f=3) and coping with one’s excitement while making a presentation and/or activity (f=3). Similar assessments were also received from the interviews held. Student E stated his/her opinion on this subject by saying ‘Yes, it did. Thanks to this, we have learnt to design and apply the learning approaches and activities we will use in our professional life.’ The answer given by another student to the question in the interview is as follows: ‘Yes, it did. I have learnt that teaching is not only talking and going away. Material preparation, being patient, being open for criticisms, self-confidence and many more benefits.’ (Student F). Student C emphasizes the use of alternative evaluation methods in the IGA and expresses his/her opinion on this subject as follows: ‘I believe that it contributes to my professional development. I have learnt how students will be assessed... It was a great opportunity for me to develop myself.’

Furthermore, the answers given by the teacher candidates to the ‘why/how?’ part of the opinion form but not included in the table since they were repeated only once are as follows: ‘By making me understand the education system better’, ‘By teaching the seriousness of teaching’, ‘By learning to be patient’, ‘By learning how to teach’, ‘By teaching how it is to teach efficiently’, ‘By teaching how I will get prepared for the subjects when I become a

teacher', 'By requiring communication with group members', 'By developing verbal and written expression skills' and 'By making me feel like a teacher'.

The last question asked to the teacher candidates on their IGA experiences is 'Do you think the practice activities carried out in this lesson have contributed to the development of your skills? If yes, which one/ones? Why?'

Regarding this question, 2 science candidate teachers left this question blank while 54 of the science candidate teachers stated that it contributed (with answers such as yes, it did, etc.). Moreover, their assessment on the development of which skills is contributed to be presented in Table 6.

Table 6. Assessments of teacher candidates regarding the contribution of the IGA to their skill developments

Codes	f	%
To their critical thinking skills	24	12.5
To psychomotor skills	22	11.4
To the skills of searching/conducting research/using the research stages	18	9.4
To cooperative working/learning skills	17	8.8
To creativity/critical thinking skill	16	8.3
To cognitive skills	13	6.7
To the skill of taking responsibility	6	3.1
To the skill of expressing oneself verbally and/or in writing	6	3.1
To manual skills	5	2.6
To the skill of productive thinking	5	2.6
To the development of imagination	4	2.1
To application skills	4	2.1
To material designing/development skill	4	2.1
To the development of professional competence	4	2.1
To the skills of self-assessment/self-criticism	4	2.1
To affective skills	3	1.5
To the development of self-confidence	3	1.5
To social skills	3	1.5
To the skill of making/preparing a presentation	3	1.5
To the skill of unbiased thinking/acting objectively	3	1.5
To the skill of learning by doing-living	3	1.5
To the project development skill	3	1.5
To the development of work ethic	3	1.5
To peer assessment skill	2	1.0
To problem-solving skills	2	1.0
To the planning skill	2	1.0
To the skill of being patient	2	1.0
To the development of positive attitudes towards the profession/lesson	2	1.0
To the skill of examining the subject from different perspectives	2	1.0
To the skill of transferring theory to practice	2	1.0
To the skill of using the technology	2	1.0
To scientific process skills	2	1.0

As it is seen in Table 6, the participants of the study made the assessment that the IGA have positive effects on many skills, and it contributes to the development of these skills. According to the candidates, the biggest contribution is made to the critical thinking skills (at a frequency of 12.5%, f=24) and psychomotor skills (at a frequency of 11.4, f=22). Furthermore, science teacher candidates are of the opinion that the IGA especially contributes to researching skills and cooperative learning skills. Student D, among the candidates who were

interviewed, stated his/her opinion on this subject by saying *'It contributed to my critical thinking skill, because we constantly criticized the ideas that we thought about and found, and we chose the best ones. It contributed to the development of my critical thinking skills as we tried to find things that were never tried and existed before when designing materials.'* Another student expressed his/her opinions by saying *'My productive thinking, critical thinking skills increased. It contributed to my self-confidence. They were activities that ensured development in problem-solving. My attitude towards my profession changed. My sense of responsibility increased. I believed that I must develop myself'* (Student B).

Moreover, the assessments made by the teacher candidates to this question of the opinion form but not included in the table since they were repeated only once are as follows: *'To the assessment making skill', 'To the development of the interest in the lesson', 'To the development of the desire for the lesson', 'To the poster preparation skill', 'To the socialization skill', 'To the skill of making association between science-technology-society-environment' and 'The skill of learning by discussion'.*

The 'why?' part of this question of the present study was not tabulated individually. The reason for this is that teacher candidates almost gave identical opinions with the 'why?' or 'how?' parts of the previous questions and generally said that 'performing the practices themselves' and 'developing different activities/materials' contributed to the development of the skills in question.

CONCLUSION AND DISCUSSION

In this study, the IGAD, which was developed to increase the vocational and learning skills of teacher candidates, was applied in the Special Teaching Methods-I course, and the achievements of teacher candidates from these practices were taken. When the results achieved in this study conducted with science teacher candidates are evaluated in a general sense, it may be concluded that the IGAD is effective to a great extent especially in connecting theory to practice, and it provides significant contributions in respect of the personal skill achievement.

A great majority of teacher candidates stated that they obtained more achievements from the practice part of the IGAD, and it contributed to their learning. They attributed this especially to having prepared activities themselves, the fact that the applications ensured permanence, they used what they learnt in theory in practice, and reinforcing their knowledge in this way. When we look at this result as a whole, it is understood that teacher candidates experienced learning by doing-living. This correlates highly with the learning philosophy that they are expected to show in their classes when they become teachers. In this context, it can be expressed that the IGA that is performed in the study gives candidates an important professional achievement.

The facts that the majority of the science teacher candidates who took part in the study stated that they liked the IGA very much, and there is no teacher candidate who expressed a negative opinion in this respect are quite an important and interesting result because the success of any program or design may not be only evaluated with the achievements of the cognitive area, which includes academic success. Another aspect that is at least as important as this is affective achievements. It can be easily said that the positive attitudes and emotions for any situation, phenomenon, incident or lesson bring about success.

In the question the candidates were asked, in which they were expected to make their assessment on the effects of design on their professional development, it is observed that they obtain important achievements especially for developing self-confidence and the sense of responsibility under the theme of affective achievement. Consequently, the fact that the candidates like these activities shows the power of design in terms of affective achievements, too. The fact that more than half of the teacher candidates define their educational experiences on these experiences as "very good" also supports this result. Furthermore, it is believed that experience-based learning, in which a connection is made between theory and practice, makes students like the curriculum more.

In the study, the contribution that is most emphasized by teacher candidates in their assessments in relation to the contributions of the IGA to their professional development is learning the learning-teaching methods they will use in their professional life in practice, which is followed by their assessments stating that they have learnt the

alternative measurement assessment methods. This achievement is quite important because one of the important points mainly emphasized as a result of important program changes (2005-2006) and revisions (2013) in science programs in Turkey is the changes in the assessment approach. According to these changes, the assessment went beyond traditional pen-paper tests, and the multiple assessment approach that focuses on assessing the process rather than the result, which also includes self and peer assessment, was adopted. In parallel to this, the self-development of teacher candidates in assessment methods with the IGA means that they understand this compulsion that is closely related to their professional development. It is believed that it is effective to provide the examples of alternative measurement methods in group activities by teaching in theoretical lessons and ensuring that the candidates make self and peer assessment after each application.

It is important that there is a relationship between the skills that science teacher candidates are expected to gain and the skills that they are expected to give to students in the classroom environment when they become a teacher, i. e. the skills of the curriculum. The skills that teacher candidates are expected to give to students when they start to perform their profession are determined by the MoNE in Turkey. For science candidate teachers, these skills were emphasized especially in the context of science literacy, and it was explained as the ability to raise individuals who conduct research-interrogate, can take effective decisions, solve problems, are self-confident, open for cooperation, can communicate effectively and learn life-long (MoNE, 2013). The fact that science teacher candidates in the study especially emphasize these skills in their IGAD assessments shows its contribution to their professional competences and increases the correlation between teacher training programs and the programs of National Education. This also overlaps with the aim of CoHE (2007) of “correlating the lesson subjects with the curricula MoNE prepared for the relevant level” and shows the importance of these achievements. In this case, it can be said that the IGAD applied in the study ensures the fulfillment of the targets of both CoHE and MoNE, and a bridge can be built between the two.

Questioning, critical thinking and being knowledgeable are defined as the first framework by the AASL (American Association of School Librarians) as the 21st-century learner standards (AASL, 2007). Again, according to this report published; making conclusions, making informed decisions, applying the information to new situations and creating new information are other framework learners' features. Considering that teacher candidates especially emphasize their critical thinking skills and researching skills for IGAD achievements together with their thought that it contributes to their transfer of theoretical knowledge to practice, i. e., applying the information to new situations regarding the contributions to their learning, it can be stated that the IGA helps teacher candidates at the point of providing and developing the skills of the 21st century. Considering the research results that show a positive correlation between the 21st century learner skills and 21st century teacher skills and emphasize that teacher candidates at the faculties of education should also develop their learner skills in the processes of introducing teaching skills (Orhan Göksün and Kurt, 2017), it can be interpreted as the fact that the skills gained by candidates can be used in the classroom environment when they become teachers.

One of the skills that are emphasized most by teacher candidates on their IGA achievements is the skill of expressing themselves verbally and/or in writing. While this skill is very important since it is among the main teaching skills, it also gains importance for its relationship with effective communication among life skills. According to the new millennium learners' characteristics report of the OECD (The Organization for Economic Co-operation and Development), communication plays an important part in preparing students to become a member of a larger community with the sense of responsibility for others by not only remaining as a life-long learner (Ananiadou and Claro, 2009). When these results are correlated, it can be said that the IGA contributes to the achievement of the skills that support life-long learning.

Another skill emphasized by teacher candidates in their assessments of the effect of the IGA on their skill development is the skill of creativity/creative thinking. The efforts to ensure that teacher candidates conduct interactive group works in their IGA practices and the activities can be correlated with originality and daily life as they are also stated in the task features among the basic components of the design are considered to be the most important reasons for this. Similarly, according to the result of the study conducted by Yanpar Yelken (2009) in which creativity-based materials and individually prepared materials were compared, teacher candidates conducted more creative and unique studies when teacher candidates worked together.

Considering all the results of the study, it can be suggested to integrate the IGAD, which helps teacher candidates to gain various skills such as using researching skills, cooperative learning, creativity, taking responsibility and expressing oneself, and especially critical thinking, to the lessons of the teacher training programs that are especially based on practice. Furthermore, teacher candidates can be suggested to associate the IGAD with lessons such as teaching practices and school experience and make and conduct long-term longitudinal studies aimed at determining its results. The assessment of certain design components or the whole educational design using qualitative and quantitative measures such as test scores may focus on the activity on learning outputs, and experimental models can be used for this. Furthermore, similar instructional designs can be developed and evaluated in terms of their usefulness, and they can be compared to past designs in the context of their outputs in raising teachers.

ABSTRACT

Visual-spatial intelligence is one of the basic intelligences needed in mathematics learning. Visual-spatial intelligence consisted of 4 characteristics, namely imagination, conceptualization, problem solving and pattern determining. This research aims to describe the visual-spatial intelligence of 15-year-old students in solving PISA standard problems. The type of this research was descriptive research with qualitative approach. The research participants consisted of 67 students aged 15 years. The used data collection methods were tests and interviews. The research indicators were based on 4 characteristics of visual-spatial intelligence, and each characteristic was stated in each question number. Data analysis was done by looking at the indicator achievement of each characteristic of visual-spatial intelligence from each research participant. Based on the data analysis of test and interview, it obtained the tendency on each characteristic as follows: a) imagination, students were included in the high level category with the tendency of being able to meet all indicators except the fourth indicator; b) conceptualization, students were included in the high level category with the tendency of being able to meet all the indicators provided; c) problem solving, students were included in the moderate level category with the tendency of being able only to meet the first and second indicators of the 4 indicators provided; d) pattern determining, students were included in the high level category with tendency of being able to meet 4 indicator provided.

Keywords: Thinking process, visual-spatial intelligence, PISA standard problems

INTRODUCTION

Programme for International Students Assessment (PISA) is a study of the international level assessment of 15-year-old students related to the knowledge and the skills of students divided into 3 main assessments that are science, reading and math (OECD, 2014). The PISA study aims to provide an evaluation to the education system in a country around the world by testing students in abilities and skills of science, reading and math. Based on PISA results in 2015, it was known that Indonesian students were ranked 63 out of 70 countries in term of math skill and ability with the percentage of female students more dominant than male students (OECD, 2016). Furthermore, the ability of students in Indonesia in solving cognitive problems of PISA standard is low that is not able to reflect by providing another solution (Kurniati & Annizar, 2017). It shows that students' mathematical literacy ability and skill in Indonesia are still very low. Whereas the ability of mathematical literacy is very important for students in developing their thinking ability when solving a daily problem that is

the ability to design, plan, diagnose, evaluate, summarize, generalize, and give suggestion (Goksu & Gulcu, 2016).

Intelligence is a natural talent that God gave to humans. Each individual has a unique and various levels of intelligence. The intelligence of each child is classified into 8 types of intelligence categories known as Multiple Intelligence Theory (Smith, 2002, 2008). The 8 intelligences include 1) Verbal / Linguistic Intelligence, (2) Logical-Mathematical Intelligence, (3) Visual Spatial Intelligence, (4) Bodily-Kinesthetic Intelligence, (5) Musical Intelligence, (6) Interpersonal Intelligence, (7) Intrapersonal Intelligence, (8) Naturalist Intelligence. The concentration in this research was the visual-spatial intelligence of students in solving the problems of PISA content of shape and space that was translated into Indonesian and had been adapted to social and cultural conditions in Jember Regency.

Visual-spatial intelligence is a personal ability to create a mindset about the spatial world; using and manipulating this mindset in solving every problem related to the spatial world (Gardner, 2006). Visual-spatial intelligence is closely related to the learning of geometry (Kelly, 2017). The cause of low understanding and ability of students in solving geometry problems is generally caused by the object of geometry that is quite abstract and the students' visual-spatial ability is still low. Therefore, it is very important to improve students' visual-spatial ability in order to increase the percentage of students' understanding in geometry learning. The suitable implementation of learning strategies with the character of students can develop students' visual-spatial ability maximally. This research aimed to describe students' visual-spatial intelligence by looking at the tendency of each characteristic of student's visual-spatial intelligence. The research results were expected to help educators to know the characteristics of students' visual-spatial intelligence and become the first benchmark in formulating the appropriate strategy and method of learning geometry and can be applied especially in schools that became research place or all equal schools.

The instruments used in this research were PISA standardized problems and interview guideline. PISA standardized problems were PISA problems that had been translated into Bahasa Indonesia and had been adapted to local social and cultural conditions. Problem PISA is divided into some contents that are Change and Relationship, Space and Shape, Quantity, Uncertainty of Data. In this research, the content of PISA problem used was Space and Shape content where each question represented each characteristic of visual-spatial intelligence. PISA standardized problems were expected to really measure the students' visual-spatial intelligence because in solving the problem of PISA, it was not only needed the concept understanding but also required high order thinking skill and skills in applying mathematical concepts.

Visual-spatial intelligence has 4 main characteristics: imagination, conceptualization, problem solving and pattern-seeking. Characteristics of visual-spatial intelligence are divided into 4 which can be prepared the indicators used in research (Hass, 2003). The characteristic of imagination is the personal ability to understand the visual explanation rather than the audio explanation. From the definition, it can be formulated the indicators as follows: 1) Students are able to write down what is known and asked; 2) Students are able to pour a picture and information about PISA standardized problems of geometry material in their mind into image form; 3) Students are able to write down the steps correctly; 4) Students are able to write the final answer correctly. The characteristic of conceptualization is the personal ability to link information in the problems with mathematical concepts. From the definition, it can be formulated indicators as follows: 1) Students are able to write down what is known and asked; 2) Students are able to connect between known data and the concept they have; 3) Students are able to write down the steps correctly; 4) Students are able to write the final answer correctly. The characteristic of problem solving is the personal ability to solve problems properly and be able to formulate divergent problem solution strategies. From the definition, it can be formulated the indicators as follows: 1) Students are able to write down what is known and asked; 2) Students are able to have divergent strategies in solving problems related to problems of PISA standardized of geometry material; 3) Students are able to write down the steps of work correctly 4) Students are able to write the final answer correctly. The characteristic of pattern-seeking is the personal ability to find various patterns related to geometry problems. From the definition, it can be formulated the indicators as follows 1) Students are able to write down what is known and asked; 2) Students are able to have divergent strategies in solving problems related to PISA standardized problems of geometry material; 3) Students are able to write down the steps correctly; 4) Students are able to write the final answer correctly. Those indicators were used to analyze students' test answers and map the students' visual-spatial intelligence level. The 12 leveling categories of visual-spatial intelligence are described in Table 1.

Table 1. Leveling of Visual-Spatial Intelligence for Each Characteristic

Description	Level
Students are able to mention all steps correctly as well as the correct final answer.	1
Students are able to mention all steps correctly but the final answer is incorrect.	2
Students are able to mention all steps correctly but no final answer.	3
Students are unable to mention all steps correctly, but they are able to give the final answer correctly.	4
Students are unable to mention all steps correctly, and they are unable to give the final answer correctly.	5
Students are unable to mention all tsteps correctly, and no final answer.	6
Students mention all steps incorrectly, but they are able to give the final answer correctly.	7
All steps are incorrect, and the final answer is incorrect.	8
All steps are incorrect and no final answer.	9
Steps of work are not mentioned, but they are able to give the final answer correctly.	10
Steps of work are not mentioned, and the final answer is incorrect.	11
Steps of work are not mentioned, and no final answer	12

Leveling categories were then divided into 3 categories namely high, medium and low categories. The high category consisted of students at level 1 to 4; the medium category consisted of students at level 5 to 8; the low category consisted of students at level 9 to 12. The students' spatial intelligence analysis in solving the PISA problem was based on each category of high, medium, and low.

METHOD

This research was a descriptive research using qualitative approach. This research aimed to analyze and describe the visual-spatial intelligence of 15-year-old students in solving PISA standardized problems. The taking of research participants was done at schools in Jember regency. The research participants consisted of 67 students born in 2001 with detail of 27 male students and 40 female students.

The used data collection methods in this research were test and interview; so that, the used research instrument was PISA standardized problem test and interview guideline. The interview was aimed to dig deeper information and obtain data that was not obtained from the test result related to students' visual-spatial intelligence.

At first, the research participants were given PISA standardized problem test. Based on test results, students would be mapped into several categories of visual-spatial intelligence. The research participants who had taken the test would be selected randomly to attend the interview. The taking of interview participants was done by paying attention to student's gender and data saturation level. The data from test result and interview would be analyzed by using Snowball Throwing method by paying attention to data saturation. The overall data was said to be saturated if the level of students' visual-spatial intelligence after the test and the interview did not change. Furthermore, to increase data validity, the researcher conducted triangulation of test result data with interview result data. The used triangulation was method triangulation. The result data of triangulation were analyzed by looking at the achievement of indicator from each characteristic of visual-spatial intelligence.

RESULT AND DISCUSSION

Based on the result of test data analysis, it was obtained achievement data of research participant indicator from each characteristic of visual-spatial intelligence as follows.

Table 2. The Indicators of Achievement from Each Charateristic of Visual-Spatial Intelligence

The Indicators of Achievement	Indicators of Visual-Spatial Intelligence															
	<i>Imagining</i>				<i>Conceptualizing</i>				<i>Problem-Solving</i>				<i>Pattern-Seeking</i>			
	1	2	3	4	1	2	3	4	1	2	3	4	1	2	3	4
Satisfied	49	61	8	20	56	51	44	45	58	5	29	27	59	65	54	66
Unsatisfied	18	6	59	47	11	16	23	22	9	62	38	40	8	2	13	1

Based on Table 2 above, the research participants can be categorized into high, medium and low categories as in Table 3 and Table 4 below.

Table 3. Leveling Category of Male Students' Visual-Spatial Intelligence after Test

Characteristic Category	Imagining	Conceptualizing	Problem Solving	Patern Seeking

After analyzing the results of the test data, then the researchers conducted interview to randomly selected students by paying attention on data saturation level. The total of students who followed the interview was 11 people with detail of 6 male students 5 female students. Based on the analysis of interview data, it was known that there was a level change on the research participants after interviewed. For example, the research participant of S05, after conducting test for characteristic of imagining, conceptualization, and problem solving, he was only on medium level, whereas for pattern seeking characteristic, he was on high level category, so the overall visual-spatial intelligence of research participant S05 was on medium level category. However, after the interview, there was a level change category on the characteristic of imagining and problem solving into high level category. It caused the category of visual-spatial level of research participant S05 became high level category. Generally, this level change was due to several reasons including students did not write down the steps or not all steps are mentioned correctly in doing test but students were able to mention all the steps correctly in interview. Students were less thorough in writing the final answer but students were able to mention step correctly in

interview. The students ran out of time; so that, the students did not write down the steps of work and final answer in doing the test, but students were able to mention the steps correctly in interview.

In imagining characteristic, the research participants tended to be in medium level category with the tendency of students at level 5. It happened because at this characteristic, students tended to be able to write what is known and asked, and able to pour information on problems into the form of image. Students did not write the steps of work during the test, but in the interview, students were able to mention the steps of work correctly. In addition, students tended to be less thorough in writing the final answer. Change levels before and after the interview was quite a lot happened. Of the 11 students interviewed, 6 students experienced a level change that was S01, S02, S03, S05, S08 and S09. Generally, the change was caused students did not write down the steps in doing test, but students were able to mention correctly in interview. Nevertheless, there were still some students who were difficult to understand the problem given; so that, students were not able to relate problems with mathematical concept. It caused the students unable to pour information on problems into the form of image. Based on table 3 and table 4, it was known that male students were more dominant than female students in term of imagining characteristic. It was in accordance with the research results which stated that there are significant differences in visual-spatial intelligence between men and women (Yenilmez & Kakmaci, 2015). Women's success rate was lower than that of men in solving problems.

In the conceptualizing characteristic, research participants tended to be on the high level category with the tendency of students at level 1. It happened because on this characteristic, students tended to be able to write what is known and asked, able to relate information in the problem with the mathematical concept, also able to write step of work and final answer correctly. Based on the data analysis results of test and interview, it could be seen that the conceptualizing ability of male and female students tended to be relatively the same. It was in line with the results of other researchers which suggested that there is no overly large difference between men and women associated with visual-spatial intelligence in solving a geometric problem (Seng & Chan, 2000). The level changes occurred on the conceptualizing characteristics was relatively less when compared with the imagining characteristic. It happened because the students' answers during tests and interviews remained consistent. The level change only occurred in 2 students out of 11 students who were interviewed e.g. S04 and S08 students. In the S04 student, the level change occurred because at the time of the test, the student ran out of time, so he did not do the given problem. However, at the time of the interview when the student was asked to mention the concept used and the step of accomplishing the problem, he was able to mention the steps of the work correctly. While the student S08, level change occurred because in the test, student was less thorough; so that, he did not write the final answer. However, in interview, the student was able to mention the final answer correctly. In this characteristic, it was also still found some students who were not able or wrong in relating problems with the mathematical concept.

On the problem solving characteristic, research subjects tended to be on the medium level category with the tendency of students at level 5. It happened because on this characteristic, students tended only to be able to write what is known and asked, but students were unable to write the steps of work and the final answer correctly. In addition, students tended only to be able to formulate one problem-solving strategy. Based on the data analysis results of test and interview, it could be seen that the problem solving ability of female students was more dominant than male students. This is suitable with the PISA results which stated that in term of problem solving, women were more dominant than men (OECD, 2016). Almost the same as the conceptualizing characteristics, the level change on problem solving characteristic was relatively few that only occurred in S05 students. The student's level change occurred due to in the test the student was less thorough in writing the final answer, so the final answer was incorrect, but in interview when the student was asked to mention the final answer, the student was able to mention the final answer correctly. On this characteristic, only a few students were able to meet all indicators given especially the second indicator. Based on the results of test and interview, it could be seen that students' mistake in accomplishing the problems caused by several reasons that was students were not able to relate the problem with the concept, so they were not able to formulate a problem-solving strategy correctly or the students were less thorough in writing the steps and final answer; so that, the step or final answer was incorrect.

On the pattern-seeking characteristic, research participants tended to be on the high level category with the tendency of students at level 1. It happened because on this characteristic, students tended to be able to write what is known and asked, and able to find the patterns contained in the problem. In addition, students were also able to write down the steps of work and the final answer correctly. Based on the data analysis results of test and interview, it could be seen that the ability of male students to solve relatively the same as female students. Level change in pattern-seeking characteristic was relatively less that only occurred in 2 students, e.g. S02 and S08 students. Similarly with the level change in the two previous characteristics, on the pattern seeking characteristic,

change level occurred because the two students did not write the steps of work at the test, but able to mention the steps of work correctly during the interview. Based on the results of the test and interview, it could be seen that in accomplishing the problems related to the pattern seeking characteristic, students tended not to have trouble. It was seen from the number of students who were on high level category.

Based on the tendency description of each characteristic above, it could be concluded that gender did not give too much influence in term of students' visual-spatial intelligence. Other factors were more influential on students' visual-spatial intelligence such as students' high-order thinking skill and problem-solving skill. This conclusion was not suitable with the results of previous researches which suggested that male students are more dominant than women in terms of visual-spatial intelligence (Yenilmez & Kakmaci, 2015), but in line with other researches which suggested that gender does not have a significant effect on Students' visual-spatial intelligence (Seng & Chan, 2000). Both male and female students showed not too many different results when they were asked to solve the problems related to geometry problems.

High level category was a level category for students who tended to be at level 1 to 4 for each characteristic of visual-spatial intelligence. Here is an excerpt of an answer from one of the students who was in a high level category.

Problem : The area of garage roof?

Given: Garage plan picture

Diket: gambar rancangan garasi

Ditanya: luas atap garasi

Jawab:

$$PR^2 = RS^2 + PS^2$$

$$PR^2 = (1)^2 + (2,5)^2$$

$$PR^2 = 1 + 6,25$$

$$PR^2 = 7,25$$

$$PR = \sqrt{7,25}$$

L_{atap} = 2 x L_□

$$= 2 \times (a \times t)$$

$$= 2 \times (6 \times \sqrt{7,25})$$

$$= 12\sqrt{7,25} \text{ m}$$

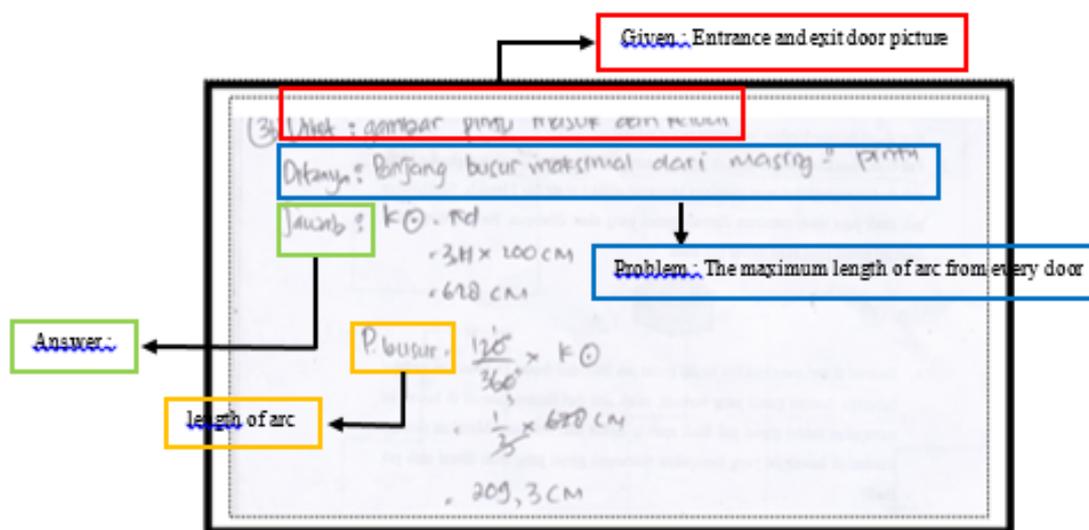

Answer:

Problem : The area of garage roof

Picture 1. The example of student's answer on high category

Based on the data analysis results of test and interview, it could be seen that on the imagining characteristic, students on high-level category tended to be able to write down what is known and asked completely and correctly. Students were also able to pour information on the problem into the image form. In addition, students were also able to write down the steps of work and the final answer correctly. There were still some students on high-level who were less thorough in writing the final answer; so that, the final answers were written incorrectly. For the conceptualizing characteristic, students on high level category tended to write down what is known and asked completely and correctly. Students were also able to relate problems with mathematical concepts. In addition, students were able to write down the steps of work and the final answer correctly. In the conceptualizing characteristic, students tended to be at level 1, only some students who were not at level 1. It happened because students were wrong in relating problems with mathematical concept; so that, the steps of work were incorrectly written, but they were able to write the final answer correctly. In the problem-solving characteristic, students on high-level category tended to be able to write down what is known and asked completely and correctly. Students were also able to relate the problems with mathematical concepts, so able to write the steps of work and the final answer correctly. However, generally, students on high level category tended only to be able to formulate one strategy to solve the problem. From 32 high-level students, only 5 students were able to formulate a divergent solution strategy. In addition, there were also some students on high level category less thorough in writing the final answer; so that, the final answer was incorrect. In pattern search characteristics, high level category students tended to be able to write down what is known and asked. Students were also able to find the patterns in the problem, so they were able to write the steps of work and the final answer correctly. In pattern seeking characteristic, high level category students did not seem to have difficulties in solving problems related to pattern seeking characteristic. It was seen from the number of high level category students who were at level 1.

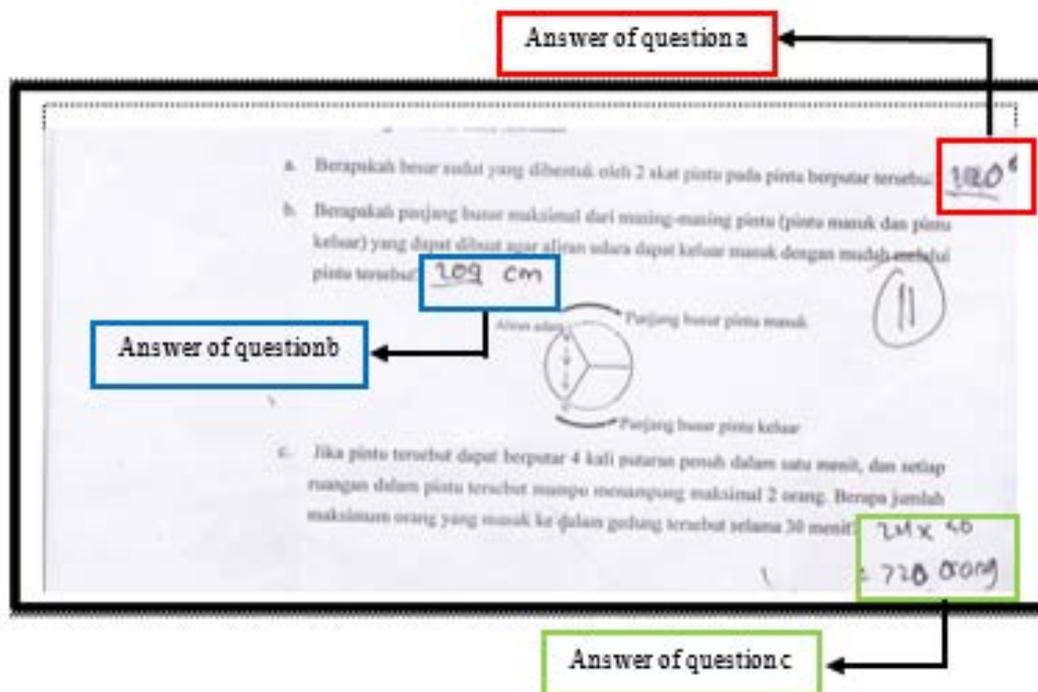

Medium level category was a level category for students who tended to be at levels 5 to 8 for each characteristic of visual-spatial intelligence. Picture 2 was an example of an answer belonged to one of the students who was in medium level category.

Picture 2. The example of student's answer on medium category

Based on the data analysis results of test and interview, it could be seen that on the imagining characteristic, medium level students tended to write down what is known and asked. In addition, students were also able to pour information on the problem into the image form. However, students tended not to write down the steps of work and less thorough in writing the final answer; so that, the final answer was incorrect. In imagining characteristic, students generally were at level 5. It happened due to students did not write the steps of work and the final answer correctly. Nevertheless, some students were at level 8 due to the inability of students in pouring the information contained in the problem into the image form; so that, all steps written along with the final answer were not true. For the conceptual characteristic, the students on medium level category tended to write down what is known and asked completely and correctly. The students were also able to relate the problem with the mathematical concept. However, students were not able to write down the steps of work and the final answer correctly. In the conceptualizing characteristic, students tended to be at level 5, and some students were at level 7 or level 8. Students who were at level 7 and 8 tended not able to relate problems with the correct mathematical concepts, so it caused that all steps of work were incorrect. Nevertheless, few students who were able to write the final answer even though the concept and steps of work were incorrect. In the problem-solving characteristic, the students on medium level category tended to be able to write down what is known and asked completely and correctly. Students also tended to be able to relate the problem with the mathematical concept, but not all the steps were written correctly, so the final answer was incorrect. Students on medium level tended to be able to formulate only one strategy to solve the problem. Generally, students' mistakes on this category were due to the students were less thorough and fooled, so there was an unmentioned step of work; so that, the final answer was incorrect. In addition, some medium level students were not able to relate problems with mathematical concept; so that, students had difficulties to formulate the strategies to be used. It caused all the steps of work and the final answers were incorrect. In pattern seeking characteristic, none of the research participants were in the medium level category. Nevertheless, the tendency of medium level students could be determined based on the achievement of indicators from level 5 to level 8. Students in medium level category tended to be able to write down what is known and asked. Students were also able to find the patterns in the problem but all the steps of work and the final answers were incorrect.

Low level category was a level category for students who tended to be at levels 9 to 12 for each characteristic of visual-spatial intelligence. Picture 3 was an example of an answer belonged to one of the students in a low level category.

Picture 3. The example of student's answer on low category

Based on the data analysis results of test and interview, it could be seen that on the imagining characteristic, the low level category students tended not to write down what is known and asked. In addition, students were also not able to pour information on the problem into the image form, so students tended not to write down the steps and the final answer correctly. On this characteristic, students were generally at level 10 and 11. It happened because students had difficulty in pouring information on the problem into the image form; so that, students were not able to relate the problem with the concept and strategy that would be used. It caused that there were no students' steps of work, and the final answer was incorrect. For the conceptualizing characteristic, the low level category students tended not to write down what is known and asked. Students were also unable to relate problems with mathematical concepts. It caused that the students did not write the steps of work at all and the final answer was incorrect. In the conceptualizing characteristic, students tended to be at level 11 and some students were at level 12. Students at level 11 and 12 tended to be unable to relate the problem with the correct mathematical concepts; so that, there was no steps of work. Students argued that they had forgotten the material contained in the problem related to the conceptualizing characteristic. In the problem-solving characteristic, low level category students tended not to write down what is known and asked. Students also tended not able to relate the problems with mathematical concept; so that, the correct steps of work were not written. It caused the students on this level were unable to write the final answer correctly. Low level category students tended to be unable to formulate a strategy at all to solve the problem. Generally, students claimed that they had forgotten the material contained in the problems based on the problem solving characteristics. In pattern-seeking characteristic, there were only 9 students included in low level category. Low level category students tended not to write down what is known and asked. Students were also able to find the patterns in the problem. However, there were no the steps of work, but the students were able to write the final answer correctly. On this characteristic, students tended to be at level 10. Students admitted difficulty to write the steps of work because the students only imagine the steps of work. Nevertheless, one student was at level 11 because the student was not able to find the patterns of problems; so that, there were no steps of work, and the final answer was incorrect.

CONCLUSIONS

Based on the data analysis result of test and interview, it can be concluded as follows

1. High category of visual-spatial intelligence tended to be able to write down what is known and asked, able to pour the information on the problem into images, able to relate the information with mathematical concepts, unable to formulate divergent solution strategies, able to find patterns, and able to write the steps of work and the final answer correctly.
2. Medium category of visual-spatial intelligence tended to be able to write down what is known and asked, able to pour the information on the problem into images, able to relate the information with mathematical

concepts, unable to formulate divergent solution strategies, able to find patterns, and unable to write the steps of work and the final answer correctly.

3. Low category of visual-spatial intelligence tended to be able to write down what is known and asked, unable to pour the information on the problem into images, unable to relate the information with mathematical concepts, unable to formulate divergent solution strategies, able to find patterns, there were no the steps of work, and unable to write the final answer correctly.

TIME ON TASK AND FINNISH CLASSROOM TEACHING MODELS FOR DEVELOPING PRE-SERVICE TEACHERS ACADEMIC WRITING SKILLS

Sri Hermawati Dwi Arini
Universitas Negeri Jakarta
Indonesia
shermawati@unj.ac.id

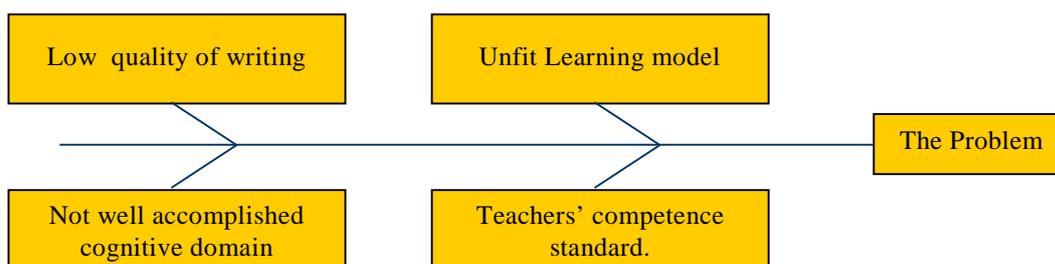

ABSTRACT

The study aims to develop pre-service teachers academic writing skills and were guided to produce a research proposal through combining time on task and Finnish classroom model focusing on pre service teacher of music and fine art. It is important for pre service teachers to develop their academic, writing skills which influence their competence as university students and future teachers. The one year mixed methods design was developed with 80 pre service teachers of music and art study programs in their final year. The results show the internal consistency reliability ranged 0,60 to 0,80 and significantly correlated which have the value off $p > 0,05$. The qualitative data on students' ability shows that the Time on Task and Finnish Classroom Models finding indicate that art pre service teachers academic writing skills on developing the writing structure, fluency on problem statement, literature review and to produce a research proposal.

Key Words: Academic writing, pre-service teacher, research proposal

INTRODUCTION

A discussion about interest in time as an educational variable is scarcely new but a discussion about having teacher think of how their activities will contribute in learning within study time might be another to explore. Paradigm of art education in Indonesia emphasizes only on psychomotor aspect and ignores cognitive domain. Studies by students of art have unfortunately merely discussed about meanings and aesthetical values, and separated texts and contexts within a work of art. A teacher is an agent of change. This can be considered from the scientific writing assignment and thesis, students are working on despite the fact that they are prospective teachers of junior and senior high school. A teacher must have a good writing competence. Why can Finnish education rank the first? It has been evident that a study of the impact of time has been ignored so far. The Finnish education has in fact applied Time on Task and Finnish Classroom Model Teaching as a key to success in education. Students' competence in writing the discussion part of the report during thesis examination has not been well accomplished. The discussion does not address the research questions. The data is not valid to support the discussion, so is the literacy which remains less updated particularly on the triangulation of the interview with experts. The questions to the experts are irrelevant with the research questions. This is in line with the result of study by PISA (*Programme Internationale for Student Assessment*) (*Indonesia PISA Centre, 2013*), and EGRA (*Early Grade Reading Assessment*) which are conducted by USAID addressing the relationship between Indonesian students' literacy and teachers' or prospective teachers' competence. Based on the above mentioned background, the problem can be drawn in the following mapping.

Carroll (1963) was the first to develop a model of school learning in which students' involvement played a central role. He suggested that learning will be optimum when students spend as much time as they need

to learn. It is supported by Further Bloom (1974) in his study on Human Characteristics and School Learning on Mastery of Learning, and by Stallings (1975) in his study on varied study time as much as 1 hour and 30 minutes during school day. Findings revealed that the length of period taking place in class of secondary schools was not related to students' academic achievement; instead, the achievement depends on how the available time is best used as supported by H. Janet Caldwell, Hitt and Glaebar (1982), in his study on academic learning time indicating students' involvement

Doyle (1984) differed time on activity and time on task in his generalization. The activities are not related to the learning goals achievement. Many early researchers referred to time, an important thing to point out an indicator called student involvement in learning, as a result in task accomplishment. Many researches were interested in the effects of Time on Task (Educational Time Factors) e.g. (Borg, 1980), (Quartarola, 1984), (Rosenshine, 1978), (Sanford and Evertson, 1983), (Seifert and Beck, 1984), (Stallings, 1980) and (Strother, 1984) who studied about activities identifying feed back, focusing on questions, thinking of discussion, reading and practice. (Marzano, 2007) noted in his study the impact of teacher effectiveness on student achievement, and the way teachers creates their students' activities. Marzano Setting Classroom consists of 4 steps, namely: 1) explaining, 2) modelling, 3) guided practice, 4) independent practice. Finnish Classroom according to (Hammond, 2010) suggested teachers' thinking about how the students' activities contribute the learning. In a typical classroom, the teacher decides and sets on the topic and target by having students gather information from small groups through questioning, having a discussion, writing articles, and improving their own work. (Paul Sahlberg, 2007) noted that a typical classroom, based on teacher professionalism by means of high stakes testing and determined learning standards, has not been part of Finnish education. The Finnish is intended to promote student achievement that best helps them reach the general goals of schooling. (Marianne Matilainen, 2017) pointed out that the application of Finnish Model requires quality teachers and autonomy in learning activities. Hence, students must be involved and have a real learning experience, do discussion and write articles. Academic writing skills, 1) develop students' abilities to compose essays (Chin, 2017), 2) drive students to go through the process of ensuring data and literature in their essays, 3) require more complex writing demands research. (Xiarong, Shao & G. Purpur, 2016) result show effect of information literacy skills on students' writing. Similarly, (A Cumming, Conttia Lai and Hye Yeon Cho, 2016) suggested that students develop strategies for writing from sources. Some differences may appear between L1 and L2, therefore, the writing instruction can help students improve their using the sources in writing. (Elbow P, 2012) developed writing competence through speaking, whilst (Toraskar & Lee, 2016) developed academic writing through brain storming, searching for relevant information, consulting the teacher. A study by (Lea R. & V. Street, 2006) addresses academic literacy's framework which can take account of the conflicting and contested nature of writing practices.

THE STUDY

Based on the theories above, this study addresses the impact of teacher effectiveness on student achievement. Hence, it designs the learning instruction and activities based on available and required time. The one- year mixed methods design by combining both qualitative and quantitative methods was developed, involving 80 art pre service teachers, and applying writing assessment using a rating scale. The researcher used 6 scales namely, journal review, fieldwork, group cohesiveness, discussion, article writing and research proposal writing. Classroom observations were conducted during discussion and fieldwork by completing independent assignment, being directed to read articles, books and journals. All students provide written paper in the reflective journal followed with researcher's guiding the practice. Having had the seminar and completed the activities, students complete writing article and writing research proposal with portfolio assessment. Combining Time On Task and Finnish Classroom aims to generate professional teachers who are able to design a learning instructions. (Marzano, 2017) settings classroom to promote time on task are 1) explaining: Teachers give topics and assignment, and divide the students into groups. The teaching activity covers 100 minutes, explains differences between articles and journals, and more complex writing such as research proposal. 2) Modeling activities like examples as follows: Teacher uses audio visual media to give a detailed learning experience. Students are given a topic about voice learning for the blind; They have an argument about having Suzuki method applied in learning music instead of

voice; They consider that Kodaly method is better applied in learning voice in spite of its using hand as signal. Will this method be likely to be used for the blind? The students are asked to give answers and find literature. 3) Guided practice by participants of the study who are senior students of prospective teachers, and who are about to compose their thesis. The researcher conducts a reflection to develop students' engagement in academic writing skills. Students' activities cover reading searched journals, reading literature in library and from experts for data collection. In addition, they must sign in an education seminar with article writing assignment. 4) An independent practice: students are given independent practice fieldwork assignment, journal reviewing, article writing, followed with discussion session. Having completed these activities, the students improve their own work. Guided practice and independent practice will make students accustomed to writing which is initiated with writing an article. This learning activity applies cognitive L3, whilst more complex writing activity applies cognitive L4, and all of these will further produce a research proposal which applies cognitive L5.

RESULT

Reliability of the places with internal consistency by using Cronbach shows that the instrument is reliable with all alpha reliability.

Table 1: Internal Consistency

Scale	Alpha Reliability	Mean	Standard Deviation
Review journal	0.60	3.00	0.78
Fieldwork dan seminar	0.80	3.50	0.80
Group cohesiveness	0.71	3.70	0.37
Discussion	0.70	3.50	0.50
Writing articles	0.80	3.70	0.78
Writing research proposal	0.78	3.50	0.80

Table 1 shows the Cronbach alpha reliability figures ranged from 0,60 to 0,80. This also promotes students' positive learning experiences through fieldwork. This is shown from the high mean scores ranging between 3.00 for the scale of writing article to 3.00 review journal. Field work group cohesiveness, discussion, writing articles, writing research proposal are shown by the mean ≥ 3.50 . Review journal and writing articles has been read low as implied by the mean score < 3.50 . The correlation could be interpreted by examining the significant value P less than 0.05. Those who initially dislike reading books and journals, begin to be interested in reading. The fieldwork has equipped students with learning resources off school and this activity also teaches students to be responsible and independent in learning. The students must attend one-time education seminar and assigned to make a report. The teacher divides the students in group in which they are responsible for the quality of the writing and have standard. The group standard is indicated with the result of paper. The results show that most of the scales have positive and significant correlations. Pearson's correlation is used to find a correlation between at least two continuous variables.

Table 2: Inter Scale Correlation

	RJ	FW	GC	D	A	RP
RJ	1	0.70	0.80	0.70	0.78	0.80
FW		1	0.70	0.80	0.78	0.50
GC			1	0.80	0.78	0.50
D				1	0.80	0.80
A					1	0.80
RP						1

Then the inter scale correction is significantly correlated with review journal and writing article which have the value of $P > 0.05$. Correlation is significant at 0.05 level. When the positive value shows positive correlation, the inter scale correlation is significantly correlated. To be competent in writing article, students have to be able to review journals. The fieldwork that students conducted have derived valid data from the resources and this learning activity leads to a small research. The students were asked to explain the reasons made from natural data of scientific writing. They had to directly search for online journals from google scholar and science, do literature review by reading, and understand the questions to answer by reviewing all of the resources. In the group cohesiveness, the group tries to meet the standard they have set up. Data of aspect correlation shows that journal review is correlated with quality of the article.

FINDINGS

It is found in the preliminary research that the article written by the students is not supported by valid and updated literacy. The students unfortunately cannot differ definition and theory. Having combining time on task and Finnish classroom in this study, the students are progressing. They are able to support valid literacy in writing their article and enjoy their learning experiences which stimulate them to think critically. The fieldwork trains them to be independent learners and develop inquiry so that they will better bear what they have learned in mind. Learning spirit grown in the group is the spirit to investigate and result standard achievement. The discussion shows which groups of students can manage the questions and have valid literature since they have to argue based on valid resources. Writing instruction can help students improve their using the sources in the writing in order to create more complex writing so that it will build up the quality of their articles. These studies have shown that students need appropriate instructional learning completed with guided practice and independent practice. The students by writing skill practice will be able to understand the validation level obtained from results of study taken from reputable journals, theories, book reviews and expert evidence.

CONCLUSIONS

Academic writing skill is competence that pre service teachers have to master by means of learning activities between available and required time. Conducting journal review, fieldwork, group cohesiveness, discussion, and attending seminars will promote students competence in writing articles producing a research proposal. It can be concluded that combining time on task and Finnish classroom will help students 1) develop writing structure, 2) develop strategies for writing from sources, 3) use sources in their writing, 4) improve fluency on problem statement, 5) build up more complex writing, 6) conduct thesis research. Combining time on task and Finnish classroom helps students achieve their learning goals, complete their assignment, and promote their writing skill.

TIMSS 2015 MATEMATİK VERİSİNİN DEĞİŞEN MADDE FONKSİYONUNUN İNCELENMESİ

Emrah Gül
emrahgul@hakkari.edu.tr
Çilem DOĞAN GÜL
cilemdogangul@hakkari.edu.tr

Öğrenci puanlarının karşılaştırılabilmesi ve maddelerin / testlerin farklı alt gruplarda aynı şekilde işleyip işlemediğinin belirlenmesi, ölçme ve değerlendirme alanının önemli bir sorunudur. Bu sorunun incelenmesi ve üstesinden gelinebilmesi, “Değişen Madde Fonksiyonu (DMF)” ile ilgili çalışmaların yapılması gerekliliğini ortaya koymaktadır. Bu araştırmanın amacı da kültürlerarası karşılaştırmalar yapan TIMSS sınavının matematik testinin değişen madde fonksiyonlarını incelemektir. İlişkisel tarama modelinde olan bu araştırma TIMSS 2015 matematik testi 1 ve 4 numaralı kitapçıkları alan 865 öğrenci verisi ile yürütülmüştür. DMF analizleri için R programlama dili ve difR paketi kullanılmıştır. Klasik Test Kuramı’na dayalı yöntemlerden Dönüştürülmüş Madde Güçlüğü, Mantel-Haenszel, Standartlaştırma ve Lojistik regresyon; Madde Tepki Kuramına dayalı olarak ise Lord’un ki-karesi ve Raju’nun alan indeksleri kullanılmıştır. Araştırma sonuçlarına göre 3, 6 ve 7 numaralı maddeler birden fazla yönetime göre DMF içermektedir. KTK’ya göre toplam 5 madde ve MTK’ya göre ise toplam 4 madde DMF içermektedir. Bu sonuçlar çerçevesinde maddelerin incelenmesi ve herhangi bir yanlışlık kaynağı olup olmadığını belirlenmesi önerilmektedir.

TO BE CONSERVATIVE AS A DISPOSITION OF EDUCATION: AN INSTRUMENTAL FAMILIARITY FROM THE PERSPECTIVE OF MICHAEL OAKESHOTT

Da Wen

jodineva1204@naver.com

Hoy-Yong Kim

khy@pusan.ac.kr

Facing the fast-changing times, “innovation and development” has been the “central theme” for the understandings of education. The disposition of this theme suggests that education in the service of country’s interest can be substantive—that is, reshape society into a government-centered model in which people are encouraged to adopt programmable lifestyles, which could be a totally misunderstood sort of education. For this reason, we recognize the fact that the conservative properties of education are another essential part that provides a more sustainable perspective. “To be conservative as an ‘indispensable component’ of education” that preserves something unique and exceptional about human nature has become the concern of conservative thinkers as diverse as Russell Kirk, Milton Friedman, Daniel Bell and Fernando Savater. As a political intellectual, Michael Oakeshott figures out an unique way to highlight the connection between education and the conservative disposition from the perspective of an instrumental familiarity. Familiarity is the foundation of the conservative disposition. Since tradition is a learned social construct, it follows that the conservative disposition itself, or rather the moral practices that from which it derives; familiarity, for Oakeshott, is the indispensable junction between education and the disposition to be conservative. This article demonstrates a traditionally deep-going Oakeshottian interpretation of the conservative disposition within liberal arts by criticising rationalist education and the prejudice from conservatives. According to Oakeshott’s logical-critical examination of the conservative disposition, we can more clearly understand his educational philosophy.

ABSTRACT

The article deals with the organization of the learning environment for onboard software developers. At the same time, one of the approaches for the implementation of the onboard software execution environment is the implementation of the pseudo-parallelism principle, namely, the simulation of parallel execution of tasks by dividing their execution time. It is shown that the implementation of the pseudo-parallelism principle of executable tasks of application software can be uncovered using the UML (Unified Modeling Language) semantic constructs, for example, a sequence diagram. Implemented possibility of systematic execution of the UML sequence diagram with the help of the developed interpreter and visualization of the state of the system (the state of each thread of application software, the contents of memory) thanks to the virtual machine, which is also part of the learning environment, is described. The possibilities of the developed learning environment are presented. As an example in the implementation, which expresses the logic of constructing the UML-diagram of sequences of the model for interpreting the task of changing the coordinate (OZ) of an unmanned aerial vehicle.

INTRODUCTION

Development of models for interpreting applied problems, an integral part of the design of both software and on-board software in general. At the same time, such a principle is accompanied by cognitive activity, first of all, by the developer of on-board software. Training a developer to design, algorithmize and programming of application software is a complex and time-consuming process (Kovalev, Loginov & Zelenkov, 2015). In a narrow sense, programming is seen as writing algorithms in a given programming language. To write the optimal code, the programmer must understand to which changes in the system within which the application software is executed, each construction lead (Kovalev & Loginov, 2016).

Now, there is no environment that allows you to clearly observe the changes following the execution of specific designs, and tools that support the interpretation of UML (Unified Modeling Language) - diagrams of sequences, in general. In this direction, the educational process is based on a series of static schematic solutions that reflect the state of the system and are accompanied by a textual link, which does not allow us to present the picture of events in dynamics (Kovalev & Loginov, 2015). Interpret these processes in the dynamics possible using the interpreter sequence diagrams. Interpreter, which allows to suspend execution of the program at any time, and visualizing the state of the system (all its threads, data exchange and synchronization) is a powerful tool in the educational process, because it quickly and visually displays the results of each design, and allows you to evaluate the correctness and optimality of various structures that perform the same tasks. For the convenience of perception, it is necessary to visualize the states of various components of the execution environment and the threads within it, which represent our application software that solves a specific problem and add some graphic abstractions. This task can be solved by writing a virtual machine that will have the necessary structure and visualization block.

RESULTS AND DISCUSSION

The task of designing of on-board software of unmanned aerial vehicles (UAV), is not trivial. At the same time, the task of forming an execution environment for software modules of application software responsible for the operation of a number of subsystems of UAV is no less important (Kovalev, Zelenkov, Losev, Ivleva & Saramud, 2016). Minimum requirements to organizing the functioning of such an environment are to comply with certain conditions. The presence of a scheduler that provides correct information threads and task management, a mechanism for message exchange, means for synchronizing competitive threads - semaphores, mutexes, critical sections; drivers that implement the interaction with hardware, as well as executable software modules - algorithms for implementing an application software of UAV subsystems.

One of the approaches to implementing the runtime environment of on-board software of unmanned aerial vehicles is the implementation of the principle of pseudo-parallelism, namely, the simulation of parallel execution of tasks by dividing their execution time. Such a functional principle is implemented by the RTOS (real-time operating system) – specifically one of the implementation options - FreeRTOS ported, i.e. adapted to execution on SoC (System On a Chip) which contributes to the possibility of testing the idea on the available tools. Thus, the main architectural principle of designing an onboard control complex in solving the problem of portability of on-board software with minimal costs - is multipartition for a number of computing platforms of the software operating environment - the real-time operating system.

The execution environment, primarily as a system software, requires a regulated, orderly interaction, both among its own structural components, and with peripheral modules of application software and hardware, executed through drivers.

Let us consider the architectural aspect of constructing the on-board software from the execution environment acting as a functional core of the on-board software (figure 1). The pseudo-parallelism principle, outlined above, corresponds to the task of regulated, ordered interaction of components. Thus, there is arises a need for the developer of the on-board software in linguistic support, with the aim of correctly documenting the project and modelling a number of procedures.

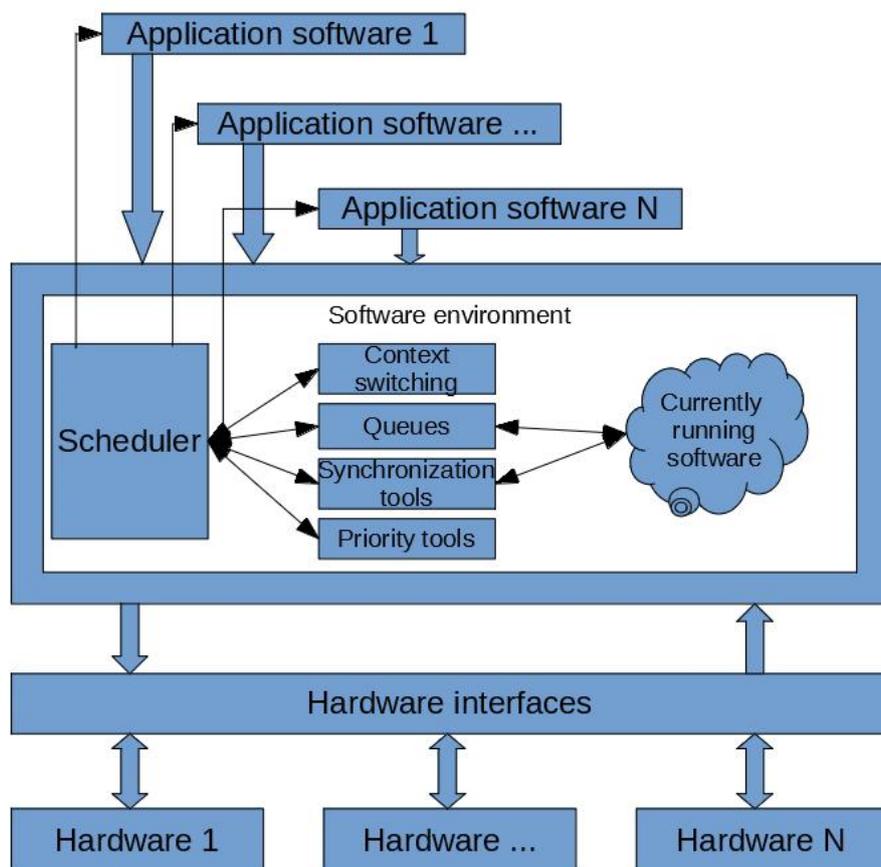

Figure 1 – The structure of the basic software of unmanned aerial vehicle.

Implementation of the principle of pseudo-parallelism of executable tasks of application software can be disclosed by using semantic constructions of UML, for example, a sequence diagram. Let us consider the implementation of the interpretation model for the problem of changing the coordinate (OZ) of an unmanned aerial vehicle in the representation of UML-diagram of sequences (Losev, 2009).

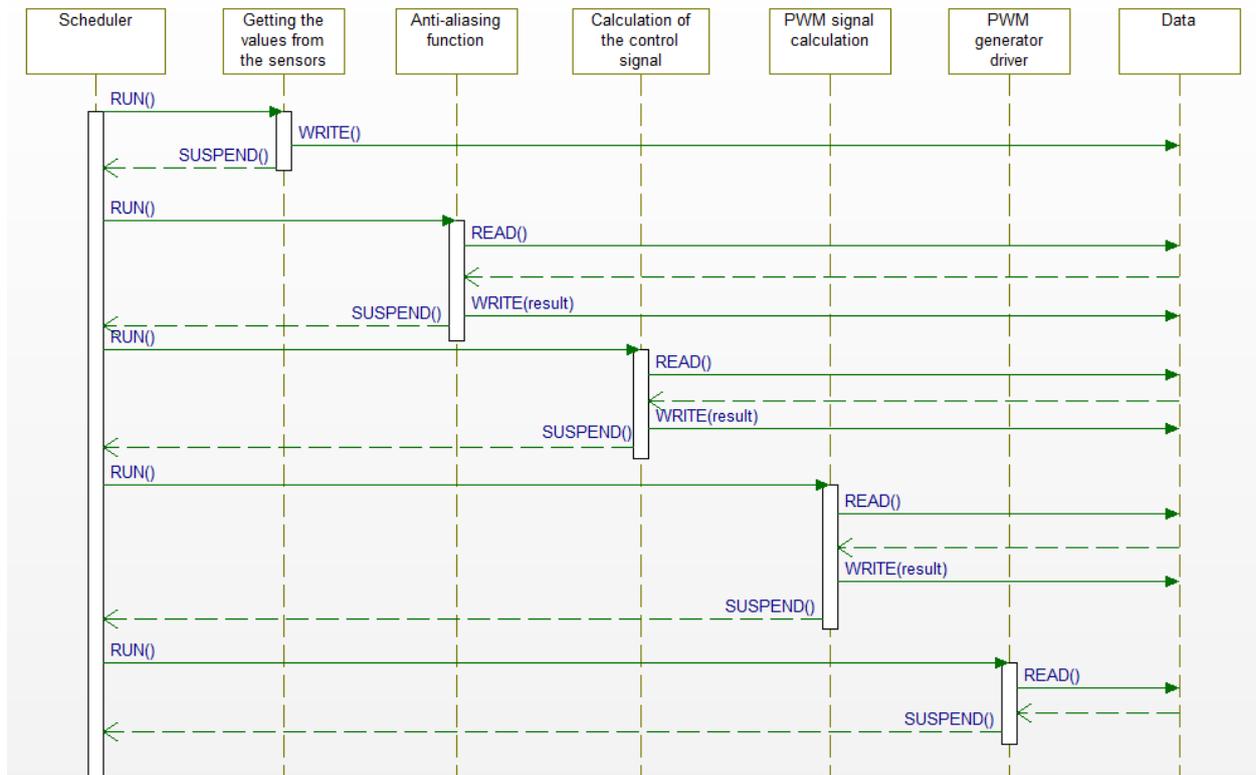

Figure 2 – Interpretation model of task of changing the coordinate (OZ) of an unmanned aerial vehicle in the representation of UML-diagram of sequences.

On the diagram (figure 2), we can observe the sequence of operations in solving the problem of compensating for the displacement of an UAV from a given position because of an external perturbing effect corresponding to a certain physical phenomenon or process (a gust of the wind, a change in the terrain, etc):

1. The scheduler starts the thread of reading the indications of the height sensors (barometer or range finder, looking vertically down), the results is written into memory, and the work of the stream is completed.
2. The scheduler launches anti-aliasing function, the thread reads the sensor readings from memory, performs anti-aliasing, and returns the final result (height) to memory, the thread ends.
3. The scheduler starts the thread of calculation of the control signal, it reads the current smoothed and set altitude from memory and, taking into account the system model, calculates a control signal, writes its value into memory, the thread ends.
4. The scheduler starts the calculation thread of pulse-width modulation (PWM), it reads the value of the control signal from memory, current PWM signal, recalculates it taking into account the control signal and returns a new value, the thread ends.
5. The scheduler starts the PWM-generator driver process, it reads the recalculated PWM parameters from memory and delivers them to the output of the generator, the thread ends, the task is performed.

Because different platforms have different hardware capabilities (presence or absence of a hardware implemented PWM-generator, different types of input and output ports, and so on), a logic of constructing a sequence of operations to achieve the same goal may slightly vary. For example, in the cases, where the appeal to hardware components (in which differences will be present) is used instead of the program logic, which is the same for all platforms. Therefore, when choosing a specific task, the proposed set of actors and links will also be different, if you need to address elements that differ from the target hardware platforms in order to solve the task. However, the general logic of solving the problem will be unified for all platforms, as will the structure of the execution environment, its main composite systems and the logic of functioning (scheduler, threads, tools for their interaction and synchronization).

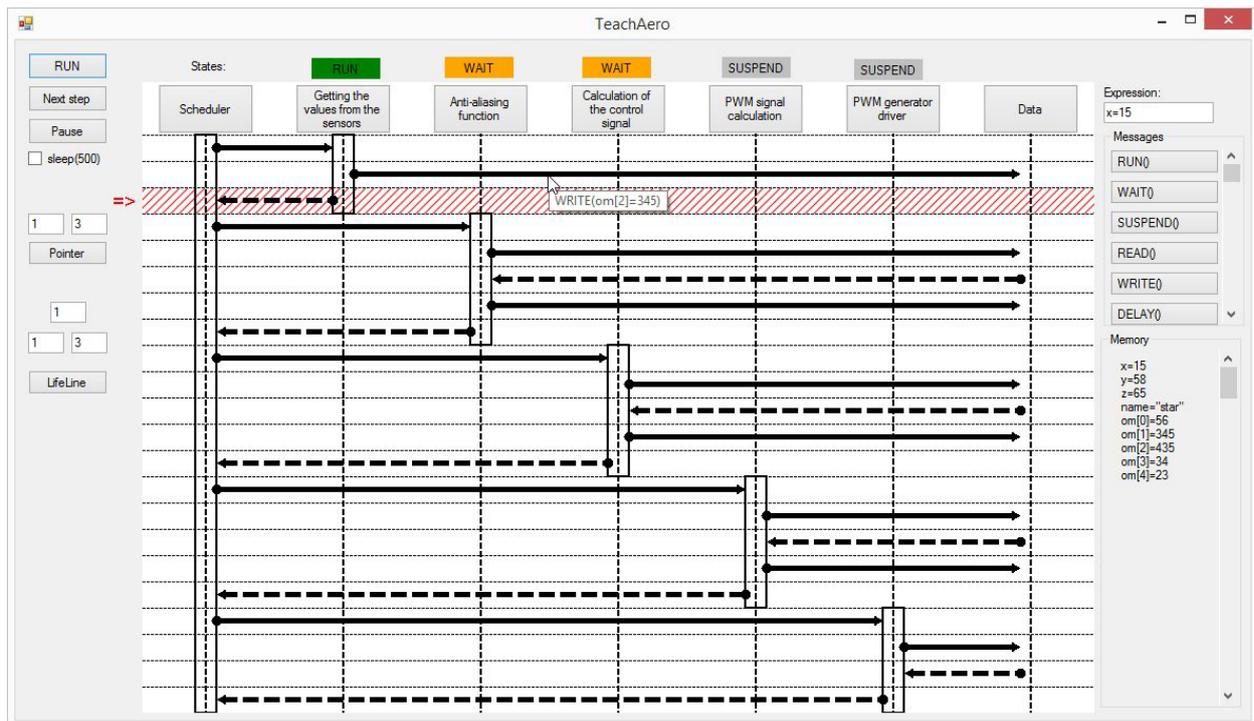

Figure 3 - The interface of the learning environment based on an implementation of interpretation model for the task of changing the coordinate (OZ) of an unmanned aerial vehicle in the representation of UML-diagram of sequences.

As an example of implementing a learning environment, let us consider an application that implements the designing logic of UML-diagram of sequences interpretation model for the task of changing the coordinate (OZ) of an unmanned aerial vehicle. The functional of this application makes it possible to implement interaction between actors, by creating links (messages) and content filling connections (computational load - variables). According to the modelling results there is the possibility of a step-by-step "run" - the execution of the model with the display of the states of the actors and the interpretation of the commands with the display of the values of variables when executing a particular message. As a result, we obtain a learning environment with elements of visual, step by step execution of commands with the ability to evaluate the program in dynamics.

CONCLUSION

With the further design of the integrated environment for the development of on-board software it is possible to implement a graphical programming module where the developer will apply the skills learned in the learning environment for implementing application software modules through the schematic construction of a sequence diagram, and the environment will generate the code for the target platform, since the program code of modules implementing the same functionality may differ due to the hardware features of the target platforms. Thus, multiplatform will be implemented, and the developer will have to think less about the specificity of various controllers and boards. In addition, portability of logical schemes of application software will be provided, due to the possibility of code generation (translation) based on them for different platforms.

TOURISM COLLEGE MAJOR AND THE RELATIONSHIPS AMONG CHOOSING TOURISM AS A MAJOR, MAJOR SATISFACTION AND COMMITMENT, AND CAREER DECISION SELF-EFFICACY

KyuMee Kim

Ph.D. Candidate, Hanyang University
kyumee0705@daum.net

NamJo Kim

Professor, Hanyang University
njkim@hanyang.ac.kr

ABSTRACT

The human resource potential of college tourism students is the foundation for growth of the future tourism industry. The aim of this study is to analyze problems in human resource programs within tourism studies and to provide useful insights to tourism educational and training institutes. This study examined the characteristics of college students majoring in tourism studies and delved into the relationship among choosing tourism as a major, major satisfaction, major commitment, and career decision self-efficacy. Data were collected via a convenience sample, with self-administrated questionnaires given to college students participating in tourism classes. The 412 students sampled were enrolled in either 2-year, 3-year, or 4-year college programs. Frequency analysis, factor analysis, and regression analysis were used. Results from this research showed that tourism majors had positive inclination towards major satisfaction, major commitment and career decision self-efficacy. Impact of such findings may help to better understand the characteristics and conditions of college students majoring in tourism studies, and help them overcome a sense of failure or loss of will, which may potentially lead to school dropout, or selection of jobs that are irrelevant to their major. Moreover, this study provides some important insights on college student's growth and development to become tourism experts after graduating college.

INTRODUCTION

The disposable income and leisure time of Koreans are increasing. Consequently, the number of people who travel overseas is rapidly growing (Kim, 2005). The tourism industry has grown so much that it accounts for 4.1% of the OECD average GDP, 5.9% of employment, and 21.3% of service exports. It also plays an important role in promoting economic activity and increasing employment and export revenues of OECD countries. In the creation of value added to tourism-related exports, it accounts for 80%. In the long term, the number of international tourists will reach 1.8 billion by 2030(Korea Culture & Tourism Institute, 2016). In this way, the scale of the domestic tourism industry is growing every year, which can lead to further job creation. Considering the fact that manufacturing creates jobs for 9.8 persons and the IT industry for 15, the tourism industry is an excellent market as it creates jobs for about 20 persons, almost twice manufacturing, applying to multiplier effects (Newswire, 2014.6.30). In short, the tourism industry is invigorating the job market and creating a variety of jobs. This in turn leads to the challenge of producing and providing human resources for the tourism industry. In response to this reality, many universities are providing majors in tourism studies, and a considerable number of students apply for tourism majors. They do so because they expect to find a job more easily as the domestic tourism industry is employing more people in response to this growth.

However, in a survey by the Daehaknaeil20's Lapin which 400 students studying at four-year universities were surveyed, 50.5% of them responded that they regretted having chosen their major when applying for jobs at companies (University News Network, 2013.4.30). In short, many of the students chose their major based on the recommendations of their teachers and parents or their school performance rather than their own interest or aptitude. It is also worth mentioning that the atmosphere of Korean society should be held partially responsible by placing importance only on the fame of universities. In particular, tourism studies are perceived to be a major with great familiarity and accessibility due to its characteristics as the quality of life has improved and the concept of leisure expanded. For these reasons, many students easily opted for the tourism major without sufficient basic information or in-depth knowledge when choosing their major. However, students may be dissatisfied with their choice afterwards, unable to focus on their major, or have trouble in deciding their career.

This study considers tourism major students to be potential human resources for the tourism industry and the foundation for further growth of the Korean tourism industry. This study examined the characteristics of college students majoring in tourism studies and delved into the relationships among choosing tourism as a major, major

satisfaction, major commitment, and career decision self-efficacy.

LITERATURE REVIEWS

Choosing Tourism as a Major

In a 2013 survey conducted by the Korea Education and Research Information Service (KERIS), 32.3% of high school students and 34.4% of middle school students responded they had “no dream” for a future career. They further explained that they study in high school in order to later study at college, and only 10.6% of middle school students entered high school with a clear goal “to achieve their dream of a future career.” In choosing high school, 29.2% responded “with no special reason,” 19.2% “according to school performance,” and 15% “to enter a target college” (KERIS, 2013). Thus, the majority of students decided their major according to the “university entrance exam score” and entered college without realizing their dream. Further, students may change their major as they had not sufficiently explored their aptitudes and career after entering college, or else lose direction in their career after graduation.

Therefore, this study operationally defined “choosing a major” as “the acts of understanding one’s own interests or aptitudes that he considers important and deciding a major to study in order to develop his future career.” This study divided choosing a major into personal factors (occupations and values of parents, economic circumstances, and family circumstances) and prospective factors (prospects of the major, outlook of the study field, and salary and income after graduation). The factors were measured with ten questions modified and complemented for this study from previous studies by Shin (1997), Jo (1998), Lee (2007), and Son (2012).

Major Satisfaction

With respect to a chosen major, major satisfaction is related to values and beliefs, state of positive emotions, and attitudes toward the major generated through the process of interaction between personal characteristics and the environment associated with the major (Han, 2008). Derry and Brandenburg (1978) analyzed college students’ major satisfaction with three factors—general factors, learning factors, and teaching factors.

Therefore, this study operationally defined major satisfaction as when the student feels positive about the major he has chosen, does not regret the decision, and gives his career a decisive influence. Major satisfaction was measured with seven questions modified and complemented for this study from the course evaluation survey developed by Braskamp et al. (1979) and previous studies by Jang et al. (1987), Ha (2000), and Park (2010).

Major Commitment

Major commitment starts from the concept of organizational commitment. Porter, Steers, Mowday, and Boulian (1974) defined organizational commitment as the degree to which an individual identifies with and gets involved in a particular organization. In the association of commitment theory with the major, major commitment was defined as the psychological affection that the student has toward his major while at college (Jang et al., 2007; Nam, 2005).

Therefore, this study operationally defined major commitment as a state in which the student is fascinated by the major of his own choice and voluntarily takes actions for a variety of major-related activities with great interest and affection. It was measured with seven questions modified and complemented for this study from previous studies by Lee (2003), Kim (2007), and Jeong (2014).

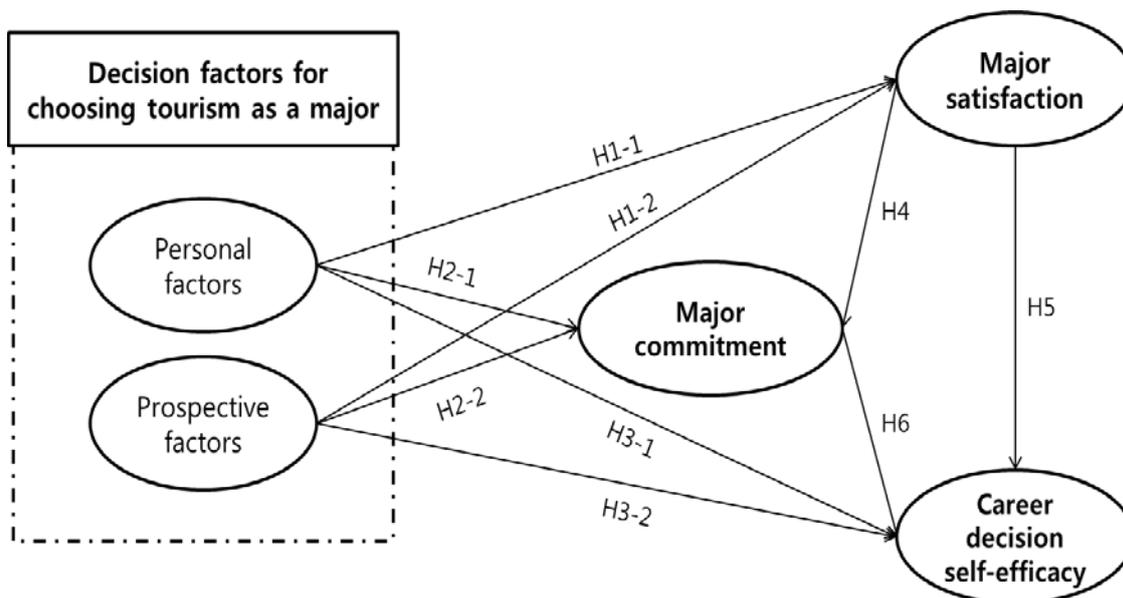

Career Decision Self-Efficacy

Before examining career decision self-efficacy, we must introduce the concept of self-efficacy, which is a superordinate concept. Self-efficacy is confidence for success and conviction in one’s personal potential in performing a given task or action. This quality influences a set of process, including choosing an action, performance, and continuity (Bandura, 1997). Hackett and Betz (1981) were the first to apply self-efficacy theory to careers, based on the theory of Bandura. They argued that self-efficacy has a highly important cognitive influence on career decision and career achievement. They also suggested that self-efficacy helps individuals make decisions on achievement behavior, decisions related to study and career, and behaviors that render the chosen career successful.

Therefore, this study operationally defined career decision self-efficacy as the belief and conviction that one can solve and overcome problems or situations arising in deciding future careers on his own, and a positive confidence in and evaluation of the chosen career. It was measured with seven questions modified and complemented for this study from previous studies by Jeong (2006) and Seo (2010).

METHOD

The Model of the Study

<Figure 1> Study model

The Hypotheses of Study

- H1. Choosing tourism as a major influences major satisfaction
- H2. Choosing tourism as a major influences major commitment
- H3. Choosing tourism as a major influences career decision self-efficacy
- H4. Major satisfaction influences major commitment
- H5. Major satisfaction influences career decision self-efficacy
- H6. Major commitment influences career decision self-efficacy

FINDINGS

Respondent Demographic Characteristics

The following <Table 1> shows the results of a frequency analysis of the general characteristics of the subjects of this study.

<Table1> General characteristic of sample

Category	Sub-category	Number of persons	%	Category	Subcategory	Number of persons	%
Gender	Male student	146	35.4	Age	Younger than 20 years	109	26.5
	Female student	266	64.6		Between 21 and 23 years	131	31.8
Year	Freshman	177	43.0		Between 24 and 26 years	84	20.4
					27 years or older	88	21.4
	Sophomore	41	10.0	Education	2-year program	171	41.5
	Junior	84	20.4		3-year program	91	22.1
Senior	110	26.7	4-year program		150	36.4	
		412	100			412	100

Reliability and Validity Test

The varimax rotation method was applied to the ten survey questions on choosing tourism as a major and two factors with an eigenvalue of 1 or greater were drawn. Therefore, they were named prospective factors and personal factors. The explanatory power of the total cumulative variance of choosing tourism as a major was 63.03%, and the explanatory power of prospective factors was greater than that of personal factors. The KMO coefficient was .828, showing it was a suitable sample. Bartlett's sphericity between the measurement items was tested for factor analysis. The approximated- χ^2 value was 2314.088, degrees of freedom (*df*) 45, and significance level smaller than (*p*) .000, and thus it was considered suitable for factor analysis. Cronbach's α was calculated for an inter-item reliability test in order to test the internal consistency of factors. The reliability coefficient per factor ranged between .782~.883, and thus reliability was secured. The results are shown in Table 2.

<Table2> Factor analysis and reliability analysis for choosing tourism as a major

Factor	Measurement item	Mean (Standard deviation)	Factor loading	Eigen-value	Explanatory power of variance	Reliability coefficient
Choosing tourism as a major	Prospects of major career	3.56(1.020)	.874	4.981	38.506	.883
	Major with promising outlook	3.64(1.021)	.834			
	Outlook of study field	3.74(.944)	.829			
	Fame of the college with tourism major	3.66(.998)	.753			
	Social recognition of the college	3.73(.854)	.655			
	Life salary and income after graduation	3.88(.845)	.594			
	Interest (field of interest)	3.50(.953)	.824			
Personal factors	Aptitude	3.46(1.033)	.754	1.322	24.527	.782
	Talent (aptitude)	3.88(.914)	.708			
	University entrance exam score	3.53(1.81)	.614			
KMO = .828		Explanatory power of total variance= 63.033		Approximated- $\chi^2 = 2314.088$		

Major satisfaction was drawn as a single factor that does not have any item with loading 0.5 or lower. Its explanatory power of total variance was 60.296% and its KMO coefficient was .818, which suggests that it was a suitable sample. The approximated- χ^2 was 1802.807, degrees of freedom (*df*) were 21, and significance value (*p*) was smaller than .000. Cronbach's α was .889, and thus reliability was secured. Table 3 shows the results.

<Table3> Factor analysis and reliability analysis for major satisfaction

Factor	Measurement item	Mean (Standard deviation)	Factor loading	Eigen value	Explanatory powerof variance	Reliability coefficient
Major satisfaction	Passion for the major and objectives of the professor	3.59(.964)	.885	4.221	60.296	.889
	Professor-student communication	3.45(.999)	.832			
	Advice of the professor on study approach or content	3.50(.965)	.793			
	Job opportunity for major courses	3.60(.916)	.779			
	Helpfulness for professional lifeafter graduation	3.92(.892)	.773			
	Popularity of the major	3.66(.902)	.696			
	Interest in subject content	3.65(1.004)	.656			

KMO = .818 Explanatory power of total variance= 60.296 Approximated- $\chi^2 = 1802.807$

Major commitment was drawn as a single factor which does not have any item with loading 0.5 or lower. The explanatory power of total variance was 62.268% and the KMO coefficient was .839; thus, it was a suitable sample. The approximated- χ^2 value was 1785.884, degrees of freedom (*df*) were 21, and the significance level (*p*) was smaller than .000. Cronbach's α was .897, so reliability was secured. The results are shown in Table 4 below.

<Table4> Factor analysis and reliability analysis for major commitment

Factor	Measurement item	Mean (Standard deviation)	Factor Loading	Eigen value	Explanatory powerof variance	Reliability coefficient
Major commitment	Major course participation rate	3.92(.833)	.820	4.359	62.268	.897
	Passion for major course assignments	3.80(.808)	.815			
	Will for major courses	3.87(.759)	.814			
	Curiosity for major course itself	3.69(.950)	.779			
	Attention and interest in major course	3.71(.888)	.777			
	Perception of the flow of time when participating in major courses	3.55(.961)	.752			
	Interest in the major	3.82(.861)	.743			

KMO = .839 Explanatory power of total variance = 62.268 Approximated- $\chi^2 = 1785.884$

Career decision self-efficacy was a single factor with no item having a load value 0.5 or lower. The explanatory power of the total variance was 52.043% and the KMO coefficient was .748, so it was a suitable sample. The approximated- χ^2 value was 1213.407, degrees of freedom (*df*) were 22, and significance level (*p*) was smaller than .000. Cronbach's α value was .748, and thus reliability was secured. The results are shown in Table 5.

<Table5> Factor analysis and reliability analysis for career decision self-efficacy

Factor	Measurement item	Mean (Standard deviation)	Factor loading	Eigenvalue	Explanatory powerof variance	Reliability coefficient
Career decision self- efficacy	Opportunity to meet experts from the major field	3.75(.879)	.854	3.643	52.043	.839
	Confidence in performing tasks of the major field	3.73(.864)	.796			
	Information on related organizations or tasks	3.94(.785)	.720			
	Belief in executing plans	3.71(.775)	.715			
	Challenging spirit for new things	3.62(.903)	.657			
	Plans for the nextfive years	3.61(1.042)	.645			
	Efforts for the major study or career	3.71(.867)	.635			

KMO = .748 Explanatory powerof variance = 52.043 Approximated- $\chi^2 = 1213.407$

Hypothesis test

H1. Choosing tourism as a major influences major satisfaction

The multiple regression analysis results of H1 showed that the goodness of fit was $Adj-R^2=.631$, and thus the explanatory power of the dependent variable of major satisfaction for the factor choosing tourism as a major was 63.1%. The significance level was $F=352.773(df=2)$ within 0.1%; thus, the regression model was fit. The tolerance was 0.1 or higher, and the VIF of all independent variables was 10 or lower. Therefore, it was concluded that there was no multicollinearity in which the areas of explanatory variables of the independent variables overlapped.

Among the factors for choosing tourism as a major in Hypothesis 1 (H1), the standardized coefficient (β) for the influence of prospective factors on major satisfaction was .194, with $t=5.320$ and $p<0.000$. Thus it was statistically significant within 0.1%. In other words, prospective factors had a significant positive influence on major satisfaction. The standardized coefficient (β) for the influence of the second factor, personal factors, on major satisfaction was .669, with $t=18.35$, and $p<0.000$, and thus it was statistically significant within the significance level 0.1%. Thus, personal factors had a significant positive influence on major satisfaction.

Therefore, H1 of this study, "Choosing tourism as a major influences major satisfaction" was adopted. The results are shown in Table 6.

<Table6> Analysis on the influence of choosing tourism as a major on major satisfaction

Dependent variable	Independent variable	Unstandardized coefficient		Standardized coefficient (β)	<i>t</i>	Tolerance (VIF)
		Gradient (B)	Standard error			
Major satisfaction	Prospective factors	.189	.036	.194	5.320***	.675 (1.481)
	Personal factors	.635	.035	.669	18.353***	.675 (1.481)

$R=.796$, $R^2=.644$, $Adj-R^2=.631$, $F=352.773(df=2)$, $sig.<.000$

Footnote) *** $p<.001$

H2. Choosing tourism as a major influences major commitment

The multiple regression analysis results of H2 showed that the goodness of fit was $Adj-R^2=.330$, and thus the explanatory power of the dependent variable of major commitment for the factor choosing tourism as a major was 33%. The significance level was $F=102.003(df=2)$ within 0.1%; thus, the regression model was fit. The tolerance was 0.1 or higher, and the VIF of all independent variables was 10 or lower. Therefore, it was concluded that there was no multicollinearity in which the areas of explanatory variables of the independent variables overlapped.

Among the factors for choosing tourism as a major in Hypothesis 2 (H2), the standardized coefficient (β) for the influence of prospective factors on major satisfaction was .339, with $t=5.320$ and $p<0.000$. Thus it was statistically significant within 0.1%. In other words, prospective factors had a significant positive influence on major commitment. The standardized coefficient (β) for the influence of the second factor, personal factors, on major commitment was .274, with $t=6.339$, and $p<0.000$, and thus it was statistically significant within the significance level 0.1%. Thus, personal factors had a significant positive influence on major commitment.

Therefore, H2 of this study, "Choosing tourism as a major influences major commitment" was adopted. The results are shown in Table 7.

<Table7> Analysis on the influence of choosing tourism as a major on major commitment

Dependent variable	Independent variable	Unstandardized coefficient		Standardized coefficient (β)	t	Tolerance (VIF)
		Gradient (B)	Standard error			
Major commitment	Prospective factors	.307	.044	.339	6.906***	.675 (1.481)
	Personal factors	.274	.043	.312	6.339***	.675 (1.481)

$R = .577, R^2 = .333, \text{Adj-}R^2 = .330, F = 102.003(df=2), sig.<.000$

Footnote) *** $p<.001$

H3. Choosing tourism as a major influences career decision self-efficacy

The multiple regression analysis results of H3 showed that the goodness of fit was $\text{Adj-}R^2 = .212$, and thus the explanatory power of the dependent variable of career decision self-efficacy for the factor choosing tourism as a major was 21.2%. The significance level was $F = 56.372(df=2)$ within 0.1%; thus, the regression model was fit. The tolerance was 0.1 or higher, and the VIF of all independent variables was 10 or lower. Therefore, it was concluded that there was no multicollinearity in which the areas of explanatory variables of the independent variables overlapped.

Among the factors for choosing tourism as a major in Hypothesis 3 (H3), the standardized coefficient (β) for the influence of prospective factors on major satisfaction was .267, with $t=5.176$ and $p<0.000$. Thus it was statistically significant within 0.1%. In other words, prospective factors had a significant positive influence on career decision self-efficacy. The standardized coefficient (β) for the influence of the second factor, personal factors, on career decision self-efficacy was .249, with $t=4.669$, and $p<0.000$, and thus it was statistically significant within the significance level 0.1%. Thus, personal factors had a significant positive influence on career decision self-efficacy.

Therefore, H3 of this study, "Choosing tourism as a major influences career decision self-efficacy" was adopted. The results are shown in Table 8.

<Table8> Analysis on the influence of choosing tourism as a major on career decision self-efficacy

Dependent variable	Independent variable	Unstandardized coefficient		Standardized coefficient (β)	t	Tolerance (VIF)
		Gradient (B)	Standard			

		error				
Career decision self-efficacy	Prospective factors	.229	.044	.279	5.176***	.675 (1.481)
	Personal factors	.201	.043	.249	4.669***	.675 (1.481)

$R = .577, R^2 = .333, \text{Adj-}R^2 = .330, F = 102.003(df=2), \text{sig.} < .000$

Footnote) *** $p < .001$

H4. Major satisfaction influences major commitment.

The influence of major satisfaction on major commitment was analyzed with simple regression. Goodness of fit for the model in the regression analysis was $\text{Adj-}R^2 = .410$. The explanatory power of the dependent variable of major satisfaction for major commitment was 41.2%. In addition, $F = 287.023(df=1)$ within the significance level 0.1%. And thus the regression model was fit and the explanatory power of the independent variable major satisfaction was statistically significant.

The standardized coefficient (β) for the influence of major satisfaction in H4 on major commitment was .642, with $t = 16.942$, and $p < .000$; thus, it was statistically significant within the significance level 0.1%. Therefore, major satisfaction had a significant positive influence on major commitment.

Therefore, H4 of this study, "major satisfaction influences on major commitment," was adopted. The results are shown in Table 9.

<Table 9> Analysis on the influence of major satisfaction on major commitment

Dependent variable	Independent variable	Unstandardized coefficient		Standardized coefficient (β)	t	Tolerance (VIF)
		Gradient (B)	Standard error			
Major commitment	Major satisfaction	.595	.035	.642	16.942***	1.000 (1.000)

$R = .470, R^2 = .221, \text{Adj-}R^2 = .219, F = 116.535(df=1), \text{sig.} < .000$

Footnote) *** $p < .001$

H5. Major satisfaction influences career decision self-efficacy.

The influence of major satisfaction on career decision self-efficacy was analyzed with simple regression. Goodness of fit for the model in the regression analysis was $\text{Adj-}R^2 = .219$. The explanatory power of the dependent variable of major satisfaction for career decision self-efficacy was 22.1%. In addition, $F = 116.535(df=1)$ within the significance level 0.1%. And thus the regression model was fit and the explanatory power of the independent variable major satisfaction was statistically significant.

The standardized coefficient (β) for the influence of major satisfaction in H5 on career decision self-efficacy was .470, with $t = 10.795$, and $p < .000$; thus, it was statistically significant within the significance level 0.1%. Therefore, major satisfaction had a significant positive influence on career decision self-efficacy.

Therefore, H5 of this study, "major satisfaction influences on career decision self-efficacy," was adopted. The results are shown in Table 10.

<Table 10> Analysis on the influence of major satisfaction on career decision self-efficacy

Dependent	Independent	Unstandardized coefficient	Standardized	t	Tolerance
<i>H6. Major commitment influences career decision self-efficacy.</i>					

variable	variable	Gradient (B)	Standard error	coefficient (β)		(VIF)
Career decision self-efficacy	Major satisfaction	.400	.037	.470	10.795***	1.000 (1.000)

$R = .470, R^2 = .221, \text{Adj-}R^2 = .219, F = 116.535(df=1), sig. < .000$

Footnote) *** $p < .001$

The influence of major commitment on career decision self-efficacy was analyzed with simple regression. Goodness of fit for the model in the regression analysis was $\text{Adj-}R^2 = .286$. The explanatory power of the dependent variable of major commitment for career decision self-efficacy was 28.6%. In addition, $F = 156.557(df=1)$ within the significance level 0.1%. And thus the regression model was fit and the explanatory power of the independent variable major commitment was statistically significant.

The standardized coefficient (β) for the influence of major commitment in H6 on career decision self-efficacy was .454, with $t = 12.867$, and $p < 0.000$; thus, it was statistically significant within the significance level 0.1%. Therefore, major commitment had a significant positive influence on career decision self-efficacy.

Therefore, H6 of this study, "major commitment influences on career decision self-efficacy," was adopted. The results are shown in Table 11.

<Table 11> Analysis on the influence of major commitment on career decision self-efficacy

Dependent variable	Independent variable	Unstandardized coefficient		Standardized coefficient (β)	t	Tolerance (VIF)
		Gradient (B)	Standard error			
Career decision self-efficacy	Major commitment	.492	.038	.454	12.867***	1.000 (1.000)

$R = .536, R^2 = .288, \text{Adj-}R^2 = .286, F = 156.557(df=1), sig. < .000$

Footnote) *** $p < .001$

CONCLUSIONS

This study investigated the influence of choosing tourism as a major on major satisfaction, major commitment, and career decision self-efficacy. The purpose of this study was to identify factors such as personal will and characteristics that are reflected when potential human resources—who will constitute the foundation of the future growth of the Korean tourism industry—choose tourism as a major. Further, it investigated the influential relationship between major satisfaction, major commitment, and career decision self-efficacy in choosing tourism as a major.

This study is summarized as follows. First, in terms of the demographic characteristics of the sample, female students accounted for more of the population of tourism major students than male students. In the sample, freshmen accounted for 43.0%, which was worth noting, but their ages ranged between 20 and 23. Second, the six hypotheses of this study were all adopted, and all had significant positive relations.

The implications of the study results are as follows. First, there are numerous studies on the Korean university entrance system and the decision-making of students concerning their college major. However, studies of the influence of choosing tourism as a major on major satisfaction, major commitment, and career decision self-efficacy have been insufficient so far. The value of this study is that it extended the scope of such studies by analyzing tourism majors.

Second, in terms of individual students, it was confirmed that choosing tourism as a major had a significant positive influence on major satisfaction, major commitment, and career decision self-efficacy. The study also conveyed to the students that choosing a major is highly important.

Third, the study provides basic data that help us understand the state of students in order to prevent them from dropping out of college or choosing a job that is unrelated to their major due to a sense of failure or loss of will to

receive an education in which they have no interest.

Finally, in terms of tourism major management, the study provided basic data to help students grow further and develop into competent tourism professionals after graduation.

ABSTRACT

Nowadays, Higher Education Institutions (HEI) are obliged to pursue the path of quality, not only because of the growing demand of society, but also because HEI are the driving force for competitiveness. As the knowledge society is increasingly demanding, it is necessary to measure and evaluate it. The use of a self-assessment tool, developed in Europe, Common Assessment Framework (CAF), allows the measurement of the quality of services provided in public administration. In order to evaluate the reliability of the application of the CAF model to Public Higher Education Institutions in Angola, a multivariate analysis it was used. The findings of this study show that the model can be applied with confidence to Angolan HEI. In addition, the CAF model can be a useful tool for HEI to help them get to know each other better and move toward the path of quality, in an endless search for continuous improvement translated into excellent organizational performance.

Keywords: Higher Education Institutions; Common Assessment Framework; Competitiveness; Self-assessment.

INTRODUCTION

The increased competitiveness in organizations, as is the case Higher Education Institutions (HEI) in terms of attracting and keeping students leads education managers reassess their strategy intended at finding the elements and indicators of competitive advantage. According to Watson (2000), strategy management is crucial for a HEI, as it provides the realization of its main activities. To this extent, it is fundamental that educational managers use instruments that help them to effectively know the main strengths of their institution. Since human capital is considered the fundamental element of an effective implementation of the organizational strategy, the only ones where companies can efficiently differentiate themselves from their competitors, since the rest is easily imitated. Thus, human resources certainly represent a sustainable competitive advantage for any organization. In this sequence the application of an instrument capable of measuring job satisfaction can be the key to an adequate measure of organizational performance.

In addition, in organizations it is important not only to assess the needs and customer satisfaction but also the level of job satisfaction and participation, making them feel satisfied in the improvement of their activities. Job activity occupies most of the time of workers, and undoubtedly has a notable importance in the life of the active population. Health and safety are two of the pillars that sustain productivity, so organizations must offer their workers favourable conditions. So that they can develop their activities, ensuring their physical and mental well-being (Chiavenato, 2008). To this extent, it is extremely relevant that the workplace provides well-being, since this satisfaction exhibits a direct connection with the other spheres of workers' lives. According to Graça (1999), job satisfaction comprises an attitude or an emotion that assumes concrete meaning in behaviours and opinions expressed. Barros and Cunha (2010) affirm that it is the activity that determines the set of all the actions (thoughts, feelings and emotions) that characterize human behaviour at work. There are several studies that show that job satisfaction has an effective effect on the productivity of organizations, on the well-being of employees and also on the various dimensions that are directly or indirectly associated with people, both in the labour and personal fields. Several dimensions were indicated in order to ascertain job satisfaction: working and health conditions, job security, achievement, autonomy, relationship, prestige and remuneration. Job satisfaction can be assessed by

different approaches and in different environments. Research at the global level suggests that good socialization practices lead individuals to understand their role more clearly, getting more involved in work and organization, leading to greater satisfaction, since according to Gomes et al. (2008) in the initial stages of the individual's life in the organization, it is important that the new employee has good opportunities to interact and socialize with his peers and leaders.

Job satisfaction has become increasingly important because it is pointed out as a variable, implicitly and explicitly, that is linked cumulatively to the productivity and personal fulfilment of workers. Greater job satisfaction contributes to the professional finds meaning in their work activity and adopts positive attitudes towards institutional development. Bearing as the main objective the quality of services provided in and the measurement of job satisfaction in the Public Higher Education Institutions in Angola, was applied the self-assessment tool, developed in Europe, Common Assessment Framework (CAF), it allows the measurement of the quality of services provided in public administration. In order to evaluate the reliability of the application of the CAF model to Public Higher Education Institutions in Angola, a multivariate analysis it was used. In sum, the present research work aims to contribute to the construction and validation of an instrument that can be used by educational managers and other researchers in assessing the level of satisfaction of academic workers in Public HEI in Angola.

This paper is organized in 5 points. In addition to the present introduction, there is a section with the theoretical framework, another with the supporting methodology of the whole study. Following is the section where the results achieved with the application and validation the model CAF 2006 are displayed and discussed. Finally, the main conclusions and contributions of the present study are highlighted.

THEORETICAL BACKGROUND

In the current context of globalisation, the work environment has undergone profound and significant changes around the need to systematic adaptation of the organizations to the new market challenges (Lawler, 2005). One of the great and current requirements of organizations is to use the range of knowledge in a strategic and integrated way, rather than simply need to retain the best professionals. In this sequence, according to Handel (2005), professionals considered more satisfied, who perceive greater autonomy and decision-making freedom in the pursuit of their activities, tend to become more involved with their work and to perceive it more in function of the designated ones rewards intrinsic, related to their interests, demands and needs, which most impact on their performance and inherently in organizational performance.

Organizations have begun to invest in strategic management and particularly in human resource management, which reveals the progressive concern with people, regarded as the key factor for excellent performance and organizational competitiveness. In addition to the usual sources of competitive advantage, people have come to be seen not as a mere organizational resource that should be managed like other resources but rather as the strategically most important "resource" for gaining competitive advantage. In the search for this advantage, the contribution requested for the human resources management is in the capacity of production of added value, representing this capacity, the implementation of certain strategic activities of human resources management (Mendes, 2012). The systematic and continuous adaptation of organizational practices to environmental changes and the adoption of leadership styles that stimulate the proximity between goals and interests shared by professionals and organizations undoubtedly lead to the improvement of sustainable organizational performance. To this extent, organizations such as HEI must implement a human resources management that is closer to professionals, which verifies the impact of their actions on their performance, with special incidence on measuring of the level of the satisfaction of their employees.

The importance of the job satisfaction construct to the area of organizational behaviour remits the researchers to respond to the challenge of evaluating it in a valid and precise way. In order to respond to this challenge, the objective proposed of this research was the adaptation and validation of the Common Assessment Framework (CAF), widely used in Europe, to measure the degree of satisfaction of HEI public professionals in Angola. It is intended that the validated application of the CAF scale make it possible to understand the perception of these professionals about this reality, to know what motivates them and what their expectations, and through this knowledge enhance their productivity and efficiency, as well as the quality of higher education Public of Angola. Lobos (1978) argues that so many managers and social researchers believe that if work dissatisfaction were reduced, human barriers to production would be eliminated and transformed into a force that would promote improved performance and consequently productivity.

With regard to the professionals of the higher education, the way in which they feel and faces his work, determine categorically the success and the quality of the education. Because it is a profession that is dynamized particularly in the field of human relations, satisfaction in the workplace becomes essential. In fact, teaching is a profession that has undergone changes and restructurings in the sense of achieving excellence in teaching. With the increasing development of communication and information technologies, education professionals need constant updating so

as not to compromise professional competence and the quality of teaching and service delivery to students and the community.

Some investigators have dedicated special attention to examine the supposed relation between the job satisfaction and professional performance and consequently organizational competitiveness. Locke (1976) understands job satisfaction as an emotional state, pleasant or positive, which necessarily results from work-related experiences. Such an emotional state is determined by agents (such as relationships with bosses and colleagues, organizational policies and procedures, etc.) and events (such as physical conditions in the industry and recognition by others) related to the work, capable to promote such satisfaction. According to Suar, Tewari and Chaturbedi (2006) job satisfaction is the individual's perception of intrinsic aspects (levels of responsibility, autonomy, functional progression, and others) and extrinsic ones (challenging work, salary, hours of work, type of work Position, among others) related to their performance within organizations. Such definitions of satisfaction directly influence the type of measure used, whether a general satisfaction measure or a measure that evaluates its dimensions or facets separately. There are a large number of measures associated with the operationalization of this variable. Tsang and Wong (2005) define job satisfaction as a positive emotional state or pleasure sensation resulting from assessment of a work or related aspects simultaneously. For Scott-Ladd, Travaglione and Marshall (2006) job satisfaction is understood as how much an individual really likes what he does. It refers, therefore, to an attitudinal response of the individual around how much work gives him rewards and compensations, not necessarily financial ones. The individual would feel satisfied from his attitude towards interpersonal relationships with peers, the confidence climate established in his sector, the friendship among his colleagues, among other intangible aspects that would promote this satisfaction.

Moreover, several studies (Locke, 1969; Cura & Rodrigues, 1999; Judge, Thoresen, Bono & Platton, 2001; Aiken, Clarke & Sloane, 2002; Martinez, Paraguaya & Latorre, 2004; Marquez & Moreno, 2005; Santos, Spagnoli, Ramalho, Passos & Caetane, 2010; Moura, 2012; Azevedo, 2012; Leite, 2013) point to an implicit link between job satisfaction and the high performance of its professionals. According to Lu, Barribal, Zhang and While (2011) workers' expectations play a role in the traditional model of job satisfaction and, in turn, job satisfaction is related to performance. Mezomo (2001) points out that an organization with satisfied employees has a potential advantage, since, as a rule, it attracts the best, reduces staff turnover, increases productivity, reduces costs, improves image in the community and gains competitiveness. The senior works of a higher education institution have an important role in creating job satisfaction, identifying which factors cause satisfaction and/or dissatisfaction, and to use those data to identify strategies that lead to improved situations that are less satisfactory, and to use this data to identify strategies that lead to improving less satisfactory situations, since they are crucial aspects since job satisfaction has a significant impact on employees' commitment to organizations, work performance and motivation (Noordin & Jusoff, 2009; Machado-Taylor, Soares & Gouveia, 2010; Machado-Taylor, et al., 2016).

In addition, job satisfaction is an indispensable condition for improving the functioning of organizations, and educational managers have a decisive role, through the promotion of strategies that lead to increase the satisfaction of the workers, with a view to achieving results in terms of creativity, commitment and productivity (Alpay & Verschoor, 2014; Castro et al., 2011, Machado-Taylor et al., 2016, Wei & Junyan, 2015).

METHODOLOGY

Process of construction and adaptation of the CAF 2006 Model

The adaptation and application of the scale was based on a bibliographical review based on literature and research studies on the satisfaction of workers who mainly used the CAF model, this model was elaborated and validated by the European Union, with the support of the Speyer Academy, representative of the German quality model, and the European Foundation for Quality Management (EFQM). The CAF model is a tool that allows public organizations to carry out self-assessment exercises in a perspective of continuous improvement since it is a Total Quality Management tool and was developed based on the Excellence Model of the European Foundation for Quality Management (EFQM). CAF is used throughout Europe as a common framework for quality assessment of Public Administrations and to assist them in the pursuit of excellence. It should be noted that CAF analyses the organization from different angles, promoting a holistic analysis of its performance. The present study was based on the perspective of teaching and non-teaching staff. It is important to mention that this study also intends to measure the satisfaction that the employees have in relation to the remuneration system in force, which is why recourse was made to the questionnaire on teacher and non-teacher satisfaction and dissatisfaction, adapted and validated for the Portuguese population by Seco (2000) being the original author of this questionnaire is (1982). From this questionnaire were extracted 4 items that evaluate the satisfaction with the current remuneration.

The questionnaire is composed of 82 items and is organized in 2 parts. In the first part, questions were asked in order to obtain elements of sociodemographic and professional characterization of the individuals (13 items). In the second part of the questionnaire, an instrument for satisfaction study was introduced, namely the CAF 2006 model. This part is composed by the set of 8 Factors (total of 69 items), such as: Overall satisfaction with the

institution with 9 items, Satisfaction With management and management system with 9 items, Satisfaction with working conditions with 8 items, Satisfaction with career development with 5 items, motivation levels with 5 items, Satisfaction with leadership style Top management with 11 items, Satisfaction with leadership style intermediate management with 11 items, Satisfaction with the conditions of hygiene, safety, equipment and services with 7 items and satisfaction with the compensation system with 4 items. In summary, this study intends to validate the adaptation of the professional satisfaction scale corresponding to the second part of the questionnaire, composed of seven dimensions taken from the CAF 2006 model and a dimension proposed by Seco (2000) to evaluate the remuneration system. The 69 items that make up the 8 factors are expressed in affirmations, in which the professionals of the Higher Education indicate the degree of satisfaction with their place of work. Thus, the present scale aims to evaluate the satisfaction of these professionals related to aspects of work dynamics, such as leadership (intermediate and top leadership styles), management systems, internal career development, hygiene conditions, safety, equipment and services, Working conditions, motivation and professional valuation and remuneration. It is a Likert-type scale with five response options: 1 = Very Unsatisfied, 2 = Unsatisfied, 3 = Moderately Satisfied, 4 = Satisfied and 5 = Very Satisfied.

Instrument and Procedure for data collection

As a data collection instrument, a questionnaire was sent to all teaching and non-teaching professionals of the Public Higher Education of the Province of Kwanza South in Angola (n = 147). The data collection was carried out from May 6 to 22, 2016. This distribution was made after obtaining superior authorization to perform the data collection in the two public institutions of Higher Education of Kwanza South: Institute Superior Polytechnic of Kwanza South (ISPKS) and Institute of Education Sciences (ISCED) of the Sumbe. After obtaining the questionnaires, statistical data were processed in the Statistical Package for the Social Sciences (SPSS) 20 program.

Data analysis procedure

Participants' responses were treated using SPSS software and subjected to descriptive statistical analysis, factorial analysis and Cronbach's alpha calculation. The data were examined for normality, collinearity and distribution of outliers. The factorial of the sample was tested by the Kaiser-Meyer-Olkin Coefficient and Bartlett's sphericity test, as recommended by Marôco (2010). After that, the data were submitted to analysis of the Principal components (PC) and the Factorization of the Principal Axes (PAF). The reliability of the factors was estimated by the calculation of Cronbach's alphas. In sum, for the validation of the scale, it was made the first extraction of its factors (dimensions and components) was performed by analysing its Principal Components (PC) in order to verify the initial number of factors in the matrix. We also analysed extreme cases, multicollinearity and matrix factorization through sample size, intercorrelations, as well as distribution of the eigenvalues and graphic analysis through the scree plot. Then, Principal Axis Factoring was carried out. Factor scores were also calculated.

Sample Profile

The sample was consisted of 147 individuals, 64.6% (95) of these professionals work at ISPKS and 35.4% (52) at ISCED. Regarding gender, 61.2% (90) of the respondents are male and 38.8% (57) female. As to age, 25.9% (38) of the individuals were aged up to 30 years, 41.5% (61) were between 31 and 40 years old and 32.7% (48) were over 40 years old. Of the respondents, 81% (119) of respondents are Angolan, 17% (25) of respondents are Cuban, one is Portuguese and two are Vietnamese. Regarding marital status, 57.1% (84) were single, 38.8% (57) were married / de facto, two were divorced and four were widowed. The majority of respondents, 81.6% (120) had children, these individuals 21.1% (31) had one child, two children and 27.9% (41) had three to five children. With regard to qualifications, it was observed that 3.4% (5) had completed the 1st cycle of secondary education, 12.9% (19) finished secondary school, 17.7% (26) graduated with a bachelor's degree, 29.3% (43) of the respondents were graduates, 33.3% (49) finished the master's degree and one respondent has the doctoral degree. Regarding the employment relationship, 68.0% (100) stated that they were effective and 32.0% (47) were employees.

Table 1: Sample Profile

Variables		<i>n</i>	%

	Total	147	100

FINDINGS

Validity and Reliability

The legitimacy of the factorial analysis was assessed by the Kaiser-Meyer-Olkin of Adequacy (KMO) measure of adequacy. The value obtained was 0.90, considered as very good according to Marôco (2010). Which means a strong correlation between the variables. The Bartlett test ($p < 0.001$) allows us to conclude that the variables are significantly correlated. In this way, it can be ensured that with the available sample, the scale is subject to factorial analysis.

Factor analysis

Exploratory factorial analysis was performed, and it were obtained eight factors (components) with a value greater than 1 (Figure 1) explaining 68.04% of the total variance (Table 2). The obtained values demonstrated, according to Marôco (2010), to be acceptable for the pursuit of the study.

Figure 1: Scree Plot

Moreover, Table 2 shows that all variables have a strong or moderate relationship with the retained factors, because for the extracted factors, the percentage of the variance of each variable explained by the common factors extracted was higher than 49,8% for all variables.

Table 2: Components Matrix

Factors	Own Value	% de Variance	% Cumulative Variance
1	27,269	39,520	39,520
2	5,628	8,156	47,676
3	3,607	5,228	52,904
4	2,566	3,719	56,624
5	2,229	3,231	59,855
6	2,122	3,075	62,930
7	1,880	2,725	65,655
8	1,648	2,388	68,043

Table 3 shows the main factor matrix obtained by the Varimax rotation method. In the factorial analysis, no item was excluded, all of which presented a correlation value higher than 0.30, in fact the minimum value obtained was 0.36. After the eight factors were obtained, their designation was made, taking into account the theoretical reference. Thus, the dimensions that make up the Satisfaction Scale were denominated: Satisfaction with Management and Management Systems that encompass Internal Career Development, Satisfaction with the Intermediate Leadership Style, Global Satisfaction of Workers with the Institution, Satisfaction with Style Leadership - Top Management, Satisfaction with the Conditions of Hygiene, Safety, Equipment and Service, Levels of Motivation, Satisfaction with the Current Remuneration System and Satisfaction with Working Conditions.

By performing a cross-analysis of tables 2, 3 and 4 we can describe the eight dimensions with respect to its composition of the items and the explanation of each dimension for the total variance. Satisfaction with Management and Management Systems was the first dimension obtained after the factorial analysis of the CAF model was carried out. It constituted by 15 items that refer to the satisfaction with the relationship established between the worker and the Management, the Management Systems and the internal development of the career. This first factor explains 39.52% of the total variance. The second dimension, Satisfaction with the Intermediate Leadership style is composed of eleven items that explains 8.16% of the variance. The all items refer to the intermediate leadership of the workplace. The third dimension obtained after conducting a factorial analysis was called Global Satisfaction of workers with the Institution. The name assigned is related to the nature of the items, which refer to aspects related to overall satisfaction with the Institution. This dimension consists of 12 items that explains 5.23% of the variance. The Top Management Leadership Satisfaction dimension consists of twelve items that account for 3.72% of the variance. All items refer to aspects related to satisfaction with the leadership style adopted by Top Management. The fifth dimension Satisfaction with the Conditions of Hygiene, Safety, Equipment and Service, is composed of seven items that explain 3.23% of the variance. The same items refer to the organizational structure of the workplace and resources. In this dimension the hygiene and safety conditions of the premises, the equipment / materials and the physical work space are taken into account. The sixth dimension refers to the levels of motivation of the workers, it is composed of five items that explain 3.08% of the variance. Satisfaction with the current remuneration system was the seventh dimension obtained after the execution of the factorial analysis. It consists of four items that explain 2.73% of the variance. This dimension is composed of items that refer to the satisfaction with the remuneration in relation to the work performed and the literary qualifications. The last dimension obtained Satisfaction with working conditions consists only of 3 items that explain 2.38% of the total variance. These items refer to the satisfaction with the working environment, working hours and the conjugation of work with family life.

The internal consistency study was performed using Cronbach's alpha coefficient (Table 4). All dimensions have obtained values for the Cronbach Alpha ranging from 0.795 to 0.96, which means that the dimensions have a good internal consistency. We highlight the first 5 dimensions of the satisfaction scale with values above 0.90, which means according to Hill and Hill (2009) that these dimensions present an excellence internal consistency. In the remaining dimensions Cronbach's alpha values are very good, according to Marôco (2010). Thus, taking into account the previously mentioned, it can be said that the values demonstrate an internal consistency appropriate to the achievement of the study (Table 4). Regarding the determined factors, it can be seen from table 4 that the best results in average terms occur for the factors (dimensions): F2, F6 and F8, while the less satisfied perspective happens in factors F5 and F7.

Table 4: Statistic Summary of Factors extracted by Factorial Analysis

Factors	Items	Alpha de Cronbach	Minimum	Maximum	Average	Standard Deviation	Medium
F1	7;9;12;15;16;17;18;20; 24;25;26;27;28;29;30	0,960	1,07	5,00	3,12	1,01	3,13
F2	48;49;50;51;52;53;54; 55;56;57;58	0,947	1,45	5,00	3,73	0,88	3,82
F3	1;2;3;4;5;6;8;11;13;14; 19;31	0,920	1,17	5,00	3,59	0,76	3,67
F4	10;37;38;39;40;41;42; 43;44;45;46;47	0,939	1,00	5,00	3,64	0,87	3,75
F5	59;60;61;62;63;64;65	0,900	1,00	5,00	2,88	0,98	2,71
F6	32;33;34;35;36	0,876	1,20	5,00	3,78	0,93	4,00
F7	66;67;68;69	0,837	1,00	5,00	3,10	1,06	3,25
F8	21;22;23	0,795	1,00	5,00	3,77	0,89	4,00

Correlation between Factors

Concerning the correlations between factors and total scale, it is observed that F1, F3 and F4 are the ones that present a stronger relation with the total score. Among factors, there are correlations of weak to moderate intensity, although they are all statistically significant. In short, the correlations between the factors are positive and statistically significant, being an indicator of consistency between the dimensions of the construct and also the validity or fidelity argument of the measure (Table 5).

Table 5: Correlation between Factors

	F1	F2	F3	F4	F5	F6	F7	F8	TOTAL
F1	1	0,636**	0,693**	0,785**	0,695**	0,459**	0,460**	0,510**	0,925**
F2		1	0,409**	0,708**	0,466**	0,337**	0,196*	0,340**	0,750**
F3			1	0,538**	0,552**	0,587**	0,449**	0,486**	0,785**

F8								1	0,572**
TOTAL									1

Note: **Correlation is significant at the 0,01 level (2-tailed).

DISCUSSION AND CONCLUSION

In this study, the application of the CAF 2006 Satisfaction Scale was validated in a population of teachers and non-teaching personnel from Public Higher Education of Angola, belonging to the Kwanza South Public HEI: ISPKS and ISCED of Sumbe. It was verified that the minimum, maximum, average and median values are distributed over the intervals of the response scale, revealing some sensitivity in the evaluation of the construct. The value obtained from KMO was 0.90, being the same, according to Marôco (2010) considered excellent. Concerning the values of the Cronbach alpha, the scale dimensions presented values varying between 0.795 and 0.96, values that mean a very good internal consistency (Hill & Hill, 2009; Marôco, 2010), which shows a good Reliability of the instrument of the professional satisfaction scale. By means of the above, it can be affirmed that the results obtained have proved satisfactory in all dimensions to the pursuit of the study. An exploratory factorial analysis with varimax rotation was performed. After the same, the 69 items under evaluation were grouped into eight dimensions named, according to the bibliographic research by: 1) Satisfaction with Management, Management Systems and Career Development; 2) Satisfaction with the Intermediate Leadership Style; 3) Global Satisfaction of Workers with the Institution, 4) Satisfaction with Leadership Style - Top Management; 5) Satisfaction with the Conditions of Hygiene, Safety, Equipment and Service; 6) Levels of Motivation; 7) Satisfaction with the current Remuneration System and 8) Satisfaction with Working Conditions. The dimensions that constituted the final version of the professional satisfaction assessment instrument explain 68.04% of the total variance. In the present study, the fact that the research design was transversal could be considered as a limitation, since it did not allow to test the stability of the instrument, i.e. its capacity to produce the same results in successive applications.

This study aimed to validate the satisfaction scale in the CAF 2006 work. It was intended to verify the factorial structure of this scale obtained in a sample of the professionals of Public Higher Education of Angola, and thus verify the validity of the application of the CAF 2006 model, developed In a European context, to measure the degree of satisfaction of HEI professionals in Angola. The results pointed to an empirical structure similar to the CAF 2006 model, made up of eight factors. The eight dimensions identified allow the evaluation of the degree of satisfaction of the individuals in relation to both the working conditions, such as the perception of the degree of satisfaction with the leaders, and the characteristics more intrinsic to the task. Some dimensions can be evaluated separately, in the case of replication of this scale in organizations. If there is, for example, an interest in investigating the greater or lesser satisfaction of the individual with the organization's remuneration policy, it is recommended to analyse the items belonging to this factor. The same can be observed in relation to other dimensions identified, such as the degree of satisfaction with leadership styles, satisfaction with working conditions, among others. In summary, the CAF 2006 scale was reliable for what it aims to evaluate, and it is an important tool in the strategic of management human resources within organizations, especially in the specific case of HEI. It is recommended that there be replication in other organizations, with distinct cultural characteristics and a diversified organizational structure compared to those used both in their original design of the CAF 2006 model and in this study.

In addition, employee satisfaction correlates with productivity and the sustainable competitiveness of

organizations. It is therefore important to assess the satisfaction of workers to promote working conditions based on their needs while ensuring their physical and mental well-being. The purpose of this study was to present the construction and validation of the CAF 2006 Scale for the context of Angolan Higher Education. The scale consisting of 69 items that are grouped in eight factors, allows evaluating the satisfaction of the professionals that perform functions at HEI. This model proved to be easy to apply and presented a good index of reliability and validity, so it can be a valuable tool for studies that intend to evaluate the perception of job satisfaction at HEI.

ABSTRACT

Qur'an is the central religious text of Islam, which Muslims believe to be a revelation from God (Arabic: الله, Allah). It is widely regarded as the finest piece of literature in the Arabic language. Translation of the Qur'an has always been a problematic and controversial issue for each translator in the Islamic theology. Furthermore, translating Qur'anic text might raise several serious problems in translation; these problems are due to the different translations of puns and the misinterpretations between the intended meanings of pun with their inherent notions, which could result in a certain amount of ambiguity. The present study deals with problems of translating the rhetorical purposes of puns in the Glorious Quran into English. The study examines Quranic text and its four widespread English translations by Yusuf Ali (2014), Pickthall (1963, 2011), Arberry (1991), and Shakir (1999). The research corpus is based on four verses (Ayat) selected randomly from the Holy Quran. The objectives of this study are to determine the pun translation strategies applied by the translators in translating the Quranic puns from Arabic into English in terms of Delabastita's (1996) strategies. In addition, to find out to what extent is the meaning of the Arabic puns has maintained in the English translation with regard to Newmark (1988) translation methods. A descriptive method was used to analyze the data. The researcher calculated the frequency and percentage of strategies applied by each translator. The findings of the study will pave the way for further investigations on the translatability of different issues in the Holy Quran.

Keywords: the holy Quran, pun sentences, methods of translation, Delabastita strategies, typology of puns.

INTRODUCTION

Islam is a worldwide religion, which was sent to all humanity. Its teachings, orders, prohibitions and laws are all found in its holy book, the Quran. The holy Quran is a unique form of Arabic speech, and is divided into chapters (sura in Arabic), which are then divided into verses (ayah). The totality of every chapter has a special character, with its own unique form, and its unique use of literary devices.

Pun is one of the rhetoric devices that have been frequently used in the holy Quran. The puns have brought forth a sublime reconciliation between form and content.

Several scholars (e.g., Alexieva, 1997; Delabastita, 1996; Weissbord, 1996) used the terms wordplay and pun interchangeably; however, since distinguishing between wordplays and puns is not the focus of this study, it will be assumed that puns are included in the given definition of wordplay. Shaw (1905) indicated that puns have appeared in literature since the time of Homer, 8th century B.C., states that pun is the humorous use of a word emphasizing different meanings or associations. Some scholars (e.g. Delabastita, 1997; Leech, 1969; Newmark, 1988) emphasized the homonymous and polysemous nature of words used in pun or wordplay. According to Newmark (1988, p. 217) one makes a pun by using a word, or two words with the same sound (piece-peace), or a group of words with the same sound (personne alitee / personnalite) in their two possible senses. He adds that the purpose of making a pun is to arouse laughter or amusement, and sometimes to concentrate meaning. Based on the reason that puns depend on the structural features of a language, and that different languages have different structures, it is believed that the task of translating them to be a very difficult one. The translation even will be more difficult between unrelated language systems such as Arabic and English. Besides the language distinctions, the different cultural backgrounds are also big barriers to translate Arabic puns into English. Moreover, the translation of the Quranic puns will causes serious problems to the translators since the holy Quran is a unique expression of the Arabic language and nothing can match its literary form.

A brief look at the studies on pun indicated that so far very little research has been done in the field. The current study is one of the few studies that focused on the holy Quran and pun translation from Arabic into English. It is conducted to see the strategies were applied by different translators in rendering the Quranic puns into English.

STATEMENT OF PROBLEM

Pun makes Arabic texts (Quranic, poetic and everyday formal expressions) more vivid and their content richer in semantic values. Puns are not often used for daily speech, so they have gained little attention from researchers. Puns are mainly used to attract the attention of the hearer/ speaker towards the dual meaning of the verse or sentence for example, {قَالُوا تَأْتِيهِمْ مِنْ قَبْلِهِمْ سَبْحًا}، They said: "By God, you are still persisting in your old delusion." Here

the pun word is ضَالِكٌ which has two meaning, (1) ignorance and (2) love 'still loving Yusuf and don't forget him'. This meaning may deviate from its platform to yield another new meaning for instance, the first one is "not intended meaning", while the second is "intended meaning". Tanaka (1994: 68) notices, "Puns attract attention because they frustrate initial expectations of relevance and create a sense of surprise." The translator stands helpless towards such expression since it has two different meanings. Thus, the translator has to make a clear distinction in order to convey the real meaning of such an expression to the reader.

The Quran is opulent with a variety of meanings relevant to pun sentences, which are deserve an intensive study. The present study investigates the translation of prominent types of pun sentences in the Glorious Quran, which contain a given rhetorical purpose. It argues that each pun sentence has a particular rhetorical purpose, which may be missed if the translator fails to capture it through translation from Arabic to the target language. Consequently, the internal meaning of the pun sentence will be distorted and a different meaning of the original message is produced. Furthermore, rhetorical pun sentences are associated to the feelings of the speaker thus may be problematic issue to the translator seeking to determine how to convey that sentiment into the target language. Besides, sometimes there is a loss of meaning since the translator uses various linguistic components, which unrelated to the cultures involved. Although the use of pun sentences is quite common in the Glorious Quran, there are no studies to explicate the problem from translation perspective. Hence, the current study is intended to fill this gap. In other words, the intention of the current study is not to focus upon the amusing, tricky, and even humorous effects produced by puns. The aim is to pinpoint pun translation as a problematic area in Quran translation.

RESEARCH QUESTIONS OF THE STUDY

This study is an attempt to answer the following questions:

- 1) What are the translation strategies applied by the different translators in translating the Quranic puns from Arabic into English in terms of Delabastita's (1996) strategies?
- 2) To what extent is the meaning of the Arabic puns maintained in the English translation?

SIGNIFICANT OF THE STUDY

The current proposed study reserves its significance from the significance translation of the Holy Quran and the function of puns in creating a coherent and meaningful text through utilizing different types of puns in the text.

To the best knowledge of the researcher, and although to date there has been little of literature available on the contrasting parts between English and Arabic with regard to the Quranic pun, in each language, little work has been done on it. As far as translation is concerned, this study is expected to be of great value in the sub-field of rhetoric pun on Quran translation between English and Arabic as a great deal of pun meanings and functions are found in both languages.

Furthermore, this study is hoped to contribute some important findings to the translation of Quranic text.

SCOPE AND LIMITATION OF THE STUDY

The study covers and tackles the English translation of Arabic puns in the Quranic text, and its inherent meaning. The study will focus only on the meaning, rhetoric function and strategies used of translating Quranic pun from Arabic into English.

LITERATURE REVIEW

Translation of Pun

According to Delabastita (2004), whether serious or comical, wordplay creates linguistic problems of translatability because different languages have different meaning-form distributions. Delabastita (1996) also believed that puns due to the combination of the subject-oriented (reference) and the self-oriented (self-reference) mode of language from which puns lend their individuality, present special problems to translators. Furthermore, he noted that a structural and typological dissimilarity of source and target language increases the linguistic untranslatability of puns (1996).

Alexieva (1997) argued that: the difficulty of translating puns is caused by the asymmetry between world and language manifesting itself in different ways in different languages. For example, a word, which has a set of multiple meanings in one language, may have a corresponding word in another with only one meaning or with a different set of multiple meanings.

As Weissbrod (1996) stated there are always subjective features relevant, including the translator's talent, proficiency, and willingness to spend time finding solutions in the face of hard-to-translate wordplays.

Delabastita strategies of pun translation:

Delabastita (1996) has presented the following translation strategies for wordplay (pun):

1. *Pun to pun*: the source text pun is translated by a target language pun, which may be more or less different from the original wordplay in terms of formal structure, semantic structure, or lexical function.
2. *Pun to non-pun*: the pun is rendered by a non-punning phrase, which may salvage both senses of wordplay but in a non-punning conjunction, or select one of the senses at the cost of suppressing the other; of course, it may also occur that both components of the pun are translated beyond recognition.
3. *Pun to related rhetorical device*: the pun is replaced by some wordplay related rhetorical device (repetition, alliteration, rhyme, referential vagueness, irony, paradox, etc.) which also aims to recapture the effect of the source text pun.
4. *Pun to zero*: the portion of text containing the pun is simply omitted.
5. *Pun ST= pun TT*: the translator reproduces the source-text pun and possibly its immediate environment in its original formulation, i.e. without actually „translating“ it.
6. *Non pun to pun*: the translator introduces a pun in textual positions where the original text has no wordplay, by way of compensation to make up for source text puns lost elsewhere, or for any other reason.
7. *Zero to pun*: entirely new textual material is added, which contains wordplay that has no apparent precedent or justification in the source text except as a compensatory device.
8. *Editorial techniques*: explanatory footnotes or endnotes, comments provided in translator's forewords, the anthological presentation of different, supposedly complementary solutions to the same source text problem, and so forth.

Translation Methods

Newmark (1988, p. 18) suggested a concrete steps and procedures in order to transfer the ST into the TL. Newmark (1988, p. 144) confirms that there are three basic translation processes:

- a. The interpretation and analysis of the SL text;
- b. The translation procedures, which may be direct, or on the basis of SL and TL corresponding syntactic structures, or through an underlying logical 'interlanguage';
- c. The reformulation of the text in relation to the writer's intention, the readers' expectation, the appropriate norms of the TL, and so on.

Accordingly, the translator first must understand or figure out the SLT. The process of understanding involves analyzing the text in several ways, linguistically, semantically, syntactically and culturally. The second phase is the transformation, where the translator tries to frame the meaning of the SLT to fit, linguistically and culturally, the TLT. The third phase is to produce the TT.

Translation of the Holy Quran

The opponents of the illegitimacy of the holy Quran translation believe that "it is legitimate to translate all verses of the Quran to the foreign tongue" (Baker & Saldanha, 2008, p. 201). Their rationale is that we live in an era in which the wider demand for translations of the Quran, among Muslims and non-Muslims alike, has become far greater than at any time in the past. Thus, "Non-Muslim audience in many different parts of the world turns to the Quran almost always in translation in the search for the bases of deeper mutual understanding" (Morris, 2000, p. 53).

Muslim scholars take two opposing stands regarding the translation of the holy Quran: Some accept the idea of translating it while others refuse its translation totally. In the second edition of Routledge Encyclopedia of Translation Studies (2009), the translatability and legitimacy of the translation of the holy Quran has been discussed. For example, it mentions that the Quran cannot be translated with the view that the book has senses, which are exclusive to the Quranic Arabic. On the other hand, the Al-Azhar Encyclopedia states that 'Al-Azhar Alsharif' (Egypt's renowned Islamic institution, al-Azhar al-Sharif, has been serving the Islamic World for more than 1,000 years) agreed on Pickthall's translation of the Quran. As long as, his 1930 translation does not carry the title of 'The Quran', rather it should be 'a translation, or interpretation of the meanings of the Quran'. According to Arberry (1998), rhetoric and rhythm of the Koran are so distinctive, powerful and emotive that any translation seems to be just a poor copy of the glorious original.

Many orientalist and linguists have highlighted the uniqueness and sensitiveness of the Quran as a text, making it a genre of literary beauty (Tzortzis, 1960). As Mir (2000) states, what makes the literary repertoire of the Quran

rich is its masterful use of language on the level of words and phrases. According to him, the all-pervading rhythm along with the rhymed prose creates, in many verses, a spellbinding effect for those who can read the Quran in Arabic that is impossible to reproduce.

Definition of Pun in English

Also, in this definition, according to Sanderson (2009): According to Delabastita (1996): wordplay is the general name for the various textual phenomena in which structural features of the languages used are exploited in order to bring about a communicatively significant confrontation of two (or more) linguistic structures with more or less similar forms and more or less different meanings. (p. 128). In this definition, it is stated “the pun is based on the confrontation of linguistic forms that are formally similar, but have different meanings” (Delabastita, 1993, p. 58).

The formal similarity is manifested in terms of spelling and pronunciation. It is therefore the confrontation of similar forms and dissimilar meanings between linguistic structures, which rise to ambiguity. This means that ambiguity arises because words that look and/or sound the same but have different meanings are exploited in such a manner that an additional semantic layer is added to the otherwise stable relationship between signifier and signified (p. 123).

Categorization of Pun in English

Several criteria can be attended to carry out a categorization of wordplay. Delabastita, (1993) applied a formal criteria and a linguistic phenomenon as basis of his classification. According to the formal criterion, a distinction can be drawn between two types of puns, namely vertical pun and horizontal pun. Delabastita asserted that different types of horizontal pun are Homophony, homography, paronymy, and homonymy (Ibid). He explained the puns as the follow:

- *Homophonic pun* is based on the exploitation of word pairs, which sound alike, but are different in spelling. An example of such word pair is tale and tail.
- *Homographic pun* indicates two expressions, spelt the same way and creating graphemic ambiguity. A word of the same spelling as another but derived from a different root and having a different meaning (e.g., to wind and the wind; to present and a present or bow (the front part of a ship), bow (to bend), and bow (a decorative knot)).
- *Paronymic pun* exploits words that have slight differences in both spelling and pronunciation. An example of such a word pair is adding in Salt/insult to injury.
- *Homonymic pun* is comprised of words that are identical in both spelling and pronunciation. The words have different meaning, though. An example is the word bear, which can be a verb (to carry) or a noun (the animal).
- *Syntactic pun* is constituted by a statement, which can be analyzed syntactically in at least two different ways.
- *Morphological pun* is composed by words, which can be related to other words by means of morphological devices such as derivation or compounding.

Definition of Pun in Arabic

Originally, the Arabic rhetorical term “التورية” [at-Tawriyyah, lit.pun] is derived from the Arabic statement “وَرَيْتُ الْخَيْرَ أَوْ الشَّيْءَ” [warraytu al-khabara aw al-shaya] which literally means, “I have hidden the news or the thing in order not to be known by others”. Technically speaking, it means intentionally hiding a very subtle sense of a spoken or written text and makes it difficult or impossible to be completely grasped by certain people in an audience (Al-Jawhari, 1956:2523). This interpretation is clearly supported by a number of Quranic texts such as:

(1) Surah “An-Nahl, The Bee”, ayah 59.

. يَتَوَارَىٰ مِنَ الْقَوْمِ مِنْ سُوءِ مَا بُشِّرَ بِهِ

He hides Himself with shame from his people, Because of the bad news he has had.

(2) Surah “Al-Ma'idah, The Table” ayah 31.

فَبَعَثَ اللَّهُ غُرَابًا يَبْحَثُ فِي الْأَرْضِ لِيُرِيَهُ كَيْفَ يُورِي سَوْأَةَ أُخِيهِ

Then God sent a raven that scratched the ground in order to show him how to hide the nakedness of his brother.

Rhetorically speaking, the Arabic term “تورية” and its English counterpart “pun” both refer to a figure of speech which is rich in its linguistic (syntactic, semantic, morphological, and lexical) content. Pun is seen by Arab rhetoricians as a fundamental figure of speech for its rhetorical force in texts. It has been used as a rhetorical device and played an essential role in both poetry and prose since the pre-Islamic era. It has been frequently used in the Glorious Quran as well as in the Prophetic Tradition to express certain semantic values in various textual structures. Abd Ut-Tawwab (1967) defined pun “At-Tawriyyah” as:

“A word which has two meanings: Adjacent with clear reference, and far with hidden reference. The latter is often intended. The faster that comes to the hearer’s mind is the approximate meaning. The speaker aims at the far meaning but uses the near one to cover it” (p. 293).

Briefly speaking, English rhetoricians mostly concentrate on a number of phonologically oriented rhetorical figures, which have homophonic, homographic and / or homonymic nature, and consider them as major types of pun, while the Arab rhetoricians treat these western puns as types of paronomasia, therefore they are seen as non-puns in Arabic rhetoric.

Categorization of Pun in Arabic

According to most Arabic rhetoricians (al-Qazwini, 1975:p.499; Al-Satiq, 1971;As-Safadi, 1987; Ibn abi Rabi'ah, 1935; Al-Jawhari, 1956) there are four main types of Arabic puns which are governed and controlled by a logico-semantic contextual framework which determines both their immediate and far-fetched meanings. According to this criterion, pun is divided into:

(1) Tawriyyah al-Mujaradah (stripped-off pun)

In this type of pun, devoid from duo; the lexical requirements of the punned with (al-muwarra bihiالمواري به), which normally represents the immediate meaning, and the requirements of the punned to (al-muwarra anhuالمواري عنه), which are represents by the remote meaning. Consider the following Quranic text:

Surah "Taha", ayah 5.

الرَّحْمَنُ عَلَى الْعَرْشِ اسْتَوَىٰ

The ever merciful, established on the throne (of authority).

(2) Tawriyyah al-Murashahah (strengthened pun)

In this type of pun, there must be a lexical requirement for the punned with بهالمواري به, i.e. the immediate meaning, which should be stated either before or after the punnable word. According to this definition, the present type of pun is divided into two subtypes:

I. Pre-required Strengthened Pun

The speaker\writer should provide a lexical requirement for the "punned with بهالمواري به - immediate meaning" before the word, which carries the pun.

Consider the following Quranic text:

Surah "Adh-Dhariyat", ayah 47.

وَالسَّمَاءَ بَنَيْنَاهَا بِأَيْدٍ وَإِنَّا لَمُوسِعُونَ

We built the heavens by Our authority; and We are the Lord of power and expanse.

II. Post-required Strengthened Pun

The speaker\writer should provide a lexical requirement for the "punned with بهالمواري به - immediate meaning" after the word, which carries the pun.

Surah "Al-Ghashiyah", ayah 8.

{وَجُوهٌ يُّؤْمِنُونَ نَاعِمَةً} {لَسْتَغْفِرُهَا رَاضِيَةً}

Many faces will be joyous on that day

(3) Tawriyyah al-Mubayyinah (clarifying pun)

In order for this type of pun to work properly, the speaker\writer should provide a lexical requirement for the "punned to عنهالمواري عنه - remote meaning" before or after the word, which carries the pun.

Thus, this type of pun is divided into two subtypes:

I. Pre-required Clarifying puns:

The speaker\writer should provide a lexical requirement for the "punned to عنهالمواري عنه - remote meaning" before the word, which carries the pun such as:

Surah "Yousuf", ayah 70.

فَلَمَّا جَهَّزَهُمْ بِجَهَّازِهِمْ جَعَلَ السِّقَايَةَ فِي رِجْلِ أَخِيهِ ثُمَّ أَذَّنَ مُؤَذِّنٌ أَيُّهَا الْعَبْرِيُّ إِنَّكُمْ لَسَارِقُونَ)

When he had given them their provisions, he put his goblet in his brother's saddlebag. Then a crier announced "O men of the caravan, you are thieves."

I. Post-required Clarifying puns:

The speaker\writer should provide a lexical requirement for the "punned to عنهالمواري عنه - remote meaning" after the word, which carries the pun such as:

Surah "Al-Rahman", ayah 6.

{السَّمْسُ وَالْقَمَرُ بِحُسْبَانٍ} {5} {وَالنَّجْمُ وَالشَّجَرُ يَسْجُدَانِ}

The sun and moon revolve to a computation; And the grasses and the trees bow (to Him) in adoration.

(4) Tawriyyah al-Muhayyah (preparing pun)

In this type, the pun can only be considered if it came before or after a punnable word.

Surah "Al-Rahman", ayah 6.

(يوم تقوم الساعة يقسم المجرمون ما لبثوا غير ساعة)

The day Resurrection is set the sinners will swear: "We did not tarry more than an hour (and cannot be guilty)."

METHODOLOGY

In this section, the researcher is discussing the theoretical framework of investigation, as well as the methodology, which consists primarily of description of the data collection, justification for choosing the data and method of Analysis.

Data Collection

To achieve the purpose of the study the descriptive approach is selected. This study is focusing on the Holy Quran as the source text (ST) and its four English translations by Yusuf Ali (2014), Pickthall (1963), Arberry (1991), and Shakir (1999) as target texts (TT). The data of four (Ayah) verses is gathered from the holy Quran and their equivalents in the selected English translations.

Method of Analysis

To fulfill the aim of the study, 4 Ayat from the holy Quran is selected randomly. The selected Ayat in the original Arabic source text, the holy Quran, is read. 4 texts out of the puns under study is selected and underlined. The correctness of some examples is considered by using the commentaries of *Tafsir ibn Kathir (AH 759)*. Then, the same Ayat in the four English target texts is read to *identify* those parts of the texts, which corresponded to the original puns and underlined them. After that, Delabastita's (1996) strategies is used as the theoretical framework in the study to identify which strategies are applied in translating each original pun by the translators. Then, Newmark's (1981, 1988) methods of translation is used to see how the four translators translated the pun sentences into English. Having identified each translator's strategies, the frequency and percentage of each strategy is calculated and presented in a table of four translators to identify the most frequently used strategy by each translator. Finally, conclusions are drawn based on the data analysis.

Justification of Data and Methodology

The Justification for use of this methodology is to investigate translation of puns expressions in the holy Quran from semantic, pragmatic, and rhetoric perspective that has been recognized by several scholars (Mark, 2014; Perry, 1999; Abdul karim, 2006). This study is based on a PhD research project that concerned with four English versions of translation of the Holy Quran, and the selection of forty pun words from the holy Quran.

The case study approach is a highly appropriate method for investigating the precise translation of Holy Quran for non-Arabic speakers.

DATA ANALYSIS

In this section, 4 data out of the puns under study is gathered and analyzed according to Delabastita's (1996) strategies. Then, the frequency and percentage of each strategy is calculated. The results are presented in a table. Some more prominent examples are presented below as better illustration of the pun translation strategies.

Text 1:

(Data 1) Surah "Taha- Ta Ha", ayah- verse 5.

ST: الرَّحْمَنُ عَلَى الْعَرْشِ اسْتَوَى

BT: al rahman ala al arish istawa

TT-1: The most Gracious (Allah) rose over (Istawa) the (Mighty) Throne (in a manner that suits His Majesty), rose over (Istawa) the throne (of authority) (Ali, 2006)

TT-2: The Beneficent One, Who is established on the Throne. (Pickthall, 1963)

TT-3: the All-compassionate sat Himself upon the Throne; to Him belongs (Arberry, 1991)

TT-4: The Beneficent Allah is firm in power. (Shakir, 1999)

According to the commentary of *Tafsir ibn Kathir (AH 759)* the underlined pun is "استوي" is a noun which has two meaning, first; (sitting) which is immediate and non-intended meaning and second, (power of authority) which is remote and intended meaning.

Neither of Pickthall, Arberry and Shakir managed to convey the pun to the target text since the pun has been translated by the pun to non-pun strategy. However, Yusuf Ali has managed to translate the source text pun into target text pun "rose over (Istawa)" and quoted the same Arabic word with footnote indication. Pickthall has translated source text pun into "who is established" while Arberry has translated it into "sat Himself upon", and Shakir has translated it into "firm in power". Most of translators Pickthall, Arberry and Shakir have conveyed only the sense of the puns into the target text.

Hence, the aesthetic effect of source text pun has lost in the process of translation. The type of pun used in this text is *Tawriyyah al-Mujaradah* (stripped-off pun) due to it is devoid from any lexical requirements of the punned with (al-muwarra bihi به الموارى), which normally represents the immediate and non-intended meaning, and the requirements of the punned to (al-muwarra anhu عنه الموارى), which represents the remote and intended meaning.

Rhetorically, the word (استوي) could be interpreted in two different meanings as in the following:

A. Sit.

B. Rose over (Istawa) the throne of authority.

The analysis of these instances has different sense. The word *إستوى* *Istawa* has been translated differently by the translators. Pickthall translated as *established*, while, Arberry translated as *sat Himself upon*, then Shakir translated as *firm in power*. Unluckily all of them used the literal translation method to deliver the meaning and represent the non-intended meaning whereas Yousuf Ali has used the faithful translation method and translated it as *Rose over (Istawa) the throne of authority*, which convey the meaning, represents the remote and intended meaning. The pun in (*Istawa*) cannot be grasped by native speakers of Arabic unless they are acquainted with some religious aspects. Theoretically speaking, any word “which has two completely different senses, and can represents remote and intended meaning” can be used as a pun by linguistically and rhetorically competent native speaker.

Text 2:

(Data 2) Surah “Adh-Dhariyat- the Winnowing Winds”, ayah- verse 47.

والسَّمَاءُ بِنِينَاهَا بِأَيْدٍ وَأَنَا لَمَوْسِعُونَ

BT: wa alsama'a banainaha bi ayd wa ina la mowaseoun

TT-1: We built the heavens by our authority; and we are the Lord of power and expanse (Ali, 2006)

TT-2: We have built the heaven with might, and we it is who make the vast extent (thereof). (Pickthall, 1963)

TT-3: And heaven - We built it with might, and we extend it wide. (Arberry, 1991)

TT-4: And the heaven, we raised it high with power, and most surely, we are the makers of things ample. (Shakir, 1999)

In this verse, the pun is “بأيدي” which has translated differently by several ways. Pickthall, Arberry, Shakir have translated the source text pun literally “*with might or with power*” and transmitted only the sense of original pun by applying the pun to non-pun strategy. While, Ali has translated as “*by our authority*” and sustains the same effect of aesthetic and meaning in both texts by adopting the faithful translation method of Newmark. In fact, he has transmitted the source pun from *Tawriyyah al-Murashahah* (strengthened pun) into morphological pun. In this sentence the punned with is “*ببيناها – we built it*” is associated with the close meaning “we built it by our hands” because the building fits the hand, however, this is not right translation and does not fit at all with the power of Allah almighty. The underlined pun “بأيدي” is an Arabic noun which has two meaning, first; (with hand) which is called an immediate meaning “*with hand*” but non-intended and the second; (authority) which is remote and intended meaning.

Text 3:

(Data 3) Surah “Najm- The Star”, ayah- verse 1-3.

وَالنَّجْمِ إِذَا هَوَىٰ {1} مَا ضَلَّ صَاحِبُكُمْ وَمَا غَوَىٰ {2} وَمَا يَنْطِقُ عَنِ الْهَوَىٰ {3}

BT: wa alnajim eza hawa, ma dal sahibakum w ma ghawa, w ma yantiq an al hawa

TT-1: By the Star when it goes down, (1) Your Companion is neither astray nor being misled. (2) Nor does he say (aught) of (his own) Desire. (3) (Ali, 2006)

TT-2: By the Star when it set, (1) Your comrade erred not, nor is deceived ;(2) Nor doth he speak of (his own) desire. (3) (Pickthall, 1963)

TT-3: By the Star when it plunges (1) your comrade is not astray, neither errs (2) nor speaks he out of caprice(3) (Arberry, 1991)

TT-4: I swear by the star when it goes down (1) Your companion (PM) does not err, nor does he go astray (2) Nor does he speak out of desire (3) (Shakir, 1999)

In this example, the pun in the words "هوي - هوي". According to the commentary of *Tafsir ibn Kathir (AH 759)*, the first word is a verb and means, “goes down” and the second word is a noun and means “desire”. None of Pickthall and Arberry took into account the existence of pun in these two verses since they have translated the source text pun literally and have tried to transmit only the sense of pun by applying the pun to non-pun strategy. Arberry has selected the words “plunges-caprice” and Pickthall has selected the words “set-desire” which all of them divert from the source text pun. However, Shakir and Yusuf Ali have selected the words “goes down- Desire” for source text puns, by using pun-to-pun strategy. Therefore, Pickthall and Arberry have failed to transmit the sense of source text into target text, while Shakir and Yusuf Ali have sustained to transmit the aesthetic and rhetoric effect of source text into the target text. Consequently, the meaning of the source text is sustained in the target text after applying the faithful translation method.

Text 4:

(Data 4) Surah "Rahman- The Gracious", ayah- verse 7-8.

ST: {8} وَالسَّمَاءَ رَفَعَهَا وَوَضَعَ الْمِيزَانَ {7} أَلَّا تَطْغَوْا فِي الْمِيزَانَ

BT: wa alsamaa rafaa'ha wa wadaa' al mizan, ala tatghaw fi al mizan

TT-1: And the Firmament has He raised high, and He has set up the Balance (of Justice), (7). In order that ye may not transgress (due) balance. (8) (Ali, 2006)

TT-2: And the sky He hath uplifted; and He hath set the measure, (7) That ye exceed not the measure, (8) (Pickthall, 1963)

TT-3: and heaven He raised it up, and set the Balance (7) Transgress not in the Balance (8) (Arberry, 1991)

TT-4: And the heaven, He raised it high, and He made the balance (7) that you may not be inordinate in respect of the measure (8) (Shakir, 1999)

These two verses are considered clear examples for pun "Tawriyah al-Mubayyinah (clarifying pun)" in the holy Quran. According to the commentary of *Tafsir ibn Kathir (AH759)*, the underlined words in the translated texts hold different meanings from the original Arabic texts. In the Arabic text, the word "الميزان", al mizan" means justice while the second one means "balance". However, these two words have been translated by four different strategies. Arberry and Pichthall have applied the strategy of pun to related rhetorical device through repeating the equivalent word. Shakir has applied the strategy of pun to non-pun due to transmitting only the sense of the source text pun into the target text, while, Yusuf Ali has used the strategy of pun-to-pun and replaced the original pun with a pun in the English. The pun produced in target text is called "homonymic" pun, which is the equivalent to pun called "Tawriyah al-Mubayyinah" in the source text. Linguistically, Yousuf Ali has managed to convey the rhetorical and pragmatic sense of the Arabic pun into English without changing the meaning. Thus, the meaning of the source text is sustained in the target text after applying Newmark's (1981) faithful translation method.

CONCLUSIONS

From the analysis, it can be realized that the occurrence of the pun in the Quran generates a significant problem for the translators since several words in the Quranic verses are pun. Consequently, if the Quran translators are not aware of the factors that help them to capture the deep meaning, they will not be able to transfer the intended meaning effectively.

Obviously, the analyses show that the translators do not have a certain strategy in solving the problem of the pun in the Quran. Furthermore, it seems that depending on numerous commentaries is an important strategy to define the meaning of the pun words, but this will confound the translators the more because, in some cases, there are several interpretations for one word or for one case in the Quran. Consequently, it is recommended for the translators to rely on at least two of the authorized commentaries and employ them.

In terms of style of translation, Ali's translation is in a modern style and plain English that flows softly and it is easy to read and comprehend. He also opted for contemporary language usage of sentence structure and he avoided confusing phrases. He transliterated many Arabic words and provided their meanings in parenthesis.

The selected translators did not treat the problem of the pun in the Holy Quran carefully. They transferred most of the samples of the pun words into primary, sense by using literal and formal translation. Only in a few instances did they transfer by using paraphrase strategies.

TURİZM ÖĞRENCİLERİNİN İLETİŞİM BECERİLERİNİN SOSYO DEMOGRAFİK FAKTÖRLERE GÖRE İNCELENMESİ: PAMUKKALE ÜNİVERSİTESİ ÖRNEĞİ

AN INVESTIGATION OF THE COMMUNICATION SKILLS OF TOURISM STUDENTS ACCORDING TO SOCIO DEMOGRAPHIC FACTORS: PAMUKKALE UNIVERSITY SAMPLE

ÖZET

İletişim becerisi özellikle hizmet sektöründe çalışan kişiler açısından oldukça önemli bir özelliktir. Bir hizmet sektörü olarak turizm de iletişim ihtiyacının öne çıktığı bir alandır. Bu açıdan değerlendirildiğinde turizm alanında eğitim alan öğrencilerin iletişim becerileri büyük önem kazanmaktadır. Bu çalışmanın amacı turizm öğrencilerinin iletişim becerilerinin demografik faktörler açısından incelenmesidir. Çalışma Pamukkale Üniversitesi'nde turizm alanında eğitim gören toplam 429 öğrenci ile gerçekleştirilmiştir. Veriler kişisel bilgi formu ve Korkut (1996) tarafından geliştirilen "İletişim Becerileri Ölçeği" ile elde edilmiştir. Çalışma sonunda öğrencilerin mezun oldukları okul ve eğitim gördükleri bölümler ile iletişim becerileri arasında anlamlı bir farklılık olduğu görülmüş ve eğitim boyutunun iletişim becerilerinin gelişmesinde önemli bir parametre olduğu değerlendirilmiştir. Diğer demografik faktörler ile iletişim becerileri arasında ise herhangi bir anlamlı farklılık bulgusuna ulaşılamamıştır.

Anahtar Kelimeler: İletişim Becerileri, Turizm Öğrencileri

ABSTRACT

Communication skill is a very important feature especially for those working in the service sector. Tourism as a service sector is also a field where communication needs to come to the forefront. From this point of view, the communication skills of the students who are educated in the tourism field are gaining importance. The aim of this study is to examine the communication skills of tourism students in terms of their demographic factors. The study was conducted with a total of 429 students studying in the field of tourism at Pamukkale University. The data was obtained by the personal information form and the "Communication Skills Scale" developed by Korkut (1996). The results of the study show that there is a meaningful difference between the schools the students graduated from the and the departments they studied and their communication skills. Moreover, it is concluded that education dimension is an important parameter in the development of communication skills. There was no significant difference between other demographic factors and communication skills.

Keywords: Communication Skills, Tourism Students

1. GİRİŞ

Günümüz dünyasında en çok üzerinde durulan, tartışılan konulardan biri iletişimdir. kitle iletişim araçlarının günlük yaşama egemen olduğu, tarihin hiçbir döneminde olmadığı kadar insanların birbiriyle iletişim kurabildiği bir dönemde, ironik bir şekilde kişilerin iletişim düzeyleri ile ilgili yoğun tartışmalar yaşanmaktadır. Sağlıklı

iletişimin nasıl kurulacağı, kişilerin bu konuda sahip olması gereken becerilerin ne olması gerektiği, iletişim becerisine etki eden faktörlerin ne olduğu konuları tartışma alanlarından birkaçıdır.

Turizm sektörü insan ilişkilerinin yoğun biçimde yaşandığı bir alandır. Sektörde çalışanların bu konuda daha donanımlı olması, yeterli becerilere sahip olması büyük önem taşımaktadır. Müşteri memnuniyetinin çok kırılmalı bir yapı gösterdiği sektörde, müşterilerle sağlıklı bir iletişim kurulması kritik noktalardan biridir.

Turizm eğitimi alan öğrencilerin gelecekteki muhtemel çalışma alanı olan turizm sektörü dikkate alındığında, bu öğrencilerin sahip oldukları iletişim becerileri büyük önem kazanmaktadır. Bu noktada öğrencilerin iletişim becerilerini etkileyen tüm faktörlerin ele alınması, bu becerilerin geliştirilmesini sağlayacak çalışmaların yapılması gerekmektedir. Turizm öğrencilerinin demografik faktör özellikleri ile iletişim becerileri arasında anlamlı bir ilişki olup olmadığının incelenmesi de bu kapsamda düşünülmesi gereken boyutlardan birisidir.

Bu çalışmada turizm öğrencilerinin iletişim becerileri demografik faktörler açısından incelenmiş, bu faktörlerin her biri ile ilişkisi belirlenmeye çalışılmıştır. Çalışma kapsamında Pamukkale Üniversitesi'nde turizm alanında eğitim gören toplam 429 öğrenci ile görüşülmüştür. Veriler kişisel bilgi formu ve Korkut (1996) tarafından geliştirilen "İletişim Becerileri Ölçeği" ile elde edilmiştir. Yapılan anket çalışmasından elde edilen sonuçlar doğrultusunda, demografik özelliklerin iletişim becerisi üzerindeki etkilerine ilişkin elde edilen veriler yorumlanarak; yazına bu yönde katkı sağlanmaya çalışılmıştır.

2. LİTERATÜR

Literatürde öğrencilerin iletişim becerilerinin incelendiği birçok çalışma mevcuttur. Ancak turizm öğrencilerinin iletişim becerilerine yönelik ise sınırlı sayıda çalışma yapılmıştır.

Tokmak vd. (2013), turizm ve otelcilik eğitimi alan öğrencilerin sosyal aidiyet ve kendini idare etme boyutlarıyla ilgili yaptıkları bir çalışmada, kadın öğrencilerin erkek öğrencilere göre iletişim becerilerinin daha yüksek olduğunu belirlemişlerdir. Bunun yanında yaş değişkeni ile iletişim becerisi arasında anlamlı bir farklılık olduğu bulgusuna da rastlamışlardır.

Eskiyörük (2014), turizm işletmeciliği ve otelcilik yüksekokulu öğrencilerinin iletişim becerilerini çeşitli değişkenler açısından değerlendirmeyi amaçladığı çalışmada öğrencilerin sosyo demografik özelliklerinin bu konuda yapılan birçok araştırmada iletişimi etkilediği saptanmasına rağmen iletişim becerileri üzerinde etkisi olmadığını ve turizmciler adayların iletişim becerisi algılarının oldukça yüksek olduğu tespit edilmiştir.

Summak (2014), turizm eğitimi alan öğrenciler üzerine yaptığı çalışmada, turizm öğrencilerinin önemli bir kısmının turizm hizmetlerinde iletişim becerilerinin önemli bir yer teşkil ettiğini ve karşı taraftaki kişiyi anlamaya çalışmanın etkili iletişimde önemli olduğunu düşündüklerini tespit etmiştir. Ancak turizm öğrencilerin önemli bir bölümü de yabancı dili etkili kullanamadıkları için düşünce aktarımında zorlandıkları ve eleştirilere genellikle kapalı olduğu da belirlenmiştir.

Elbeyi ve Karaçor (2015), turizm öğrencilerinin iletişim becerileri üzerine yaptıkları araştırmada, turizm öğrencilerin iletişim becerilerinin genel olarak yüksek olduğunu ve kadın öğrencilerin erkek öğrencilere göre daha yüksek iletişim becerilerine sahip olduklarını tespit etmişlerdir.

Yıldız (2016), Turizm Rehberliği Bölümünde öğrenim gören öğrencilerin iletişim ve problem çözme becerilerine ilişkin yapmış olduğu araştırmada, öğrencilerin bu tür becerileri ile demografik değişkenler arasında anlamlı bir farklılık bulunmadığı sonucuna ulaşmıştır.

Erigüç vd. (2014), hemşirelik öğrencilerinin duygusal zekâ düzeylerini ve iletişim becerilerini değerlendirmek, aralarındaki ilişkiyi belirlemek amacıyla yaptıkları çalışmada öğrencilerin duygusal zekâsı ve iletişim becerileri arasında pozitif yönde anlamlı bir ilişki tespit etmişlerdir.

Ulinski ve O'Collaghan (2002), çalışmalarında, öğrencilerin sözlü iletişim becerilerine yönelik algılarında farklılıklar olduğunu tespit etmişlerdir.

Ahmetoğlu ve Acar (2016), çalışmalarında Türkiye'deki okul öncesi eğitim kurumlarında çalışmaya hazır olan öğretmen adaylarının kişisel-eğitsel özellikleri, sosyal yeterlilikleri, empati ile iletişim becerileri arasındaki ilişkileri incelemişler, okul öncesi kadın öğretmen adayların erkek adaylara göre empati ve iletişim becerilerinde daha yüksek puan aldıklarını tespit etmişlerdir.

Aydın (2015), çeşitli üniversitelerdeki Beden Eğitimi ve Spor alanında eğitim gören öğrencilerin iletişim becerilerini değerlendirmiş ve katılımcıların yüksek iletişim becerilerine sahip olduğunu, beceri düzeylerinin ise üniversiteler arasında farklılaştığını belirlemiştir.

Şahin (1999), çalışmasında iletişim becerileri eğitimi programının üniversite öğrencilerinin iletişim beceri düzeylerine etkisini incelemiştir. Araştırma bulguları, iletişim becerileri eğitimi programına katılan öğrencilerin iletişim beceri düzeylerinin, bu programa katılmayan öğrencilerin iletişim beceri düzeylerinden yüksek olduğunu ortaya koymuştur.

Erigüç vd. (2013), yüksekokul öğrencileri üzerinde yaptıkları çalışmalarında, mesleklerine hazırlanmakta olan öğrenciler için iletişim becerilerinin önemli bir konu olduğunu, iletişim becerilerinin üniversite öğrencilerine eğitimleri sürecinde kazandırılması ve geliştirilmesi gerektiğini belirtmişlerdir. Araştırma sonucunda, kız öğrencilerin iletişim becerileri erkek öğrencilere oranla; ve arkadaşlarıyla ilişkileri olumlu ve sakin olan öğrencilerin iletişim becerileri diğerlerine oranla daha yüksek olarak tespit edilmiştir.

Gülbağçe (2010), Eğitim fakültesinin farklı bölümlerinde öğrenim gören öğrencilerinin iletişim becerilerini karşılaştırmış, Araştırma bulguları sonucunda üniversitelerin bütün fakülte ve bölümlerinde etkili iletişim dersinin zorunlu ders olarak verilmesi, bu dersin bulunduğu bölümlerde de ders sayısı ve çeşidinin artırılarak, öğretmen adaylarının bu konuda donanımlı olarak görevlerine başlamalarının sağlanması önerilmiştir.

Pehlivan (2005), öğretmen adaylarının iletişim becerisi algıları üzerine yaptığı çalışmada, öğretmen adaylarının iletişim becerisi algılarının oldukça yüksek olduğunu, adayların algıları arasında cinsiyetlerine göre bir farklılık olmadığını tespit etmiş, öğretmen adaylarının iletişim becerisi algılarının 1. sınıftan 4. sınıfa doğru arttığı ve anlamlı farklılıkların 4. sınıfların lehine olduğunu belirlemiştir.

Gölönü ve Karcı (2010), iletişim meslek lisesi öğrencilerinin, iletişim beceri düzeylerinin sosyo-demografik değişkenler açısından incelenmesi amacıyla yaptıkları çalışmalarında, öğrencilerin iletişim becerilerinin; cinsiyete ve sınıflara göre anlamlı bir farklılık gösterdiğini belirlemiştir. Kız öğrencilerin etkili iletişim kurmada daha başarılı oldukları, öğrencilerin okudukları sınıf düzeyi arttıkça, iletişim becerilerinin de olumlu yönde geliştiği, bu sonucu da, iletişim becerilerinin öğrenilebilir ve geliştirilebilir beceriler olduğu yönünde değerlendirmenin mümkün olduğunu ortaya koymuşlardır.

Kılıçgil vd. (2009), iki farklı üniversitenin beden eğitimi ve spor yüksekokulu öğrencilerinin iletişim becerilerini değerlendirdikleri araştırma sonucunda, her iki üniversitenin beden eğitimi ve spor yüksekokulu öğrencileri arasında iletişim becerisiyle cinsiyet arasında oldukça anlamlı bir ilişki bulunmuş, bayan öğrencilerin erkek öğrencilere göre iletişim becerilerinin daha iyi olduğu tespit edilmiştir.

Akçakoyun vd. (2016), Muğla Sıtkı Koçman Üniversitesi'nde (Spor bilimleri fakültesi, Mühendislik fakültesi ve Turizm fakültesi) öğrenim gören öğrencilerin, fiziksel aktivite katılım durumları, cinsiyet farklılıkları, hangi fakültede eğitim gördükleri, nerede fiziksel aktivite yaptıkları ve ne şekilde fiziksel aktivitelere katılım gösterdikleri değişkenlerine bağlı olarak iletişim becerisi düzeylerini incelemiştir. Çalışmanın sonucunda, cinsiyetle iletişim becerileri arasında anlamlı bir farka rastlanmamıştır.

Bingöl ve Demir (2011), Amasya Sağlık Yüksekokulu Hemşirelik Programı öğrencilerinin iletişim becerilerine ilişkin algılarının ne düzeyde olduğunu belirlemeyi amaçlamışlar ve araştırma sonucunda öğrencilerin iletişim becerisi algılarının oldukça yüksek olduğunu tespit etmişlerdir. Araştırmada devam edilen bölüm ve öğrencilerin akademik başarı düzeyi ile iletişim becerilerine ilişkin algıları arasında anlamlı ilişki saptanmıştır.

Uçkun vd. (2015), Büro Yönetimi ve Yönetici Asistanlığı Program öğrencilerinin iletişim becerilerini; cinsiyet, anne-baba eğitim durumu ve algıladıkları sosyo-ekonomik düzey değişkenleri açısından incelenmişler, kız öğrencilerin erkek öğrencilere oranla iletişim becerileri ortalamalarının daha yüksek olduğu sonucuna ulaşmışlardır.

3. MATERYAL VE YÖNTEM

3.1. Materyal

Çalışmanın verilerini turizm eğitimi almış öğrencilere uygulanan anket yoluyla elde edilen birincil veriler oluşturmaktadır. Anket uygulaması 2015 yılının Nisan- Temmuz ayları içerisinde yapılmıştır. Yapılan anket

çalışmasında toplam 429 öğrenciye ulaşılmış ve elde edilen anketler değerlendirmeye alınmıştır. Bu sayı, araştırma evrenini açıklamaya yetecek düzeydedir.

3.2. Yöntem

Çalışmada kullanılan anket formu iki bölümden oluşmaktadır. Birinci bölümde turizm öğrencilerinin iletişim becerilerinin ölçülmesine ilişkin ifadeler, ikinci bölümde ise demografik özellikler yer almaktadır. Değerlendirmeler 5'li Likert ölçeğine göre yapılmıştır: (Kesinlikle katılmıyorum 1, Katılmıyorum 2, Ne Katılıyorum, Ne Katılmıyorum 3, Katılıyorum 4, Kesinlikle Katılıyorum 5). Elde edilen veriler SPSS Programı kullanılarak analiz edilmiştir.

Turizm öğrencilerinin iletişim becerilerinin belirlenmesinde Korkut tarafından geliştirilen “İletişim Becerileri Ölçeği”nden yararlanılmıştır (Korkut,1996:18-23).

3.3. Anket Formunun Güvenilirliği ve Geçerliliği

Turizm öğrencilerinin iletişim becerilerini ölçmeye yönelik kullanılan ölçekler güvenilirlik testinden geçirilmiştir. Turizm öğrencilerinin iletişim becerilerini ölçmek amacıyla oluşturulan 43 ifade, beklenen güvenilirlik düzeylerini sağladığı için herhangi birisi çıkartılmamıştır. Anketin güvenilirlik oranı (Cronbach Alfa) 0,747 olarak bulunmuş ve iyi derecede beklenen güvenilirlik düzeyini sağlamıştır (Güriş ve Astar, 2014: 246).

3.4 Normallik Sınamasının Yapılması

Çalışmanın normallik sınaması için Skewness ve Kurtosis değerlerine bakılmış ve elde edilen değerlerin normal dağılımı gösterdiği kabul edilmiştir ($-2 < -0,693$ ve $1,855 < 2$) (Kalaycı, 2016:6). Bu sonuçla “Veriler normal dağılmaktadır” şeklinde kurulan H_0 hipotezi kabul edilmiş ve verilere parametrik testler uygulanmıştır.

3.5. Kullanılan İstatistikî Yöntem ve Hipotezler

Çalışmanın başlangıcında yapılan normallik sınamasında verilerin normal dağıldığı görülmüştür ($-2 < -0,693$ ve $1,855 < 2$). Bu nedenle değişkenler arasında anlamlı bir farklılığın olup olmadığının belirlenmesinde Anova ($K > 2$) ve T Testi istatistiği ($K \leq 2$) kullanılmıştır. (Özdemir, 2013, s. 343-344).

Anova ve T Test İstatistiği ile aşağıda verilen 7 hipotez test edilmiştir.

H₁: Katılımcıların cinsiyetleri ile iletişim becerileri arasında anlamlı bir farklılık bulunmaktadır.

H₂: Katılımcıların öğrenim durumları ile iletişim becerileri arasında anlamlı bir farklılık bulunmaktadır.

H₃: Katılımcıların yaşam biçimleri ile iletişim becerileri arasında anlamlı bir farklılık bulunmaktadır.

H₄: Katılımcıların medeni durumları ile iletişim becerileri arasında anlamlı bir farklılık bulunmaktadır.

H₅: Katılımcıların eğitim gördükleri bölüm ile iletişim becerileri arasında anlamlı bir farklılık bulunmaktadır.

H₆: Katılımcıların yaşadıkları yer ile iletişim becerileri arasında anlamlı bir farklılık bulunmaktadır.

H₇: Katılımcıların mezun oldukları okul türü ile iletişim becerileri arasında anlamlı bir farklılık bulunmaktadır.

4. BULGULAR

4.1. Araştırma Örnekleminin Demografik Özellikleri

Anket çalışması sonucunda toplam 429 anket formu elde edilmiştir. Bu anketlerin geçerli olanları dikkate alınarak elde edilen demografik verilere ilişkin istatistiksel sonuçlar Tablo 1’de verilmiştir.

Tablo 1. Araştırma Örnekleminin Demografik Yapısı

Değişkenler	Katılımcı Sayısı	%
Cinsiyet		
Erkek	231	53,8
Kadın	198	46,2

Toplam	429	100
Öğrenim Durumu		
Lise	45	10,7
Ön lisans	286	67,7
Lisans	91	21,6
Toplam	422	100,0
Yaşam Biçimi		
Yalnız	171	40,3
Biriyle Birlikte	255	59,7
Toplam	427	100,0
Medeni Durum		
Evli	8	1,9
Bekar	418	98,1
Toplam	426	100,0
Eğitim Gördüğü Bölüm		
Turizm ve Otel İşletmeciliği	259	62,4
Seyahat	156	37,6
Toplam	415	100,0
Yaşanılan Yer		
Yurt/Apart	169	39,5
Ailenin Yanında	109	25,5
Kiralık Ev	139	32,4
Akraba Yanında	11	2,6
Toplam	428	100
Mezun olunan okul		
Lise	151	35,7
Meslek lisesi	152	35,9
Turizm meslek lisesi	120	28,4
Toplam	423	100,0

Ankete katılan kişilerin %46,2'sinin kadın, %53,8'nin erkek olduğu görülmektedir.

Ankete katılanların öğrenim durumlarına bakıldığında; %10,7 Lise, %19,1 Ön lisans, %67,7 Lisans, %21,6 Lisansüstü eğitimi aldıkları görülmektedir.

Ankete katılanların %40,3'ü yalnız yaşamakta, %59,7'si ise biriyle birlikte yaşamaktadır.

Ankete katılanların %98,1'inin bekar, %1,9'unun evli olduğu görülmektedir.

Ankete katılanların %62,4'ü Turizm ve Otel İşletmeciliği, %37,6'sı ise Turizm ve Seyahat Hizmetleri Eğitimi almıştır.

Ankete katılanların yaşanılan yer tercihlerine bakıldığında; Yurt/Apart %39,5, Ailesinin yanında %25,5, Kiralık ev %32,4, Akraba yanında %2,6 olarak gerçekleşmiştir.

Ankete katılanların mezun oldukları okullar incelendiğinde; %35,7'i Lise, %35,9'u Meslek Lisesi, %28,4'ü ise Turizm Meslek Lisesi çıkışlı oldukları görülmüştür.

4.1.1 Cinsiyet ve İletişim Becerisi

Araştırmada kişilerin cinsiyeti ile iletişim becerileri arasında anlamlı bir farklılık olup olmadığı incelenmiştir.

Çalışmada, değişkenler arasında farklılık olup olmadığını belirlemede t Testi istatistiği kullanılmıştır. Elde edilen sonuçlar tablo 1 de gösterilmiştir.

Tablo 1. Cinsiyet ve İletişim Becerisi Arasındaki İlişki

Cinsiyet	Sayısal Dağılım	Ortalama	F	p	Fark
Kadın	151	3,4020	0,75	,755	
Erkek	152	3,4137			

$$p = 0,75 > 0,05$$

Tabloya bakıldığında katılımcıların cinsiyeti ile iletişim becerileri arasında, 0,05 anlamlılık düzeyinde istatistiksel olarak anlamlı bir farklılık bulunmadığı ($p = 0,75 > 0,05$) görülmektedir. Bu durumda H_1 reddedilmiştir.

4.1.2. Öğrenim Durumu ve İletişim Becerisi

Öğrenim durumuyla iletişim becerisi arasında anlamlı bir farklılık olup olmadığını belirlemek amacıyla Anova test istatistiği kullanılmıştır. Elde edilen sonuçlar Tablo 3'de gösterilmiştir.

Tablo 2. Öğrenim Durumu ve İletişim Becerisi Arasındaki İlişki

Öğrenim durumu	Sayısal Dağılım	Ortalama	F	p	Fark
Lise	45	3,3932	1,603	,173	
Önlisans	286	3,3949			
lisans	91	3,4344			

$$p = 0,173 > 0,05$$

Yapılan test sonucunda katılımcıların öğrenim durumları ile iletişim becerileri arasında anlamlı bir farklılık bulunmadığı ($p = 0,173 > 0,05$) belirlenmiş ve H_2 reddedilmiştir.

4.1.3. Yaşam Biçimi ve İletişim Becerisi

Tablo 3. Yaşam Biçimi ve İletişim Becerisi Arasındaki İlişki

Yaşam biçimi	Sayısal Dağılım	Ortalama	F	p	Fark
Yalnız	171	3,4138	1,347	,788	
Biriyle birlikte	255	3,4034			

$$p = 0,788 > 0,05$$

Ankete katılanların yaşam biçimleriyle iletişim becerileri arasında anlamlı bir farklılık bulunmadığı ($p = 0,788 > 0,05$) belirlenmiş ve H_3 reddedilmiştir.

4.1.4. Medeni Durum ve İletişim Becerisi

Tablo 4. Medeni Durum ve İletişim Becerisi Arasındaki İlişki

Medeni Durum	Sayısal Dağılım	Ortalama	F	p	Fark
Evli	151	3,1977	0,006	,123	
Bekar	152	3,4110			

$$p = 0,123 > 0,05$$

Yapılan test sonucunda bu konuda anlamlı bir farklılık bulunmadığı ($p = 0,123 > 0,05$) belirlenmiş ve H_4 reddedilmiştir.

4.1.5 Eğitim Görülen Bölüm ve İletişim Becerisi

Tablo 5. Eğitim Görülen Bölüm ve İletişim Becerisi Arasındaki İlişki

Bölüm	Sayısal Dağılım	Ortalama	F	p	Fark
Turizm ve otel işletmeciliği	259	3,3650			
Seyahat	156	3,4567	0,021	,020	

$p= 0,02 < 0,05$

Yapılan test sonucunda ankete katılanların eğitim gördükleri bölüm ile iletişim becerileri arasında anlamlı bir farklılık bulunduğu ($p= 0,02 < 0,05$) belirlenmiştir. Turizm ve Seyahat bölümü öğrencilerinin iletişim becerileri ortalamalarının turizm ve otel işletmeciliği bölümüne göre daha yüksek olduğu görülmektedir.

4.1.6. Yaşanılan Yer ve İletişim Becerisi

Tablo 6. Yaşanılan Yer ve İletişim Becerisi Arasındaki İlişki

Yaşanılan yer	Sayısal Dağılım	Ortalama	F	p	Fark
Yurt/Apart	169	3,4726			
Ailenin yanında	109	3,3800	0,623	,600	
Kiralık ev	139	3,3589			
Akrabasının yanında	11				

Ankete katılanların yaşadıkları yer ile iletişim becerileri arasında anlamlı bir farklılık bulunmadığı ($p= 0,600 > 0,05$) belirlenmiş ve H_0 reddedilmiştir.

4.1.7. Mezun Olunan Okul ve İletişim Becerisi

Tablo 7. Mezun Olunan Okul ve İletişim Becerisi Arasındaki İlişki

Mezun olunan okul	Sayısal Dağılım	Ortalama	F	p	Fark
Lise	151	3,4726			
Meslek lisesi	152	3,3800			
Turizm meslek lisesi	120	3,3589	3,462	,032	Lise> Turizm, meslek lisesi

$p= 0,032 < 0,05$

Yapılan test sonucunda ankete katılanların mezun oldukları bölüm ile iletişim becerileri arasında anlamlı bir farklılık bulunduğu ($p= 0,032 < 0,05$) belirlenmiştir. Anlamlı farka neden olan okul türünü belirlemek için post hoc testlerinden Bonferroni testi kullanılmıştır. Bonferroni testiyle, Lise mezunu öğrencilerin iletişim becerileri ortalamalarının, diğer lise mezunlarının (turizm ve meslek lisesi) iletişim beceri ortalamalarından daha yüksek olduğu sonucuna ulaşmak mümkündür.

5. SONUÇ

Yapılan literatür taramasında Türkiye’de turizm alanında eğitim gören öğrencilerin iletişim becerilerinin belirlenmesine yönelik çalışma sayısının oldukça kısıtlı olduğu görülmüştür. Konunun incelenmesi ve aynı zamanda literatüre de katkı yapması amacıyla Pamukkale Üniversitesi’nde turizm alanında eğitim gören öğrencilerin demografik özelliklerinin iletişim becerilerine olan etkileri üzerine bir araştırma yapılmıştır.

İletişim becerisi turizm sektörü çalışanları açısından yaşamsal önem taşıyan konulardan birisidir. Turizm çalışanlarının hizmet verdikleri kişilerle etkili ve olumlu bir iletişim gerçekleştirmeleri gerek hizmet kalitesi, gerekse de sektörün sürdürülebilirliği açısından zorunludur. Bu noktada turizm sektöründe istihdam edilmeyi hedefleyen öğrencilerin de iletişim becerilerinin yüksek ve olumlu olması beklenmektedir.

Yapılan çalışmada elde edilen bulgular değerlendirildiğinde, ankete katılanların cinsiyetleri, yaşam biçimleri, öğrenim durumları, medeni durumları ve yaşadıkları yer ile iletişim becerileri arasında anlamlı bir farklılık bulunmadığı belirlenmiştir.

Buna karşın ankete katılanların eğitim gördükleri bölüm ile iletişim becerileri arasında anlamlı bir farklılık bulunduğu belirlenmiştir. Turizm ve Seyahat Bölümü öğrencilerinin iletişim becerileri ortalamalarının Turizm ve Otel İşletmeciliği Bölümüne göre daha yüksek olduğu görülmektedir.

Yapılan araştırma sonucunda elde edilen bir başka veri de, ankete katılanların mezun oldukları okul türü ile iletişim becerileri arasında anlamlı bir farklılık bulunduğudır. Lise mezunu öğrencilerin iletişim becerileri ortalamaları, diğer lise mezunlarının (turizm ve meslek lisesi) iletişim beceri ortalamalarından daha yüksek bulunmuştur.

Yapılan çalışmada elde edilen veriler, konuyla ilgili yapılan diğer araştırmaların verileriyle karşılaştırıldığında tam olarak uyumlu bir tablo göstermemektedir. Örneğin cinsiyet konusunda farklı sonuçlar görülmektedir.

Lise mezunu öğrencilerin, Turizm Meslek Lisesi mezunlarına oranla daha yüksek bir iletişim becerisine sahip olması dikkat çekici bir durumdur. Beklenen, Turizm Meslek Lisesi mezunlarının iletişim becerilerinin daha yüksek olmasıdır. Bu konuda Turizm Liselerindeki eğitim içeriklerinin gözden geçirilerek, daha fazla iletişim becerileri eğitimlerinin eklenmesi yararlı olabilir.

Elde edilen sonuçlar değerlendirildiğinde sosyo demografik faktörler arasında sadece eğitimle ilgili faktörlerin etkili olduğu görülmektedir. Bu alanda yapılmış farklı çalışmalara bakıldığında kimi çalışmaların benzer sonuçlar verdiği, kimi çalışmaların da tersi sonuçlar ürettiği görülmektedir.

ABSTRACT

Ottoman Turkish course is one of the fundamental courses that must be taken by undergraduate students/prospective teachers of Turkish Language Teaching/Turkish Education. Because, as a matter of course, Turkish alphabet with Arabic origins is used in this course, it is observed that teacher candidates' learning anxiety increases.

It is thought that this study will make an important contribution in determining the learning difficulties of the teacher candidates to remove or minimize their anxieties and to make the Ottoman Turkish education more productive. We will try to determine in this research Turkish language teacher candidates' opinions and solutions to problems related to the Ottoman Turkish course. For this reason, our study group consists of randomly selected 80 teacher candidates who have studied in the Department of Turkish Language Teaching/Turkish Education in the Turkish Republic of Northern Cyprus and taken the Ottoman Turkish course. Of these prospective teachers, 40 were the ones who succeeded in taking the course at the first time, and 40 were the ones who took the lesson more than once. "Student Interview Form" was applied to the teacher candidates in order to determine the data. This student interview form consists of 6 questions that reveal the approaches of the teacher candidates in the three categories related to the pre-process, process and post-process related to Ottoman Turkish. In analyzing the collected data, percentage, frequency and content analysis were used. Based on the findings, the anxieties of the Turkish language teacher candidates about the Ottoman Turkish and the sources of these anxieties were determined; the effects and problems created by them were identified. The implemented study methods during the efforts to overcome these problems and the gains obtained/to be obtained in the end were discussed. Suggestions were put forward in this regard and it was emphasized that the Turkish language teacher candidates should definitely take advantage of the equipment that Ottoman Turkish will bring in.

Keywords: Ottoman Turkish, learning anxiety, difficulty, Turkish Language Teaching, teacher candidates.

INTRODUCTION

Language is the most important national asset in which all material and spiritual values of a nation are carried throughout history. Turkish, too, is a communication link, a bridge that brings the existence of the Turkish nation to the present from the earliest times. The Turkish language education, which makes possible the transfer of the values of the Turkish nation, is also very important in this respect.

The Ottoman Turkish lecture, which teacher candidates should take within the scope of the Turkish language education, deals with a section in the Turkish language history. Ottoman Turkish is sometimes referred to as "Ottoman" in a way that would lead to the misconception that it is a separate language. However, "Ottoman or Ottoman Turkish language generally refers to the language written or spoken by the Turks who lived in the borders of the Ottoman State, or the language written in the same period in which Arabic or Persian words appear intensively, or more generally Turkish written in the Arabic alphabet. Scientifically, Ottoman Turkish, including the first period called the Old Anatolian Turkish in the development process of Turkish of Turkey, is a writing language that continues from XIII century until the beginning of the XX century. It is not true to think of Ottoman Turkish as separate from the present Turkish, which is its continuation" (Ozkan, 2007, 483).

One of the alphabets we have used so far is the Turkish alphabet of Arabic origin (Ergin, 1999, 2). If it is considered that the Turks have been acquainted with this alphabet since they converted to Islam, this alphabet witnesses to the existence and development of Turkish language through the presence in the life of Karahanli, Gazneli, Great Seljuk and Ottoman Turkish states in a thousand years time period (Timurtas, 1999, 1).

In Ottoman Turkish, which is our historical literary and written language, there is a scope to be informed by three separate sources along with the rules regarding the use of Arabic and Persian origin phrases under the Turkish sentence structure (Oztoprak-Ahiskali, 2011, 9).

Knowing Ottoman Turkish will contribute to knowing enough about the development of today's Turkish. "It cannot be expected of a Turkish language teacher who cannot comprehend the historical depth and richness of the Turkish language to fulfill his or her duty in the educational field decently" (Cifci, 2011, 409). In this respect, the candidate teachers who will carry out the education of Turkish language should have knowledge of Ottoman Turkish.

Knowing Ottoman Turkish is not just about overcoming an alphabet issue. This information will also be the key to an instrument of language and literature that will often have to be resorted to when using our Latin alphabet today. Because, it is an instrument of language that we need to possess both in the new and old literature and even need to understand texts about the folk literature. Especially, it is a need that the educators of Turkish language can never ignore.

The aim of our study was to determine the anxiety that Ottoman Turkish lecture given within the scope of the Turkish language education program causes in teacher candidates. Based on this, proposing solutions to overcome the anxieties that arise and thus to serve to increase the chances of success will mean this work's reaching its goal.

METHOD

Sample

Our sample consists of 80 teacher candidates who took the Ottoman Turkish course in Turkish Language Education / Turkish Education Department in Turkish Republic of Northern Cyprus. Of these teacher candidates, 40 were the ones who took the course for the first time, and 40 were the ones who did not succeed at the first time. Moreover, these teacher candidates were randomly selected.

Data Collection

"Student Interview Form" was applied to teacher candidates who took the Ottoman Turkish course in order to collect the data. This student interview form consists of 6 questions that will reveal the opinions of the prospective teachers about the Ottoman Turkish in three categories related to the pre-process, process and post-process. Below are the questions on the interview form:

- What were your thoughts before taking Ottoman Turkish course?
- What are the sources of your positive/negative thoughts before taking the Ottoman Turkish course?
- What are the difficulties you have experienced in learning Ottoman Turkish?
- What have you done/could one do to succeed in the Ottoman Turkish course?
- Have your first thoughts about Ottoman Turkish changed after taking the course?
- Do you think that what you gained from the Ottoman Turkish course is/will, is not/will not be of any contribution to you?

Data Analysis and Interpretation

The obtained data were analyzed by content analysis and divided into specific categories and also the views of more than one teacher candidate were quoted. In addition to this, it is aimed to reflect the attitudes of the teacher candidates more clearly by taking percentages and frequencies of the emerging data.

FINDINGS AND DISCUSSION

It was deemed appropriate to examine the findings under 6 headings initiating from the 6 questions on the student interview form. When the findings were assessed, the candidates that passed the Ottoman Turkish course at the first attempt was named Group 1, and the ones with more than one attempt was named Group 2, and were shown by the abbreviation G1 and G2 in the scope of the study. During the evaluation, answers for each question were examined by separating them into specific categories. In some cases, a small number of teacher candidates were excluded from the evaluation because they responded with unsatisfactory responses or wrote nothing. In addition, if more than one answer was given by prospective teachers for a number of questions, all of these answers were taken into consideration.

A. Findings about the Teacher Candidates' Opinions before Taking the Ottoman Turkish Course

It is clear that before the process, prospective teachers either perceived the Ottoman Turkish course with a prejudice stemming from accepting it as difficult and unachievable, or with opinions as useful, achievable and meaningful, or as an unnecessary course.

The issues as such that the course has an unknown scope, that even its name scares, that it is written in Arabic alphabet, that it appears like English, and that it has complicated rules have caused the teacher candidates to regard Ottoman Turkish as a difficult and unachievable course.

The ones who consider the course easy, meaningful and achievable have the tendency to think that the course will be easy and pleasurable and they tend to have the circumstances such as the existence of relatives in the family who know Ottoman Turkish, having graduated from Imam-Hatip High School, knowing Arabic language, having desire to know their history and ancestors' history, and having curiosity of learning the old Turkish.

Those who indicate that the course is unnecessary think that they will not use the Ottoman Turkish in the future, and that this writing does not exist anymore.

Table 1: Frequencies and Percentages of Teacher Candidates' Opinions before Taking the Ottoman Turkish Course

Category	G1		G2	
	f	%	f	%
Difficult and Unachievable	21	52.5	28	70
Useful, Meaningful and Achievable	14	35	9	22.5
Unnecessary	2	5	4	10

Looking at Table 1, it can be seen that 52.5% of the G1 students and 70% of the G2 students are prejudiced before taking the course in the sense that the Ottoman Turkish course is difficult and unachievable.

In the face of the fact that the successes of the teacher candidates have been significantly affected, it is understood that the G1 group made more efforts to face the negative outcome, but the G2 group did not make the effort to overcome this situation because of their prejudices. Student opinions on these can be illustrated as follows:

"I thought I could not understand, I was prejudiced. Because, I'm not used to this alphabet. It seemed like it was not different from English." (G1-S1)

"I was afraid because of its name. I did not believe I would succeed." (G2-S9)

35% of G1 students and 22.5% of G2 students see the course useful, meaningful and achievable. There is a significant difference in this proportional structure. It is understood that the ones with positive attitude towards the course are relatively more successful than the others.

"I thought I would succeed because it was similar to Arabic and I had a little bit of knowledge of Arabic." (G1-S7)

"I knew that I could succeed before I took this lesson. Because, I had no fear of the course as I had an Imam-Hatip High School background. I thought I would even add information on my knowledge." (G1-S2)

It is seen that G1 (5%) students are less than G2 (10%) students who think that the course is unnecessary. This situation, then, can be considered to have a quantitatively positive impact on the success. Student opinions on these can be illustrated as follows:

"I thought it was unnecessary and a waste of time." (G1-S19)

"When I looked at the program before coming, I thought it was not necessary to offer this course. If it was necessary, it would have already been given during the four years." (G2-S32)

B. Findings on the Sources of Turkish Language Teacher Candidates' Positive/Negative Thoughts before Taking the Ottoman Turkish Course

Sources of the teacher candidates' thoughts before taking the Ottoman Turkish course depend on circumstances and tendencies such as the existence of relatives in the family who know Ottoman Turkish, conducted research studies, the act of learning a new language/alphabet, reading past writings and books, acquiring cultural gains, learning one's ancestry, knowing one's history, the fact of knowing Ottoman alphabet, interest in Arabic language, and the fact of having taken Arabic education; and that this turns into positive/negative factors. Accordingly, the following table was created.

Table 2: Frequency and Percentages of the Sources of Teacher Candidates' Positive/Negative Thoughts before Taking the Ottoman Turkish Course

Category	G1		G2	
	f	%	f	%
Positive	7	17.5	3	7.5

	Interest in Ottoman Alphabet and Arabic	10	25	6	15
Negative	Acquired from the Environment and Research Studies	18	45	16	40
	Interest in Ottoman Alphabet and Arabic	2	5	11	27.5

G1 students were 17.5% positively and 45% negatively, while G2 students were 7.5% positively and 40% negatively affected by the environment and research studies. It is seen that knowledge acquired from the environment and conducted research studies cause the teachers candidates rather to think negatively about this course.

What is striking here is that the negative attitude ratios, which seem to be very close to each other, have increased in the current situation the success level of the successful G1 group with more effort. The same factor had the opposite effect in group G2. This negativity seems to have contributed to the G1 group's making more effort and succeeding.

"I have always wanted to learn because I think that in terms of reading documents and books about the past, it is beneficial personally and it culturally influences in a positive way." (G1-S9)

"I am an Ottoman grandson. It is the fact that I myself want to read and understand the documents and books that my ancestors left me, instead of someone else's translating and giving it to me." (G2-S18)

"The information that I got from the environment before I took this course influenced me negatively." (G1-S30)

"My History-graduate cousin had told me that I would not have much trouble." (G2-S9)

G1 students were affected 25% positively and 5% negatively by the Ottoman alphabet and interest in Arabic whereas G2 students were 15% positively and 27.5% negatively affected, respectively. This situation led the G2 group to remain behind in terms of success and the G1 group to rise positively. It is seen here that the alphabet and interest in Arabic can affect the teacher candidates in both positive and negative ways. Teacher candidates' views can be illustrated as follows:

"Going abroad and studying Arabic proved that I could succeed in this course." (G1-S2)

"My friends who study History teaching and Turkish teaching have told me that it was very difficult for them and that it would be difficult for me, too." (G2-S18)

"I thought it was unnecessary because we were going to be primary school teachers. It does not work for someone who teaches at that level." (G1-S26)

"Because the spelling is different." (G2-S38)

C. Findings on the Difficulties Faced by Teacher Candidates in Learning Ottoman Turkish

Findings regarding the difficulties faced by prospective teachers in learning Ottoman Turkish originated from letters with Arabic origin, depending of vowels and consonants on separate rules, different grammatical rules, difficulty in reading and writing, lack of infrastructure, lack of practicality of books, lack of learning time, and failing to create different group levels.

Table 3: Frequencies and Percentages of Turkish Teacher Candidates' Difficulties in Learning Ottoman Turkish

Category	G1		G2	
	f	%	f	%
Letters	16	40	25	62,5
Difficulties in Reading and Writing	17	42.5	18	45
Difficulties with regard to Suffixes, Words and Rules	3	7.5	3	7,5
Other Challenges	5	12.5	7	17,5

G1 students say that 40% of the difficulties stem from the letters. With 62.5% of G2 students' thinking the same way shows that difficulty is experienced in letters. This has a significant impact on success.

"...I got difficulty in combining when writing." (G1-S5)

"I had a lot of difficulties in combining letters and writing." (G2-S18)

Reading and writing are seen as the second reason for the difficulty of learning Ottoman Turkish. There was a difference of 2.5% between groups G1 and G2, and it is understood that this was not a meaningful difference. Both groups suffer from this problem.

"I did not have difficulty in reading because I knew how to read the Qur'an, but as I wrote, it was difficult to combine." (G1-S5)

"I had difficulty in writing and reading." (G2-S24)

It was found that both groups were affected at the rate of 7.5% in terms of suffixes, words and rules.

"I had difficulty in when I could and when I could not use the vowels." (G1-S14)

"... I experienced difficulties in understanding and practicing the rules, in recognizing and writing letters." (G2-S36)

"I only had difficulties in writing nasal n, and sometimes in writing suffixes." (G1-S18)

"It was very difficult for me because I did not have a command of the rules used when writing Arabic and Persian words." (G2-S16)

In the other difficulties category, G1 and G2 students seemed to be affected at the rate of 12.5% and 17.5%, respectively.

"It is a little bit difficult to fit in a single year all the rules and the grammar information of Ottoman Turkish." (G1-S7)

"Books' not being understandable and being heavy." (G2-S8)

D. Findings on the Teacher Candidates' Opinions about What They Have Done or What could be Done to Succeed in Learning Ottoman Turkish

Teacher candidates indicate that to be successful in the Ottoman Turkish course, the study method, and benefiting from various persons, sources and tools are important; and make various suggestions.

For the method of study, the spoken items were found to be the learning of presentation of sounds, letters and their spelling, and rules; reading and writing a lot; working with friends as if solving puzzles and playing word games; attending classes regularly, being active in classes, listening to the instructor and performing the requests; and so on.

In order to be successful, students point out the value of getting help from various persons, using a variety of books and resources, frequently looking up in dictionaries, benefiting from social media and reliable sites as well as course books.

These suggestions come out in the form of getting rid of the effects of negative judgments, studying, solving abundant examples, anticipating the course to be offered in a longer time span, arranging additional courses, offering the course every semester, increasing the number of quizzes, liking the course and the instructor's having students like the course by making it more enjoyable.

Table 4: Frequency and Percentages of Teacher Candidates' Opinions about What They Did or would Do to Be Successful in Learning Ottoman Turkish

Category	G1		G2	
	f	%	f	%
Study Method	33	82.5	32	80
Benefiting from Different Person, Resource and Tools	14	35	10	25
Suggestions	9	22.5	6	15

Findings about the thoughts of teacher candidates with regard to what they did or would do to succeed in learning Ottoman Turkish were found to be proportionally very close to each other with respect to the study method for both the ones successful (82.5%) at the first attempt and the ones unsuccessful (80%). This closeness shows us a very important point: whether they succeeded or not, prospective teacher candidates show that they comprehended the point of solution of the problem.

"The most important factor in this course is to do repetition ... It is important to read and think on it." (G1-S17)

"... I did repetition. I translated texts; I tried to reinforce using the word game method with my friends. I understood that it is settled when you make an effort." (G2-S9)

Emphasis on referring to various people, resources and tools is 35% for G1 students and 25% for G2 students. It can be said that depending on this, G1 students have succeeded by using this method; alternatively, G2 students have a tendency that they can succeed by referring to various people, resources and tools.

"I have reinforced my topic by describing the topics I understand to my friends, so I did not have difficulties during the examinations. I have used different sources and watched a video about these sources." (G1-S2)

"... I watched videos, I applied to additional sources." (G2-S40)

In terms of succeeding in this course, 22.5% of the G1 group and 15% of the G2 group made suggestions.

“To be successful, continuous reading and writing work must be done.” (G1-S6)

“We have to review what we learned on the day. We have to do writing work.” (G2-S18)

E. Findings on Whether the Teacher Candidates’ First Thoughts Related to Ottoman Turkish Changed After Taking the Course

Teacher candidates stated that after taking the Ottoman Turkish, the first thoughts about the course both did not change and changed.

The ones that experienced change in a positive way stated that they enjoyed the course, that reading their ancestors’ writings made them happy, that they saw the course as a pleasurable puzzle, that the teacher has brought the course fun, that the writings of the Ottoman Turkish were enjoyable, that the course contributed to understanding of the old literary texts, that they could do it if they studied, and that learning and saying that I know gives enjoyment.

Those who say that there was a change in the opposite direction said that letters, dominance of the thought of failure to learn, and seeing it difficult were effective in their opinion.

Those who had negative tendency while having a positive attitude or those who had positive tendency while having a negative attitude said that they continue to have the pleasure of learning, to feel the comfort of having building a background and so forth, or they were located at the opposite point.

Table 5: Frequency and Percentages of Whether the Teacher Candidates’ First Thoughts Related to the Course Changed After Taking the Ottoman Turkish

Category	G1		G2	
	f	%	f	%
Changed, Became Positive.	18	45	12	30
Unchanged; I Keep Thinking Positively.	9	22.5	3	7,5
Changed, Became Negative.	6	15	15	37,5
Unchanged; I Keep Thinking Negatively.	7	17.5	10	25

According to Table 5, it is seen that the G1 group has a 45% positive change, and the G2 group has a 30% change in the same direction. It is seen together with a proportional difference that there is a change at a significant level towards the positive end in both those who succeeded at the first attempt, and those who could not succeed at the first attempt. This, no doubt, means rise of the success.

“When I took the course, I realized that it was a very easy and fun lesson. I learned that what had been said is not true.” (G1-S8)

“Yes, it has changed. It was very frightening and difficult at first, but it was even easier and more fun in the course of the course.” (G2-S36)

In the G1 group, 22.5% and in the G2 group, 7.5%, respectively, appear to maintain the same point of view of the teacher candidates who think positively.

“I thought that I would understand this lesson easily and succeed, and it happened that way.” (G1-S9)

“Unchanged. I think I can learn no matter how hard I slog.” (G2-S28)

In the G1 group, 15% and in the G2 group, 37.5%, indicated that their first thoughts have become negative, respectively. It is clear that 17.5% in the G1 group and 25% in the G2 group are the ones who continue to think negatively from the outset, and this will decrease the degree of success.

“It changed, I started to be frightened of the course ...” (G1-S36)

“Yeah. At first I had thought it was easy. But after I took the lesson, I realized it was difficult.” (G2-S29)

“No, it has not changed. Because I thought I would have difficulty.” (G1-S29)

“No, it has not changed; because, I still do not think that Ottoman Turkish will be a contribution to me.” (G2-S16)

F. Findings on the Teacher Candidates’ Thoughts about Whether What They Gained from the Ottoman Turkish Course Is/Will, Is Not/Will Not Be of Any Contribution to Them

Those who think positively that Ottoman Turkish had a contribution think that anything learned will contribute in a way and grant a new instrument to a person. Also, candidates indicate that in addition to the contribution it provides at the moment, it will be of use in the future in terms of access to job opportunities and benefits in academic studies.

The ones that have negative attitude towards the subject of contribution of the course continue to look from a negative point, and they also say that the course is unnecessary. They are fixed in their attitude of “there will be no contribution from the course because ...”

Table 6: Frequency and Percentages of the Teacher Candidates' Thoughts about Whether What They Gained from the Ottoman Turkish Course Is/Will, Is Not/Will Not Be of Any Contribution to Them

Category	G1		G2	
	f	%	f	%
Contributed/Will Contribute.	33	82.5	22	55
Did Not Contribute/Will Not Contribute.	4	10	17	42.5

The G1 group's being at 82.5% and the G2 group's being at the 55% in the subject of whether the teacher candidates' gains from the Ottoman Turkish course made any contribution/will make any contribution reveal that G1 is more positive in comparison to G2. An assessment of whether or not a contribution was made or will be made without emphasizing being successful or unsuccessful is important in terms of the gains of the course. Because, students have had gains from this course. The positive attitudes of those who are unsuccessful (the G2 group students) will be a source of motivation for them to succeed in their subsequent instances of the course. The G1 group students have already achieved considerable success.

"I think it will contribute considerably. ... as it will contribute from the cultural point of view, there is a wide range of possibilities in job opportunities. In addition, the pleasure of being able to read and understand the books of our past personally gives a different happiness to man." (G1-S9)

"If I cannot teach, I can work as a translator or work in the library. So of course there will be contribution. I do not think that an unnecessary lesson will be offered to us." (G2-S4)

It is also meaningful that the ones who have a negative thought about the contribution of the course were at the rate of 10% in G1 and 42.5% in G2. Because the negative views of the G2 group seem to explain the situation in terms of their failure to pass the course at the first time.

"I have not seen a contribution of it until now." (G1-S26)

"I do not think this course will ever be of use to me." (G2-S8)

CONCLUSIONS AND RECOMMENDATIONS

Based on the findings, the majority of teacher candidates have anxiety towards the Ottoman Turkish course. However, it can be said that those who overcome these anxieties and prejudices are considerably successful, and those who are lost in their worries, although they do not leave the effort altogether, cannot make enough effort to succeed.

Positive respondents seem to have tried to capture achievement with meaningful justifications, while negative ones often seem to be behaving with the responsibility and obligation to achieve only one course.

It should be said that Ottoman Turkish preserves the value of the teaching aims if it is taken into consideration that even the unsuccessful have taken an approach that this course is useful. What is dominating the negative attitudes of failed students is the anxiety of being able to succeed.

One of the crucial anxieties of Turkish language teacher candidates is that they will not be able to use this acquisition for their students when they become teachers, and that this alphabet has lost its relevance today.

However, it cannot be expected of a Turkish language teacher who is unable to comprehend the development and change of the Turkish language in the historical process and the richness it has gained in the process to fulfill his or her duty.

In spite of all the anxieties, the approach of achieving the Ottoman Turkish as a course and acquiring it as an instrument is gaining importance. Today, new opportunities emerging in terms of the need for educated people who know Ottoman Turkish intensify this learning desire and give hope to teacher candidates in terms of job opportunities.

Turkish language teacher candidates find that the length of the Ottoman Turkish course is inadequate and therefore demand that the number of credits/hours should be increased. Otherwise, it will not be possible to teach the contents of the current program, and to do enough reading and writing practice.

It is beneficial to take the following suggestions into account in order for the Ottoman Turkish lesson to yield better results by making use of the student opinions:

- In order for the teacher candidates to become more active, making the lessons entertaining and processing the lessons in a race atmosphere will be effective in increasing the success.

- Based on availability, creating of level groups will be beneficial for the lesson to be more productive.
- The creation of an environment where the motivational goals of successful prospective teacher candidates can be shared with other pupils will be effective in reducing the anxieties. For this purpose, student panels can be created by creating discussion environments.
- The knowledge and experience gained in this field is beneficial to be operated and used in literary courses, even in oral and written lectures.
- Visiting the historical artifacts and archives, which will keep the memory of the Ottoman Turkish, will be meaningful.
- It will be important to consider these anxieties in the preparation of textbooks.
- It will be useful to increase the number of semesters and credit hours of the course so that Ottoman Turkish can be learned better.

TUVA DİNİ İNANIŞLARI ÜZERİNE BİR ARAŞTIRMA*

Prof. Dr. Münir YILDIRIM**

Giriş

Tuva Özerk Cumhuriyeti günümüzde Rusya Federasyonu içerisinde yer alan bir devlettir. Bu bölgede aynı adı taşıyan ve kadim bir Türk boyuna dayanan Tuva halkı bulunmaktadır. Tuva adı altında İrkit, Argamık, Hasut, Aynar, Monguş gibi farklı etnik yapıların bir araya geldiği de ifade edilmektedir. Tuva'nın milli dili Türk dil ailesinin kuzey grubundandır. Ayrıca Rusça da Tuva bölgesinde çok sık kullanılan dillerdendir. Uzun yıllar Sovyetler Birliğinin ve günümüzde de Rusya'nın etki alanında olduğundan Rus dil ve kültürü Tuvalılar üzerinde son derece etkindir. Türklerin ilk yurtlarından biri olan Tuva'nın nüfusu 500.000'e yakındır. Bunun 2/3'ü Tuva Türkü, geri kalan kısmı ise Rus, Moğol ve diğer topluluklardan teşkilidir.¹

Tuva'nın birinci resmi dili Türkçe'nin Sibiryaya koluna ait olan Tuva Türkçesi'dir. Tuvaların ilk ulusal alfabesi Göktürk, Turan, Orhun alfabesi olarak da bilinen eski Türk alfabesidir. Ancak 1941'den itibaren Kiril alfabesi kullanılmaktadır.

1. Tarih

Tuvalar kendilerini "Tıva" olarak adlandırır. Tuvaların menşei hakkında çeşitli görüşler vardır: "Tuva" kelimesinin III-IV. asırlarda Çinin kuzeyinde büyük bir devlet kurmuş olan "Toba-Topalardan geldiği, günümüz Tuvaları arasında yaygın olan bir kanaattir. Bugün "Tuva" (kendilerince "Tıva") olarak bilinen kelimenin 19. asırdan itibaren yazılı kaynaklarda geçtiği ileri sürülmektedir. Bu kelime dışında Tuvalar çeşitli

* Bu çalışma Çukurova Üniversitesi BAP komisyonu tarafından "SED-2017-9278" proje koduyla desteklenmiştir.

** Çukurova Üniversitesi İlahiyat fakültesi Öğretim Üyesi.

¹ Orhan Gedikli, "Tuva Özerk Cumhuriyeti", Türk Dünyası Tarih Dergisi, Aralık 2013, s. 36.

kaynaklarda; Soyon, Soyot, Uranhay, Uryanhay, Tuba kelimeleriyle anlatılmıştır. Aslında bütün bu kavramlar Tuvaların bir üst kimliğinin adı olarak kabul edilebilir. Günümüzde toplu olarak bu adla bilinen cumhuriyet insanları çeşitli boylardan, oymaklardan geldiklerini bilirler. Bu oymaklar çeşitli Uygur, Kırgız, Türkmen boylarından günümüze ulaşmışlar, ortak ad olarak da "Tıva" kelimesini kullanmaya başlamışlardır. Bu boyların bazıları şunlardır: Bay-kara, Çoodu, Deleg (Telengit), Doňgak, Hertek, İrgit, Kırgıs, Küjuget, Maadı, Oorjak, Oyun, Sat, Salçak, Sayan, Tumat, Toju, Todut; Uygur, Balıkçı, Kuskun, Höyük, Homuşku, Monguş, Ondar, Hovalıg, Hoyug, Sarıg, Oy-ondar, Kara-ondar, Darhat (Tarkat).²

2. Dini İnanışlar

Tuva dini inancında geleneksel Tuva yerel inanışları, Lamaizm ve kısmen de Hıristiyanlığın hâkim olduğu görülmektedir. Tuva'da rastlanan bu dinlerin halk tarafından en çok öne çıkarılanı içerisinde şamanistik karakterleri barındıran yerel inanış olarak da zikredilen geleneksel inanışlardır. Bunlar aynı zamanda Geleneksel Türk dini inanışlarında da görülen tanrı anlayışlarını ve tabiat kültlerini de ihtiva etmektedir. Zira Tuva halkı da Türk dil ailesinin üyesi olmakla birlikte Türk milletinin tarih sahnesine çıktığı ilk yurtlarda yaşamaktadırlar. Tuva dini inanışlarında Buddizmin tibet kolu olan Lamaizm de etkilidir. Tuva'ya özellikle Moğolistan üzerinden gelen Lamaizm bölgede önemli sayıda taraftara sahiptir. Bu durum Tuva geleneksel milli inanışlarını da olumsuz yönde tesir ederek onların giderek zayıflamasına sebep vermektedir. Yine Tuva da varlığını hissettiren dini inanışlardan biri de Rus misyonerlerin çabası sonucu gelişen Ortodoks Hıristiyanlıktır. Bölgede önemli sayıda Rus kilisesine bağlı Ortodoks halk yer almaktadır.

Tuva'da görülen dini inanışlardan en özgün ve otantik olanı geleneksel yerel inanışlardır. Tuvalılar tarafından daha çok kamlık olarak adlandırılan bu inanışlarda şamanistik unsurlar ve tabiat kültleri kendini göstermektedir. Bu inanışların temel özelliklerini tanrı, tabiat kültleri ve kamlık gelenekleriyle ifade edebilmek imkân dâhilindedir. Bu bağlamda ilk etapta tanrı anlayışlarına gelindiğinde genellikle Altay halkının kullandığı "Kayrakan" tabirinin kullanıldığı görülmektedir. Ayrıca Tuvalılar, "Gök" e de tanrı demekle birlikte onu insanın atası ve babası biçiminde de algılamaktadırlar. Onlara göre Gök'ten türeyen insan yeryüzüne inerek hayat başlamış ve

² Ekrem Arıkoğlu, Tuva Cumhuriyeti ve Tuva Türkleri, www.academia.edu, s.

bu şekilde çoğalmışlardır.³ Diğer taraftan Tuvalılar, gök cisimleri arasında “Hocanak” olarak isimlendirilen ve kırk bir yıldızdan müteşekkil yıldız topluluğuna da tanrılık atfetmektedirler.⁴

Tuva inanışlarına göre tabiattaki tüm nesnelere, dağ, ağaç, sular canlıdır ve insanla aralarında derin bağlar mevcuttur. Dolayısıyla Tuva halkı tabiata şükranlarını bildirmek için günlük hayatlarında ve çevrelerindeki her tabiat iyisine hediyelerde bulunurlar.⁵ Tabiat inanışlarına bağlı olarak kuru ağaçların ruhları olduğundan kutsal sayılmakta ve tümünden ağaçların kesilmesi yasaklanmaktadır. Bunun yanında suyun da ruhu bulunduğundan suları kirletmek, rastgele girmek ve suyu dağıtmak da saygısızlık kabul edilmektedir. Yine Tuva halkı yeryüzüne büyük önem vermekte, toprağın rastgele kazılmasını, üzerine tükürülmesini ve zarar verilmesini kötü davranış olarak görürler.⁶

Tuvalılarda dini inanışların icrasında çeşitli ayin ve törenler de kendini gösterir. Bunlar arasında en öne çıkanlardan biri hiç şüphesiz kurban ayinidir. Kurban edilecek hayvanlar arasında en ideali attır. Kurban ayininde hayvan kemikleri kırılarak öldürülmekte ve kafası bir sırığa geçirilerek çadırın karşısına dikilmektedir. Kurban etinden ziyafet verilerek ikram da bulunur. Kansı kurban geleneği olarak saç törenleri düzenlenir. Bu törende tabiat iyelerine dokuz gözlü kaşıkla süt serpmekte bu da tabiattaki su ve nehirleri temsil etmektedir.⁷

Tuvalıların kamlık geleneğinde Kamlar kökenlerini sanatlarını icra ederken dile getirirler. Bu daha çok törenin başladığı sırada, kamin kendisini tanıtmaya sırasında olur. Kam kökeninin gücünü belirtirken, kendilerine seslendiği ruhlara daha inandırıcı gelmekte, onların sözünü niçin yerine getirmeleri gerektiğini belirten açıklamalar yapmaktadır. Tuva’da kamlık geleneğini şu başlıklarla maddeler halinde toplayabiliriz:

1. Kalıtım Yoluyla

Kamlık bilgisi irsidir ve babadan oğula geçen bir meslektir. Bu özellikler kam olacak kişide doğuştan bulunur.

³ Kenin Lopsan Monguş, *Magic of Tuvianian Shamans*, Kızıl 1993, s. 15-18.

⁴ Ekrem Arıkoğlu, “Tuva’da Şamanizmin Dünü Bugünü”, *Türk Kültürü*, Mayıs 1995, Sa: 385, s. 33.

⁵ Tamara Budegeçi, “Tuva Şamanlarının Dünya Görüşü Hakkında”, *Çev. Ekrem Arıkoğlu, Türk Kültürü*, Ekim 1995, Sa: 395, s. 60.

⁶ Budegeçi, “Tuva Şamanlarının...”, s. 61-62.

⁷ Arıkoğlu, “Tuva’da Şamanizmin...”, s. 35.

2. Gökten Kamlayanlar

Tuvalılarda göğün çeşitli katlardan oluştuğu inancı yaygındır. Tuva inancına göre gök dokuz katlıdır. Dokuz kat göğün en üst katında Hayırakan (Kayra Kan) yaşar. Bazı kamlar kamlık yeteneklerini bu gökyüzündeki topluluklardan almaktadır. Hastaları tedavi ederken kendi köklerinden olduklarına inandıkları bu toplulukları yardıma çağırırlar.

3. Yer, su iyelerinden

Tuvaların inancına göre yer, dağ, aşitlar, şifalı sular, kam ağaçların iyeleri (sahipleri) vardır. Bu sahiplerin kızdırılmaması, onlara saygı gösterilip dua edilmesi gerekir. Bu iyelerle iyi geçinilerek tabiatın insana sunduğu yararlı ürünleri artırılması sağlanabilir.

4. Aza ve Buk soyundan

Azalar ıssız yerlerde, eski yurt ve obalarda, nehir kıyılarında, çukur yerlerin ağzında bulunur. Daha çok akşam kızılığında ortaya çıkarlar. Bazen sadece sesleri duyulur. Çoğunlukla insan kılığındadırlar. Bunun dışında köpek, kuş, yabanî hayvan kılığında da olabilirler.

5. Albıs ve Diiren soyundan

Albıs'lar insanların yaşamadığı ıssız yerlerde guruplar hâlinde görülür. Albısların yeri yurdu, obası oymağı vardır. Kendi aralarında misafirliğe gidip, tanışıp düğün yapıp evlenirler. Albıs'la karşılaşınca bazı kişilerin anlayışı zayıflar, hatta müzmin hastalığa yakalanabilirler.⁸

Tuva halk inanışlarında önemli bir yere sahip olan “Dokuz Kutsal’ı” şu şekilde sıralamak mümkündür:

1. Güneş

Tuvalılar sabah kalkınca kaynatılan süttten dokuz çukuru olan kaşıkla güneşe saçar. Güneşten mutluluk ve dileklerin yerine gelmesi istenir.

2. Ay

⁸ Arıkoğlu, www.academia.edu

Tuva halkı ay, güneş, anne, baba kelimelerini geleneklerinde birbirleriyle karşılaştırılarak verirler. Ay'ın durumundan nasıl bir yağış olacağını, karın yağacağını, rüzgârın eseceğini veya havanın güneşli olacağını tahmin ederek çeşitli kanaatlerde bulunurlar.

3. Gök

Gök insanın atasıdır. Göğün meyvesi ak damlalardır. Bu damlalar yer anaya düşünce hayat olur. Bu yüzden Tuva insanı eskiden beri göğü kutsamıştır.

4. Yeryüzü

İnsanoğlunun dokuz kuşaktan beri yaşadığı yerdir. Bu sebeple “atalarımızın yurdu” denir. İnsanın ata yurdu ayla, güneşle eş değerdedir. İnsanoğlu doğduğu yeri kötüleyemez. Çünkü orası atalarının yattığı yerdir. “Yer anam!” Sözü Tuvaların yeryüzüne ettikleri duadır. Çadır yeri, doğulan yer, eski yurt yerleri, ihtiyarların cesetlerinin gömüldüğü yerler, avlanılan ormanlar, otlaklar, ekin ekilen tarlalar hep ”Yer” adlı kutsal kelimeyle karşılanır. “Yer” insanın anasıdır. Bu yüzden kutsal saydığı yerlere Tuva insanı yalvarır.

5. Su

Suyun sahibi vardır. Su gece gündüz akar. Su başı gündüz fısıldanır, o zaman onun sahibi güneşten saklanır. Su başı gece çağlar. O zaman sahibi ortaya çıkarak konuşur. Su başı kirletilirse, sahibi kızdırılmış olur. Suyun sahibini kızdıran kişinin kolu bacağı eğilir. Bu sebepten su başı kirletilmez, ona saygı gösterilir.

6. Aşıt

Aşıtlar “eelig” (sahipli)’dir. Acelesi olan insan aşta geldiğinde atından iner. Dağ sahibine duasını ettikten sonra, atının kuyruğundan kılı keserek taşların üzerinde bulunan kuru ağacın bir koluna bağlar.

7. Ayı

Ayıyı kutsallaştırma tarihin bilinmeyen zamanlarından kalan bir inançtır. Ayıdan eerenlerin (putların) bulunması bunun için bir işarettir. Güçlü Şamanların evinde ayıdan put mutlaka bulunur.

8. Yedigir

İhtiyarların fikrine göre Yedigir yıldızı, eskiden yeryüzünde yaşamış yedi oğlandır. Yedi oğlan gökyüzüne uçup çıkmıştır.

9. Süt

Süt ak renklidir ve Tuva insanı onun kendisine en faydalı şeylerden biri olduğuna inanmıştır. “Süt gibi temiz insan” sözü kalbinde kötülüğü olmayan, insanlara faydası dokunan kimseler için kullanılır.⁹

Tuvalarda etkin olan bir diğer dini inanış da Buddizm’in Lamaizm koludur. Tuva’da Budizm inancı kabul edilmekle birlikte, kamlık inancı da ortadan kalkmamış, iki inanış birlikte yaşamaya devam etmektedir. Tuva’da Budizm-lamaizm ile kamlık arasındaki temel farklılıklar şu şekilde sıralanmaktadır:

1. Budizmde sadece erkekler lama olabilirler. Oysa kamlıkta kadınlar da kam olabilir. Hatta bazı kadın kamların erkeklerden daha güçlü olduğuna inanılır.

2. Budizm kitaba dayanır, lamalar Budizm kitaplarından bölümler okuyarak mesleklerini icra ederler. Kamların yazılı kaynakları yoktur. Tefiyle, tokmağıyla o anda aklına gelen alkışlarını söyleyerek kamlık ederler.

3. Lamalar Buda’ya dua ederler. Kamların çeşitli eerenleri vardır. Eerenler kamın ruhlarla bağlantı kurmalarına yardımcı öğelerdir. Kamın tefinden giyimine, elbisesinin üzerindeki yılanlara, kuş tüyelerine, halkalara varıncaya kadar hepsi kamın yardımcılarıdır. Her kamın irtibat kurduğu ruhlar ve bu ruhların güçleri de farklı olduğundan, her kamın tedavi edeceği hastalık türleri de farklılık gösterir. İyi bir kam kendinin tedavi edemeyeceği bir hastayı, o konuda uzman olduğunu düşündüğü farklı bir kama gönderir. Budizm-lamaizm ve kamlık inancının bu farklı yönleri bulunmasına karşılık, içinde yaşadığımız tabiata saygılı olarak, onunla uyum içerisinde yaşama felsefesi her iki inanç sisteminde de ortak özelliştir ve bir arada yaşamalarını sağlar.¹⁰

Türkiye’de Felsefe Eğitimi ve Sorunları¹ Philosophy Education and Its Problems in Turkey

Doç. Dr. Cahit Aslan
Çukurova Üniversitesi, Eğitim Fakültesi,
Felsefe Grubu Eğitimi Ana Bilim Dalı, Balacalı,
Adana / Türkiye
caslan@cu.edu.tr; caslan117@hotmail.com

ÖZET

Türkiye’de felsefe eğitimi ve sorunlarının nedenleri üç boyutta ele alınmalıdır. Bunlardan ilki tarihsel ve konjonktürel sosyo-politik sorunlardan kaynaklı olanlar. İkincisi öğrencilerin ve velilerinin felsefe öğretimine yönelik tutumlarından ve üçüncüsü de felsefe öğretiminde kullanılan yöntem ve öğretmenlerin yeterliliğinden kaynaklı olanlardır. Bu araştırmanın amacı Türkiye’de felsefe eğitimi ve sorunlarını ortaöğretim düzeyinde bahsi geçen üç boyutta ele alıp değerlendirmek ve çözüm önerileri sunmaktır. Araştırma için gerekli olan veriler bir anket yardımıyla örneklem esasına göre mevcut 187 felsefe öğretmenlerinden elde edilmiştir. Bulgular çok değişkenli analiz temel alınarak elde edilmiştir. Sonuçlar, bulgulara dayanan problem tanımlama biçimindedir. Aynı zamanda daha önce başka araştırmacılar tarafından yapılan benzer çalışmalarla da karşılaştırılmıştır.

Anahtar kelimeler: Türkiye’de Felsefe Eğitimi, Felsefe Eğitimi Sorunları.

ABSTRACT:

Philosophy education and its problems in Turkey should be considered in three dimensions. First of them is mainly due to historical and conjectural socio-political problems. The second is the attitude of the students and their parents towards teaching philosophy, and the third is teachers as evaluated by the methods they use. The purpose of this study is to analyse the philosophy education and its problems in Turkey in the three dimensions mentioned above, and to present proposals for solutions for high schools. The data required for the research were obtained from the current 187 philosophy teachers on the basis of the sampling with the help of a questionnaire. Findings are based on multivariate analysis. The results are presented as problem identification based on findings. The results have also been compared with similar studies previously done by other researchers.

Keywords: Problems of Philosophy Education, Philosophy Education in Turkey

¹ Bu çalışma Çukurova Üniversitesi Bap biriminin SED-2017-8685 ID kodlu proje tarafından desteklenmektedir.

Giriş

Bir toplumun rekabet gücü yalnızca sermayeye ve sahip olduğu teknolojiye bağlı değildir. Daha da önemlisi insani gelişmişlik düzeyine bağlıdır. Yetiştirilen insanın niteliği toplumun gelişmişliğine, o da rekabet gücüne etki edecektir. İnsani gelişmişliğin göstergeleri çok boyutludur. Okur-yazar oranı, kişi başına düşen gelir, kadınların işgücüne katılım gibi göstergeler söz konusudur. Bir diğer sonuç gösterge de toplum üyelerinin eleştirel düşünceye sahip olup olmamasıdır. Bireylerin eleştirel düşünme vasıflarına sahip olmasını sağlayacak olan şey de felsefe eğitimidir. Türkiye’deki gelişme göstergelerinin bazıları ayrıca tartışılabilir. Fakat bu çalışma Türkiye’de felsefe eğitimi ve sorunları ele alınmaktadır.

Türkiye’de felsefe eğitimi ve sorunları ise üç boyutta ele alınmalıdır. Bunlardan ilki tarihsel ve konjonktürel sosyo-politik sorunlardan kaynaklı olanlardır. İkincisi öğrencilerin ve velilerinin felsefe öğretimine yönelik tutumları ve üçüncüsü de felsefe öğretiminde kullanılan yöntem ve öğretmenlerin yeterliliğidir. Bu araştırmanın amacı Türkiye’de felsefe eğitimi ve sorunları ortaöğretim düzeyinde bahsi geçen üç boyutta ele alıp değerlendirmek ve çözüm önerileri sunmaktır.

Araştırma için gerekli olan veriler, kaydı verilerden elde edildiği gibi araştırmacının bilakis anket aracılığı ile öğretmen deneyimlerinden yararlanarak da elde edilmiştir. Alan araştırması için yarı yapılandırılmış anket kullanılmıştır. Milli eğitime bağlı farklı liselerde görev yapan 187 felsefe öğretmeni anket yardımıyla verdikleri felsefe eğitimiyle ilgili deneyimlerini paylaşmışlardır. Araştırmacının sahadan örneklem esasına göre elde ettiği verilerin daha önce başka araştırmacıların konu ile ilgili yapmış oldukları benzer çalışmalarla karşılaştırması yoluna da gidilmiştir. Bulgular çok değişkenli analiz temel alınarak elde edilmiştir.

Birinci kısımda tarihsel ve konjonktürel sosyo-politik boyutları ile felsefe eğitimi ve sorunları ele alınmıştır. İnci, üçüncü ve dördüncü kısım ise araştırmacının örneklem esasına göre sahadan elde ettiği verilerin yorumlanmasında oluşmaktadır. İkinci kısımda örneklemin genel nitelikleri tanımlanmıştır. Üçüncü kısımda Türkiye’deki öğrenci velilerinin felsefe öğretimine karşı nasıl bir tutum sergiledikleri tespit edilmiştir. Dördüncü kısımda ise yine verilere dayalı olarak felsefe öğretmenlerinin öğretim zorlukları tespit edilmiştir. Sonuç kısmı, bulgulara ve çözüm önerilerine dayanan problem tanımlama biçiminde sunulmuştur.

Felsefe Eğitiminin Tarihsel ve Konjonktürel Sosyo-Politik Boyutları

Bazı araştırmacılara (Yıldırım 2013; Kafadar’a 1994a; 1994b; 2000; Bolay 1994; Akyüz 1993) göre, İslâm dünyasında bilim ve felsefe hareketleri; başlangıçta Halife Memun’un 830 yılında resmî bir tercüme ve araştırma enstitüsü olarak Bağdat’ta kurduğu Büytül-Hikme’de, Grek felsefe eserlerinin çevrilmesiyle oluşmuştur. İslâm dünyasında klâsik eğitim/ öğretim kurumları olan medreseler, temelde fıkıh öğretimi veren kurumlardır. Nizamîye Medreseleri’nin programlarında felsefe yer almakla birlikte, çok geçmeden kötü bir gözle görülmüş, felsefe programlardan çıkarılarak yerini kelâma bırakmıştır. Gazali’nin, matematik bilimlerle fazla meşgul olmayı, kelâmı küçülten felsefe ve filozofları yönelik ağır eleştirileri; İslâm dünyasında felsefi araştırmaların etkinliğini yitirmesinde önemli bir rol oynadı. Felsefe tamamen medrese programlarından çıkartıldı, hatta felsefeyi zararlı bilimler arasında gören bir zihniyet medreselere yerleşti.

Genel anlamda eğitim anlayışına özelde de felsefe eğitimine düzenli bir ivme kazandırılmamasının en önemli sebepleri hızla değişen Maarif Nazırları ve Şeyhülislamla bağlı olarak ortaya çıkan siyasi istikrarsızlık ve dönemin içinde bulunduğu savaş durumu olarak gösterilebilir. İlk defa Mülkiye Mektebi’nin 1879 programında son sınıfta “İlm-i Kelam” adıyla felsefe dersi yer aldı. 1880’lerde felsefe dersleri Mülkiye Mektebi’nde verilmeye çalışılmışsa da daha sonra kelam dersleri ile değiştirilmiş. Sonrasında Hukuk Mektebi’nde 1884 yılı programında hukuk felsefesi dersleri yer alır. Daha önce iki kez kapatılmış olan Darülfünun, 1900 yılında tekrar açıldığında, ilk defa teşekküllü hikmet derslerine yer verir. 2. Meşrutiyet (1908) ile birlikte “felsefe” terminolojisinin yerleşmeye başladığını ve Sultanilerde okutulmaya başladığını görürüz. Üç yıllık eğitim programında iki saat yer tutan felsefe dersleri 1923 Türkiye Cumhuriyeti’nin ilanından sonra on saate kadar çıkmıştır. 1900 yılında Darülfünun’un Edebiyat Şubesinin programında felsefe derslerinin üniversite seviyesinde programlara fiilen girmiş olduğunu görürüz. 1914 yılında Medresetü’l-Vaizin adlı bir medresenin programında felsefe adıyla bir ders ilk defa medrese programına girmiştir. 2. Meşrutiyet Dönemi’nde felsefe derslerinin ortaöğretime de girdiği görülmektedir. Cumhuriyet Döneminde ise, felsefe dersleri liselerin bütün programlarında haftalık ders saati olmuştur. Böyle II. Meşrutiyetten bu yana Türk eğitim sistemi ortaöğretiminde felsefe derslerinin liselerin temel derslerinden biri olarak karşımıza çıktığını görüyoruz. Felsefenin II. Meşrutiyet’in ilanından sonra kurumsal ve akademik bir nitelik kazanarak aydınlardan üniversiteye geçtiğini (Kafadar 2000: 215) söyleyebiliriz.

Cumhuriyet Dönemi’nde üniversitelerdeki felsefe eğitimi/öğretimi ise, önce İstanbul Dârülfünun’un Edebiyat Fakültesi Felsefe Kürsüsünde başlar. Daha sonraki dönemlerde üniversitelerin gelişmesine paralel olarak yeni Felsefe bölümleri açılır. İstanbul Dârülfünun’un yerine, İstanbul Üniversitesi kurulmuştur. Bu yeni yapı içinde

İlahiyat Fakültesi yer almadığından Tasavvuf, Din Felsefesi ve İslâm Mezhepleri, Kelâm gibi felsefe ile ilgili derslerin kaldırıldığı gibi, Edebiyat Fakültesi programından da İslâm Felsefesi dersinin yerine Türk Filozofları dersi konulmuştur. Bugün Türkiye’de birçok üniversiteye bağlı çeşitli fakültelerin bünyelerindeki Felsefe Bölümleri ve Felsefe Grubu Öğretmenliği Bölümlerinde felsefe alanında yükseköğretim yapılmaktadır. Fakat günümüzde ortaöğretimde gittikçe felsefe dersleri ve saatleri azalmıştır.

Çağdaş Türk felsefi düşüncesinin sosyo-politik sorunların derinden yaşandığı bir ortamda ortaya çıkıp gelişmek zorunda kalması, Türkiye’de felsefenin bir talihsizliği olagelmıştır. Türk düşüncesinin gelişim sürecinde aşamadığı kısaca “pragmatik olma” olarak nitelenen bu özellik, felsefenin bir dünya görüşü olarak algılandığı bir tutumun yerleşmesine yol açmıştır. İkinci Meşrutiyet Dönemi’nde felsefenin “dünya görüşü” olarak algılanması ve hatta felsefeyi bu çerçevede işe koşma tutumu, Batılılaşma sürecinin ivme kazandığı Cumhuriyet Dönemi’nde yeni boyutlar kazanarak sürmüştür.

Günümüzde de sosyal-kültürel ve ekonomik nedenler gibi faktörler felsefe öğretimine ket vurmaktadır (Akdağ 2002). Örneğin felsefenin çok fazla gelir getiren, statüsü yüksek bir meslek olmaması, ayrıca felsefe ile uğraşan kişilerin dinî, siyasi yönden çeşitli şekillerde etkilenmesi (Kefeli 2011) gibi nedenler felsefe öğretimin zorlaştırmaktadır. Oysa Türkiye’de siyasi ve kültürel dönüşümlerle toplumun kazanımlarının muhafazası ve sürdürümü için günümüzde etkili felsefe eğitimi kaçınılmazdır. Türkiye Cumhuriyeti’nin kuruluşundan itibaren 1924, 1938, 1957, 1976, 1985, 1993, 2009’da olmak üzere 7 kez felsefe programı değiştirilerek uygulanmıştır (Kafadar 1994b). 2017 yılı itibarıyla da yeni bir program üzerinde çalışılmaktadır.

Felsefe Öğretmenlerinin Deneyimleri

Türkiye’de yaşayan, uygulanan, süregiden felsefe eğitimi ve sorunlarının tespiti için içeriden okuma yapmak gerekir. Özellikle hali hazırda görev yapan felsefe öğretmenlerinin deneyimleri ve yaşantıları önem arz etmektedir. Felsefe eğitimi ve sorunlarının tespiti için gerekli veriler önceden hazırlanmış anket yardımı ile mevcut felsefe öğretmenlerine sorularak elde edilmiştir. Örneklemin nitelikleri ve elde edilen sonuçlar şu şekildedir:²

Örneklemin Genel Nitelikleri

Örneklemin Türkiye’de 49 farklı şehirde görev yapmaktadır.³ Türkiye’de felsefe eğitimi mezun olduğu okullardaki felsefe ekollerinin etkisi de olabilmektedir. 25 farklı üniversiteden mezun olan öğretmenlerin ankete katılmasıyla çok farklı ekollerin temsili de sağlanmıştır.⁴

Tablo 1: Örneklemin cinsiyet dağılımı

Cinsiyet	n	%
Erkek	73	39,0
Kadın	114	61,0
Toplam	187	100,0

Örneklemin % 61’i (n=114) kadınlardan ve % 39’u (n=73) erkeklerden oluşmaktadır.

² Bu çalışmada kullanılan veriler Çukurova Üniversitesi BAP birimi tarafından desteklenen SBA-2017-8173 ID kodlu projede üretilene verilerden elde edilmiştir.

³ Ankete iştirak eden örneklemin görev yaptığı şehirler: Adana, Adıyaman, Afyonkarahisar, Ağrı, Aksaray, Ankara, Antalya, Artvin, Aydın, Balıkesir, Bartın, Batman, Bingöl, Bolu, Bursa, Denizli, Diyarbakır, Düzce, Elazığ, Erzurum, Eskişehir, Gaziantep, Giresun, Hakkâri, Hatay, Isparta, İstanbul, İzmir, Kahramanmaraş, Karaman, Kayseri, Kocaeli, Konya, Kütahya, Manisa, Mardin, Mersin, Nevşehir, Ordu, Şanlıurfa, Sivas, Şanlıurfa, Şırnak, Tekirdağ, Tokat, Tunceli, Uşak, Van, Zonguldak.

⁴ Ankete iştirak eden öğretmenlerin mezun oldukları üniversiteler: Adnan Menderes Üniversitesi, Akdeniz Üniversitesi, Anadolu Üniversitesi, Ankara Üniversitesi, Atatürk Üniversitesi, Cumhuriyet Üniversitesi, Çukurova Üniversitesi, Dicle Üniversitesi, Dumlupınar Üniversitesi, Ege Üniversitesi, Fırat Üniversitesi, Gazi Üniversitesi, Hacettepe Üniversitesi, İnönü Üniversitesi, İstanbul Üniversitesi, Mersin Üniversitesi, Mimar Sinan Üniversitesi, Muğla Üniversitesi, ODTÜ, Pamukkale Üniversitesi, Sakarya Üniversitesi, Selçuk Üniversitesi, Süleyman Demirel Üniversitesi, Uludağ Üniversitesi, Yüzüncü Yıl Üniversitesi.

Tablo 2: Örneklemin yaş dağılımı

Yaş grupları	n	%
24 yaş ve altı	3	1,6
25-34 yaş arası	75	40,1
35-44 yaş arası	73	39,0
45-54 yaş arası	32	17,1
55 yaş ve üstü	4	2,1
Toplam	187	100,0
Medyan=37; \bar{x} =37,32; σ = 7,856; Ranj=36; Min.=23; Max.=59		

Tablo 3: Örneklemin medeni durumu

Medeni durumu	n	%
Hiç Evlenmedi	51	27,3
Evli	119	63,6
Boşanmış/Eşi ölmüş/Ayrı yaşıyor	17	9,1
Toplam	187	100,0

Felsefe öğretmenlerinin ortalama yaşı 37,32, ortanca yaş ise 37'dir. En genç felsefe öğretmeni 23 yaşında en yaşlı ise 59 yaşındadır. Yine %63,6'sı evli, %36,4'ü bekârdır.

Tablo 4: Örneklemin öğretmenlik deneyimi

Öğretmenlik Deneyimi/Yıl	n	%
5 yıl veya daha az	55	29,4
6-10 yıl arası	40	21,4
11-15 yıl arası	12	6,4
16-20 yıl arası	52	27,8
21 yıl ve üzeri	28	15,0
Toplam	187	100,0
\bar{x} =12,18 yıl σ =0,918		

Tablo 5: Örneklemin görev aldığı okul türleri

Okul Türleri	n	%
Fen Lisesi	12	6,4
Anadolu Lisesi	77	41,2
Mes. ve Teknik Anadolu Lis.	46	24,6
Temel Lise/Özel Kolejler	20	10,7
İmam-Hatip Lisesi	13	7,0
Diğer	19	10,2
Toplam	184	100,0

Felsefe öğretmenlerinin % 29,4'ü öğretmenliklerinin ilk beş yılı içerisinde. % 15'i ise 21 ve üzeri yıl öğretmenlik deneyimine sahiptir. Öğretmenlik deneyiminde genel ortalama 12 yıldır. Yine felsefe öğretmenlerinin (örneklemin) büyük çoğunluğu Anadolu Liselerinde (% 41,2) görev yapmaktadır. En az Fen Liselerinde (% 6,4) ve daha sonra İmam-Hatip Liselerinde (%10,2) görev yapmaktadır.

Tablo 6: Örneklemin yabancı dil bilgi düzeyi

Dil düzeyi	İngilizce		Fransızca		Almanca		Arapça	
	n	%	n	%	n	%	n	%
0. Hiç bilmiyor	14	7,5	177	94,7	166	88,8	163	87,2
1. Çok zayıf	90	48,1	8	4,3	18	9,6	16	8,6
2. Orta	71	38,0	2	1,1	3	1,6	5	2,7
3. İyi	10	5,3	0	0	0	0	2	1,1
4. Pekiyi	2	1,1	0	0	0	0	1	,5
Merkezi eğilim	\bar{x} =1,44 σ =0,75		\bar{x} =0,06 σ =0,28		\bar{x} =0,13 σ =0,38		\bar{x} =1,19 σ =0,58	

Felsefe öğretmenlerinin Türkçe dışında bir dil bilme oranı en yüksek İngilizce olup o da ortalama itibarıyla dil bilme düzeyi oldukça zayıftır (\bar{x} =1,44). Fransızca, Almanca ve Arapça bilgisi İngilizcilerinden daha da geridir. Bu dillerin dışında Türkiye'deki felsefe öğretmenlerinin % 20,8'i (n=39) başta Kürtçe olmak kaydı ile Yunanca, İtalyanca, İspanyolca ve Rusça gibi dilleri de (\bar{x} =0,61 σ =1,253) bilmektedir.

Öğrenci ve Velilerinin Felsefe Eğitimine Yönelik Tutumları

Türkiye'de felsefe eğitimine yönelik öğrencilerin ve velilerin tutumlarını etkileyen çok çeşitli faktörler var. Daha önce bahsedildiği gibi felsefe eğitimine yönelik tarihsel ve konjenktürel sosyo-politik faktörlerin yol açtığı olumsuz tutumların varlığı bugün de öğrencilerin ve velilerin tutumlarını aynı doğrultuda etkilemektedir. Ayrıca pragmatik nedenlerden dolayı felsefe eğitimine yönelik olumsuz tutumların oluşması da söz konusudur. Örneğin lise eğitimindeki öğrencilerin önünde geçmeleri, başarılı olmaları gereken kocaman bir üniversiteye giriş sınavı var. Öğrencilerin enerjilerinin çoğunu bu sınava yönelik harcamaaktadırlar. Öğrencilerin hangi derse daha çok ağırlık vereceklerini ve seçmeli olarak hangi dersleri seçeceklerini bu sınav belirlemektedir. Üniversite sınavlarında diğer derslere göre felsefe dersleriyle ilişkin çok az soru çıktığı için ve üstelik ders seçmeli ise felsefe dersleri tercih edilmemektedir, ders zorunlu ise felsefe derslerini üniversite sınavında daha çok soru çıkan diğer derslerin sorularını çözmek için kullanılacak bir zaman olarak değerlendirilmemektedir. Hatta okul yöneticileri genelde

felsefe grubu derslerini sadece serbest zaman olarak görüp öğrencilerin test çözecekleri dersler olduğunu dile getirdikleri söylenmektedir (Akdağ 2002; Ünal 2016). Kısaca “öğrenciler felsefe bilgisini işlevsiz algılaması ve öğrencilerin hazır oluş düzeylerinin düşük olması gibi nedenler felsefe derslerini olumsuz etkilemektedir” (Biçer 2103: 1). Ünal’a (2016) göre öğrenci ilgi ve beklentileri, derslerin soyut olması, ders kitaplarının yetersizliği, sınav sistemi, öğretmenin bakış açısı, öğrencilerin hazır oluş düzeyleri ve ders saatlerinin yetersizliği gibi faktörler öğrenci ve velilerin felsefe eğitime karşı olumsuz yargıların oluşmasına neden olmaktadır. Felsefe eğitime yönelik bu yorumlarının gerçeklik boyutunu görmek için ankette sekiz maddeden oluşan bir soru sorulmuştur. Anket sorularına 187 felsefe öğretmenin yanıt verdiği sahadan elde edilen verilere göre öğrencilerin felsefe eğitime yönelik olumsuz tutumları sırasıyla şu şekildedir:

Tablo 7: Felsefe derslerine karşı tutumlar

Tutumlar	1		2		3		4		5		\bar{x}	σ
	n	%	n	%	n	%	n	%	n	%		
1.Felsefe dersleri kuramsal bilgi yığını olarak sunulması.	14	7,5	41	21,9	45	24,1	53	28,3	34	18,2	3,28	1,208
2.Üniversite sınavında puan getirmemesi.	24	12,8	25	13,4	62	33,2	57	30,5	19	10,2	3,12	1,163
3.Felsefe öğrenimi psikolojilerini bozacağı düşünülmesi.	17	9,1	25	13,4	38	20,3	64	34,2	43	23,0	3,49	1,237
4.Felsefe ders kitaplarının felsefe öğretiminde oldukça yetersiz olması.	25	13,4	21	11,2	48	25,7	54	28,9	39	20,9	3,33	1,293
5.Felsefe ders saat sayısının felsefe eğitimi için oldukça yetersiz olması.	17	9,1	30	16,0	50	26,7	55	29,4	35	18,7	3,33	1,212
6.Felsefeciliğin fazla para getiren bir iş olmaması.	56	29,9	56	29,9	42	22,5	23	12,3	10	5,3	2,33	1,181
7.Felsefe yapmayı öğrenmenin zor olması.	15	8,0	30	16,0	45	24,1	46	24,6	51	27,3	3,47	1,267
8.Öğrencileri dinî, siyasi vb. nedenlerden ötürü felsefe derslerine karşı ön yargılı olması.	15	8,0	33	17,6	60	32,1	51	27,3	28	15,0	3,24	1,149
1.Hiç katılmıyorum; 2.Büyük ölçüde katılmıyorum; 3.Kararsız; 4.Büyük ölçüde katılıyorum;5.Tamamen katılıyorum												

Felsefe öğretmenlerinin tecrübelerine göre birinci sırada öğrencilerin büyük çoğunluğu felsefe öğrenmenin psikolojilerini bozacağı düşünüyor ($\bar{x}=3,49$ $\sigma=1,237$). Aynı zamanda felsefe yapmayı öğrenmenin zorluğundan da şikâyetçiler ($\bar{x}=3,47$ $\sigma=1,267$). Üçüncü sırada felsefe ders saatlerinin ve felsefe ders kitaplarının felsefe öğrenimi için yetersiz olması ($\bar{x}=3,33$) gelmektedir. Bu tutumlara ek olarak “öğrencilerin dinî, siyasi vb. nedenlerden ötürü felsefe derslerine karşı ön yargılı olmaları” ($\bar{x}=3,24$ $\sigma=1,149$) da felsefe derslerine karşı olumsuz tutum geliştirmelerine neden olmaktadır. Öğrenci ve velilerinin felsefe derslerine karşı olumsuz tutum geliştirmelerinde felsefe derslerinin “üniversite sınavında puan getirmemesi” ($\bar{x}=3,12$ $\sigma=1,163$) diğer sebeplere göre düşüktür; fakat bu algı da belli oranda etkilidir. Öğrencilerin felsefe eğitime yönelik bu maddelerin genel ortalaması alınınca şu sonuçlar elde edilmiştir:

Tablo 8: Felsefe derslerine karşı tutumlar ortalaması

Sıklık	n	%
1.Hiç katılmıyorum	5	2,6
2.Büyük ölçüde katılmıyorum	27	14,4
3.Yarıyariya katılıyorum	74	39,5
4.Büyük ölçüde katılıyorum	70	37,4
5.Tamamen katılıyorum	11	5,8
Toplam	187	100,0
$\bar{x}=3,201$ $\sigma=0,84$		

Öğrencilerin felsefe eğitime yönelik bu maddelerin beşli Likert derecelendirmeye göre genel ortalaması $\bar{x}=3,201$ ve standart sapması $\sigma=0,814$ 'dir. Buradan öğrencilerin felsefe eğitime karşı bariz bir olumsuz duruş

sergiledikleri görülmektedir. Kısaca felsefe öğretmenlerinin deneyimine göre öğrenci ve velilerin % 82,7'si felsefe derslerine karşı olumsuz tutumlara sahiptirler. Bu tespitler, öğrencilerin felsefe derslerinde etkili öğrenme ve felsefenin işe yararlı olması bakımından oldukça negatif görüşlere sahip oldukları konusunda Akdağ'ın (2002) ve Ünal'ın (2016) bulguları ile paralellik göstermektedir.

Tablo 9: Görev okullarına göre felsefe derslerine yönelik tutumlar

Okullar	1. Katılmıyor		3. Kararsız		5. Katılıyor		Top. n
	n	%	n	%	n	%	
	Fen Lisesi	5	41,6	3	25,0	4	
Anadolu Lisesi	15	19,4	30	38,9	32	41,5	77
Mes. ve Tek. Anadolu Lis.	4	8,6	15	32,6	27	58,6	46
Temel Lise/Özel Kolejler	3	15,0	7	35,0	10	50,0	20
İmam-Hatip Lisesi	2	15,3	8	61,5	3	23,0	13
Diğer	3	15,7	11	57,8	5	26,3	19
Toplam	32	17,1	74	39,5	81	43,3	187

Felsefe derslerine yönelik olumsuz tutumlar daha ziyade Mesleki ve Teknik Anadolu Lisesindeki öğrenciler sahipler (% 58,6). Daha sonra Temel Lise/Özel Kolejlerdeki öğrenciler olumsuz tutumlara sahipler (%50,0). Felsefe derslerine yönelik olumlu tutumlara sahip olan öğrenciler ise daha ziyade Fen Lisesindeki öğrenciler (% 41,6). Daha sonra Anadolu Lisesindekiler (% 19,4) felsefe derslerine yönelik olumlu tutumlara sahiptirler. İmam-Hatip lisesindeki öğrenciler (% 61,5) ise felsefe derslerine yönelik kararsız bir durumdadır.

Felsefe öğretmenlerinin açık uçlu sorulara verdiği yanıtlara göre öğrenci ve veliler felsefeye ihtiyaç duymuyor. Ailede başlayan dini eğitim ve din kültürü gibi diğer branş öğretmenlerinin ve idarecilerinin etkilerinden kaynaklı olarak öğrencilerde felsefe eğitimine karşı önyargıların oluşmasına neden olmaktadır. 35-40 kişilik sınıfta ortalama 3-5 öğrenci felsefeye ilgi duymaktadır. Genelde felsefe öğretmeni olmanın bazı toplum kesimlerindeki itibarı da tartışılabilir.

Tablo 10: Felsefe öğretmenlerinin itibarı

Toplum kesimleri	0. Hiç saygın değil		1. Biraz saygın		2. Saygın sayılır		3. Oldukça saygın		\bar{x}	σ
	n	%	n	%	n	%	n	%		
	Toplumda	44	23,5	63	33,7	57	30,5	23		
Diğer öğretmenler arasında	24	12,8	48	25,7	71	38,0	44	23,5	1,72	0,966
Öğrenciler arasında	9	4,8	35	18,7	78	41,7	65	34,8	2,06	0,853
Bürokraside	104	55,6	43	23,0	34	18,2	6	3,2	0,69	0,880
Genel itibar (Ortalama)	26	13,9	83	44,4	67	35,8	11	5,9	1,34	0,789

Felsefe öğretmeni olmanın nispeten itibar gördüğü kesim öğrenci kesimdir. Felsefe öğretmeni, öğrenciler arasında "saygın" bir yere sahiptir. Öğrencilerden sonra diğer öğretmenler arasında ve halk kesiminde de biraz saygınlık görmektedir. Felsefe öğretmeni olmanın saygınlığının en düşük olduğu yer bürokrasidir. Felsefe öğretmeni olmak bürokraside neredeyse hiç itibar görmemektedir. Felsefe öğretmeni olmanın felsefe öğretmenlerine sağladığı maddi yaşam olanakları da oldukça zayıf sayılır.

Tablo 11: Felsefe öğretmenlerin elde ettiği gelir yeterliliği

Yeterlilik düzeyi	n	%
1. Hiç yeterli değil.	64	34,2
2. Büyük ölçüde yetersiz	60	32,1
3. Yarı yarıya yeterli	41	21,9
4. Büyük ölçüde yeterli	20	10,7
5. Tamamen yeterli	2	1,1

Toplam	187	100,0
$\bar{x}=2,12 \quad \sigma=1,037$		

Felsefe öğretmenlerinin %66,3'ü elde ettikleri gelirden şikâyetçiler. Felsefe öğretmeni olarak elde ettikleri gelirlerden memnun değiller, yetersiz buluyorlar. Ancak %11,8'i elde ettikleri gelirden memnundur. %21,9'u orta düzeyde memnun olduğunu ifade etmektedir. Genel ortalama itibarıyla felsefe öğretmenlerinin elde ettiklerinin yetersiz olduğu söylenebilir.

Felsefe Öğretiminde Kullanılan Yöntem ve Öğretmenlerin Yeterliliği

Felsefe dersinin amacı öğrencilerin yaşadıkları dünyayı, toplumu ve kültürlerini eleştirel bir bakış açısıyla anlamasını sağlamaktır. Felsefe dersi bireyin kendi yaşamı için amaç belirlemesine, egemen görüşlere bağlı kalmadan kendi düşüncesine göre bir bakış açısını ortaya koymasına, farklı durumlar arasında ilişkiler kurabilmesine, çeşitli düşünceler üzerine yorum yapabilmesine, olaylar karşısında bireysel bir duruş sergilemesine katkı sağladığı (Kızıltan, 2012; Ünal, 2016: 3172) bilinmektedir. Fakat etkili bir öğretim ile gerçekleşmez ise felsefe öğretimi amacına ulaşamayacaktır. Bu yüzden “çağdaş öğretim ilke ve yöntemlerinin kullanılması, öğrenciler tarafından dersin soyut bir etkinlik olarak değerlendirilmesinin önüne geçerek, felsefe dersinin de daha etkili ve anlaşılır olmasını sağlayacaktır” (Ünal, 2016: 3187). Bu yüzden felsefe öğretiminde felsefe öğretmenlerine önemli görevler düşmektedir. İşte bu yüzden mevcut felsefe öğretmenlerinin deneyimlerinden yola çıkarak felsefe öğretiminin zorluklarının tespitini ve sürdürülebilir daha etkili felsefe öğretiminin nasıl olması gerektiğini ortaya koymak gerekmektedir.

Sunuş yoluyla, buluş yoluyla ve araştırma-inceleme yoluyla öğretim stratejileri olmak üzere felsefe eğitimi ile ilgili üç farklı öğretim stratejisi önerilmektedir.⁵ Bu öğretim stratejilerinin önerdikleri öğretim yöntem ve tekniklerini felsefe öğretmenlerinin ne oranda kullandıklarını test etmek için felsefe öğretmenlerine soruldu ve şu sonuçlar elde edildi:

Tablo 12: Felsefe öğretmenlerinin kullandığı öğretim stratejileri (%)

Kullanım sıklığı	Sunuş		Buluş		Araştırma		Yapılandırıcı	
	n	%	n	%	n	%	n	%
0. Hiçbir zaman	7	3,7	6	3,2	55	29,4	52	27,8
1. Bir-iki sefer	24	12,8	31	16,6	67	35,8	55	29,4
2. Üç-dört sefer	74	39,6	51	27,3	45	24,1	48	25,7
3. Beş-dokuz sefer	59	31,6	75	40,1	16	8,6	23	12,3
4. On ve üstü	23	12,3	24	12,8	4	2,1	9	4,8
Toplam	187	100,0	187	100,0	187	100,0	187	100,0
Merkezi Eğilim	$\bar{x}=2,36 \quad \sigma=0,981$		$\bar{x}=2,43 \quad \sigma=1,015$		$\bar{x}=1,18 \quad \sigma=1,021$		$\bar{x}=1,37 \quad \sigma=1,154$	

Türkiye’de felsefe öğretmenleri en çok buluş ve sunuş yolu ile öğretme stratejisine önem vermektedir. En düşük izlediği öğretim stratejisi araştırma-inceleme yoluyla öğretim stratejisidir. Felsefe öğretmenlerinin % 29,4’ü araştırma-inceleme stratejisi ile eğitim vermeye hiçbir zaman denememiş.

“Yapılandırıcı” öğretim stratejisinin de felsefe eğitiminde etkili öğretim stratejilerinden olduğu tartışılmaktadır (Kızıltan, 2012). Anket verilerine göre, felsefe öğretmenlerinin yapılandırıcı öğretim stratejilerini kullanım düzeyinin sıklığı ve yoğunluğu diğer stratejilere göre düşüktür. Örneğin felsefe öğretmenleri bir öğretim dönemi boyunca sunuş ve buluş stratejilerini en azından dört-beş kere kullanmalarına karşı yapılandırıcı öğretim stratejilerini iki-üç kere, araştırma-inceleme stratejilerini bir-iki kere kullanmaktadırlar.

Yılmaz, Cihan ve Şahin’in (2005) birlikte yapmış oldukları alan araştırmasına göre, üç üzerinden ortalamaya göre felsefe öğretmenleri öğretim yöntemlerinden en fazla sunuş stratejisinin yöntemlerinden “düz anlatım yöntemlerini” kullanmaktadır ($\bar{x}=2,77$). Daha sonra sırasıyla buluş stratejisi yöntemlerinden “soru-cevap yöntemini” ($\bar{x}=2,37$), “tartışma yöntemini” ($\bar{x}=2,28$) ve “örnek olay yöntemlerini” ($\bar{x}=2,23$) kullanmaktadırlar. Yapılandırıcı stratejinin yöntemlerinden “drama yöntemini” ($\bar{x}=1,4$) ise en az kullandıkları tespit edilmiştir.

Felsefe öğretmenleri hangi öğretim materyallerini ne sıklıkta uygulamaktadırlar?

⁵ <http://tebesirtozu.blogcu.com/felsefe-zumre-toplantilari-3-ogretim-stratejileri/1674622>

Tablo 13: Öğretmenlerinin felsefe eğitimi sırasında tercih ettiği öğretim materyalleri (%)

Öğretim Materyalleri	0. Hiçbir zaman	1. Bir iki sefer	2. Üç-Dört sefer	3. Beş-dokuz sefer	4. On ve daha fazla	\bar{x}	σ
Bilgi, kavram veya zihin haritası gibi haritaları kullanma.	18,2	21,9	21,9	18,7	19,3	1,99	1,383
Venn gibi diyagramlar kullanma.	83,4	9,1	4,3	3,2	0	0,27	0,692
Örgüt veya akış şeması gibi şemalar kullanma.	72,2	15,0	9,1	3,7	0	0,44	,810
Çizgili resim, fotoğraf, afiş, posterler gibi resimler kullanma.	43,3	19,8	18,2	18,7	0	1,12	1,164
Basılı materyaller	46,0	24,1	13,4	16,6	0	1,01	1,124
Video ve film	41,2	24,6	19,3	15,0	0	1,08	1,097
Gerçek eşyalar	73,8	12,8	7,0	6,4	0	0,46	0,881
Tepegöz saydamları	91,4	4,3	1,1	3,2	0	0,16	0,592
Ses kayıtları	89,8	5,3	2,7	2,1	0	0,17	0,570
Bilgisayar yazılımı	65,2	10,2	9,1	15,5	0	0,75	1,143
Projeksiyon	84,5	5,3	3,2	7,0	0	0,33	0,840
Akıllı tahta	22,5	12,3	10,2	55,1	0	1,98	1,257
Yazı tahtaları	5,9	3,7	8,6	81,8	0	2,66	0,809

Felsefe öğretmenleri felsefe derslerinde öğretim materyali olarak en çok yazı tahtasını kullanmaktadır. Daha sonra “bilgi, kavram veya zihin haritası gibi haritalarını” sıklıkla kullanmaktadır. Akıllı tahtaları da kullanım oranı diğer materyallere göre yüksek sayılır. Diğer yandan sırasıyla, tepegöz, ses kayıtları, projeksiyon, örgüt veya akış şeması gibi şemalara, bilgisayar yazılımı gibi öğretim materyallerine pek ilgi göstermemektedirler.

Peki, ne sıklıkta ders dışı bir etkinlikte bulunmaktadırlar?

Tablo 14: Felsefe öğretmenlerinin öğrencilerle yaptığı ders dışı etkinlikler.

Ders dışı etkinlik sayısı	n	%
0. Yapmadı	47	25,1
1. Bir sefer	59	31,6
2. İki sefer	37	19,8
3. Üç sefer	22	11,8
4. Dört sefer	8	4,3
5. Beş sefer	14	7,5
Toplam	187	100,0
$\bar{x}=1,61$ $\sigma=1,46$		

Türkiye’deki felsefe öğretmenleri gezi-gözlem, sınıf-okul gazetesi, yarışma vb. gibi felsefe öğretimi ile ilgili ders dışı etkinlikleri yapma sıklığı da oldukça düşüktür. Bir dönem içerisinde felsefe öğretmenlerinin ders dışı gerçekleştirdikleri gezi-gözlem, sınıf-okul gazetesi, yarışma vb. gibi bir-iki defayı geçmemektedir. Fakat öğretmenlik deneyimi ile öğretmenlerin felsefe dersleri ile alakalı ders dışı etkinlikler arasında pozitif korelasyon tespit edilmiştir (Pearson $r=0,193$ Sig.= 0,008). Felsefe öğretmenlerin öğretmenlik deneyimi arttıkça ders dışı etkinlikleri de kullanma eğilimi artmaktadır.

Felsefe öğretmenleri mesleki uygulama süresinde kendilerini geliştirecek ne tür etkinliklerde bulunmuştur?

Tablo 15 ve 16: Felsefe derslerinde öğretim etkinliği

Katıldığı seminer sayısı	n	%	Aldığı kurs sayısı	n	%
0. Katılmadım	111	59,4	0. Almadı	89	47,6
1. Bir-iki sefer	43	23,0	1. Bir-iki sefer	73	39,0
2. Üç-dört sefer	22	11,8	2. Üç-dört sefer	15	8,0
3. Beş-altı sefer	8	4,3	3. Beş-altı sefer	3	1,6
4. Yedi ve üstü	3	1,6	4. Yedi ve üstü	7	3,7
Toplam	187	100,0	Toplam	187	100,0
$\bar{x}=0,66$ $\sigma=0,95$			$\bar{x}=0,75$ $\sigma=0,94$		

Öğretmen olarak göreve başladıktan sonra felsefe öğretmenlerinin büyük çoğunluğu felsefe öğretimi ile ilgili hizmet içi eğitim seminerine hiç katılmamışlar. Tüm öğretmenlik yaşamları boyunca aldıkları hizmet içi eğitimleri bir-iki seferi geçmemiştir. Mesleki gelişim için gerekli olan mesleklerini icra ettikleri süre boyunca aktif öğretim yöntem ve teknikleri konusunda hizmet içi aldıkları kurs sayıları da ortalama bir-iki kursu geçmemiştir. Gerek öğrencilerin gerekse sınıfın fizikî durumu, Sınıfta sıraların yerleştirilme biçimi ve oturma düzeni de öğrencileri olumlu veya olumsuz etkilediği bilinmektedir.⁶

Felsefe eğitimi yapıldığı sınıfların mevcudu nedir? Nasıl bir oturma düzenine sahipler?

Tablo 17 ve 18: Felsefe derslerinin sınıf mevcudu ve oturma düzeni

Sınıf mevcudu	n	%	Oturma düzeni	n	%
24 veya daha az	62	33,2	Geleneksel oturma düzeni	176	94,1
25 - 34	110	58,8	Kümeler oturma düzeni	1	0,5
35 - 44	15	8,0	U oturma düzeni	10	5,3
Toplam	187	100,0	Toplam	187	100,0

2016-2017 eğitim-öğretim dönemi itibarıyla Türkiye’de verilen felsefe derslerinin sınıf mevcudunun büyük çoğunluğu (%58,8) 25-34 arası öğrenciden oluşmaktadır: Daha sonra 24 ve daha öğrenciden oluşan sınıflar gelmektedir. Bu verilere göre Türkiye’de felsefe dersleri çok kalabalık olmamaktadır. Bunda felsefe derslerinin pek tercih edilmiyor olmasının payı yadsınmaz. Öğrencilerin neredeyse tamamı (%94,1) sınıfta oturma düzeni, öğrencilerin sıra düzeninde enseye bakar şekilde geleneksel oturma düzeninde derslere katılmaktadır. Bu durum doğal olarak bazı öğretim tekniklerinin gerçekleştirilmesi için zafiyet oluşturmaktadır. Örneğin grup tartışması öğretim tekniğinin gerçekleştirileceği kümeler şeklinde oturma düzenine hemen hemen yok gibidir (% 0,5).

SONUÇ VE ÖNERİLER

Çağdaş eğitimle birlikte dünyada düşünce eğitimi hızla ilerlemekte, bu ilerlemenin olumlu etkileri toplumun her kesiminde siyasetten, edebiyata kadar kendini hissettirmektedir. Ülkemizde felsefe eğitimi çeşitli değişkenlerin etkisiyle birçok sorunla karşı karşıya kalmıştır. Bu sorunları üç boyut altında toplamak doğru olacaktır. Felsefe eğitiminin tarihsel ve konjontürel sosyo-politik durumu İslami eğitimin ağırlıklı olduğu dönemlerde Gazali’nin etkisiyle medrese programlarından uzak tutulmuştur. Kısa süreli “İlm-i Kelam” dersleri Osmanlıda felsefe dersi olarak yerini aldı ancak yine programdan kaldırılmıştır. Cumhuriyet Dönemi’nde “Darilfünun” içerisinde felsefe dersleri yürütülmüş, Darilfünun’un İstanbul Üniversitesine dönüştürülmesiyle de yine bir kısım felsefe dersi yürütülmeye devam edilmiştir. Günümüz üniversitelerinde Felsefe ve Felsefe Öğretmenliği programlarında eğitim verilmeye devam edilmektedir. Ancak yeni öğretim programları ve yeni üniversite sınavı anlayışları özellikle ortaöğretimde felsefe derslerinin saati ciddi şekilde azaltmıştır. Bu durum fakültelerin ilgili bölümlerine öğrenci alınmasını da olumsuz yönde etkilemiştir.

Günümüz politik dünyasında felsefeye ve onunla uğraşanlara olumsuz bir gözlükte bakılmış, statüsü tartışılmaya başlanmıştır. Yukarıda saydığımız durumlar felsefe öğretmenlerini de olumsuz yönde etkilemiştir. Araştırmada Türkiye’nin farklı illerinde görev yapan öğretmenler alanlarıyla ilgili seminer ve kurslara pek fazla katılmadığı dikkat çekicidir. Bu durum mesleğin önemi konusunda öğretmenlerin tükenmişliğinin bir göstergesi olabileceği gibi aynı zamanda bu alanda yeterli seminer ve kursun düzenlenmediğini de akla getirmektedir. Öğretmenlerin ortalama 25-34 kişilik sınıflarda eğitim vermesi olumlu görülürken bu öğrencilerin bu derse fazla ilgi göstermelerini de akla getirmektedir. Felsefe derslerinin etkili yapılmasında öğrencilerin oturma düzeni önemlidir. Sınıflarda geleneksel oturma düzeninin ve yazı tahtasının tercih edilmesi gibi özellikler yapılandırmacı eğitimin kabul gördüğü günümüzde farklı yöntem ve tekniklerin uygulanmasına salık vermeyecektir. Geleneksel oturma düzeninin yanı sıra “u” biçimde veya kümeler şeklinde oturma olanakları sınıfta yaratılarak değişik öğretim stratejilerin hayata geçirilmesine zemin hazırlanmalı.

Türkiye’de felsefe eğitimi müfredatı felsefe yapmaktan daha ziyade felsefe tarihi ağırlıklıdır. Oysa felsefe derslerinde felsefe yapılmalıdır. Bunun için de felsefe derslerine uygun özel öğretim yöntemleri geliştirilmelidir. Benzer şekilde öğretmenlerin araştırma-inceleme stratejisi ve yapılandırmacı öğretmeden ziyade daha kolay ve geleneksel eğitime yatkın olan buluş ve sunuş yoluyla eğitim vermeleri bir başka olumsuz etkidir. Belki birçok yöntem kullanıp öğretim programları öğrenci merkezli olmalıdır. Öğretim stratejilerinden yapılandırmacı öğrenme ve onun metotları tavsiye edilmeli. Hizmet içi kurslar ile felsefe öğretmenlerini anlatılmalıdır. Etkili felsefe eğitimi için tek veya iki boyutlu materyal kullanımının yanı sıra üç boyutlu materyallerinde kullanımı da özendirilmelidir.

⁶ <http://www.egitimciyim.net/forum/egitim/sinif-organizasyonu-t6123.0.html>;
<http://dahibeyin.blogspot.com.tr/2013/06/ogrencilerin-oturma-duzeni.html>

Edebiyat, gezi-gözlem ve tarih gibi dersler ders dışı etkinlikler birlikte yürütülen bütüncül kültür ve düşünce dersleridir. Ancak araştırmada felsefe öğretmenlerinin bu tür etkinlikleri çok az yaptıkları ortaya çıkmıştır. Bu durum sınıftaki dersin, dersin dışında da bütünleşmesini ve pekiştirilmesini engellemektedir. Kısaca felsefe eğitimi felsefe dışındaki alanlarla da ilişkilendirilerek verilmelidir. Böylece ders dışı etkinliklerle felsefe eğitimi pekiştirilmeli. Felsefe öğretmenleri her dönem yeni öğretim yöntem ve teknikler, materyaller, yapılabilecek ders dışı etkinlikler konusunda felsefe öğretmenleri hizmet içi kurs ve seminerler verilmeli.

Felsefe öğretmenin öğrenciler arasında popüler kültürün de verdiği iyi bir saygınlık düzeyi vardır. Ancak bu durum bürokraside eksi ivmede kendini gösterir. Bu da politik ve kurumsal bağlamda felsefeye olumsuz bakılmasının nedenini açıklamaktadır. Aynı zamanda öğretmen mesleğinden elde ettiği geliri yetersiz görmektedir. Bu durumda da öğretmenlerin mesleklerini icra etmelerinde motivasyonlarının düşmesine neden olacaktır. Felsefe öğretmenlerinin sosyoloji, felsefe, felsefe grubu öğretmenliği mezunu olmaları ya da eğitim fakültesi veya edebiyat veya fen-edebiyat fakültesi çıkışlı olmaları bakımından bütün bu yukarıdaki tespitlerde anlamlı farklar bulunmamıştır.

Aslında Türkiye'de felsefe eğitiminde sorun felsefe öğretme tekniklerine gelmeden önce toplumun ve devletin felsefe eğitimine olan ilgisizliği söz konusudur. Bir de felsefe dersleri seçmeli olup üniversite sınavlarında da alana ilişkin dikkate değer soru çıkmayınca öğrenci ve velilerin felsefeye ilişkin tutumları negatif olarak etkilenmektedir. Her alanda sınava giren öğrenciler felsefe ile ilgili sorular çözmek zorunda olursa felsefe eğitimine talebi arttırabilir.

TÜRKİYE’DE İKTİSADI DEVLETÇİLİĞİN EĞİTİME YANSIMASI: İÜ İKTİSAT FAKÜLTESİ’NİN KURULUŞU

Murat Koraltürk
mkoralturk@marmara.edu.tr

Türkiye’de İktisadi Devletçiliğin Eğitime Yansıması: İÜ İktisat Fakültesi’nin Kuruluşu

Türkiye’de 1920’lerde izlenen iktisat politikasının 1929 krizinden sonra ülke ekonomisinin ihtiyaçlarını karşılayamaz hale gelmesi nedeniyle 1930’lu yıllarda iktisadi devletçilik benimsenir. 1930’lu yıllarda iktisadi devletçiliğin somut bir yansıması olarak iki sanayi planı gündeme gelir. Devlet öncülü ve eliyle modern sanayinin temelleri atılır. Sanayi sektöründe olduğu gibi devletin finans başta olmak üzere diğer sektörlerde de yatırımcı ve işletmeci olarak aktif rol oynadığına tanık olunur. Bütün bu gelişmeler daha çok sermaye gerektirdiği gibi daha çok ve nitelikli işgücüne olan talebi de artırır. Türkiye’de mesleki ve teknik eğitimin temeli 19. yüzyılda Osmanlı Devleti zamanında atılmış olmakla birlikte 1930’lardan itibaren bu alanda önemli yeni adımlar atılır. Bu adımlardan birisi de ilk kez üniversite düzeyinde iktisat eğitimi vermek üzere 1937’de İstanbul Üniversitesi’ne bağlı olarak bir iktisat fakültesinin kurulmasıdır. Bu bildiride anılan fakültenin 1930’larda iktisadi devletçiliğin bir yansıması olarak kuruluşu ele alınmaktadır.

TÜRKİYE’DE PİYANO EĞİTİMİ ARAŞTIRMALARINDAKİ EĞİLİMLER: 2010-2016 YILLARI ARASINDA YAYIMLANAN MAKALELERİN İNCELENMESİ

Elif GÜVEN
Balıkesir Üniversitesi
Necatibey Eğitim Fakültesi

ÖZET

Bu çalışmanın amacı 2010-2016 yılları arasında Türkiye’de gerçekleştirilen piyano eğitimi konulu makalelerin incelenerek kullanılan yöntem ve tekniklerle ilgili eğilimlerin belirlenmesidir. Yapılan araştırmalar sonucunda ulaşılan makaleler yayımlandıkları tarih, dergi, çalışma grubu, kullandıkları metodoloji, veri toplama araçları, kullanılan istatistiksel analizler ve çalışılan konulara göre irdelenerek gruplandırılmıştır. Araştırma verileri içerik analiz yöntemi kullanılarak çözümlenmiştir. Elde edilen bulgular frekans(f) kullanılarak tablolar halinde sunulmuştur. Bu çalışmadan elde edilen sonuçların Türkiye’de son yıllarda piyano eğitimi alanında yapılan bilimsel çalışmaların yoğunlaştığı konulara ve sonuçlarına dikkat çekerek yöntem ve konu seçimine yön verebileceği, bu sayede gelecek çalışmalara ışık tutacağı düşünülmektedir.

ABSTRACT

The purpose of this study is to determine the trends related to the methods and techniques in the piano education articles by examining the articles between the years 2010-2016 in Turkey. The articles reached as a result of the investigations were grouped by the date they were published, journals, working groups, methodology, data collection tools, statistical analyzes and to the topics. Research data were analyzed using content analysis method. The findings are presented in tables using frequency (f). It is thought that the results obtained from this study will draw attention to the topics and the results of the scientific studies in the field of piano education in Turkey in recent years thus will keep a light on future work.

GİRİŞ

Bilimsel araştırma; sosyal ve fiziksel olgular ile ilgili bilimsel yollardan bilgi edinebilmek amacıyla sistematik ve planlı olarak, bazen de yapay yollarla kontrollü olarak yapılan etkinliklerin tümü olarak tanımlanmaktadır (Ekiz, 2013). Bilginin sorgulanmasında önemli bir yer tutan araştırmanın eğitim açısından önemi de büyüktür. Eğitim kalitesinin araştırmalar ile daha nitelikli hâle geleceği bilinmektedir (Küçüköğlü, Taşgın & Çelik, 2013). Günümüz dünyasında bilimsel iletişim, en az bilimsel çalışmanın hazırlanışı kadar önemli bir yere sahiptir. Bilginin paylaşılması, farklı ortamlarla yayılması, yeni araştırmalar için kaynak sağlamakta ve araştırmacıların daha doğru bilgiye daha kolaylıkla ulaşmalarını sağlamaktadır. Bilimsel iletişim, üzerinde çalışılan konu ya da konuların bilim çevrelerine çeşitli yollarla (mektup, konferans, makale gibi) aktarımını sağlayan bir yapı olarak karşımıza çıkmaktadır (Al, 2015, akt. Ömür & Gültek, 2011). Bir bilim dalında yapılan araştırmaların sayısının artması, bu araştırmaların belirli niteliklere göre derlenmesini ve genel bir bakış açısının sağlanmasını zorunlu kılmaktadır (Ahi & Kıldan, 2013). Bu bakımdan eğitim alanında yapılan bilimsel araştırmalar, eğitim konusunda yapılan faaliyetlerin değerlendirilmesini sağlamanın yanında yapılacak olan faaliyetlerin planlanmasına da ışık tutacaktır (Yaşar & Papatğa, 2015). Diğer eğitim alanlarında olduğu gibi müzik eğitiminde de son yıllarda yapılan araştırmaların incelenmesi, alandaki güncel eğilimleri ortaya çıkarmada ve ne tür konularda yeni araştırmalara ihtiyaç duyulduğunun belirlenmesinde önemli görülmektedir. Müzik eğitimi alanında çok önemli bir yeri bulunan piyano eğitimi de araştırmacılar tarafından sıklıkla üzerinde durulan ve ele alınan bir alandır.

Piyano, çok sesliliği ve zengin armonik özelliği ile solfej-armoni-kontrpuan-müzik formları gibi derslerde öğrenmeyi hızlandıran, öğrencileri geliştiren ve etkili sınıf ortamı yaratan bir çalgı olması, ayrıca öğrencilerin şan-koro ve çeşitli çalgı topluluklarında önemli bir eşlik çalgısı olması nedeniyle, müzik eğitiminde önemli bir yer tutmaktadır (Sönmezöz, 2015). Eğitim fakültelerinin müzik öğretmenliği programlarında ve bu programlara öğrenci kaynağı olan Güzel Sanatlar Liselerinde de piyano, tüm öğrenciler için zorunlu bir ders olarak okutulmaktadır. “Piyano, Solfej eğitiminden, armoni eğitimine, ses eğitiminden okul parçalarına dağarcık oluşturma ve bu parçaları eşliklendirmeye kadar bir müzik öğretmeni için en gerekli donanımların oluşturulmasında en temel ve en önemli yardımcıdır” (Pirgon, 2010). Piyano, birçok sesi aynı anda duyurabilme; ses sınırı ve gürlük bakımından yeterli bir kapasiteye sahip olma, iyi bir eşlik çalgısı olma gibi özelliklere sahiptir. Bu özellikleri, “Müziksel İşitme, Okuma-Yazma Eğitimi”nde; “Armoni Eğitimi”nde; “Koro ve Şan Eğitimi”nde değişilmez bir eğitim aracı olarak kullanılmasını sağlamaktadır (Ekinci & Özdemir, 2013).

Müzik eğitiminde bu denli öneme sahip olan piyano eğitimi alanında yapılmış bilimsel çalışmaların son yıllarda ne durumda olduğunun belirlenmesi önemli görülmektedir. Lee, Wu ve Tsai (2009) alandaki güncel durumun ne olduğu ve yapılan araştırmaların eğilimlerinin belirlenmesi adına bu yöndeki çalışmaların önemli olduğunu belirtirken, Falkingham ve Reeves (1998) belli bir alanda yayınlanmış olan bilimsel çalışmaların içerik analizi ile incelenmesinin alana yapılacak çalışmalar için ayrı bir katkı getireceğini belirtmiştir (akt. Küçükoğlu & Ozan, 2013). Belirli bir alana yönelik olarak daha önce tamamlanmış olan çalışmaların değerlendirildiği bir araştırma; hangi konularda, hangi yöntemler ile hangi yıllarda çalışmalar bulunduğu ve bu çalışmalarda hangi sonuçlara ulaşıldığı gibi bilgilerin bir arada sunulması bakımından önemlidir (Çeşit, 2015). Türkiye’de literatür incelemesine yönelik olarak yapılan tarama çalışmaları her geçen gün artmaktadır. Bu doğrultuda birçok alanda yazılı kaynakların (tezler, makaleler vb.) irdelenmesi, sınıflandırılması ve analizini içeren çalışmalar mevcuttur (Öztutgan, 2016). Müzik eğitimi alanında da ilgili literatürün incelendiği ve değerlendirildiği çalışmalar bulunmaktadır.

Demirbatır (2001) ülkemizde 1987-1999 yılları arasında 13 üniversitede yayımlanan tezler alanında yazılan tezleri taramış; bulguları, yazarın soyadı, adı, tezin adı, yeri, yılı, sayfa sayısı, biçiminde tasnif ederek soyadı harf sırasına göre dizmiştir. Çalışmasının sonucunda tezlerin üniversiteler arası dağılımıyla ilgili bir tabloya yer vermiştir. Ece (2007) ise Cumhuriyetin ilanından günümüze çoksesli müziğin ülkemizde gelişimine katkıları bulunan bestecilerimizin biyografilerinden oluşan bir seçki oluşturmayı amaçlamış ve bu amaçla bir antoloji oluşturmuştur. Orhan (2012) viyolonsel alanında yapılan 75 lisansüstü tezi türleri, yapılan enstitü, üniversite ve yıllara göre dağılımını incelemiş ve konularına göre sınıflandırmıştır. Varış (2012) 1994-2012 yılları arasında ülkemizde viyola alanında yazılmış olan lisansüstü tezleri yapısal ve niteliksel açıdan analiz etmiştir. Benzer şekilde Çeşit (2015) de viyola alanında yazılan tezleri incelediği çalışmasında viyola alanında yapılacak yeni çalışmalar için literatür taraması ve konu seçimi aşamalarına yönelik kaynak oluşturulması, viyola alanında yapılan bilimsel çalışmalardaki problemlerin ve eksikliklerin ortaya çıkarılarak daha nitelikli çalışmaların oluşturulmasına katkı sağlanmasını amaçlamıştır. Orhan ve Tunca (2014) oda müziği alanında yapılan lisansüstü tezleri incelemiş ve konularına göre sınıflandırmışlardır. Apaydınlı (2014) 1987-2011 yılları arasında koro alanında yapılan lisansüstü tezleri analiz etmiş ve koro türlerine göre sınıflandırmıştır. Çelik, Sarı ve Doğru (2015) ise Türkiye’de ve Avrupa’da 2000-2013 yılları arasında özel gereksinimli çocuklarla yapılan müzik eğitimi çalışmalarının nasıl bir dağılım gösterdiğini ortaya koymayı amaçlamışlardır. Kaptanoğlu ve Çanakçı (2015) Türkiye’de 1987 – 2013 yılları arasında, vokal müzikte piyano eşlik alanında yapılmış 25 lisansüstü tezi konularına göre sınıflandırmışlardır. Yöndem (2015) ve Öztutgan (2016) ise gitar alanında yapılan lisansüstü tezleri analiz etmişlerdir. Literatür incelendiğinde piyano alanındaki çalışmaları kapsayan iki araştırmaya rastlanmıştır. Bunlardan birincisi Ömür ve Gültek (2011) tarafından yapılmıştır. Piyano ile ilgili 154 adet tez incelenmiş, bu tezler, yıllara ve konulara göre sınıflara ayrılmış, çıkan sonuçlar analiz edilerek, piyano tezlerinin genel bir profili elde edilmiştir. Toptaş (2013) ise 1982-2012 yılları arasında piyano üzerine yazılmış 276 tezin yıllara, enstitülere, üniversitelere ve konularına göre dağılımını incelemiştir.

Literatürde müzik alanında yapılan çalışmalar incelendiğinde, çoğunlukla lisansüstü tezlerin incelendiği, bilimsel dergilerde yayınlanan makalelerin araştırmalara konu olmadığı görülmektedir. Bu çalışmanın amacı 2010-2016 yılları arasında Türkiye’de gerçekleştirilen piyano eğitimi konulu makalelerin incelenerek kullanılan yöntem ve tekniklerle ilgili eğilimlerin belirlenmesidir. Bu doğrultuda yapılan çalışmaların yıllara göre dağılımının nasıl olduğu, piyano eğitimine ilişkin çalışmaların hangi dergilerde yoğunlaştığı, kullanılan araştırma modelinin ve türlerinin neler olduğu, hangi örneklem gruplarıyla çalışıldığı, hangi veri toplama ve çözümleme tekniklerinin daha çok kullanıldığı ve piyano eğitimi ile ilgili hangi konularda araştırmalar yapıldığı sorularına yanıt aranmıştır. Çalışmadan elde edilen sonuçların Türkiye’de son yıllarda piyano eğitimi alanında yapılan bilimsel çalışmaların yoğunlaştığı konulara ve sonuçlarına dikkat çekerek yöntem ve konu seçimine yön verebileceği, bu sayede gelecek çalışmalara ışık tutacağı düşünülmektedir.

YÖNTEM

Araştırma Modeli

2010-2016 yılları arasında Türkiye’de piyano eğitimi üzerine yazılmış bilimsel makaleleri incelemeyi amaçlayan bu çalışma, var olan bir durumu olduğu gibi ortaya koymak hedeflendiğinden betimsel tarama modelinde nitel bir çalışmadır. “Tarama modelleri, geçmişte ya da halen var olan bir durumu var olduğu şekliyle betimlemeyi amaçlayan araştırma yaklaşımlarıdır” (Karasar, 2009).

Evren ve Örneklem

Araştırmanın evrenini Türkiye’de piyano eğitimi alanında yazılmış bilimsel makaleler oluşturmaktadır. Çalışmanın amacı, piyano eğitimi alanında yapılan araştırmaların son yıllardaki durumunu ve eğilimleri belirlemek olduğundan 2010-2016 yılları arasında yapılan ve tam metin olarak ulaşılabilen çalışmalar örneklem grubu olarak belirlenmiştir. Araştırma kapsamında Google akademik arama motorunda ve Ulakbim sosyal bilimler ve eğitim

bilimleri dergi listelerinde “piyano eğitimi” anahtar kelimeleri ile 2010-2016 yılları arasını kapsayacak şekilde arama yapılmıştır. Arama sonucunda 88 makaleye ulaşılmıştır.

Verilerin Toplanması

Çalışmaya dahil edilen araştırmalardan elde edilen veriler nitel veri toplama yöntemlerinden doküman inceleme tekniği kullanılarak toplanmıştır. Doküman incelemesi, araştırılması hedeflenen olgu veya olgular hakkında bilgi içeren yazılı materyallerin analizini kapsar (Yıldırım & Şimşek, 2006). Elektronik ortamda yapılan aramalar sonucu ulaşılan makaleler tam metin olarak kaydedilmiştir. Kaydedilen makaleleri incelemek üzere araştırmacı tarafından bir “makale inceleme formu” hazırlanmıştır. Makale inceleme formu hazırlanırken literatürdeki benzer çalışmalar incelenmiş ve daha önce kullanılan başlıklara benzer başlıklar kullanılmaya çalışılmıştır. Geliştirilen bu formda “makalelerin yayınlandıkları yıl, yayınlandıkları dergi, araştırmanın türü, çalışma grubu ve modeli, kullanılan veri toplama araçları, veri çözümleme yöntemleri ve araştırmanın konusu” ölçütleri bulunmaktadır. Bu ölçütlerin uygun ve yeterli olup olmadıklarını saptayarak araştırmanın kapsam geçerliliğini sağlamak amacıyla “bilimsel araştırma yöntemleri” konusunda iki, müzik eğitimi alanında uzman bir kişi olmak üzere toplam üç öğretim üyesinin görüşüne başvurulmuştur. Uzmanlar, oluşturulan ölçütlerin makalelerin yapısal ve niteliksel özelliklerini ortaya koymak açısından uygun olduğu konusunda ortak görüş belirtmişlerdir. Formun son hali elde edildikten sonra makaleler belirlenen alt başlıklara göre tek tek incelenmiştir.

Verilerin Analizi

Makale inceleme formu ile elde edilen veriler içerik analizi yöntemi ile analiz edilmiştir. İçerik analizinde temel amaç birbirine benzeyen verileri belirli kavramlar ve temalar çerçevesinde bir araya getirmek ve bunları okuyucunun anlayacağı biçimde düzenleyerek yorumlamaktır (Yıldırım & Şimşek, 2006). Çalışmada elde edilen veriler SPSS 21.0 bilgisayar programına kaydedilmiş ve ilgili analizler gerçekleştirilmiştir. Araştırmada incelenen makalelerin sayısı 100’ün üzerinde olmadığından veri analizinde yüzde (%) kullanılmamış, veriler frekans (f) şeklinde sunulmuş ve grafikler üzerinde gösterilmiştir.

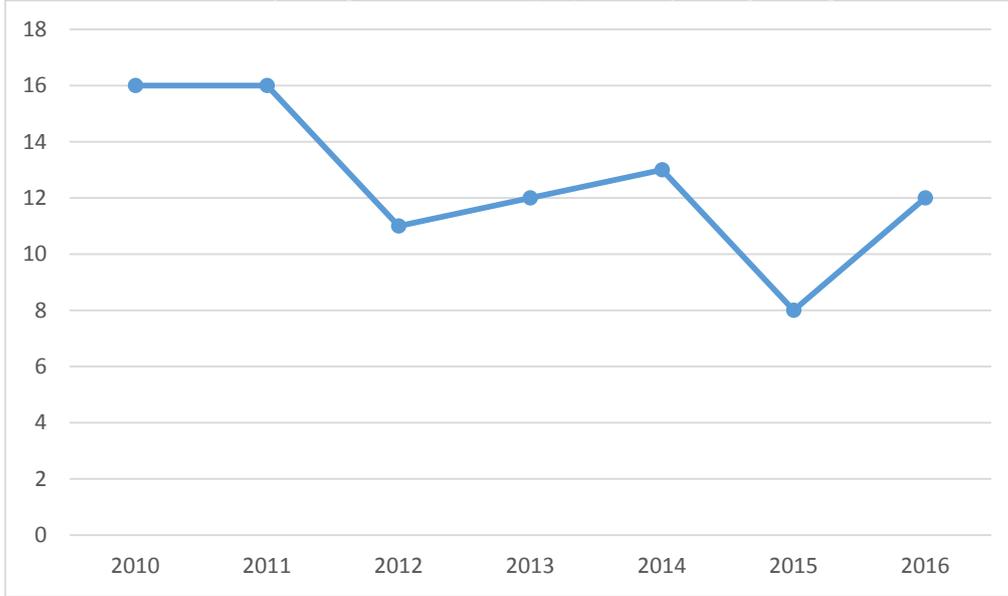

BULGULAR VE YORUM

Bu bölümde verilerin analizinden elde edilen bulgulara yer verilmiştir.

Tablo 1 incelendiğinde, 2010 ve 2011 yıllarında piyano eğitimi alanında 16 makale yazıldığı görülmektedir. 2012 yılında bu sayı 11’e düşmüş; 2013’te 12, 2014’te ise 13 çalışma yapılarak yeniden yükselişe geçmiştir. 2015 yılında ciddi bir düşüş bulunmaktadır (8 çalışma). 2016 yılında ise 12 çalışma bulunmaktadır. Bu durumda piyano eğitimi alanında yapılan çalışmaların sayısının yıllara göre düzensiz bir dağılım gösterdiği görülmektedir. En çok çalışma 2010 ve 2011 yıllarında, en az çalışma ise 2015 yılında yapılmıştır. Grafik 1’de yıllara ilişkin dağılımın durumu daha net bir şekilde görülmektedir. İlgili literatür incelendiğinde, Ömür ve Gültek (2011), 2000-2010 yılları arasında piyano eğitimi alanında yapılan lisansüstü tez çalışmalarını inceledikleri araştırmalarında benzer şekilde tezlerin yıllara göre düzensiz bir dağılım gösterdiğini belirtmişlerdir. Toptaş (2013) ise daha geniş bir zaman aralığında (1987-2012) piyano eğitimi alanında yazılan lisansüstü tezleri incelemiş; yıllar içerisinde yapılan tezlerin sayıca artış göstermesine rağmen, bu artışın düzenli olmadığını ortaya koymuştur. Bahsedilen araştırmaların devamı niteliğinde sayılabilecek mevcut araştırmanın sonucu bu sonuçlarla tutarlıdır. Bu durumda, piyano eğitimi alanında yapılan bilimsel çalışmaların yıllar içerisinde düzenli bir dağılım göstermediği söylenebilir. Bu durumun lisans programlarında zaman zaman yapılan değişikliklerden kaynaklanmış olabileceği düşünülmektedir.

2015	8
2016	12
Toplam	88

Grafik 1. Piyano eğitimi alanındaki çalışmaların yıllara göre dağılımı

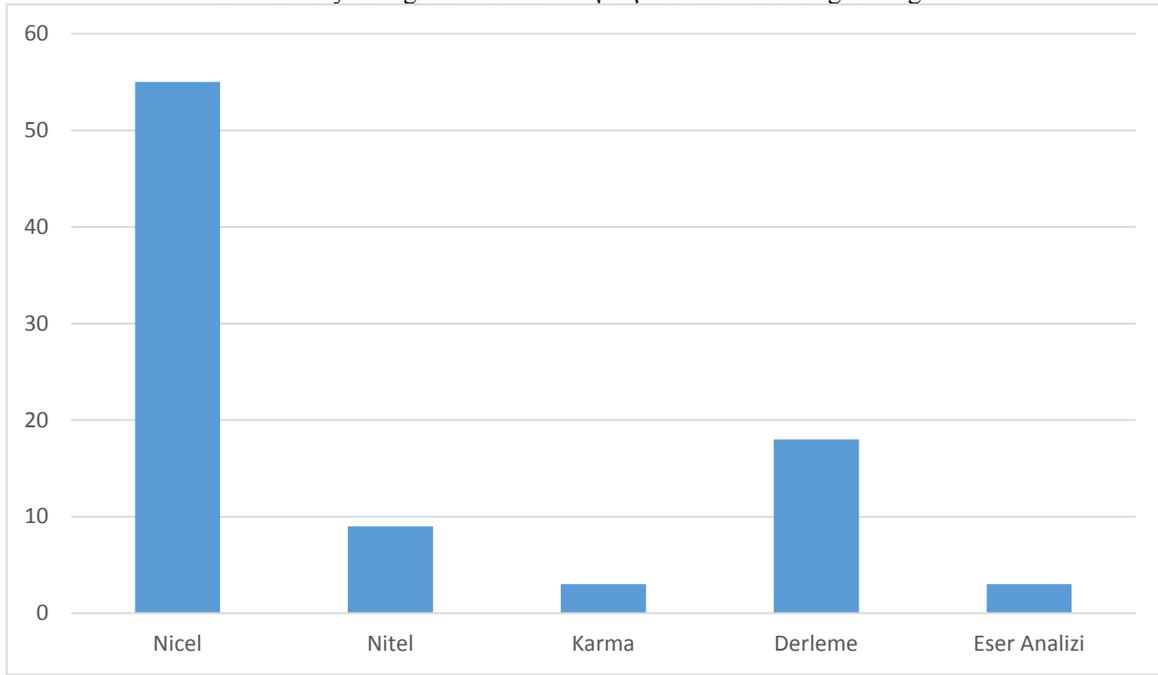

Tablo 2’de görüldüğü gibi, piyano eğitimi alanında 2010-2016 yılları arasında yayınlanan çalışmaların en sık olarak NWSA-Fine Arts dergisinde yayınlandığı görülmektedir (18 çalışma). E-Journal of New World Sciences Academy’nin serilerinden biri olan derginin yalnızca güzel sanatlar alanına yönelik çalışmaları yayınlıyor olmasının yazarlar tarafından daha fazla tercih edilme nedeni olduğu düşünülmektedir. Gazi Üniversitesi Gazi Eğitim Fakültesi Dergisi, Kastamonu Eğitim Dergisi ve Sanat Eğitimi Dergisi’nde 4’er makale yayınlanırken, diğer dergilerde daha az sayıda çalışmanın yayınlandığı görülmektedir. Çalışmaların toplam 42 dergide yayınlandığı belirlenmiştir.

Piyano eğitimi alanında 2010-2016 arasında yapılan çalışmalar türlerine göre incelendiğinde çalışmalarda en fazla kullanılan yöntemin nicel araştırma yöntemi olduğu görülmektedir (55) (Grafik 2). Bu sonuç, literatürde farklı alanlarda yapılmış araştırmaların sonuçlarıyla örtüşmektedir (Ulutaş & Ubuz, 2008; Yalçınkaya & Özkan, 2012; Ahi & Kıldan, 2013; Yaşar & Papatğa, 2015; Yöndem, 2015). İkinci sırada literatür taramasına dayalı derleme çalışmaları (18), üçüncü sırada ise nitel çalışmalar (9) bulunmaktadır. Nicel ve nitel yöntemlerin bir arada bulunduğu 3 adet karma çalışma ve 3 adet eser analizi çalışması bulunmaktadır. Tablo 3 ve Grafik 3'te çalışma türlerinin yıllar içerisindeki durumu görülmektedir. Buna göre nicel araştırmaların sayısının 2010 yılından sonra düzenli bir düşüş gösterdiği, nitel araştırmaların ise özellikle 2016 yılında artış gösterdiği görülmektedir. Hatta 2016 yılında yapılan nicel ve nitel araştırmaların sayısı eşittir. Daha derinlemesine bilgi sağlayan karma yöntemler ise yalnızca 3 araştırmada kullanılmıştır. Yıldırım ve Şimşek (2006)'e göre, nicel araştırma yüzeysel fakat genellenebilir bir sonuç verirken, nitel araştırma derinlemesine ve açıklayıcı bir anlayış kazandırır. Sosyal olay ve olgular üzerinde çalışırken her iki yöntemin de bize sunacağı ve diğer yöntem tarafından yeteri kadar açıklanamayacak boyutları vardır. Bu nedenlerle bu iki araştırma yöntemi birbirini tamamlayıcı yöntemler olarak düşünülmelidir (Yıldırım & Şimşek, 2006). Piyano eğitimi, öğretmenin ve öğrencinin birebir şekilde yürüttüğü, dolayısıyla sosyal anlamda etkileşimin yoğun düzeyde yaşandığı bir derstir. Piyano eğitiminin özellikle performansa dayalı olduğu ve değerlendirmenin gözleme dayalı olarak yapıldığı düşünüldüğünde, araştırmacıların nicel araştırma yöntemlerinin gözlem ya da görüşmeye dayalı nitel araştırma yöntemleri ile desteklendiği karma yöntemlere daha fazla ağırlık vermeleri önerilmektedir. Piyano eğitimi alanında yapılan çalışmalarda sıklıkla kullanılan bir diğer yöntem de literatür taraması ile yapılan derleme çalışmalarıdır. Piyano eğitimi ve öğretimine ilişkin farklı konularda yapılan bu derleme çalışmalarının bilgiye toplu halde ulaşmayı kolaylaştırdığı ve alan bilgisine ilişkin eksiklikleri kapatmada yardımcı olduğu için öğretmenler ve öğrenciler açısından önemli olduğu düşünülmektedir. Öğrencilerin sıklıkla çalıştıkları eserlere yönelik analiz çalışmalarının da sayıca artması alana ilişkin literatüre önemli ölçüde katkıda bulunacaktır.

Grafik 2. Piyano eğitimi alanındaki çalışmaların türlerine göre dağılımı

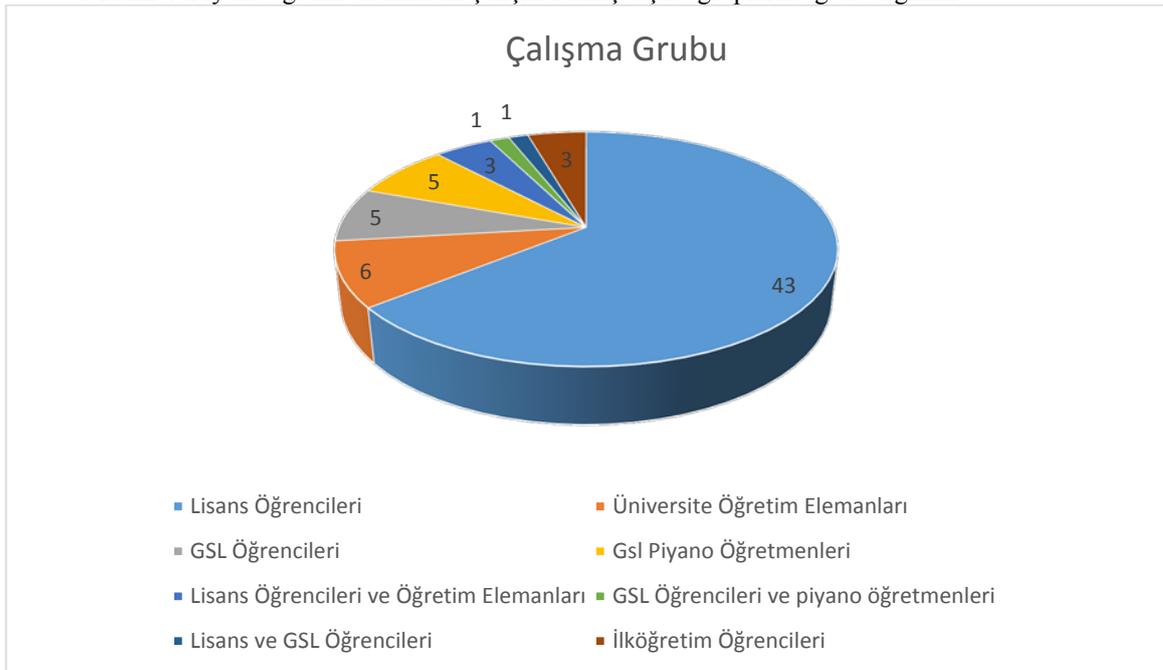

Tablo 3. Piyano eğitimi alanındaki çalışmaların yıllara ve türlerine göre dağılımı

	Nicel	Nitel	Karma	Derleme	Eser Analizi	Toplam
2010	13	-	-	3	-	16
2011	11	1	1	2	1	16
2012	8	-	-	2	1	11
2013	7	1	1	3	-	12
2014	7	2	1	2	1	13
2015	5	1	-	2	-	8
2016	4	4	-	4	-	12
Toplam	55	9	3	18	3	88

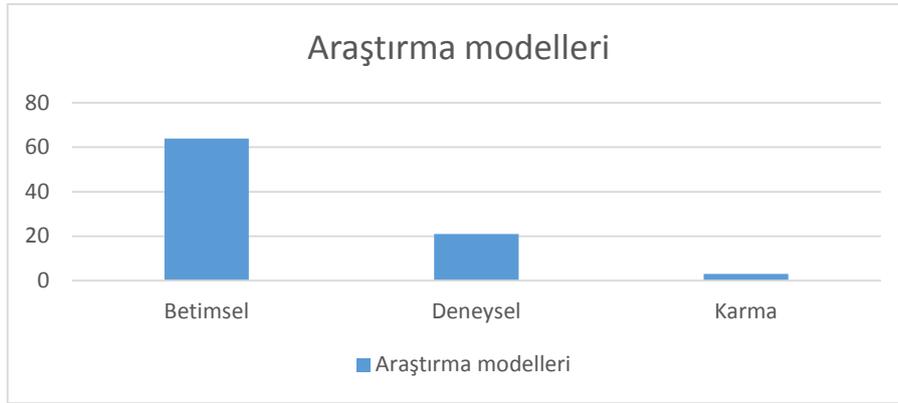

Grafik 3. Piyano eğitimi alanındaki çalışmaların yıllara ve türlerine göre dağılımı

İncelenen 88 makaleden eser inceleme ve derleme çalışmaları dışında kalan 67 makale, çalışma gruplarının gösterdiği dağılım açısından incelenmiştir (Grafik 4). Buna göre, en fazla çalışmanın lisans öğrencileri (43) ile yürütüldüğü belirlenmiştir. Daha sonra ise üniversite öğretim elemanları ile yürütülen çalışmalar gelmektedir (6). 3 çalışmada ise hem lisans öğrencileri hem de piyan öğretim elemanları ile çalışılmıştır. Bilimsel çalışmaları yürüten araştırmacıların büyük çoğunlukla üniversite öğretim elemanları ya da lisansüstü öğrenciler olduğu düşünüldüğünde çalışma grubuna ulaşım kolaylığı açısından bu beklenen bir durumdur. Farklı alanlarda yapılan çalışmalarda da benzer bir durum söz konusudur (Şimşek vd., 2008; Çiltaş, Güler & Sözbilir, 2012; Göktaş vd., 2012; Yöndem, 2015) Ancak müzik öğretmenliği lisans programlarına öğrenci kaynağı sağlayan Güzel Sanatlar Liseleri (GSL) öğrencileri (5) ya da öğretmenleri (5) ile yürütülen çalışmaların oldukça az olduğu dikkat çekmektedir. Bu kurumlara yönelik çalışmalara daha fazla ağırlık verilmesi önerilmektedir. Literatürde ilköğretim öğrencileri ile yürütülen 3 çalışma bulunmaktadır.

Grafik 4. Piyano eğitimi alanındaki çalışmaların çalışma gruplarına göre dağılımı

Piyano eğitimi alanında 2010-2016 arasında yapılan çalışmalar modellerine göre incelendiğinde büyük çoğunluğunu betimsel araştırmaların oluşturduğu (64) görülmektedir (Grafik 5). 21 çalışmada deneysel yöntemler kullanılırken 3 çalışmada betimsel ve deneysel yöntemler bir arada kullanılmıştır. Bu sonuçlar literatürde müzik alanında yapılan diğer çalışmaların sonuçları ile örtüşmektedir. Varış (2012) 1994-2012 yılları arasında ülkemizde viyola alanında yazılmış olan lisansüstü incelediği çalışmasında incelediği 38 tezin tamamının betimsel modelde desenlendiğini belirtmiştir. Öztutgan (2016), 1986-2015 yılları arasında gitar alanında yazılmış 94 tezin 84'ünün betimsel, 6'sının deneysel, 4'ünün ise karma modelde desenlendiğini ortaya koymuştur. Çeşit (2015) ise yine viyola alanında yazılan 37 tezi incelemiş ve tezlerinin tümünün betimsel desende olduğunu belirtmiştir. Farklı alanlarda yapılan çalışmalar incelendiğinde, sınıf öğretmenliği alanında yazılmış olan tezlerde de benzer şekilde betimsel tarama modelindeki çalışmaların fazla olduğu Şahin vd. (2013) tarafından belirtilmiştir. Matematik (Ulutaş & Ubuz, 2008; Yalçinkaya & Özkan, 2012; Yaşar & Papatğa, 2015), eğitim teknolojisi (Şimşek vd., 2008) ve fen bilimleri (Doğru vd., 2012) alanlarındaki çalışmalarda ise deneysel desenlerin daha sık kullanıldığı anlaşılmaktadır.

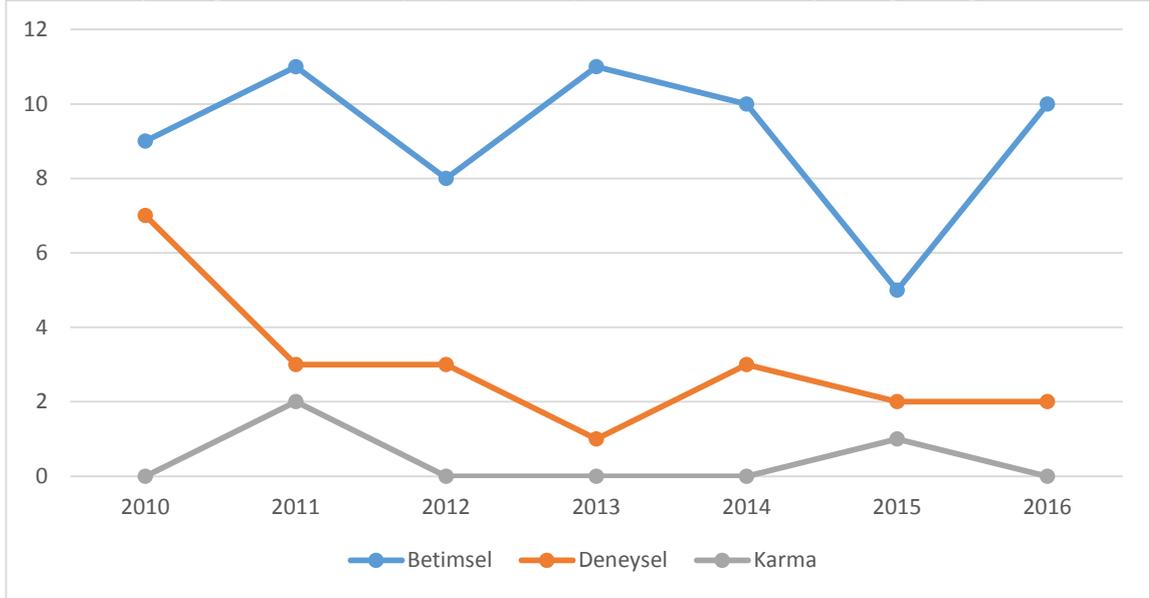

Grafik 5. Piyano eğitimi alanındaki çalışmaların araştırma modellerine göre dağılımı

Tablo 4 ve Grafik 6'da çalışma modellerinin yıllar içerisindeki durumu görülmektedir. Buna göre, betimsel çalışmaların sayısı yıllara göre düzensiz bir dağılım gösterirken, deneysel çalışmaların sayısı 2010 yılından sonra giderek düşmüştür. Tarama-deneme modellerinin birlikte kullanıldığı karma yöntemler ise yalnızca 3 çalışmada kullanılmıştır. Bu sonuçlar, müzik alanında çalışmalar yapan araştırmacıların ve lisansüstü eğitimi veren öğretim üyelerinin deneysel çalışmalar üzerinde yeterince durmadıklarını ortaya koymaktadır. Piyano eğitimi, doğası gereği var olan durumu betimlemenin yanı sıra farklı yöntemler denemeye ve sonuçlarını değerlendirmeye oldukça müsait bir alandır. Bu nedenle deneysel çalışmaların sayısının artırılması ve sonuçlarının paylaşılması eğitim kalitesini artırma açısından önemli görülmektedir.

Tablo 4. Piyano eğitimi alanındaki çalışmaların araştırma modellerine ve yıllara göre dağılımı

	Betimsel	Deneysel	Karma	Toplam
2010	9	7	-	16
2011	11	3	2	16
2012	8	3	-	11
2013	11	1	-	12
2014	10	3	-	13
2015	5	2	1	8
2016	10	2	-	12
Toplam	64	21	3	88

Grafik 6. Piyano eğitimi alanındaki çalışmaların araştırma modellerine ve yıllara göre dağılımı

Tablo 5 ve Grafik 7’de piyano eğitimi alanında yapılan makalelerde kullanılan veri toplama araçlarının dağılımı görülmektedir. Buna göre en sık kullanılan veri toplama aracı çalışma grubunun tutum, motivasyon vb. durumlarını ölçmeye yönelik ölçeklerdir (24). Daha sonra ise değerlendirme formları, (19), anket (18) ve doküman inceleme (18) yöntemleri gelmektedir. Gözlem (9) ve görüşme (9) gibi nitel araştırma yöntemlerine ait veri toplama araçlarının ise daha az sayıda kullanıldığı görülmektedir. Nicel araştırmaların nitel araştırmalara göre sayıca fazla olduğu düşünüldüğünde bu beklenen bir durumdur. 6 araştırmada başarı testleri kullanılırken 1 araştırmada veriler kompozisyon yazdırma suretiyle toplanmıştır. Bu sonuçlar farklı eğitim alanlarında gerçekleştirilen araştırmaların sonuçları ile tutarlılık göstermektedir. İlgili literatürde araştırmaların büyük çoğunluğunda ölçekler, anketler ve başarı testlerinin en çok kullanılan veri toplama araçları olduğu görülmektedir (Şimşek vd., 2008; Ulutaş & Ubuz, 2008; Doğru vd., 2012; Gökteş vd., 2012; Çiltaş, Güler & Sözbilir, 2012; Sert vd., 2012; Şahin vd., 2013; Ahi & Kıldan, 2013; Yaşar & Papatğa, 2015). Bazı alanlarda ise en çok kullanılan veri toplama yönteminin doküman inceleme olduğu belirtilmektedir (Tatlı & Adıgüzel, 2012; Yalçınkaya & Özkan, 2012). Müzik alanında gerçekleştirilen benzer çalışmaların büyük çoğunluğunda araştırmaların veri toplama araçları boyutunda incelenmediği görülmüştür. Mevcut çalışmanın bulguları ile tutarlı olarak, gitar eğitimine yönelik lisansüstü tezlerin incelendiği bir çalışmada (Yöndem, 2015) en sık kullanılan veri toplama aracının doküman inceleme yöntemi ve anketler olduğunu, gözlem ve görüşme tekniklerinin oldukça az sayıda olduğunu belirtmektedir. Piyano eğitimi, performansa dayalı bir alan olduğundan yapılan araştırmalarda derse ilişkin başarının ölçülmesinde başarı testlerinden çok gözleme dayalı değerlendirme formlarının kullanıldığı görülmektedir. Bu açıdan da elde edilen sonuçların ilgili literatür ile uyumlu olduğu söylenebilir. Alana ilişkin olarak yapılan araştırmaların farklı desenlerde tasarlanması ve dolayısıyla nicel verilerin nitel verilerle desteklenmesi, bu nedenle piyano eğitimi alanında oldukça yararlı olacağı düşünülen gözlem ve görüşmelere araştırmalarda daha sık yer verilmesi önerilmektedir.

Tablo 5. Piyano eğitimi alanındaki çalışmaların veri toplama araçlarına göre dağılımı

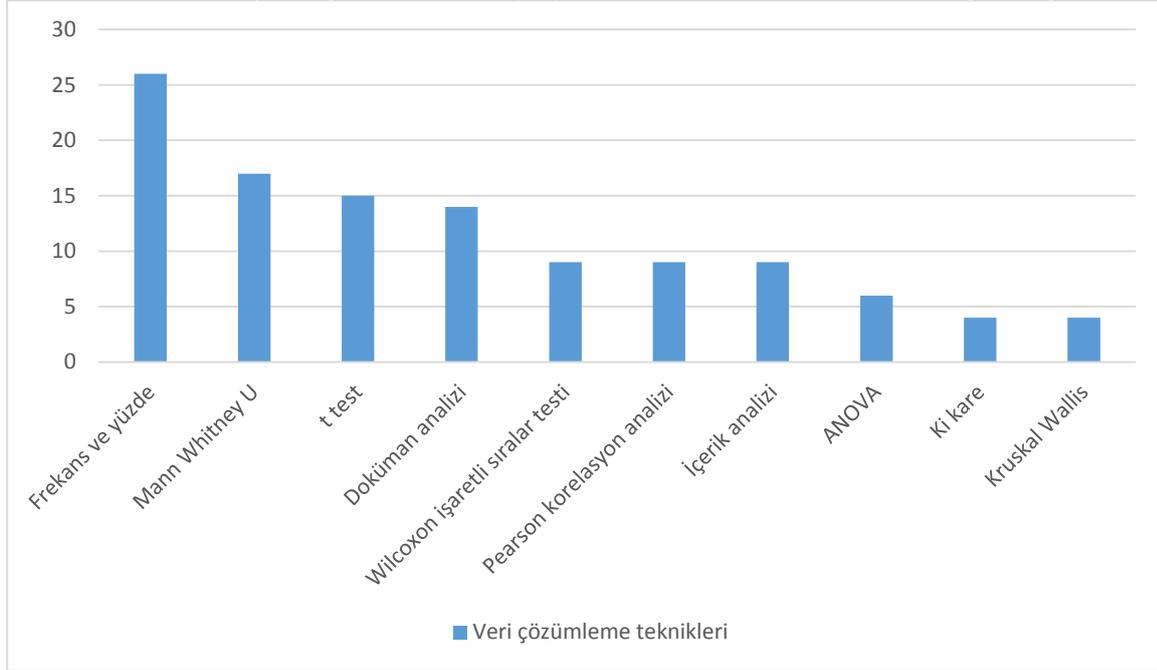

Veri toplama aracı	f
Ölçek (tutum, motivasyon vb.)	24
Değerlendirme Formu	19
Anket	18
Doküman inceleme	18
Gözlem	9
Görüşme	9
Başarı testi	6
Kompozisyon	1

Grafik 7. Piyano eğitimi alanındaki çalışmaların veri toplama araçlarına göre dağılımı

Veri toplama araçları ile toplanan verilerin analiz edilmesinde kullanılan teknikler incelendiğinde araştırma yöntemleri ve veri toplama araçları ile paralellik gösterdiği görülmektedir (Tablo 6 ve Grafik 8). Buna göre, en fazla f ve %'lerden yararlandığı (26), daha sonra gruplar arasındaki farklılıkları saptamaya yönelik olarak non parametrik tekniklerden Mann Whitney U (17) ve parametrik tekniklerden t testi (15) kullanıldığı görülmektedir. Doküman incelemesi yöntemiyle toplanan verilerin doküman analizi (14) ile çözümlendiği anlaşılmaktadır. Yine non parametrik testlerden ilişkili ölçümler için Wilcoxon işaretli sıralar testi (9) ve iki değişken arasındaki ilişkinin belirlenmesine yönelik olarak korelasyon analizi (9), daha az kullanılan teknikler arasındadır. Nitel araştırmalarda büyük çoğunlukla içerik analizi (9) kullanıldığı anlaşılmaktadır. Parametrik tekniklerden ANOVA (6), non parametrik tekniklerden ki kare (4) ve Kruskal Wallis (4) de az sayıda çalışmada kullanılmıştır. Non parametrik tekniklerin parametrik tekniklerden biraz daha fazla kullanılması genellikle az sayıda örneklem grubu ile çalışılmış olduğunu ya da çalışılan grupların normal dağılım göstermediğini akla getirmektedir. Diğer alanlarda yapılan çalışmalar incelendiğinde mevcut çalışma ile tutarlı olarak nicel araştırma tekniği daha fazla tercih edildiği için genel anlamda betimsel istatistiklerin yoğun olarak kullanıldığı görülmektedir. Özellikle var olan durumu sayısal değerlerle ya da grafiklerle ortaya koymayı amaçlayan betimleyici istatistikler, parametrik testlerden t-testi ve ANOVA, Non parametrik testlerden Mann Whitney-U ve Kruskal Wallis yaygın olarak kullanılmaktadır. Nitel araştırmalarda ise içerik analizi tekniği en sık kullanılan tekniktir (Şimşek vd., 2008; Göktaş vd., 2012; Çiltaş, Güler & Sözbilir, 2012; Ahi & Kıldan, 2013; Yaşar & Papatğa, 2015; Erdoğan vd., 2015). Yöndem (2015) de gitar eğitimine yönelik lisansüstü tezlerde en sık kullanılan veri analiz tekniğinin aritmetik ortalama, standart sapma, frekans ve yüzde gibi tanımlayıcı istatistikler olduğunu belirtmektedir. Müzik alanında yapılan diğer benzer çalışmaların veri çözümleme teknikleri boyutuna yer vermedikleri görülmüştür.

Tablo 6. Piyano eğitimi alanındaki çalışmaların veri çözümleme tekniklerine göre dağılımı

Veri çözümleme tekniği	f
f ve %	26
Mann Whitney U	17
T testi	15
Doküman analizi	14
Wilcoxon işaretli sıralar testi	9
Pearson Korelasyon analizi	9
İçerik analizi	9
ANOVA	6
Ki kare	4
Kruskal Wallis	4

Grafik 8. Piyano eğitimi alanındaki çalışmaların veri çözümleme tekniklerine göre dağılımı

Piyano eğitimi alanında 2010-2016 yılları arasında gerçekleştirilen çalışmalar konularına göre incelendiğinde piyano dersine yönelik tutum ve görüşlerin belirlendiği betimsel çalışmaların yanı sıra başarıyı arttırmaya yönelik çeşitli yöntemlerin denendiği deneysel çalışmalara sıklıkla yer verildiği görülmektedir (Tablo 7). Daha sonra piyano eğitiminde karşılaşılan sorunlar (7), piyano öğretimi (7), piyano çalışma alışkanlık ve yöntemlerine (7) ilişkin çalışmalar bulunduğu tespit edilmiştir. 5 çalışmada başlangıç piyano eğitimi, 5 çalışmada piyano eğitiminde başarı ve başarısızlık nedenleri konu edilmiştir. piyano eğitimine dair çeşitli eserlerin analizi, deşifre çalışmaları, performans değerlendirme çalışmaları, öğrenme stratejilerinin piyano eğitimi üzerindeki etkileri, piyano eğitiminde teknik beceriler ve karşılaşılan güçlükler, kullanılan ders kitapları, pedal kullanımı, Piyano öğretmenlerinin profillerine ilişkin bilgiler, piyano üzerine yazılmış yüksek lisans tezlerinin incelenmesi, piyano eğitimi ve teknoloji ilişkisi, repertuar seçimi, ilköğretim düzeyinde piyano eğitimi, görme engelli öğrencilerin piyano eğitimi, piyano dersine yönelik motivasyon ve kaygı düzeyleri de çalışılan konular arasındadır (Tablo 7). Ulaşılan sonuçlar göstermektedir ki piyano eğitimi alanında son yıllarda yürütülen çalışmalarda konulara ilişkin oldukça geniş bir dağılım bulunmaktadır. Ömür ve Gültek (2011), 2000 ile 2011 yılları arasında piyano üzerine yazılmış lisansüstü tezleri analiz etmişlerdir. İncelenen 154 çalışmanın 66 tanesi piyano literatürü üzerine, 41 tanesi ise eğitim üzerine yazılmıştır. Yazarlar, eğitim alanında yazılan tezlerin konu dağılımı hakkında ayrıntılı bilgiye yer vermemişlerdir. Toptaş (2013) ise 1987-2012 yılları arasında yazılmış 276 lisansüstü çalışmayı incelemiştir. İnceleme sonucunda tezlerde öne çıkan konuların “besteciler”, “eser ve etüt inceleme”, “eğitim ve öğretim” olduğu görülmüştür. Mevcut çalışmada piyano dersine yönelik tutumlar en çok çalışılan konulardan biri olduğu halde Toptaş (2013)’ın çalışmasında tutumlar üzerinde yalnızca 3 çalışma bulunmaktadır. Bu durum, Toptaş (2013)’ın çalışmasının yapıldığı yıllarda piyano dersinde tutum ölçmeye yönelik bir ölçeğin bulunmadığını akla getirmektedir. Bu nedenle alana özgü ölçeklerin geliştirilmesi önerilmektedir. Varış (2012) 1994-2012 yılları arasında viyola üzerine yazılmış tezleri incelemiş ve tezlerde üzerinde en çok durulan konunun “viyola eğitimi” olduğunu belirtmiştir. 1994-2014 yılları arasında viyola üzerine yazılan tezleri inceleyen Çeşit (2015) ise viyola eğitimi üzerine yazılan tezlerin sayıca çok gibi görünse de konu çeşitliliğinin fazla olmadığını vurgulamıştır. Orhan (2012) 1992-2011 yılları arasında viyolonsel alanında yazılan tezlerde en çok ağırlık verilen konuların eser-etüt analizleri ve viyolonsel eğitiminde teknikler olduğunu belirtmiştir. Yöndem (2015) 1990-2013 yılları arasında gitar alanında en fazla eser incelemesi konusunda tez yazıldığını, Öztutgan (2016), ise 1986-2015 yılları arasında tezlerin en çok gitar eğitimi ve eser incelemesi-analizi konularına odaklandığını belirtmiştir.

Bahsedilen çalışmaların tamamında lisansüstü çalışmalar incelenmiş ve doğrudan eğitim alanına odaklanılmamış, eğitim kategorisindeki çalışmalar alt başlıklara ayrılmamıştır. Mevcut çalışmada ise bilimsel dergilerde yayınlanan akademik makaleler incelenmiş ve doğrudan piyano eğitimi alanındaki çalışmalar incelenmiştir. Bu nedenle çalışmaların ele aldığı konular üzerinde karşılaştırma yapmak çok fazla mümkün olmamaktadır.

Tablo 7. Piyano eğitimi alanındaki çalışmaların konularına göre dağılımı

SONUÇ VE ÖNERİLER

2010-2016 yılları arasında Türkiye’de gerçekleştirilen piyano eğitimi konulu makalelerin incelendiği bu çalışmada toplam 88 makaleye ulaşılmıştır. Yapılan çalışmaların sayısının yıllara göre düzensiz bir dağılım gösterdiği görülmektedir. En çok çalışma 2010 ve 2011 yıllarında, en az çalışma ise 2015 yılında yapılmıştır. Çalışmaların toplam 42 dergide yayımlandığı belirlenmiştir. Çalışmaların en sık olarak NWSA-Fine Arts dergisinde yayımlandığı görülmektedir. Çalışmalarda en fazla nicel araştırma yöntemi kullanılmaktadır. İkinci sırada literatür taramasına dayalı derleme çalışmaları, üçüncü sırada ise nitel çalışmalar bulunmaktadır. Yapılan incelemeler sonucu nicel araştırmaların sayısının 2010 yılından sonra düzenli bir düşüş gösterdiği, nitel araştırmaların ise özellikle 2016 yılında artış gösterdiği belirlenmiştir. Çalışmaların büyük çoğunluğu lisans düzeyindeki öğretmen adayları ile gerçekleştirilmiştir. Betimsel araştırmalar çoğunluktadır ve en sık kullanılan veri toplama yöntemleri çalışma grubunun tutum, motivasyon vb. durumlarını ölçmeye yönelik ölçeklerdir Daha sonra ise değerlendirme formları, anket ve doküman inceleme yöntemleri gelmektedir. Gözlem ve görüşme gibi nitel araştırma yöntemlerine ait veri toplama araçlarının ise daha az sayıda kullanıldığı görülmektedir. Verilerin analizinde en fazla f ve % lerden yararlanıldığı, daha sonra gruplar arasındaki farklılıkları saptamaya yönelik olarak non parametrik tekniklerden Mann Whitney U ve parametrik tekniklerden t testi kullanıldığı anlaşılmıştır. Konularına göre incelendiğinde ise piyano dersine yönelik tutum ve görüşlerin belirlendiği betimsel çalışmaların yanı sıra başarıyı arttırmaya yönelik çeşitli yöntemlerin denendiği deneysel çalışmalara sıklıkla yer verildiği görülmektedir.

Araştırmalarda daha derinlemesine bilgi edinmek için nicel ve nitel yöntemlerin birlikte kullanıldığı karma yöntemin tercih edilmesinin alana daha fazla katkı sağlayacağına inanılmaktadır. Ayrıca deneysel desenlerin kullanımının artırılması ile alanda elde edilen sonuçların güvenilirliğini arttıracığı ve daha geçerli sonuçlara ulaşılacağı düşünülmektedir. Kullanılan standart araştırma desenlerinin dışına çıkılması ve bugüne kadar kullanılmamış olan ya da daha az kullanılan araştırma desenlerinin daha çok kullanılmasına özen gösterilmesi alanda bu yöndeki eksiklikleri karşılamada etkili olabilir. Yapılan araştırmalarda ölçek geliştirme konusuna ağırlık verilmesi de araştırmacıların ortak standart ölçme araçları kullanmalarını sağlayacak ve araştırma sonuçları diğer araştırma sonuçları ile birlikte değerlendirilirken daha sağlıklı tartışmalar yapılabilecektir. Çalışmaların önemli bir bölümünde örneklem, lisans düzeyindeki öğretmen adaylarıdır. Çalışmaların değişik örneklem düzeyleriyle, özellikle üniversite öncesinde 4 yıl piyano eğitimi alan GSL öğrencileriyle yürütülmesi sorunlara yönelik farklı

çözümlerin üretilmesine kaynaklık edebilir. Ayrıca, piyano eğitimi düzeyinde araştırma sayısının oldukça az olması dikkati çekmektedir. Ülkemizin piyano eğitimi araştırmalarında gelmiş olduğu durumu görebilmek için yayın sayısının daha da artması araştırmacılar için yol gösterici olacaktır.

Bu tip literatür analizine dayalı çalışmaların zaman zaman güncellenmesi ve farklı araştırmacılar tarafından ele alınması, gelecekte yapılacak araştırmalara ve lisansüstü tezlere ışık tutarak araştırmacıları yeniliklere yöneltecek, alana dair hangi konularda çalışmalara ihtiyaç duyulduğu ya da hangi konularda güncel çalışmaların yapılması gerektiği belirlenebilecektir. Mevcut çalışma, 2010-2016 yıllarında yapılan, elektronik ortamda tam metinlerine ulaşılabilen çalışmalar ile sınırlıdır. Gelecek çalışmalar daha geniş bir süreci kapsayacak şekilde ve daha fazla derginin ve son yıllarda yapılan lisansüstü tezlerin de incelenmesiyle mevcut durumu daha geniş bir tabloyla yansıtabilecek şekilde yapılabilir.

TÜRKİYE'DEKİ İLETİŞİM FAKÜLTELERİNDE EĞİTİM VE YAŞANILAN İSTİHDAM SORUNLARI

Güven BÜYÜKBAYKAL

İstanbul Üniversitesi İletişim Fakültesi, Gazetecilik Bölümü

guvenb@istanbul.edu.tr

ÖZET

Günümüzde yaşamın her alanında iletişim olgusu büyük anlam ifade etmekte ve kendini göstermektedir. İletişim dünyasına ilişkin gelişmeler ayrıntılı olarak kitle iletişim araçları ile insanlara aktarılmaktadır. Dünyanın herhangi bir yerindeki haber, anında dünyanın her bir farklı köşesine ulaştırılabilmektedir. Medya da bu alanda uzmanlaşmış gazetecilerle haber dünyasını takip etmektedir. Her ne kadar iletişim olgusu, gelişmiş Batı ülkelerinde üzerinde ciddiyle durulan ve hakkında çok sayıda haber, makale, yazı dizisi ile kitap yazılan geniş bir araştırma alanına sahipse de, ülkemizde önemi son yıllarda artmıştır. Bu noktada iletişim alanındaki faaliyetlerin medyada hak ettiği ölçüde yer bulabilmesi, daha bilimsel ve nitelikli bir biçimde ele alınmasını sağlamak için iletişim alanında uzmanlaşmanın sağlanması ve devam ettirilmesi önem taşımaktadır.

Çalışmanın amacı, sağlıklı ve doğru bir biçimde insanlar-toplumlar-kurumlar arası iletişimin sağlanması noktasında, bu alanda verilecek eğitimin önemini farklı yönleriyle vurgulamaktır. Çalışmanın yöntemi olarak yerli ve yabancı literatür taramasına başvurulacak, ayrıca geçmiş dönemdeki uygulamalarda tespit edilen eksiklikler ile yaşanan istihdam sorunlarına yönelik çözüm önerileri vurgulanacaktır. Yine mevcut çalışma aracılığıyla iletişim fakültelerindeki teorik ile pratik eğitim süreçlerinin başarıyla verilmesi, mesleki anlamdaki uygulamalarda kalite düzeyinin artırılması ve ilgili literatüre katkı sağlanması hedeflenmektedir.

Anahtar kelimeler: iletişim, iletişim fakültesi, eğitim

ABSTRACT

Today the concept of communication has a very important meaning and it can be seen in every facet of life. The developments pertaining to the world of communication are conveyed to people in a detailed way. An event occurred anywhere in the world can heard in different places at short notice. Meanwhile the media pursues the news world with professionalized journalists. Although communication is an extensive research field which has long been considered seriously and where numerous news, articles, books etc. have already been issued in western countries, its importance has recently been realised in Turkey. At this point, in order to make the activities in the field of communication have the due importance in the media and let them regarded in a more scientific and qualified way, it is imperative that professionalization in communication be realized and sustained. The purpose of this study is to highlight the importance of communication education through different perspectives with respect to the establishment of sound and proper communication among people, societies and institutions. As for the method, initially, literature review pertaining to Turkish and foreign sources will be held; then, the deficiencies determined in previous practices and the solutions suggested for employment problems will be highlighted. In addition, with this study, it is aimed to provide theoretical and applied educational processes in communication faculties, increase quality in professional practices and make a contribution to respective literature.

Keywords: communication, communication faculties, education

1. İLETİŞİM VE EĞİTİM KAVRAMLARININ ANLAMI VE ÖNEMİ

“İletişim” ve “eğitim” kelimeleri bizlerin sadece bu fakültelerin isimlerinden tanıdığımız kavramlar değildir. Bunun yanısıra bizim birer insan olarak günlük yaşamımızda da en sık kullandığımız kavramlardan birisi “iletişim”, diğeri ise “eğitim”dir. Eğitim, insanın kalıtsal güçlerinin geliştirilip istenen özelliklerde bir kişiliğe kavuşması için kullanılacak önemli araçlardan biridir. Eğitim, insanlara bilgi ve beceri kazandırmanın ötesinde, toplumun yaşamasını ve gelişmesini devam ettirebilecek ölçüde ve nitelikte değer üretmek, yeni ve eski değerleri bağdaştırmak sorumluluğu taşır. Bu değerler, öğrencilerin davranışlarını ve istek düzeylerini yine eğitim yolu ile etkiler.” (Varış, 1998:1)

“İletişim insan hayatının ayrılmaz bir parçasıdır. Aslında, iletişim biz insanların anlamlarında uzlaştıkları simgeler aracılığıyla dünyayı bir düzen içerisinde görmelerine yardımcı olur. İletişim becerilerimiz yardımıyla günlük yaşamımızdaki birçok sıkıntımızı kolayca aşmak mümkündür. İletişim alışverişi bazında sınıflarımızda da eğitim yoluyla kazandırılması amaçlanan birtakım bilgi, beceri ve tutumların etkin bir biçimde aktarılabilmesi yine eğitimcilerin sahip olduğu iletişim becerileri düzeyi ile doğru orantılıdır. Kısacası, eğitim ve öğretimin

amaçlarına etkin bir biçimde ulaşabilmesi, eğitimcilerin etkili ve güçlü iletişim becerilerine sahip olmasına bağlıdır.” (Eroğlu, 2004:585)

“İletişim büyük bir pazar olarak, hem üretimi hem de tüketimi arttıran, dünya ekonomisine yön veren bir sektör haline gelmiştir. Böylece büyük bir sektör, reklamdaki TV programına, belgeselden sinema filmine, karşılıklı konuşmadan ikna, propaganda, tutum ve davranış değişmesine, ekonomik, kültürel, yerel, psikolojik, antropolojik, tarihi ve felsefi açıdan araştırma konusu olmuş ve giderek değişik yaklaşım ve paradigmalara toplumbilimsel araştırmaların merkezine yerleşmiştir.” (Tekinalp&Uzun, 2009:20)

“Çağdaş toplumsal yapıda yaşantımızı düzene koyan önemli bir süreç olan eğitime, insanlar yaşamlarının her döneminde gereksinim duymaktadır. Eğitim bilgi toplumunda son derece önemli bir rol oynamaktadır. Bir ülkenin geleceği o ülkenin insanların göreceği eğitime bağlıdır...Bir toplumun gelişmişlik düzeyi o toplumda yaşayan eğitilmiş insanların artmasıyla doğru orantılıdır. Bilginin eğitimle aktarıldığı dolayısıyla eğitime gerekli önemin verilmesi gerektiği unutulmamalıdır.” (Büyükbaykal, 2015:640)

2. TÜRKİYE’DE İLETİŞİM EĞİTİMİNİN TARİHÇESİ VE ÖNEMİ

İletişim eğitimi yıllardan beri hem akademisyenler, hem öğrenciler hem de basında çalışanlar arasında sıklıkla gündeme gelmekte ve genellikle de yaşanan olumsuzluklar ve sıkıntılar dile getirilmektedir. Ancak mevcut sorunlara yönelik çözüm önerileri noktasında alınmış somut bir başarı yoktur. Bu sorunların çoğalan iletişim fakülteleri ve artan öğrenci popülasyonu göz önüne getirildiğinde gün geçtikçe daha da arttığı görülmektedir.

“İletişim fakültelerinin sayısının son yıllarda artması, beraberinde mezun sayısını da artırmıştır. Fakat medya sektöründeki istihdam aynı paralelde artmamıştır. İletişim fakültelerinin gazetecili bölümlerinden mezun öğrencilerine büyük bir kısmı, medya sektörü dışındaki alternatiflere yönelmektedir. Doktorluk, avukatlık, eczacılık gibi meslekleri yapabilmek için ilgili fakülteden mezun olmak, diplomanın olması şarttır. Fakat günümüz Türkiye’inde medya sektöründe çalışanlarda gazetecilik eğitimi ve diploma aranmamaktadır. Her kesimden insanın gazetecilik yapabileceği bir meslekte dört yıl eğitim almak ve karşılığında iş bulamamakta mezunların motivasyonunu düşürmektedir. Devletin iletişim fakültelerinin sayısını sınırlaması ve mezunlar için yeni istihdam politikaları üretmesi gerekmektedir.”(Korkmaz, 2012:10)

“İletişim fakülteleri evrensel bilginin ışığında hem teorik hem de pratik düzeyde iletişim öğretimi ve araştırma yapan akademik birimlerdir. İmkânları ölçüsünde her açıdan donanımlı iletişimci yetiştirmeyi ilke edinmişlerdir. Ülkemizdeki yapılanmaları itibariyle, gazetecilik, halkla ilişkiler, radyo, sinema ve televizyon gibi gelenekselleşmiş bölümleri bünyelerinde barındırmaktadırlar. Son yıllarda görsel iletişim tasarımı ya da reklamcılık gibi kimi bölümlere de kapılarını açmışlardır. Vakıf üniversiteleriyle birlikte sayıları her gün artan iletişim fakülteleri, her yıl binlerle ifade edilen sayılarla mezun vermektedir. Kuşkusuz kendilerine özgü sorunları da bulunan iletişim fakülteleri, birer öğretim ve araştırma kurumu olarak, medya kuruluşları gibi küresel gelişme ve rekabette varlıklarını korumaya çalışmaktadır, yenilikleri olabildiğince yakından takip etmekte, edinim ve kazanımlarını öğrencileri başta olmak üzere kendisine ihtiyaç duyan tüm muhataplarına aktarmaktadırlar.” (Korkmaz,2012:11)

“Türkiye’de ilk özel gazetecilik okulu 1948’de Müderris Fehmi Yahya tarafından açılan İstanbul Özel Gazetecilik Okulu’dur. Üniversite düzeyinde bir eğitim kurumu olan okul, basın dünyasına ve iş hayatına hazırlıklı eleman yetiştirmek amacıyla kuruldu. Okul, biri ortaokul üzerine 3 yıllık, diğeri ise lise üzerine bir yıllık eğitim veren iki devreden oluşuyordu. Okulun eğitimine 1963 yılında ara verildi.” (Uzun,2007: 120)

“2547 sayılı yasa ile Yüksek Öğretim Kurulunun kurulmasıyla birlikte, tüm mevcut devlet üniversitelerinde eğitim ve öğretim bakımından yeni düzenlemeler yapılması gündeme geldi. Bu düzenlemelerle birlikte, yüksek öğretim kurumlarının teşkilatı 1982 yılında 41 sayılı kanunu hükmündeki kararname ile tekrar düzenlendi. Bu kararname ile gazetecilik alanında eğitim veren okullar, Ankara, İstanbul, Marmara, Ege ve Gazi Üniversiteleri Basın Yayın Yüksek Okulları adı altında bu üniversitelerin rektörlüklerine bağlandı. 1992’de ise 3837 sayılı yasa ile 2908 sayılı yüksek öğretim kurumları yasasında değişiklik yapılarak, mevcut bulunan beş Basın-Yayın Yüksek Okulu, İletişim Fakültelerine dönüştürüldü. Ayrıca, bu yasa ile Konya’da Selçuk Üniversitesi’ne bağlı İletişim Fakültesi ile Eskişehir’de Anadolu Üniversitesi’ne bağlı İletişim Bilimleri Fakültesi kuruldu. Devlet üniversiteleri içinde iletişim fakültelerinin sayısı artarken, 1997 yılından itibaren vakıf üniversitelerinin kurulmasının yolu açılınca, vakıf üniversiteleri içinde de iletişim fakülteleri açıldı.” (Uzun,2007: 122)

11.07.2017 tarihi itibariyle ülkemizde 114’ü devlet 65’i vakıf ve 6’sı vakıf meslek olmak üzere 185 üniversite vardır.63’ü İletişim Fakültesi,1’i İletişim Bilimleri Fakültesi (Anadolu Üniversitesi-Eskişehir) olmak üzere 64 iletişim eğitimi veren fakülte bulunmaktadır. (<https://istatistik.yok.gov.tr>)

“Bunların yanında, devlet üniversitelerinin ya da vakıf üniversitelerinin güzel sanatlar fakülteleri içinde iletişimle ilgili lisans programları açılmaya başlandı. Bu süreçte, meslek yüksek okullarında da iletişim, halkla ilişkiler, radyo ve televizyon yayıncılığı, fotoğrafçılık gibi bölümler oluşturuldu...Günümüzde iletişim fakülteleri, misyonlarını belirlerken iletişim eğitiminin niteliğini irdelemekte, ders programlarının hazırlanmasından, ders verecek kadroların oluşturulmasına varıncaya kadar çeşitli başlıklar altında iletişim eğitiminin amacını tartışmaktadır. Ancak, iletişim fakültelerinin öncelikleri konusundaki tartışma henüz sonuçlanmış değildir.” (Uzun,2007: 123)

“Türkiye’de gazetecilik/iletişim eğitiminin başlamasında sırasıyla İstanbul ve Ankara Gazeteciler Cemiyetlerinin büyük rolü olduğunu söylemek gerekir. İstanbul ve Ankara Gazeteciler Cemiyetlerinin “eğitimli gazeteci” yönündeki girişimlerini, İstanbul ve Ankara Üniversiteleri gazetecilik/iletişim eğitimi üzerinde eğitim programları başlatarak gerçeğe dönüştürmüşlerdir. İstanbul Gazeteciler Cemiyeti, İstanbul Üniversitesi’yle birlikte, İstanbul Üniversitesi İktisat Fakültesi Gazetecilik Enstitüsü’nün hayata geçmesini sağlarken, o zamanki Cemiyet Başkanları olan Cihat Baban ve Sedat Simavi’nin bu konuda gösterdikleri çabalar gerçekten çok büyüktür. Aynı şekilde, Ankara Üniversitesi Siyasal Bilgiler Fakültesi Basın Yayın Yüksek Okulu’nun kurulmasında Ankara Üniversitesi’nin, Ankara Gazeteciler Cemiyeti’nin, Ankara Gazeteciler Sendikasının, Anadolu Ajansı’nın rolü bulunmaktadır.” (Tokgöz,2017:5)

“Önceleri başka fakültelelere bağlı birer enstitü iken, daha sonra yüksekokul ve fakülte konumuna kavuşan iletişim fakülteleri; bu süreçle birlikte son yıllarda tüm olanaklarını kullanarak, sorunların içerisinde nitelikli öğrenim verme çabasına girmişlerdir. İletişim fakültelerinde öğretim elemanı başına düşen öğrenci sayısı oldukça fazladır. Bir yandan nitelikli öğretim elemanı sağlama uğraşısında olan iletişim fakülteleri, aynı zamanda öğrenci sayısının düşürülmesini, öğretimin niteliği açısından zorunlu görmektedir. ÖSYM sisteminde ve üniversite öncesi eğitimde yapılacak yeni düzenlemelerle öğrencilerin seçimlerinin tesadüfi olmasının önüne geçilmelidir. Her iki öğeden kaynaklanan tesadüfi seçimler, öğrencinin üniversite eğitiminde önemli uyum sorunlarına yol açmaktadır.” (Gezgin, 2002:129-130)

“Günümüzde tüm dünyada olduğu gibi, Türkiye’de de küreselleşme, bilgi ve iletişim teknolojilerindeki gelişmelerle birlikte artan rekabet ve bilgi ekonomisinin yükselmesi, öğrenme biçimlerini farklılaştırmış, öğrenci profilini değiştirmiş, eğitimde bilgi üretimi ve araştırmanın yanında uygulamanın da önemini artırmış ve bu yeni ortam ve araçlar yeni becerilerin ve melez mesleklerin ortaya çıkmasına yol açmıştır. Bilgi toplumunda artık zaman ve mekan sınırı olmadan, maliyeti düşük ve öğrenci odaklı olan, fırsat eşitliği yaratan, kişilerin bireysel özelliklerine göre planlayabildiği yöntem ve araçlardan yararlanma her düzeyde öğrenmeyi daha etkin hale getirmiştir.” (Özkanal&Özgür, 2017:6)

“İletişim eğitiminin amacı, yıllık yaklaşık 5 milyar TL işlem hacmi olan (Reklamcılar Derneği Verileri 2015) iletişim sektörüne donanımlı medya profesyoneli yetiştirmek olarak belirlenmiş, ancak sektörde mezunların istihdamı sürekli tartışılır olmuştur. Dahası yeni kurulan iletişim fakültelerinin öğretim elemanı ihtiyacının karşılanması da bu nedenlerle sağlanamamaktadır. Fakültelerden mezun olanların sayısı sektörün ihtiyaç duyduğu sayının oldukça üzerindedir. Sektörde sadece iletişimi mezunları değil, pek çok farklı alandan insan çalışmaktadır. Son yıllarda iletişim sektöründe değişme ve gelişmeler doğrultusunda farklı öğrenim yöntemleri (açık ve uzaktan eğitim) ile programlar, anabilim dalları ve dersler açılmıştır. Türkiye’de üniversitelerde ön lisans ve lisans düzeyinde örgün ve açık ve uzaktan öğrenme yöntemi ile verilen iletişim eğitimi ise henüz kurumsallaşmasını tamamlayamamıştır. Bunun bir nedeni verilen iletişim eğitiminin kalitesi üzerine çalışmaların halen sürdürülmesidir. Diğer bir neden ise iletişim alanının meslekleşmemesi, herkesin yapabileceği bir iş olarak görülmesidir”(Özkanal&Özgür, 2017:7)

“Günümüzde iletişim eğitimi: İletişim ve İletişim Bilimleri Fakülteleri’nde, Güzel Sanatlar, Güzel Sanatlar ve Mimarlık, Güzel Sanatlar ve Tasarım, Sanat ve Tasarım, Mimarlık Tasarım, Sanat ve Sosyal Bilimler, Uygulamalı Bilimler, Sosyal ve Beşeri Bilimler, İşletme, İktisadi, İdari ve Sosyal Bilimler ile İnsani Bilimler ve Edebiyat ve Fen-Edebiyat Fakültelerinde verilmektedir. Yükseköğretim Kurulu’nun 2015 yılı verilerine göre 74’ü devlet, 49’u vakıf olmak üzere 123 üniversitedeki lisans programlarında ve 200’ü devlet, 30’u vakıf ve 6’sı vakıf meslek yüksekokulu olmak üzere 236 önlisans programında iletişim eğitimi verilmektedir.”(Özkanal&Özgür, 2017:8-9)

“İletişim fakültelerindeki ders programları, “üçlü bir kategorileştirme” çerçevesinde ele alınmıştır. Birincisi, iletişim eğitimine altyapı sağlayan sosyal bilimlerde disiplin olma hüviyetini kazanmış “genel formasyon”a yönelik temel kültür dersleri; ikincisi iletişim ve kitle iletişimini konu alan “kuram ve kavramsal çerçeve” dersleri; üçüncüsü ise uzmanlaşmaya yönelik “uygulama” dersleri eğitim programlarını oluşturmaktadır... Sosyoloji, Psikoloji, Sosyal Psikoloji, Ekonomi, Hukuk, Felsefe, Antropoloji, Siyaset Bilimi vb. dersler “genel

formasyon”a yönelik dersler kapsamında ele alınmıştır. Bununla birlikte, İletişim Bilimine Giriş, Kitle İletişim Kuramları, Medyanın Ekonomi Politikası, Kültürel Çalışmalar, Medya Etiği, İletişim Sosyolojisi, Popüler Kültür, İletişim Bilimlerinde Araştırma Yöntemleri vb. dersler ise “iletişim kuram ve kavramları”na yönelik dersler başlığında değerlendirilmiştir. Haber Toplama ve Yazma Teknikleri, Gazete Yazı Türleri, Masaüstü Yayıncılık, Basın Fotoğrafçılığı, Bilgisayar Uygulamaları, Gazetecilik Uygulamaları vb. dersler de “uygulama”ya dönük dersler bağlamında değerlendirilmiştir.” (Dağtaş, 2003:154-155)

Türkiye’de iletişim eğitiminin bazı önemli sorunlar yaşadığı bilinmektedir. Sorunlar çok yönlü olmakla birlikte başlıcaları; iletişim eğitiminin niteliği ve eğitime yaklaşım, verilen eğitimin medya sektörüyle uyumu, iletişim fakültelerinin sayı ve kontenjanındaki artış, öğrenci kalitesindeki düşüş ve mezun öğrencilerin istihdamında karşılaşılan güçlükler şeklinde sıralanabilir.

Bu bağlamda Berna Yazar Aslan’ın 2014 yılında hazırladığı “Türkiye’de Genç İşsizliğe Yönelik Bir Alan Araştırması: Üniversite Öğrencileri Arasında Kaygı ve Umutsuzluk Düzeylerinin Belirlenmesi” başlıklı uzmanlık tezi ise, iletişim fakültesi öğrencilerinin daha okurken geleceğe dair yaşadıkları kaygı ve umutsuzlukları net olarak ortaya koymuştur. Tez kapsamında 12 fakülte eğitim gören 751 öğrenci üzerinde çalışma yapılmış ve öğrenim görülen fakülte bakımından sürekli kaygı düzeyine ait en yüksek ortalama “iletişim fakültesi”nde çıkmıştır. (Akçakoca, 2016:41)

“Yüksek okul döneminde, eğitimin temel amacı, mesleğe nitelikli eleman yetiştirmek olarak algılandığı için iletişim eğitiminin sektörle uyumlu olduğu söylenebilir. Oysa fakülte yapısına geçildikten sonra bu amaç sorgulanmaya başlanmıştır. İletişim eğitiminin amacının sadece iletişim mesleklerine yönelik eleman yetiştirmek, meslek öğretmek olmadığı, öğrencilere gelecekte katılacakları medya sistemiyle ilgili eleştirel bir bakış açısı kazandırılması gerektiği savunulmaya başlanmıştır.

İletişim eğitimi verilen okullardaki ders programları ve içerikleri, gazetecilik okulları dönemindeki temele bağlı kaldığı için kuramsal ve uygulamalı derslerin birlikte yürütüldüğü bir yapı egemendir. Dört yıllık eğitimin bir bölümü sosyal bilimlerle ilgili temel kazandırmaya yönelik derslere ayrılmakta, özellikle eğitimin son iki yılında mesleki kuramsal ve uygulamalı dersler ağırlık kazanmaktadır. Bu derslerin nicelik ve nitelik bakımından ne kadar yeterli olduğu tartışmanın bir başka yönüdür. Bazı fakülteler sayıca daha fazla uygulamalı derse yer verdiği gibi, bu derslerin bir bölümünü sektörün içinden gelen uzmanlara verdirerek, öğrencilerini staj, gezi vs. gibi organizasyonlarla sektörün içinde bulunmaya yönlendirerek sektörle bütünleşme çabası göstermektedir. Diğer yandan bazı akademisyen ve bağlı buldukları fakülteler, tercihlerini kuramsal eğitimden yana koymakta, müfredatın ağırlığını bu yönde belirlemektedir...Diğer yandan iletişim fakültelerinin sayısı hızla artmaktadır. Bu artış iletişim eğitimi verilen öğrenci kontenjanının ve dolayısıyla mezun öğrenci sayısının artışı da beraberinde getirmektedir. Medya alanında zaten var olan istihdam sıkıntısına yeni mezunların eklenmesi, iletişim eğitimi almış genç insanların alanlarıyla ilgisi olmayan işlerde çalışmalarına yol açmaktadır. Kontenjan artışı ve mesleğin gençler için iyi bir gelecek vaat etmemesi nedeniyle, başarılı öğrenciler, iletişim fakültelerini tercih etmemektedir. Çok düşük puanlar ve yüzdelerle bu fakülteye öğrenci alınması, eğitimin ve mezunların niteliğinde ciddi sorunlara yol açmaktadır.” (Şeker&Şeker,2011:100)

“İletişim fakültelerindeki müfredat genel okura kuramsal ve uygulamalı dersler olarak ayrılmaktadır. Kuramsal dersler öğrencilere toplumsal konularda ve meslek alanında vizyon kazandırmayı amaçlamakta, öğrencinin alacağı üniversite eğitimin sonucunda içinde yaşadığı topluma, dünyaya ve aday olduğu meslek alanındaki işleyişe eleştirel ve yorumlamacı bir mesafeye bakabilmesini sağlamayı hedeflemektedir. Uygulamalı dersler ise, öğrencilerin alanlarıyla ilgili teknik ve mesleki bilgilerini artırmayı, sektörde kendilerine yer bulabilmelerine destek olmayı amaçlamaktadır.” (Şeker&Şeker,2011:101)

“Gazetelerde, radyo-televizyonlarda ve halkla ilişkiler sektöründe iletişim eğitimi olarak mesleğe başlayan ve yönetici konumuna kadar yükselen pek çok okullu iletişimci bulunmaktadır. Ancak, bu uzun süreye ve tecrübeye rağmen, sektörde çalışanların iletişim eğitimi olarak aralarına katılmayı bekleyen yeni mezunların yeterli olmadığı konusunda süregelen bir yakınmaları vardır. İletişim eğitiminin niteliğini yakından ilgilendiren bu yakınmaların birinci bölümü mezunların sektörde doğrudan sorumluluk üstlenecek düzeyde yetişmediği yönündedir. Bir başka ifadeyle fakültelerde verilen uygulama derslerinin yetersiz olduğu, öğrencilerin meslek hayatına hazır olarak mezun edilmediği ileri sürülmektedir. Bu noktada uygulama derslerinin sayıca az olduğu ve güncelliği yakalayamayan bir içerikle yürütüldüğü, fakültelerde sektördeki uygulamayı aktaracak yeterlilikte öğretim elemanı ve teknik altyapı bulunmadığı gibi eleştiriler yapılmaktadır. Bu eleştirileri azaltmak amacıyla iletişim fakültelerinde bazı derslerin sektördeki önemli isimler tarafından yürütülmesi, öğrencilerin sektördeki kuruluşlarda zorunlu ve isteğe bağlı staj yapmalarının sağlanması, seminer, konferans, söyleşi gibi çeşitli etkinliklerle öğrencilerin sektör önde gelenleriyle buluşturulması gibi yollara başvurulmaktadır.” (Şeker&Şeker,2011:105)

“Türkiye’de üniversite düzeyinde iletişim eğitiminde, gerek eğitim veren üniversite sayısı, gerekse fakülte ve yüksekokul sayısı açısından hızlı bir nicel gelişme gözlenmektedir. Devlet üniversiteleri yanında son yıllarda açılan vakıf üniversitelerinde de iletişim alanında eğitim verilmekte, iletişim bu üniversitelerin popüler programları arasında yer almaktadır. İletişim sektörünün büyümesi, iletişim teknolojilerindeki gelişmeler ve iletişim araçlarının yaygınlaşmasıyla, medyanın ve medya çalışanlarının görünürlüğünün artmasının, iletişim

fakültelerine talebi artırdığı, bu talep artışının da vakıf üniversiteleri tarafından fark edildiği görülmektedir. Türkiye’de iletişim alanındaki eğitim, parçalı bir yapıya sahiptir. Bu eğitim, daha çok iletişim fakülteleri ile güzel sanatlar fakülteleri içindeki bölümlerde yer almaktadır. Ancak iletişim fakültesi bulunmayan bazı üniversitelerde bile fen edebiyat fakültesi, iktisadi ve idari bilimler fakültesi ya da işletme fakültesi bünyesinde iletişim eğitimi veren bölümler yer almaktadır. İletişim eğitimi fakülteler yanında yüksekokullarda da verilmektedir. Lisans düzeyinde eğitim vermeyen üniversitelerde bile ön lisans düzeyinde iletişim eğitimi verildiği görülmektedir. Hatta bazı üniversitelerde, birkaç yüksekokulda birden iletişimle ilgili aynı programlar açılmıştır. Ayrıca hem lisans hem de yüksek lisans düzeyinde ikinci öğretim veren üniversiteler bulunmaktadır.” (Uzun,2007: 132)

“Her yıl binlerce mezuna karşın, medya sektöründe aynı oranda istihdam yaratılamamıştır. Artık yeni iletişim fakülteleri açılmamalı ve sayıları sınırlandırılmalıdır. Hükümet, üniversite kapılarında bekleyenlerin sayılarını azaltmak için sınıf kontenjanlarını arttırmaktadır. Kalabalık sınıflar hem öğrencileri, hem öğretim elemanlarını olumsuz etkilemektedir. Dersler ve uygulamalardan istenilen verim alınmamaktadır. İletişim fakülteleri gibi alınan öğrenci sayıları da sınırlandırılmalıdır (ideal sınıflar 20-30 kişi arasında olmalıdır). Teknolojinin en çok kullanıldığı alan iletişim/medya sektörüdür. Medya sektörü, son iletişim teknolojilerini kullanmaktadır. Bu yüzden iletişim fakülteleri son teknolojileri öğrencilerine vermelidir.” (Korkmaz,2012:25)

Örnek Model:

İstanbul Üniversitesi İletişim Fakültesi’nde Eğitim Öğretime Yönelik Düzenlemeler

-2016-2017 döneminde, İletişim Fakültesi uluslararası sıralamada 100 üniversitenin eğitim programları tek tek karşılaştırılarak eski müfredatta bulunan 246 ders yeni müfredatta 80 ders olarak düzenlenmiştir.

-İletişim Fakültesi bünyesinde bulunan tüm programlarda program yeterlilikleri ve öğrenme çıktıları dikkate alınmaktadır. Programlardaki ders listeleri ve programların müfredatı bu bilgiler ışığında tasarlanmıştır.

-Türkiye Yükseköğretim Yeterlilikleri Çerçevesi temel metin olarak dikkate alınmakta ve Bologna Süreci hedeflerine yönelik olarak, sistemli bir şekilde bilgi paylaşımı, tanınma ve ulusal-uluslararası hareketliliği artırma amaçlarıyla çalışmalar gerçekleştirilmektedir. Bu süreç, toplantı ve çalıştaylarla çeşitli platformlarda tüm akademik personel ve öğrencilere duyurulmuştur. Meslekî kuruluşlar, Ulusal Gazete ve Televizyonlar, işverenlerle yapılan temaslarda bu süreci geliştirebilecek veriler elde edilmektedir.

-Müfredat çalışmaları kapsamında İletişim Fakülteleri öğretim üyeleri ve elemanlarının görüşleri toplantı yapılarak alınmıştır.

-İÜ İletişim Fakültesi olarak Programlardaki derslerin öğrenme çıktıları ve gerçekleştirilmesi hedeflenen amaçlar uyumlu bir şekilde tasarlanmış olup Programlarda bu ilke temel ilke olarak benimsenmiştir. Her eğitim öğretim sonunda yapılan müfredat çalışmalarında bu ilkeye uyulup uyulmadığı tespit edilip uygun olan revizyon önerileri getirilmektedir.

-İletişim Fakültesi olarak Programlarda şeffaflık ilkesi hâkimdir: Programlardaki eğitimin amaç ve kazanımları tüm kamuoyuna web tabanlı platformlarda duyurulmaktadır.

-Fakültemiz Bölümlerine ait staj yönergesi mevcuttur. Ayrıca bütün duyurular web sitemizde bulunmaktadır.

-Öğrencilerin programla ilgili düşüncelerinin değerlendirilmesinde anket vb. gibi yöntemlerden yararlanılmaktadır. İÜ Rektörlüğü tarafından yapılan AKSİS sistemi üzerinden Öğrenci Memnuniyet Anketi, Öğretim Üyesi Performansını Değerlendirme Anketi ile değerlendirmelere ulaşılmıştır.

-Fakültemiz Öğrencilerinin kullandığı AKSİS sisteminde tanımlanan ders danışman hocaları kendi eğitimleri ile ilgili sorunları için danışmanlık yapılmakta olup, rehberlik desteği Üniversitemizin Kariyer Geliştirme Merkezi ve Sağlık Kültür Daire Başkanlığına bağlı Rehberlik danışmanlık ve sosyal destek birimi tarafından sağlanmaktadır.

-Özel yaklaşım gerektiren öğrencilerimiz bulunmakta olup, engelli öğrencilerimiz için Üniversitemizin Engelliler Uygulama ve Araştırma Merkezi, mülteci öğrenciler için Üniversitemiz Öğrenci İşleri Daire Başkanlığı, uluslararası öğrenciler için Üniversitemiz Uluslararası Akademik İlişkiler Birimi tarafından kanunlar çerçevesinde düzenlemeler yapılmaktadır. Ayrıca engelli öğrencilerimiz için rampa, asansör ve WC ihtiyaçları fakültemizce sağlanmaktadır.

-Öğrencilerimizin mezuniyet koşulları, ilgili mezuniyet komisyonu tarafından incelenerek fakültemiz yönetim kurulunca alınan kararlar Fakültemizin Web sitesinde yayınlanmaktadır.

-Fakültemiz öğrenci kabulleri ÖSYM tarafından yapılan sınavla olmakta olup, Farabi, Mevlana ve Erasmus öğrencileri içinde açık ve tutarlı kriterler yönetmelikler çerçevesinde uygulanmaktadır. Öğrencilerimiz ile ilgili bütün yönetim kurulu kararları şeffaf olarak web sitemizde yayınlanmaktadır.

-Fakültemizde sunulan hizmet ve desteklerin kalitesi ve etkinliği İSO9001 kalite güvencesi altına alınmaktadır. Akademik, idari personelin ve öğrencilerin tüm işlemleri EBYS ile kayıt altına alınmış olup, ayrıca Akademik, idari personel için İSKOP ve HİTAP programları, öğrenciler için AKSİS programı kullanmakta kanun, yönetmelik ve yönergeler doğrultusunda işlemler yapılmaktadır.

-Fakültemizin Dış Paydaşlarının yani işveren, iş dünyası ve meslek örgütü temsilcileri ile mezunlarının müfredat çalışmalarında aktif katılımı sağlanmış değerlendirilmeleri dikkate alınmıştır.

-Fakültemiz Web Sitesinde bulunan fakültemiz mezunları ile ilgili ve iş imkanları duyuru olarak sunulmakta, online olarak sisteme girip özgeçmiş oluşturulmakta ve duyurulara başvuru sağlanmaktadır. Bunun haricinde staj döneminde medya şirketleri ile yapılan işbirliği çerçevesinde iş imkânları sağlanabilmektedir.

3. TÜRKİYE'DE İLETİŞİM SEKTÖRÜNDE YAŞANILAN İSTİHDAM SORUNLARI

“Yaklaşık 60 yıldır gazetecilik ve sonrasında iletişimin diğer alanlarında eğitim verilmekte olan ülkemizde, iletişim eğitimi veren kuruluşlar, bir kısım zorluklarla karşı karşıya kalmış bulunmaktadır. Özellikle 1990'ların başlarından itibaren, Türkiye'de radyo ve televizyon yayıncılığında devlet tekelinin ortadan kalkmasını izleyen dönemde bu sıkıntılar daha fazla hissedilir olmuştur. 1980'lerin sonlarından itibaren basın kuruluşlarında yaşanan bir kısım değişikliklerin ki özellikle bu değişiklikler imtiyaz sahipliği alanında yaşanmıştır, basın sektörü dışından gelen ve yüklü sermayelerle bu sektöre giriş yapan yeni patronlarla birlikte basın kuruluşları her alanda bu yeni gelişimden etkilenmiştir. Basın alanına ve sonrasında televizyon, radyo ve elektronik medya alanına çok büyük meblağlar tutan yatırımlar yapılmış, sektör genişlemiş ve bu genişleme çok kısa bir süre içerisinde gerçekleşmiştir. Bu durum, iletişim sektöründe yeni istihdam olanakları yaratmıştır.” (Gezgin, 2005).

“1990'lı yılların başında özel televizyon ve radyoların yayın hayatına girmesiyle bu sektörlerde istihdam açığı oluşmuştur. Bu talep doğrultusunda yeni iletişim fakültelerine ve bölümlere ihtiyaç duyulmuştur. Ayrıca özel akademi/eğitim kurumları ve kurslarla sektörün ihtiyaçları karşılanmıştır. 1990'lı yıllardan itibaren hem kamu, hem özel üniversitelerin iletişim fakültelerindeki artış, bu fakültelerden mezun olan öğrenciler ya işsiz kalmıştır ya da başka sektörlere yönelmiştir. Ayrıca sektöre ara eleman yetiştiren ve sayıları günden güne artan iki yıllık meslek yüksekokulları ve iletişim meslek liseleri de sektörün eğitilmiş insan gücünü karşılamaktadır.” (Korkmaz, 2012:12)

“İletişim fakültelerinin sayıca ihtiyacın üzerinde olmasının yanı sıra, bu fakültelere öğrenci alımında ayrılan kontenjanlar ihtiyacın çok üzerindedir. Bu durum hem öğrenci açısından hem de öğretim elemanı açısından birtakım sorun ve sıkıntıları da beraberinde getirmektedir. Sistemden kaynaklanan yığılmalar, fakültelerin sınırlı olanaklarını zorlamaktadır. Öğrenci sayısının çokluğu, öğretim elemanı başına düşen öğrenci sayısının haddinden fazla olmasına neden olduğu gibi öğrenciler açısından da gördükleri eğitimin niteliğinin düşmesine neden olmaktadır. Bu durum, pek çok ders, kuramın yanı sıra uygulamaya yönelik olarak da çalışma gerektirdiğinden sıkıntıya yol açmaktadır. Uygulamalı derslerde öğrenciler, gerekli araç gereci yeteri kadar kullanma fırsatı bulamamakta ve bu sebeple söz konusu araçların kullanımına genellikle tam anlamıyla hâkim olamamaktadır. Kontenjanların bu denli yüksek tutulması öğrenim kalitesinin düşmesine sebep olduğu gibi ayrıca, öğrencilere mezun olduktan sonra da istihdam sorunu olarak yansımaktadır. İletişim fakültelerinden her yıl binlerce gazeteci, radyocu, televizyoncu, halkla ilişkiler uzmanı, reklamcı mezun olmakta ancak bunları çok azı meslekleri ile ilgili bir alanda çalışabilme imkânına erişebilmektedir.” (Gezgin, 2005).

Nitekim Türkiye İstatistik Kurumu (TÜİK) tarafından her yıl yayımlanan İşgücü Araştırma Raporu'nun 2016 yılı sonuçlarına göre gazetecilik ve enformasyon sektörü, yüzde 62.9 ile istihdam oranının en düşük gerçekleştiği üçüncü sektördür. Sektördeki işsizlik oranı ise % 15.9'dur. Türkiye Gazeteciler Cemiyeti'nin 2015 Raporu'nda ise işsiz gazeteci sayısı 7 bin olarak açıklanmıştır.

Bunun dışında “Öğrenci başına düşen akademik personel sayısı düşük kaldığı gibi, teknik araç gereçten de öğrencilerin faydalanma süreleri daha az olmaktadır. Ayrıca her yıl sektörün ihtiyacını çok üzerinde yeni mezun genç, kendisini, piyasaya dâhil olma yarışında kıyasıya bir rekabet içinde bulmaktadır. Ancak mezun sayısı o kadar fazla ve istihdam alanı o kadar azdır ki, durum son derece üzücü sonuçlara neden olmakta, pek çok iletişim

fakültesi mezunu, işsiz kalabilmektedir...Daha çok kar kaygısıyla hareket eden medya organizasyonları, yeni mezun gençleri, ‘stajyer’ adı altında gereğinden fazla sürelerde hiçbir ücret ödemeksizin çalıştırabilmekte, kurumda tutunup, yerini sağlama almak isteyen, sigortasız, sözleşmesiz olarak kullanılan bu kişiler, hiçbir iş güvenceleri olmadığı için kendilerinden istenen konuları, kendilerinden istendiği şekliyle hazırlamak ve amirlerine teslim etmek durumunda kalmaktadırlar. Tabii bu arada pek çoğu, dört yıl boyunca kendilerine benimsetilmeye çalışılan meslek etiği kurallarını defalarca ihlal edebilmektedirler.” (Gezgin,2008:32-33)

“Öte yandan akademi dışında medya ve iletişim eğitimi veren ve ardından kendi bünyesinde istihdam olanağı sunan kurumların, yayın politikaları çerçevesinde eğitimleri, odak noktalarına koymaktadır. Sözgelimi, Anadolu Ajansı, Savaş Muhabirliği, Adliye Muhabirliği ve Foto Muhabirlik gibi eğitimler vermektedir. Bu nedenle eğitim veren kurumların, kendi yayın politikalarıyla uyumlu ve işe alım sürecinde öncelik gösterecekleri adaylar yetiştirdikleri de açıktır. Nitekim çalışma kapsamında söz konusu kurumların, katılımcılara kendi yayın politikaları veya işe alım sürecinde öncelikleri kistaslar ışığında eğitimler verdiği ve programın sonunda başarılı olanları işe istihdam ettiklerine veya çeşitli medya kuruluşlarına yönlendirdiklerine ulaşılmıştır. Ancak söz konusu kurumların, savaş muhabirliği ya da hak haberciliği eğitimi vermeleri, bu spesifik alanlarda yetişmiş eleman açığı olduğunun da bir göstergesidir.” (Ezber&Sayar, 2016:81)

“Mezunlar arasında son derece iyi yetişmiş, nitelikli olanların da istihdam sorunuyla karşılaşmaları sektördeki soruna işaret etmektedir. Türkiye’de ulusal medyanın ekonomik nedenler ve tekelleşen sahiplik yapısı nedeniyle beklenen istihdamı yaratamadığı bilinmektedir. Günümüzde gazete ve televizyon arttığı halde, genç gazetecilerin istihdamı sorununda iyileşme görülmemektedir. Medya grupları gazetelerinin içeriğini ortak havuzdan karşılamakta hatta aynı gazetecileri, gruba ait gazeteler yanında televizyon ve dergiler için de çalıştırmaktadır. Dolayısıyla medya sayısındaki artış bu kuruluşlarda çalışan gazetecilerin artmasını sağlamaktadır. Mesleğe yeni adım atacak genç gazeteciler bir yana, yıllardır ulusal medyada çalışan deneyimli gazetecilerin bile işsiz kaldıkları ya da mevcut şartlardan tatmin olmadıkları için başka sektörlere geçtikleri bilinmektedir. Diğer yandan medya, iletişim mezunlarının yanında başka alanlarda eğitim görmüş kişilere de açıktır. Bu nedenle iletişim eğitimi almış genç mezunların ulusal medyada istihdamı son derece sıkıntılıdır. Kısıtlı miktardaki istihdamın yüksek öğretim görmüş insanların hayattan beklentilerini karşılayacak maddi-manevi imkanları sağlamaktan uzak olduğu da ortadadır.” (Şeker&Şeker,2011:113)

“Ancak medya ulusal ya da yaygın gazete ve televizyonlardan ibaret değildir. Türkiye’de Osmanlı’ya kadar uzanan geçmişi bulunan bir yerel gazetecilik yapısına, 90’lı yıllardan bu yana yerel televizyonculuk ve radyoculuk yapısı da eklenmiştir... Dolayısıyla yerel medyanın iletişim mezunlarının istihdamında ulusal ya da yaygın medyadan daha büyük bir alternatif oluşturabileceği söylenebilir. Yerel radyoların genellikle bir iki kişi tarafından sürdürülen yapısı göz önünde bulundurulduğunda, istihdam açısından özellikle yerel gazeteler ve televizyonların dikkate alınması gerekir. Ancak yerel gazetelerde ve televizyonlarda çalışanların sayısı ve niteliğiyle ilgili önemli sorunlar yaşanmaktadır. Geleneksel yapıdaki küçük yerel gazetelerin çalışanı bulunmadığı, gazetenin sahibi ve yakınlarının hem içeriği hazırladıkları, hem teknik süreci gerçekleştirdikleri bilinmektedir.” (Şeker&Şeker,2011:113-114)

“Bu noktada, yerel gazeteler ve televizyonlarda iletişim fakültesi mezunlarının daha yüksek oranda istihdamı için çalışmalar yapılması gerektiği açıktır. İletişim eğitimi almış çalışanlar, yerel medyanın niteliğini yükseltecek, bu nitelik artışı gazetelere tiraj, televizyonlara yükselen izlenme oranı olarak yansıtacaktır. Dolayısıyla yerel medyanın etkinliği, gücü ve buna bağlı olarak sorunların birçoğunun temelini oluşturan ekonomik sıkıntılar çözümlenebilecektir. En azından belli gelişmişlik düzeyindeki illerde kurulu bulunan yerel gazete ve televizyonlarda iletişim mezunlarının yer alması mümkün görünmektedir. Gazetecilik mesleğine giriş, tüm dünyada yasalarla sınırlanmadığından, iletişim mezunlarının istihdamında ancak özendirici tedbirler önerilebilir.” (Şeker&Şeker,2011:116)

SONUÇ

“İletişim fakültelerinin yapması gereken işe, medya sektörünün karşısında sağlam durabilmektir. Verdikleri eğitimin ardında yatan nedenleri iyi bir şekilde tartışmalı, iletişim fakültelerinin neden, niçin kurulduklarına önem vermelidir. Profesyonelliğin önemini vurgulamalıdır. Giderek sayısı artan iletişim fakültesi yerine, nitelikli ve donanımlı kurumsallaşmış iletişim fakültelerinin öğrenci yetiştirmesine ön ayak olmalıdır. Yeni iletişim fakültelerinin açılmasına medya sektörü ile ilişkiler raya oturtuluncaya kadar son verilmesi belki en tutarlı yoldur.

İletişim fakülteleri lisans, yüksek lisans ve doktora derslerinin işlevsel olarak düzenlenmesini gözden kaçırmamalıdır. Aynı zamanda, iletişim fakülteleri yetiştirdiği insan gücünü donanımlı olarak yetiştirmeli, sektörün Pazar/piyasa ilişkileri bağlamında ileri sürdüğü koşulları hiçbir zaman göz ardı etmemelidir. Yetiştirilen

eğitici kadroların ise iletişim eğitimin sürdürme yönünden son gelişmeleri izleyen kişiler olarak yetişmelerini sağlamalıdır. Bu nedenle, eğitici eğitiminde niteliğe son derecede önem verilmelidir. Bilinmelidir ki, nitelikli eğitici eğitilen öğrencilerin nitelikli olarak yetişmelerini sağlayacaktır.

Son yıllarda gerek devlet gerekse vakıf üniversitelerinde iletişim fakültelerinin sayıca artış göstermesi, bu fakültele alınan öğrenci sayısının giderek artması, özel iletişim eğitimi veren kurumların kurulması ve kuruluşların açılması üzerinde ise önemle düşünülmelidir...Genelde eğitim özelde iletişim eğitimi politikasına yön verebilmek için, amaçlar, hedefler, ilkeler iyi bir şekilde belirlenmelidir. İstihdam politikalarının üretilmesi yönünden medya ve eğitim kurumları arasında verimlilik ve işbirliğine gidilmelidir.” (Tokgöz,2017:21)

“Yükseköğrenim ve özel sektör arasındaki uzaklık önemli sorunlardan birisidir. İletişim fakülteleri de kendi bünyelerinde bu türden sorunlar yaşamaktadırlar. Sektör, kendilerine insan kaynağı sağlayan fakültele karşı ilgisiz bir durumdadır. Oysa sektör, kendi beklentilerine yanıt verecek nitelikli eleman yetişmesine destek olmak zorundadır. Yine iletişim sektöründe var olan örgütlenmeler, fakültelerin uzağında kalmaktadır. Öğrenci sayısında yaşanan aşırı yoğunluk, özel sektördeki kuruluşların sınırlı sayıda öğrenciye staj olanağı tanımalarına yol açmaktadır. Bu bağlamda halkla ilişkiler şirketlerinin üye bulunduğu Halkla İlişkiler Derneği, üyelerine İletişim Fakültesi Halkla İlişkiler ve Tanıtım Bölümü öğrencileri için her yıl belli sayıda öğrenci stajı için zorunluluk koymalıdır. Böylelikle halkla ilişkiler alanında eğitim almış heveslilerin, halkla ilişkileri meslek edinerek uzmanlaşmaları sürecine katkıda bulunulabilir. Halkla ilişkiler alalından mankenden, fotomodelden, torpilli kişilerden çok, halkla ilişkiler uzmanı görmemiz belki böylelikle sağlanır.

Basın konseyi, Gazeteciler Cemiyeti yine bu tür bir uygulamayla gazete, radyo ve televizyon kuruluşlarına yönelik böylesi yaptırımlar, uygulamalar getirmelidir. Yerel basının siyasal iktidar tarafından desteklenmesi ve canlılık kazandırılması gerekir. Çünkü yerel basın, gazetecilik bölümü mezunu öğrencilerin istihdamı için önemli bir olanaktır. Ayrıca yerel gazeteleri bünyesinde toplayan yerel örgütlenmeler, yerel gazeteleri de böylesi bir uygulamaya dâhil etmelidir. Yerel gazeteler birer aile gazetesi ya da lise mezunu elemanların etkin bulunduğu bir yapıdan kurtarılmalıdır. Yerel gazeteler, çağdaş toplum yapısında yer sorunlara karşı duyarlılık sağlanmasında önemli bir işleve sahiptir. Yine özel radyo ve televizyon kuruluşları, iletişim fakülteleri ile sıkı bir işbirliği içerisinde, görüş alışverişinde bulunulması gerekmektedir.” (Gezgin, 2002:132-133)

Öte yandan akademik çevrelerce zaman zaman çözüm yolunda, iletişim fakültesi mezunlarının iletişim meslek liselerine öğretmen olarak atanmaları, Türkiye Gazeteciler Cemiyeti ile ortak hareket edilerek desteklenen yerel basın kuruluşlarında öğrenci ve mezunların istihdam edilmeleri, RTÜK’e bağlı bölge müdürlüklerinde yeni iş alanlarının oluşturulması, RTÜK bütçesinin gider dışında kalacak kısmından iletişim fakültelerinin yararlanması ve yapılacak yasal düzenleme ile medya kuruluşlarında iletişim fakültesi mezunlarının istihdam edilmesinin sağlanması önerilmektedir.

ÖZET

Günümüz dijital iletişim çağında teknolojik gelişmelerle birlikte yeni medyanın önemi hızla artmaktadır. Yeni medya birçok alanda etkisini göstermektedir. Bunlardan birisi de özel eğitim alanıdır. Bu araştırma, özel eğitim alan üstün zekâlı öğrencilerin yeni medyayı kullanım amaçlarını belirlemek ve sosyal medyaya ilişkin tutumlarının cinsiyet, yaş ve sınıf düzeyi değişkenlerini dikkate alarak değişkenler arasında anlamlı farklılıklar olup olmadığını tespit etmek amacıyla yapılmıştır. Rastgele örneklem ile araştırmada İzmit Bilim ve Sanat Merkezi'nde eğitim görmekte olan 100 öğrenci tercih edilmiştir. Nicel araştırma yönteminden yararlanılmıştır. Veri toplanmasında kişisel bilgi formu ve sosyal medya tutum ölçeğini içeren bir anket kullanılmıştır. Anket sonuçlarına göre üstün zekâlı öğrencilerin yeni medya kullanım sıklıklarının oldukça fazla olduğu ve sosyal medyanın kayda değer bir biçimde bilgi edinmek amacıyla kullanıldığı sonucuna ulaşılmıştır.

Anahtar Kelimeler: Üstün zekâlı öğrenci, yeni medya, sosyal medya

GİRİŞ

Üstün zekâlıların eğitimi Türkiye’de henüz yeni şekillenmekte ve dinamizm kazanmaktadır. Yeni teknoloji araçları ile birlikte üstün zekâlı öğrencilerin yeni medyadaki buldukları nokta merak konusudur. Bu öğrencilerin yeni medya ile olan ilişkilerinden önce üstün zekâ, üstün yetenek, özel yetenek kavramlarına açıklık getirmek gerekmektedir. Kavram kargaşasının önüne geçmek adına bu kavramların neler olduğuna bakmakta yarar vardır. Çünkü öncelikle zekâ, üstün zekâ, özel yetenek ve üstün yetenek kavramlarının ne olduklarına ilişkin net bir bilgi verilmelidir. Çalışmamızda üstün zekâ tanımı belirtilmekte, özel yetenek ile üstün yetenek kavramları yerine üstün zekâ kavramının kullanılma nedeni açıklanmaktadır. Belirtilen kavramlardan önce zekânın ne olduğuna dair bir açıklık getirilmelidir.

Zekâ ile ilgili farklı çalışmalar yapılmış ancak bilimsel olarak zekâyâ bir sınır getirilememiştir. Soyut olan bu kavramın kişiden kişiye duygusal andaki durumlarına göre farklılık gösterdiği bilinmektedir. Üstün zekâ daha çok IQ (Intelligence Quotient – Entelektüel veya Akademik Zekâ) testleri ile ölçülmeye çalışılmıştır (Gage & Smith, 2016). Fakat bütün bu araştırmalar zekânın tam olarak ölçülebilirliğini doğrulamaz. Ancak çoklu zekâ üzerinde ciddi çalışmalar öne sürülmüş ve bu alanda bir takım ilerlemeler kaydedilmiştir.

Zekâ ve çoklu zekânın dışında üstün zekâ, üstün yetenek ve özel yetenek kavramlarını da bir kategoride toplamak ayrıca önemlidir. Üstün zekâ kavramı birçok yerde üstün yetenek kavramı ile karıştırılmakta ve bu kavramlar birbirlerinin yerlerine kullanılmaktadır. Üstün zekâ, üstün yetenek ve özel yetenek kelimelerinin aynı anlama gelmediklerinin bilinmesi ve kavram kargaşasına yer vermemek için bunların ne olduklarının açık ve anlaşılır bir şekilde izah edilmesi oldukça önemlidir. Ama bahsedilen kavramlardan önce zekâ kavramına ve çoklu zekâ kuramına bir açıklık getirmek gerekmektedir.

Zekâ, soyut bir kavram olmakla beraber kişilerin zihinsel yapılarına ve davranışlarına göre farklılık göstermektedir. Zekâ kavramı aslında her bireyde var olan potansiyel bir soyut kavram olarak kabul edilmektedir. Fakat her insanda değişik boyutlarda ortaya çıkmaktadır. Thorndike, zekâyı soyut, sosyal ve mekanik olarak üçe ayırmaktadır (Demirel, Başbay ve Erdem, 2006). Zekâ üzerine yapılan ilk çalışmalara göre, zekâ kişinin kendisini şartlara uyarlayabilme becerisi şeklinde ifade edilmektedir (Binet ve Simon, 1905). Benzer bir tanıma göre zekâ bireyin yaşadığı ana kadar öğrenebildiklerini çevreye uyarlamasıdır (Sternberg, 2005). Zekâ; düşünme kapasitesi, yeni sorunları çözme, sebep sonuç ilişkisi kurabilme ve dünyadaki gelişmelerden haberdar olma şeklinde de tanımlanmaktadır (Anderson, 2006).

Gardner daha çok zekânın tek bir faktörle açıklanamayacak kadar fazla yetenekten meydana geldiğini belirtmekte ve zekâyı problem çözme kapasitesi ya da bir veya daha fazla kültürel yapıda değeri olan bir ürün ortaya koyabilme yetisi olarak tanımlamakta, bireyin zekâsını veya yeteneğini belirlemek için geliştirilen entelektüel zekâ gibi testlerin, kişideki performansın sadece bir kısmını ölçtüğünü dolayısıyla okullarda verilen eğitimi, tek düze haline getirdiğini ileri sürmektedir (Gardner, 1993’den aktaran Bakioğlu ve Levent, 2013). Okullarda öğrencilere aktarılan sınav sistemi sadece öğrencilerin belirli bir potansiyelini ön plana çıkarırken zayıf yönlerinin neler oldukları konusu belirsiz bir hale gelmektedir. Onların güçlü yanları değil aynı zamanda zayıf yönlerinin de neler olduğu tespiti yapılmaktadır. Bu sayede öğrenciler kendileri hakkında bir sonuca varacak ve öğretmenleri de alan yönlendirmelerini buna göre yapacaklardır. Ancak alan yönlendirmelerinde sınav sistemi dışında farklı yetenekler dikkate alınarak ve bunların ölçümleri de doğru bir biçimde yapılarak değerlendirilmektedir. Bu yüzden farklı yetenekler farklı zekâ türlerine göre

sınıflandırılıp hangi öğrencinin hangi alanda daha başarılı olduğu konusu üstün zekâ kavramı çerçevesinde ele alınmaktadır.

Üstün zekâ kavramının yanı sıra üstün zekâlı çocukların ne tür özelliklere sahip oldukları konusuna açıklık getirilmelidir. Üstün zekâlı bireylerin en önemli özelliklerinden birisi olan liderlik kavramına açıklık getirilirken, zekâ seviyesinin artması ile liderlik becerileri gösterme fırsatının da artacağı belirtilmiştir (Tannenbaum, 1983). Üstün zekâlıların muhtemel sorun teşkil edecek bazı özellikleri de bulunmaktadır. Hızlı öğrenmeye meyilli olan bu çocuklarda kendi akranlarında oluşan normal öğrenme onlar için bir can sıkıntısı oluşturmaktadır. Güçlü bir hafızaya sahip oldukları için gördükleri her şeyi ezberlemeye gayret sarf ederler. Yaptıkları derinlemesine araştırma ile öğretmenlerin kesin cevap isteklerine olumsuz bir yanıt verebilmektedirler. Sorulara doğru yanıt verdikleri halde eğitim sisteminde kesin cevabın istendiği bir sınav anlayışından uzaktırlar. Yoğun enerji seviyeleri onların yorgun düşmelerine sebebiyet vermektedir. Aşırı duyarlı olmaları okul, aile ve farklı ortamlarda çabuk kırılmalarına neden olmaktadır. Farklı ve yaratıcı düşünme becerileri her zaman karşılık bulmamaktadır. Gelişmiş mizah duyguları akranları tarafından anlaşılabilir ve bu durum onları yalnızlaştırmaktadır. Meraklı olma özellikleri olanakların kısıtlı olduğu durumlarda hayal kırıklığına neden olmakta ve eğitimde önemli bir özellik olan merak sonraki süreçte bu çocuklarda bilinçaltına itilebilir ki bu durum çok olumsuz sonuçlar doğurmaktadır. Mükemmeliyetçi yapıları yüzünden üstün olabilecekleri bir alanı hemen tercih etmemektedirler. Kontrol edilemeyen durumlarda kendilerine verilen liderlik sorumluluğu yerine getirilmemektedir. İlgi alanında çeşitlilik olması onların ne yapacağı konusunda uzun süre düşünmelerine ve sonuçta bazen hiç bir şey yapmalarına neden olmaktadır. Gelişmiş ahlak duyguları yüzünden rahat olamazlar. Birçok alanda başarı olma özellikleri ile sorumlulukları bir kat daha artmaktadır. Kişilik özellikleri sıralandığında mükemmeliyetçilik, duyarlılık ve liderlik özellikleri görülmektedir.

Mükemmeliyetçi özelliklerinden dolayı bu çocukların yeni medya kullanımında nasıl bir yol izledikleri de tahmin edilebilmektedir. Ancak yeni medya kavramına da açıklık getirmekte fayda vardır. Yeni medya kavramından önce medya kavramının ne olduğunu da iyi anlaşılması gerekmektedir. Medya, zaman ve mekân içerisinde çok fazla sayıdaki mesaj veya iletileri birbirinden çok farklı yerlerde alıcı kitlelerine ulaştırabilen araçları, ortamları belirtmektedir. Radyo, televizyon, sinema, kitap, dergi gibi basılı materyaller ile reklam ve fotoğraftır (Öztürk, 2013, s. 17). Yeni medya geleneksel medyadan farklı olarak dijital kodlama sisteminde temellenen multimedya içeriği ile birlikte çok katmanlı etkileşimin gerçekleştiği yüksek hızda karşılık bulan iletişim araçları olarak karşımıza çıkmaktadır. (van Dijk, 2004, s.46). Yeni iletişim teknolojileri ile birlikte artık hayatımızın içerisinde yer alan yeni medyanın üç temel özelliğinden bahsedilmektedir: Etkileşim, kitlesizleştirme ve eşzamansızlık şeklindedir (Rogers, 2003).

Etkileşim kavramı yeni medyayı geleneksel medyadan ayıran temel özelliklerden birisi olmakla birlikte medya içeriği ile kullanıcıyı daha da yakınlaştıran ve kullanımı bireyselleştiren, çok fazla sayıda kullanıcı seçeneği sunan zengin bir yapıdan oluşmaktadır. Etkileşimin tam olarak gerçekleştirilmesi internet sayesinde olmaktadır. Yeni medyanın bir diğer özelliği olan kitlesizleştirmede bireye özel ileti gönderme ve alma yetisi söz konusudur. Geleneksel medyada ise gönderilen iletiler tüm izleyici veya dinleyici kitlelerini kapsamaktadır. Yeni medyada birey medyayı kendi ihtiyaçları doğrultusunda düzenleyebilmektedir. Yeni medyanın bir diğer özelliği olan eşzamansız olabilmeye kullanıcı uygun olan herhangi bir zamanda bilgi gönderebilmekte ve alabilmektedir. Yani bilgiye olan erişim daha da özgür bir hale gelmiştir (Öztürk, 2013, s. 20).

Bahsedilen özelliklerin yanı sıra yeni medya kavramına farklı bakış açıları da getirilmeye çalışılmıştır. Bu bakış açıları daha çok enformasyonun dağıtılmasıyla ilgilidir. Ancak yeni medya ile birlikte kullanıcı da aktif olabilmektedir. Yeni çıkan teknolojiler ile bunların kullanımını, aynı zamanda eski teknolojiler için geliştirilen yeni yöntemleri yeni medyada görebilmekteyiz. Bunlara örnek olarak internet gazeteleri, e book, dijital animasyon ve 3D filmler verilebilmektedir (Bulunmaz, 2011. s.25) Bedenin bir parçası haline gelen akıllı cep telefonları, bilgisayar, internet ortamı, dijital oyunlar, İpod veya avuçiçi veri bankası kayıtlayıcıları ve iletişimcileri başka bir ifade ile bütün bu dijital teknolojiler yeni medya başlığı altında toplanabilmektedir. Yeni medyayı ayırt edici kılan özellikler arasında multimedya yer almaktadır. Çok fazla enformasyonu aynı anda aktarabilme ve kullanıcıların geri dönüşümde bulunabilme fırsatları bulunmaktadır. Yeni medyanın sahip olduğu multimedya biçimselliği göstergelerin, simge sistemlerinin, iletişim biçimlerinin ve farklı veri türlerinin tek bir araçta toplanmasıdır (Binark, 2007, ss.21-22). Buna göre yeni medyanın özellikleri arasında; multimedya biçimselliği, dijitallik, etkileşimsellik, sanallık, yayılım, hipermetinsellik, kullanıcı türevli içerik üretimi, kitlesizleştirme, eşzamansızlık özellikleri bulunmaktadır.

Üstün zekâlı öğrenciler ve yeni medyanın özellikleri belirginleştikten sonra yeni medyanın bu öğrenciler üzerinde nasıl bir etki bıraktığı ve öğrencilerin yeni medyaya karşı olan algıları, tutumları, beklentileri ve düzeyleri ile ne tür bir seviyede ve hangi korelasyon içerisinde oldukları açıklanacaktır. Topluma, çevresine, ülkesine, ülkeler arası diyaloglara, yeni ve güncel gelişmelere duyarlı olan bu çocukların sosyal medya ve multimedya içeriklerinden faydalanarak yeni medya çerçevesinde nasıl tavır takındıkları tespit edilmeye çalışılacaktır. Özellikle yeni iletişim teknolojilerinin üstün zekâlı öğrencilerin hayatında irdelenmesi ayrıca önemlidir. Dijital ortamların sağlanması gelişigüzel bir biçimde ortaya çıkarılmadığı veya her gün yenilenen teknolojinin normal insanlar tarafından üretilmediği de açıktır. Yani yeni medyayı kullanarak bu öğrencilerin ne tür yenilikçi yaklaşımlara gidecekleri, yeni medyaya karşı tutumlarının tespit edilmesi bakımından önemlidir. Enformasyon toplumunda bilginin ön plan çıkması zekâ ile olan ilişkisi bağlamında ele alınmalıdır. Dolayısıyla bilişsellik farklı bakış açıları ile birlikte dijital iletişimde ayrıca önem arz etmektedir.

Dijital iletişim, sosyal ağlar, sadece çocukların bilişsel işlevselliğini etkilemekle kalmamakta aynı zamanda beyinlerindeki fiziksel oluşumları da etkilemektedir. Örneğin elektronik iletişim araçları bir öğrencinin öğrenme tarzını ve zihnini kullanma yöntemini değiştirebilmektedir. Bilişin hatta beyin yapısının beyni kullanma yöntemine göre farklılık arz ettiği bilinmektedir. Buna örnek olarak Londra'daki taksi şoförleri verilebilir. Ehliyet alabilmeleri için üç ya da dört yılını şehirde binlerce turist dolaştığı merkezi yerleri ve 10 kilometrelik yarıçapı ile Charing Cross tren istasyonu etrafındaki 25000 labirentli sokakları dolaşarak ezberlemeleri ve bunun yanında aday şoförlerin herhangi iki yer arasındaki en kısa mesafeyi anında hesaplayabilmeleri gerekmektedir. Adaylardan sadece %50'si bu sınavı geçebilmektedir. Sınavı geçen taksi şoförlerinin uzun süre bu şekilde araç kullandıkları için beyinlerindeki sağ hipokampusün geliştiği tespit edilmiştir (Freeman, 2014. s. 2).

İnsanın zihinsel düşünme becerilerini etkileyen elektronik iletişim araçlarının üstün zekâlı çocuklar açısından ele alınması ayrıca önemlidir. Özellikle sosyal medyaya baktığımızda giderek yalnızlaşan ve kendini kolay ifade edemeyen insandan, popüler olup toplumu kolay yönetebilen insana kadar birçok kesimin söz hakkı bulduğu bir platform söz konusudur. Sosyal medya, kişisel görüşlerin sanal ağlar üzerinden açılan hesaplar yoluyla aktararak alternatif bir söylem gücüne sahip olabilme ve bunu güncel olaylara uyarlayabilme ve kullanabilme pratiklerini içermektedir (Aydemir, 2014, s. 63). Medyada yer alan tüm

haberlerin sanal ortamda tartışılabilir olması ve yukarıda bahsi geçen olaylarla birlikte üstün zekâlı öğrencilerin yeni medya kapsamında multimedya, sosyal medya gibi sanal ortamlarda nasıl tutum sergiledikleri ve sergileyecekleri iletişimsel perspektif açısından son derece önemlidir. Duyarlılık özelliğine sahip olan bu çocukların güncel olayları takip ederek sanal ortamda ne oranda yer alıp almadıkları da bu araştırmanın konusunu teşkil etmektedir.

Dolayısıyla Türkiye'deki üstün zekâlı öğrencilerin yeni medyaya karşı tutumlarının ne olduğu ve yeni medya kullanma düzeyleri, araştırmanın problemi olarak karşımıza çıkmaktadır. Bu çalışmamızda üstün zekâlı öğrencilerin yeni medyada; hangi dijital zekâ oyunları oynadıkları, hangi sosyal medyada vakit geçirdikleri, yeni medyaya eleştirel bakıp bakmadıkları; yeni medya okuryazarlığı bağlamında analiz, sentez ve yorumlarının ne oranda olduğu, yeni medyaya karşı tutumları, güncel olayları takip edip etmedikleri, yeni medyadan iletişimsel ve eğitimsel olarak nasıl faydalandıkları, en çok hangi medya araçlarını kullandıkları, multimedya ve hiper medyadan ne kadar faydalandıklarının tespiti ve bunların zihinsel düşünme becerilerine, dikkatlerine ne oranda etki ettiği sorunsalları ortaya çıkarılmaktadır.

ARAŞTIRMANIN AMACI

Zekâ bakımından birbirinden farklı olan bireylere çok zeki ifadesini kullanmak veya sayısal veriye göre insan zekâsını bir kalıbın içine sığdırmak pek de nesnel bir ölçüm değildir. Belirlenen süre içerisinde alışılmışın dışında sorulara cevap bulabilmek ve insanın kafasında canlandırdığı birçok işareti aynı anda değerlendirirken ne kadar başarılı olduğu konusu zekâ kavramı çerçevesindedir. Fakat olaya tek bir açıdan bakmak doğru bir yaklaşım olmayacaktır.

Üstün zekânın sadece belli bir alanda üstün yetenek sergileyen veya üstün yaratıcılık özelliğine sahip olan veya üstün özelliklerden sadece bir ya da ikisine sahip öğrenciler için sürekli entelektüel beceri sergileyeceklerini düşünmenin sakıncaları üzerinde durmak gerekir. Bu doğrultuda; birçok danışman, psikolog ve alanda uzman kişilerin, gelişimin sosyal, bilişsel ve duygusal yönlerinin etkileşiminden bahsetseler de yapılan programların sosyal ve duygusal yönünün göz ardı edildiği aşikârdır (Carter, 1986'dan aktaran Özbay ve Palancı, 2011). Üstün zekâyâ sahip çocuklarda bir veya birden fazla; geniş hayal gücü, uzun süreli dikkat, uykuya daha az ihtiyaç duyma ve enerjik olma, belirgin gözlemler yapabilme, güçlü hafıza gibi özellikleri bulunmaktadır (Jackson ve Klein, 1997'den aktaran İncekara, 2013).

Üstün zekâlı çocuklar için fiziki anlamda yapılan yorumların da ne kadar doğru olduğu konusuna dikkat etmekte fayda vardır. Çünkü bu çocuklar için daha fazla vücut ağırlıklarına sahip oldukları, uzun boylu oldukları, kalın gözlükler taktıkları veya çoğunlukla gözlüklü oldukları inancına toplumda rastlamak mümkündür. Bunlara bilimsel bir ışıktaki bakılmalı ve üstün zekâlı çocukların da normal bireyler gibi fiziksel özelliklere sahip olduğu dikkate alınmalıdır. Benzer şekilde yerinde duramadıkları, çok yaramaz oldukları, sürekli hareket ettikleri için çok zeki oldukları inancına toplumda rastlamak mümkündür.

O halde bu duruma şöyle bir açıklık getirmek gerekir. Zekâ ile fiziksel ve/veya karakter özelliklerinin farklı olabileceği, insanların önyargılarından kurtulup bu çocuklar için belirgin fiziksel ve karakteristik bir resim çizilmesinin yanlış olduğu fikrini ileri sürmek pek de yanlış olmayacaktır. Zekâ konusunda bile hâlâ tartışmalar sürerken ve zekânın tam olarak ölçülmesinin ne kadar doğru olduğu soruları yöneltilirken, üstün zekâlı çocuklar için kesin ifadeler kullanmadan önce bir kez daha düşünülmelidir.

Üstün zekâlı çocukların problemleri daha hızlı kavrayabildikleri ve liderlik çerçevesinde mevcut problemlere çok farklı pencerelerden bakarak çözüm ürettiklerini ileri

sürmek doğru bir ifadedir (Gage ve Smith, 2016). Yeni medya çerçevesinde kendilerinin veya yaşadıkları toplumun sorunları karşısında nasıl bir tavır sergiledikleri çalışmanın amacını belirleme konusunda bizlere ışık tutmaktadır. Çünkü içinde yaşadığımız dijital çağda yeni medya konusu ayrıca önem kazanmaktadır. Örgün eğitim kurumlarında da eğitim gören ilkökul, ortaokul ve lisedeki üstün zekâlı öğrencilerinin yeni medya ile nasıl iç içe yaşadıkları merak konusudur. Türkiye’de Bilim ve Sanat Merkezleri’ne giden bu çocukların yeni medyaya karşı tutumlarının nasıl olduğu ve yeni medya kullanım düzeyleri araştırmanın amacını oluşturmaktadır. Kendi okullarının dışında Bilim ve Sanat Merkezlerine giden öğrencilerin haftada bir veya iki gün Bilsemelerde yeni medya içeriklerini ne şekilde ve ne amaçla kullandıkları tespit edilmeye çalışılmaktadır.

Dijital zekâ oyunları, multimedya, hipermedya gibi dijital platformlarda boy gösteren üstün zekâlı çocukların görece olarak akranlarından farklı bir tutum içerisine girdikleri görülmektedir. Farklı düşünme becerileri ile yeni medya araçlarını hangi düzeyde kullandıkları ve ne tür bir vizyonla yeni medya araçlarına baktıkları üzerine farklı çalışmalar vardır (Freeman, 2014). Ancak üstünler eğitim perspektifinden yola çıkılarak Türkiye’de eğitim gören bu öğrencilerin yeni medyaya karşı tutumları ve yeni medya kullanım düzeyleri çalışmamızda ele alınmakta ve araştırmanın amacını oluşturmaktadır.

ARAŞTIRMANIN ÖNEMİ

Araştırmada Türkiye’de üstün zekâlı öğrencilerin yeni medyaya karşı olan bakış açıları ve yeni medya kullanım düzeylerinin ne ölçüde olduğu konusu incelenecektir. Bu çalışma üstün zekâlı öğrencilerin özelliklerini irdeleyerek sosyal medya ağlarını kullanım amaçları ortaya çıkarılacaktır.

Bilim ve Sanat Merkezlerine giden ilkökul, ortaokul ve lise öğrencilerinin hangi ortamlarda sosyal medyayı ne kadar kullandıkları tespit edilecektir. Öğrencilerin yaşadıkları sorunlar karşısında yeni medya araçlarından ne kadar faydalandıkları üzerinde durulacaktır.

Dijital iletişim çağında ülkemizde 6-17 yaş arası öğrencilerden hemen hemen hepsi artık sosyal medya platformları içerisinde yer almaktadır. Sosyal medya, toplumların yaşantısını hızlı bir biçimde değiştirme etkisine sahiptir. Yeni medya kullanıcıları, sosyal medyada kendi içeriklerini oluşturarak hayran kitlelerini etki altına alabilmekte ve gündem oluşturabilmektedir. Kullanıcıları sosyal bir yaşantıya entegre eden sosyal medya ağları artık hayatımızın her alanında kendi hayatımıza etki edebilecek bir seviyededir.

Toplumlar üzerindeki etkisinin oldukça fazla olması, yeni medya içinde yer alan sosyal medyanın hem faydaları hem de zararları açısından ele alınıp üstün zekâlı öğrencilerin faydasına olacak şekilde yönlendirilmesini gerektirmektedir (Ismail, 2015). Araştırmanın önemi bu açıdan ele alındığında bir kat daha artmaktadır.

Medya okuryazarlığının yerini yeni medya okuryazarlığına bırakması da araştırmamızın boyutunu belirleme açısından önemli bir durum teşkil etmektedir. Yeni medya toplumu içerisinde yer alan üre-tüketici toplumlar sosyal medya ile genellikle bir etkileşim halindedir. Sosyal medya içeriklerinin reklam açısından değerlendirilmesi, sosyal medya kullanırken dijital platformda yer alan ürünlerin toplumları ve özellikle ülkemizdeki üstün zekâlı öğrencileri ne ölçüde etkiledikleri araştırmanın odak noktası bakımından önem arz etmektedir.

İzleyicilerin metalaştırılması konseptine artık yeni medya üzerinden bakmakta fayda vardır. Yeni medya üzerinden yapılan alışverişlerin sadece gıda olarak değil aynı zamanda

dijital oyun kapsamında değerlendirilmesi gerekmektedir. Üstün zekalı öğrencilerin örgün eğitimde bulunana akranlarına göre hangi oyun türlerini tercih ettikleri, sosyal medyada ne kadar ve ne için vakit geçirdikleri araştırmada tespit edilmekte ve yeni medya tek başına bir güç olarak görülüyorsa bu öğrencilerin yeni medya okuryazarlığı sayesinde iyi yönlendirmeleri durumunda topluma ne kadar faydalı olabilecekleri açısından çalışma ayrıca önem taşımaktadır.

Bu çalışma, 6-17 yaş arası öğrencilerin yeni medya kullanım amacının ve sosyal medyaya ilişkin tutumların değerlendirilip gelecek nesillerin etkili ve verimli internet kullanıcıları olabilmeleri bakımından gerekli çerçevenin oluşturulması ve negatif etkilerin giderilip üstün zekalı öğrencilerin zihinsel, duygusal, sosyal, kişilik, mükemmeliyetçilik, duyarlılık ve liderlik gelişimine pozitif yönde etki edecek bilgileri saptamak açısından önemlidir.

Bu araştırma ile elde edilen data üstün zekalı öğrencilerin:

1. Yeni medya içerisinde yer alan sosyal medya kullanım amaçları
2. En çok hangi sosyal medya sitesinden neden faydalandıkları
3. Sosyal medyayı kendi duygularını rahatça ifade edebildikleri bir araç olarak kullanıp kullanmadıkları
4. Arkadaşlarının kendilerini fark etmeleri için sosyal medyada neler yaptıkları
5. Yeni medya kullanımlarının aile ilişkilerine ne ölçüde yansıdığı
6. Sosyal medya siteleri sayesinde arkadaşları ile ne kadar vakit geçirdikleri
7. Arkadaşlarının yeni medyada paylaşımları hakkında yorum yapmaları onları ne kadar mutlu ettikleri
8. Yeni medyada ne tür bilgiler edindikleri
9. Sosyal medyayı akademik bilgi paylaşımında (ödev, proje vb.) kullanıp kullanmadıkları
10. Sosyal medyayı arkadaşları ile iletişim kurmak için ne ölçüde kullandıkları gibi sorulara cevaplar oluşturulacaktır.

KURAM

Kullanımlar ve Doyumlar yaklaşımında medyanın insanlara ne yaptığı sorusundan ziyade asıl sorulması gereken sorunun insanların medya ile ne yaptıklarıdır (Katz'dan aktaran Yaylagül, 2016). İnsanların toplumsal ihtiyaçlarının yanında psikolojik ihtiyaçları da bulunmaktadır. Bu ihtiyaçlar neticesinde insanlar birtakım beklentiler içerisine girmektedir. Medyaya maruz kalma sonucunda bu ihtiyaçlardan bazıları giderilmektedir. Fakat duruma göre medyanın etkisi olarak birtakım istenmeyen veya niyet edilmeyen sonuçlar ile karşılaşmak da mümkündür.

Yaylagül'e (2016) göre izleyiciler yayımları, çok farklı şekilde yorumlayıp verilmek istenen mesajın dışında kendisine göre yorumlayabilmektedir. Bu yaklaşım, izleyicilerin kendi mantığını ve öznelliğini ön plana çıkarmaktadır. Dolayısıyla, medya; izleyicilerin kendi ihtiyaçlarını gidermelerini sağlayan kaynaktır. Kitle iletişim araçları ile yayılan mesajları tüketmek özgür bir biçimde ve sonsuz bir seçenek halinde değil, izleyicilere medya kurumları

tarafından ne sunuluyorsa onu tüketme şeklinde gerçekleşmektedir. İzleyiciler medyadan aldıkları mesajları üyesi oldukları grupların diğer üyeleri ile paylaştıkları ortak kültürel kodlar çerçevesinde anlamlandırmaktadırlar.

Yeni medyanın üstün zekâlı öğrenciler üzerinde bıraktığı etkiden çok, öğrencilerin yeni medyayı nasıl anlamlandırdıkları önem kazanmaktadır. Hangi sosyal medya ağ üzerinden ne tür paylaşımlarda buldukları ve yeni medyanın kendileri için ne anlama ifade ettiği araştırmanın odak noktası içerisinde yer almaktadır. Betimsel çözümleme sayesinde bu öğrencilerin yeni medya araçlarını kullanarak ne yaptıkları tespit edilmektedir. Sadece bireysel bir çözümlemenin dışında grup etkileşimleri ile nasıl bir iletişime geçtikleri de kullanımlar ve doyumlar yaklaşımı ile ele alınmaktadır.

Kullanımlar ve Doyumlar yaklaşımına yönelik araştırmalar, daha belirlenimci etki araştırmaları geleneğine karşıt olarak, bireylerin bilinçli ve gönüllü olarak kendi ihtiyaçları, istekleri doğrultusunda medya içeriklerini aramaları, bulmaları ve kullanmaları üzerinde durmaktadır. Fakat bu yaklaşımda bireylerin gereksinimleri ve bunları doyurma veya tatmin etme yöntemlerini şartlandıran ekonomik-politik çevreyi oluşturan sınıfsal şartlar ve perspektif farklı bir biçimde ele alınmaktadır (Rosengren, 1983'den aktaran Yaylagül, 2016).

Farklı bir perpektiften değerlendirildiğinde Blumler, McQuail ve Brown'un 1972 yılında İngiltere'deki televizyon izleyicileriyle ilgili çalışmalarına bakmakta fayda vardır. Burada, daha çok eğlenceye yönelik oyalanma; bireysel ilişkiler, kişisel kimlik ve gözetim üzerinde durularak, incelenen kitlenin bunlardan hangisini daha çok doyurma yoluna gittikleri tartışılmaktadır (Severin ve Tankard 1994'den aktaran: Küçükkurt vd. 2009). Onlara göre medya bize rutinden kaçmak, sorunlardan kurtulmak, endişeler veya gerilimlerden çıkmak, kitle iletişim araçları sayesinde komşularımızdan daha çok birlikte olarak kişisel ilişkilerde para sosyal etkileşim sürecine girmek, enformasyon ve tartışmalara katılmak, medya karakterlerini ve yaşadıklarını kendi problemlerimizi çözmek için kullanmak vb. şekillerde etkide bulunmaktadır (McQuail, 1989).

Blumler ve Katz, medyanın doyuma ulaştırdığı gereksinimlerin toplumsal kökenlerinin bulunduğunu vurgulamaktadır. Araştırmacılara göre kullanımlar ve doyumlar çalışmalarının temelleri şu şekildedir (Fiske, 2003'den aktaran Akçay, 2011):

1. İzleyici etkindir. Medyanın yayınladıklarına karşı edilgen değildir. Bu içerikleri seçerek alır.
2. İzleyici kendi gereksinimlerine en iyi doyumunu sağlayacak medyayı ve programı özgürce seçer. Medya yapımcısı programın kullanım biçimlerinin farkında olmayabilir ve farklı izleyiciler aynı programı farklı gereksinimleri gidermek amacıyla kullanabilirler.

Bazı kitle iletişim araştırmacıları, kullanım ve doyumlar yaklaşımının titiz bir sosyal bilim teorisi olmadığını ileri sürmektedirler. Fakat bunun tam tersi bir durumdan bahsetmek mümkündür. Kitle iletişim hakkında kuramlar ortaya atmak ciddi bir biçimde kullanımlar ve doyumlar yaklaşımı dâhilinde olmalıdır. Bilgisayar aracılı iletişimin ortaya çıkışı bu yaklaşımın önemini arttırmaktadır. Aslında kullanımlar ve doyumlar yaklaşımı yeni kitlesel iletişim aracının başlangıç aşamalarında her zaman bir üstünlük sağlamıştır: gazeteler, radyo ve televizyon ve şimdi internet.

Bilim insanları, medya kullanımı ile ilgili soruları cevaplamak için geleneksel araç ve tiyolojileri kullanmaya devam etseler de, şu anda kullanımlar ve doyumların teorik

modellerini genişletmeye hazır olmalıyız. Çağdaş ve gelecekteki modeller, etkileşim, medya parçalanması (demassification), hiper metin (hypertextuality) ve eş zamansızlık (asynchronicity) gibi kavramları içermelidir. Araştırmacılar, daha bütünsel bir yöntem ile aracılık eden iletişimin kişilerarası ve niteliksel yönlerini keşfetmeye istekli olmalıdırlar (Ruggiero, 2000, ss.3-37).

Dijital iletişim ve medyanın yer aldığı günümüz toplumunda üstün zekâlı öğrencilerin çağdaş ve gelecekteki modellere göre eş zamansızlığın yaşandığı ortamlarda yeni medyaya karşı tutumları oldukça önemlidir. Yüz yüze iletişimin yanında dijital ortamlarda etkileşim halinde bulunan öğrencilerin birbirleriyle nasıl bir iletişim halinde buldukları araştırmanın kullanımlar ve doyumlar yaklaşımı ile ele alınması bakımından ayrıca önem taşımaktadır. Üstün zekâlıların hiper medya ortamlarında neler paylaştıkları üstünler eğitimi bağlamında araştırmanın hangi tür teoriyi dikkate alması ve incelemesi yönünden belirleyici hale gelmiştir. Bu durum kullanımlar ve doyumlar kuramının ön plana çıkmasına neden olmuştur.

LİTERATÜR TARAMASI

Bu yapılan araştırmaya göre on ilgili çalışma bulunmuştur. Bunlardan ilki okul eğitiminde öne çıkan farklı zekâ türleri ile ilgilidir (Gage ve Smith, 2016). Entelektüel zekâ ile birlikte duygusal zekâ ve ruhsal zekâ türlerinin olduğu bilinmektedir. Bunların yanı sıra liderlik zekâsının özelliklerinin neler olduğu tartışılmaktadır. Üstün zekâlı bireylerin en önemli özelliklerinden bir tanesi de liderliktir. Liderlik zekâsının entelektüel zekâ ile olan bağlantısının ne ölçüde olduğu Gage (2016) tarafından kaleme alınmıştır.

Ronthy zekâ kavramını dünyaya sadece bir değil birçok açıdan bakabilme ile ilgili olduğu görüşünü savunmaktadır (Ronthy, 1984'den aktaran Gage ve Smith, 2016). Yirminci yüzyılın çoğunda şirketler seçme prosedürlerinde zekâ testlerini kullanarak en iyi liderlerin kimler olduğunu tahmin etmişlerdir. Zekânın bir liderin etkililiğini olumlu bir şekilde öngörme potansiyeli, bilişsel, duygusal ve sosyal zekâlarda araştırmaya atfedilmiştir. Bununla birlikte, yöneticilere ve çalışanlara artan talepler konulduğundan, etkili, akıllı bir lider rolü değişti. Mevcut liderlik, yeni bir dünyanın taleplerini karşılamak için yeni bir görünüm istiyor. Okul liderleri, değişen dünyadaki etkinliklerini nasıl değerlendirir? Okul liderleri akıllıca nasıl yol gösterebilir? Bu soruları keşfetmek için, liderlik zekâsı teorisi üzerine düşünülmekte ve liderlik zekâsı olarak bilinen zekânın bütünsel bir anlayışın ortaya çıkan bir bağlamda etkin okul liderliğine yararlı teorik bir yaklaşım olabileceği öngörülmektedir (Dåderman, Ronthy, Ekegren & Mårdberg, 2013).

Üstün zekâlı bireylerin tam olarak anlaşılabilmesi için farklı zeka türlerinin de neler olduğu üzerinde durulması bu bireyleri tanımak açısından önemlidir. Farklı zeka türlerinden bir diğeri de ruhsal zekadır. Ruhsal zeka entelektüel ve duygusal zeka türlerinin temelini oluşturmaktadır. Churchill, Ghandi and Mandela gibi liderler bu zeka türüne sahiptirler. Liderlerin entelektüel disipline sahip olmaları gerekir ve bu liderliğin sırrı bir liderin ruhsal zekasında yatar.

Araştırmalarla ilgili bir diğeri çalışma okullardaki yeni medyanın entegrasyonu hakkındadır (İsmail, 2015). Yeni medyayı sınıfa dijital olarak entegre etme sayesinde teknolojilerin daha iyi öğretim ve öğrenme uygulamalarına olumlu katkıda bulunduğu düşünülmektedir. Dijital teknolojileri sınıfa entegre etme çabalarına rağmen, öğrenciler öğrenim boyunca yeni medyayı kavrama noktasında genel olarak sınırlı kalmaktadır (Collins & Halverson, 2009'dan aktaran İsmail, 2015). Bunun nedeni, altyapı eksikliği ve teknik destek, sayısal kaynakları elde etmek için yetersiz fonlama ve öğretmenlerin teknolojik

bilgilerini sürekli öğrenip geliştirmeleri için yetersiz fırsatları da içeren bir dizi faktöre bağlıdır.

Sınıflarına yeni medya teknolojileri dâhil etmeyi reddeden öğretmenler de bulunmaktadır. Bunlar daha çok tebeşir ile konuş stratejisini kullanmayı tercih ederler. Bundan dolayı, politikanın ötesinde, okullarda yeni medya teknolojilerinin entegrasyonu ile ilgili olarak dikkate alınması gereken başlıca konulardan bazılarıdır. Okullardaki yeni medya entegrasyonu ile ilgili ciddi düzenlemeler getirilerek öğretim ve öğrenim için dijital teknolojilerin kullanımı ile ilgili gerçek uygulamaların araştırılması gerekmektedir.

Bu, okullarda yeni medya girişimlerinin nasıl yürütülmekte olduğunun daha iyi anlaşılmasını sağlar ve daha da önemlisi, mevcut uygulamadaki ortaya çıkan sorunları vurgular. Politika yapımcıların, yöneticilerin ve diğer paydaşların, zayıflıkları belirleyebilmesi ve uygulamayı iyileştirmek için gerekli düzenlemeleri yapabilmesi için, yeni medya politikasının mevcut durumuyla ilgili bilgilendirilmeler yapılmalıdır. Öğretim ve öğrenim için yeni medyanın başarılı bir şekilde entegrasyonu, okuldaki liderlik ve politika ile öğretmenlerin bilgi ve tutumlarını olumlu yönde etkileyecektir. Özel eğitim alanında üstün zekalılar için yapılacak yeni medya entegrasyon çalışmaları da öğrencilerin yeni medyayı daha bilinçli bir şekilde kullanmalarına neden olacaktır.

Yeni medyanın üstün zekalı öğrenciler tarafından bilinçli bir şekilde kullanımına yönelik yapılan bir diğer çalışma yeni medya okuryazarlığı ile ilgilidir (Graber, 2012). Dijital dünya, tehlikeli olasılıklar ile doludur. Okullar halen yeni teknolojilere yatırım yapma konusunda tereddütler yaşamaktadır. Okullarda yeni medya anlayışı olmasa bile bulunduğumuz dijital çağda öğrencilerin karşısına yeni medya kavramı çıkmaktadır.

Her ne kadar cihazları veya yazılımı çalıştırmayı öğrenmek için yardıma kesinlikle ihtiyacımız olmamasına rağmen, onları bu güçlü teknolojileri sorumlu ve etik olarak kullanmaya hazırlamamız gerekmektedir. Önde gelen kolejlerden esinlenen okullar etik düşünceyi geliştirme ve yeni medya okuryazarlığı becerilerini geliştirmek için başarılı bir formüle sahip olabilirler. Çok genç oldukları zaman öğrencilere zengin duyuşal deneyimler ve sosyal etkileşimler sunarak, bu okullar herhangi bir teknoloji olmadan görünürde yeni medya okuryazarlığı tohumları atabilmektedir. Hâlbuki karşılaştıkları zorluk bir sonraki adımda başlamaktadır.

Bütüncül okul yaklaşımı yeni medya vizyonuna örnek olabilir (Ohler, 2010'dan aktaran Graber, 2012). Genel etik ve davranışsal bağlamda dijital olarak aktif olmanın bütününe belirleyen davranışlar üstün zekalı öğrencilerin yeni medya algısı bakımından önemlidir. Belki bu uygulamalardan bazıları ile öğrenciler kendi yolunu bulacaktır. Yeni medya okuryazarlığı sayesinde internetten ahlaki ve gelişimsel çerçevede nasıl faydalanılacağı üstün zekalı öğrenciler açısından oldukça büyük önem taşımaktadır. Her ne kadar kontrollü bir gelişime sahip olsalar da öğrencilerin sosyal medya kullanımlarına dikkat etmek gerekir. Okullarda verilecek olan yeni medya okuryazarlığı dersi sayesinde öğrenciler çok daha bilinçli bir biçimde internetten nasıl ve ne şekilde faydalanacaklarını daha iyi kavrayacaklardır. Bunun için de okul yönetiminin dijital platformda yapacağı uygulamalar yeni medya okuryazarlığı ile aslında işlerini kolaylaştıracaktır.

Yeni medya okuryazarlığının üstün zekalı öğrenciler açısından ne kadar önemli olduğunun altının çizilebilmesi için sosyal medyanın çocukların zihinsel ve duygusal gelişimlerine ne kadar etki ettiği ile ilgili başka bir çalışma incelenmiştir (Freeman, 2014). E-postaların, sosyal ağların ve mesajlaşmanın yalnızca çocukların bilişsel işlevlerini değil aynı zamanda beyinlerinin fiziksel yapısını değiştirebileceğine dair kanıtlar ortaya çıkmaktadır.

Elektronik sosyal medya muhtemelen hem öğrenme tarzını hem de zihinlerini kullanma biçimini etkilemektedir. Ancak öyleyse, nasıl etkilediği ile ilgili net bir bilginin verilmesi gerekmektedir. Değişiklikler, tüm zekâ aralığında benzer bir tür olabilir veya farklı zekâ düzeylerini farklı şekillerde etkileyebilir. Bazı araştırmacılar, ekranlara ve kısa süren yüzeysel etkileşimlere çok fazla dikkat edilmesi durumunda, çocukların beyin gücünü düşürdüğüne ve internetin düşünülen düşünce için zayıf bir eğitim sağladığına inanmaktadırlar.

Konuyla ilgili bilimsel bulgular üzerine yapılan önemli araştırmalara göre, internetin faydalarına rağmen, okuma ve düşünme yeteneği üzerinde zararları da bulunmaktadır. Carr, insan düşüncesinin, "zihin araçları" aracılığıyla şekillendirildiğini, böylece beyinlerimizdeki değişimlerin yalnızca deneyimlerimize verilen cevaplardan değil, aynı zamanda bunların sağlandığı araçlardan geldiğini de ileri sürmektedir (Carr, 2010'dan aktaran Freeman, 2014). Bilgiyi bulmak, saklamak ve paylaşmak için kullandığımız teknolojiler, sinirsel yolları fiziksel olarak yeniden yönlendirebilir.

Psikoloji ve eğitimde çalışanlar, çocukların entelektüel ve duygusal gelişimi için profesyonel bakımın ön sıralarında yer almaktadır. Freeman (2014) çalışmasında, elektronik sosyal medyanın çocuklarımızın kalpleri ve zihinleri üzerindeki etkileri hakkında kanıtları ve farkındalığını artırmaya yönelik araştırma yapılması için acil bir çağrı sunmaktadır. Bu aynı zamanda ileri düzey interaktif elektronik programları tasarlamak ve geliştirmek için bir temel oluşturacaktır.

İleri düzey interaktif etkileşimler yeni medya teknolojileri bağlamında başka bir çalışmada ele alınmıştır (Akhba, 2014). Yeni medya teknolojileri, esasen modern bilgisayar teknolojisi, dijital veri yazılım programları ve en hızlı gelişen iletişim teknolojisi ile kontrol edilen sanal kültürlerdir. "Yeni medya" olarak tanımlanan teknolojilerin çoğu dijital ve çoğu zaman ağa açık, yoğun, sıkıştırılabilir, etkileşimli ve tarafsız olma özelliklerine sahiptir. Fidler (1997), yeni medyayı "ortaya çıkan tüm iletişim ortamları" olarak tanımlamaktadır. İletişim süreçlerinin ve mesaj kompozisyonlarının değiştiğini gösteren kanıtlar vardır.

Yeni medya, bilgisayarları ve telekomünikasyon teknolojilerini bir araya getiren yeni iletişim teknolojileri olup, zaman, mesafeden bağımsız olarak heterojen bir kitleye bilginin yayılması için kanallar olarak kullanılmaktadır. Yeni medya, bilgisayar teknolojisi ve telekomünikasyon teknolojilerinin yakınsamasıyla ilgilidir. İnternet, cep telefonları, video konferans, e-posta, sohbet odaları, çevrimiçi gazeteler, diğerlerinin ev sahipliği yaptığı dergiler gibi yeni medyadan farklı örnekler verilebilir.

Bahsedilen örneklerin yanı sıra yeni medya teknolojileri bağlamında yer alan yeni medyanın temel özellikleri beş kategoride sıralanabilmektedir. Bunlardan birincisi "dijitallik"tir. İşlemler bilgisayar aracılığıyla yapıldığı için yeni medyaya sıklıkla dijital ortam veya dijital yeni ortam denir. İkinci olarak "etkileşimlik" yer almaktadır. Dijital medya, medyaya müdahale etmek için önemli fırsatlar sunmaktadır. Bu çoklu fırsatlara genellikle yeni medyanın etkileşimli potansiyeli denir. Üçüncü olarak "köprü metni (hypertext)" söylenebilir. Köprü metni, kendisinin dışında, başka bir metne bağlantı sağlayan bir metin bağlantısıdır. Dördüncü olarak "yayıma (dispersal)" bulunmaktadır. Yayıma, hem medya metinlerinin tüketimi hem de üretimi ile ilişkilerimizdeki değişimin bir ürünüdür. Beşinci özellik olarak karşımıza "sanallık" çıkmaktadır. Sanal gerçeklik aynı anda birkaç farklı medya ve görüntü teknolojisine uygulanmaktadır. Ancak bunun da ötesinde teknolojik olarak gelişmiş toplumlarda günlük hayatın bir parçası haline gelmiştir (Lister, 2009'dan aktaran Akhba, 2014).

İnsanların artık sanal bir dünyaya gözlerini açtığı dijital çağda yapısalıcı eğitimi ve öğrencilerin yeni medyaya karşı olan tutumlarını ele alan başka bir çalışma incelenmiştir (Topolovčan& Matijević ve Dumančić, 2016). Günümüzün genç nesilleri dijital yerli veya net jenerasyonu olarak adlandırılmaktadır (Prensky, 2001 ve Tapscott, 1999'dan aktaran Topolovčan, 2016). Bilgisayar, internet, cep telefonu, tablet ve sosyal paylaşım ağlarının örgün eğitime başlamadan önce sahip oldukları ve en iyi şekilde yararlandığı dijital, multimedya ortamında dünyaya gelmektedirler. Bu nedenle, bu tür öğrenciler için öğrenci merkezli öğretim aynı zamanda yeni medyanın kullanımını da kapsamalıdır.

Bu açıdan, yeni bir öğrenme kültürü ve onun temel özelliği hakkında da söylemler mevcuttur: Öğretme didaktiklerinden öğrenme didaktiklerine doğru atılan bir adım söz konusudur. Yeni medyanın rolü, öğrenme ve didaktik modellerin hakim teorileri bağlamında ele alınmaktadır. Son 20-30 yılda, yapılandırmacı öğrenme ve dolayısıyla bu öğretime yeni medyanın kullanılması daha belirgin bir hale geldi. Geçen yüzyılın ikinci yarısında yaşanmış olan bilgi iletişim teknolojilerinin eğitim ve öğretimi değiştirip değiştireceği yönünde iyimser beklentiler sonrasında, öğretimde medyanın etkisinin azaldığı ortaya çıktı (Kulik, 1991'den aktaran Topolovčan, 2016). Bu nedenle, yeni çalışmalar, yeni medyanın kendi içinde öğretim kalitesi açısından önemlidir. Didaktik düzenlemeler de yeni medya öğretim kalitesini etkileyen en önemli faktörler arasındadır. Buna; proje tabanlı öğrenme, oyun temelli öğrenme, araştırmaya dayalı öğrenme, probleme dayalı öğrenme, işbirlikçi ve yaparak yaşayarak öğrenme dâhildir.

Bu tür öğrenme biçimlerinin temelini yapısalıcı öğrenme oluşturmaktadır. Böyle bir öğrenme öncelikli olarak yeni medya kullanımı için oldukça önemli bir adımdır. Bu adım; motivasyona, yeni medyayı kullanma becerisine ve yeni medyaya karşı tutumlara dayanmaktadır. Yapısalıcı eğitim içerisinde değerlendirilecek olan yeni medyanın öğrencilere ne tür katkılar sağlayacağı okul yönetimi tarafından yapılacak düzenlemeler ile de bağlantılıdır.

Üstün zekâlı öğrencilerin eğitim alanı ile ilgili yapılan bir diğer çalışma araştırmaya dayalı üstünler eğitimidir (Trna, 2014). Öğrencilerin içsel motivasyonunu temel alan bir takım motivasyon öğretim / öğrenme yöntemleri belirlenebilmektedir. Bu yöntemlerden bir tanesi, IBSE (Soruşturma Temelli Bilim Eğitimi) 'dir. IBSE, öğrenciler ve öğretmenler üzerinde güçlü bir motivasyon etkisi olan yenilikçi bir eğitim yöntemidir. IBSE, bilim öğrenim sürecinin derin bir anlayışından doğmuştur (Narode, 1987'den aktaran Trna, 2014).

IBSE'nin temel ilkeleri öğrencilerin doğal kanunları ve bilgiyi anlamlı bir bağlamda keşfetmesi, eleştirel düşünme yeteneği ve bilimle ilgili olumlu tutumlar geliştirmesidir. Öğretmenlerin ve öğrencilerin katılımı açısından IBSE'nin dört seviyesi bulunmaktadır. Bunlar; onaylama, yapısalılık, güdümlülük ve açıklıktır. Çalışmada her bir seviyeye göre yeni bir konuyu ele almaktadır: IBSE ve üstün yetenek. Bu pilot araştırma IBSE'nin bilimdeki yetenekli öğrencilere motivasyonel ve gelişimsel bir yöntem olarak önemini önermektedir. Konu daha ayrıntılı olarak incelenmelidir. Öğretmenlerin geliştirilmesi gereken özel yöntem ve araçlara ihtiyaçları vardır. Bu yöntemler, hizmet öncesi ve hizmet içi fen öğretmenliği eğitiminde uygulanmalıdır. Bu fikirlerin öğretmenlere ulaştırılmasının yollarından biri projeler aracılığıyla'dır.

Projelerden bir tanesi PROFILES'dir (Araştırmaya Dayalı Öğrenme ve Eğitim Üzerine Bilime Karşı Profesyonel Yansıma Odaklı Odak Projesi). Fen öğretmenlerinin IBSE'yi kullanmalarına destek sağlayan bir Avrupa projesidir. PROFILES projesi, IBSE için uyarlanmış bir dizi öğretim / öğrenme modülünü içermektedir. Bu çalışmanın araştırma sonuçları yetenekli öğrenciler için IBSE bileşenleri modüllerine uygulanmıştır. Araştırma,

PROFILES: Araştırmaya Dayalı Öğrenme ve Eğitim Üzerine Bilime Karşı Profesyonel Yansıma Odaklı Odak Projesi kapsamında çalışılmıştır.

Öğrencilerin yeni medyayı kullanım düzeyleri ile ilgili yapılan bir diğer araştırma öğretme-öğrenme aşamasında öğrenciler arasında internet kullanımı ve paylaşım düzeyleridir (Tutkun, 2011). Bilgi edinmek için kullanılan bilgi ve iletişim teknolojileri, 20. yüzyılın ikinci yarısında insan gelişiminde önemli bir etkiye sahiptir. Bu nedenle, 21. yüzyıla sıklıkla bilgi toplumu veya bilgi dönemi adı verilmektedir. Yenilikçi bilgi ve iletişim teknolojilerinin eğitimin bütün alanında büyük etkileri olmuştur. 1980'lerde, kişisel bilgisayarların aniden çoğalmasıyla birlikte, bilgi ve iletişim teknolojileri öğretim-öğrenme süreci boyunca Eğitimde problem çözme çerçevesinde yaygınlaştı. Artık internet, herkese açık olan sonsuz seçenekleri sunmakta ve değişimin simgesi haline gelmektedir. İnternet, alternatif, yaratıcı öğrenme yöntemleri sunarak insanlar için eğitim sürecini etkilemektedir (İşman ve Dabaj, 2004'den aktaran Tutkun, 2011).

İnternet, bilgi çağının en karizmatik özelliklerinden biridir. Bilgisayarları ve interneti kullanmak günlük yaşamın vazgeçilmez bir parçası haline gelmiştir. Neredeyse her soruna yanıt olarak, internet istenilen bilgiyi kolay ve sorunsuz bir biçimde üretebilmektedir. Bu nedenle, 21. yüzyıl için en önemli kavramlardan biri olarak eğitim alanında daha etkin ve kalıcı öğrenme için teknoloji kavramı kullanılmaktadır. Bu yeni yüzyılda yeni teknolojiye uyum sağlama bir anlamda zorunlu hale gelmiştir; eğitim sistemi, eğitim programları, öğretim-öğrenme yöntemleri ve öğretim materyalleri değişmiştir. Eğitimin neredeyse her alanında teknoloji ve internet uygulamaları yaygınlaşmaktadır.

Bu araştırma ile, internetin daha etkili kullanılması ve öğretme-öğrenme süreci boyunca iletişim teknolojileri için önemli etkilere sahip olduğu sonuçları elde edilmiştir. Araştırmaya göre öğrenciler için ders dışı etkinlikler olarak internet kullanımı konusunda bir müfredat oluşturulabilir. Öğrenciler interneti okul, ev ve sosyal hayatta etkin bir şekilde kullanabilmelidir.

Üstün zekâlı öğrencilerin eğitiminde incelenen başka bir araştırma müfredat programı ile ilgilidir (Oh, Hailey, Azano, Callahan ve Moon, 2012). Üstün zekâlı öğrenciler için etkin programlamanın merkezi, üstün yetenekli öğrencilerin öğrenme çıktılarını sorgulayacak ve geliştirecek müfredatta yatmaktadır. Alan, müfredat değişikliği için çerçeve sağlayan modellerle dolup taşıyor olsa da, bu modellerin etkinliği ile ilgili ampirik kanıtlar halen gelişmektedir. Çoklu ortamdaki müfredat müdahalelerine yönelik büyük ölçekli çalışmalar sınırlıdır. Müfredat etkinliğini belgelemekle ilgili zorluklar şunlardır: Deneysel paradigmlar kullanarak gözlemlenebilir ve ölçülebilir sonuçların bu modellerin sorumluluk boyutunu belirleyen etkili sonuç ölçütleri oluşturma zorluğu ve uygulamanın aslına uygunluk açısından veri eksikliğine bağlı olmasından kaynaklanmaktadır.

Eğitimciler, üstün yetenekli sınıflarda farklı müfredat ve talimatların bulunmaması ve deneysel kanıtların yetenekli öğrencilere etkinliklerini destekleyecek kadar az olması nedeniyle endişelerini dile getirmektedir. Bu gibi endişelere yanıt olarak, üstün yetenekli öğrencilere yönelik farklı müfredat ve öğretim talimatlarına yol gösterici ilkeler ulusal organizasyonlar tarafından sağlanmıştır. Bu ilkeler müfredat planlaması ve öğretimi için standartları ifade etmekte ve üstün yetenekli öğrenciler için en iyi öğrenmeyi sağlamak için dahil edilmesi gereken unsurları belirtmektedir. Bazı çalışmalar, müfredat birimlerinin geliştirilmesi ve değerlendirilmesinde bu kılavuz ilkelerden yararlanırken, rehber ilkelerin çeşitli bağlamlarda çeşitli öğrenciler tarafından etkili bir şekilde nasıl uygulanacağına ilişkin daha ileri çalışmalara ihtiyaç duymaktadır (VanTassel-Baska & Brown, 2007'den aktaran Oh, Hailey, Azano, Callahan ve Moon, 2012).

Bu arařtırmaya gre, CLEAR (zorluk, greve ynelme, bařarı ve sonular) mfredat modeli temel alınarak iki farklı alıřma biriminden alınan sonu lm zerindeki uygulama ve kontrol grupları arasındaki nemli farklılıklar, bu entegre modelin yetenekli ğrencilere ynelik ğrenmeyi olumlu ynde etkileyen birimler geliřtirme potansiyelinin umut vaat eden gstergeleridir. Sonular, yetenekli eđitimde mevcut  mfredat modelinin temel bileřenleri tarafından ynlendirilen zengin mfredat ve duyarlı đretim bađlamını ortaya koyan TEMEL program modelinin đrencinin ğrenmesini arttırmak iin uygulanabilir bir seenek olduđunu dřndrmektedir.

Arařtırmalarla ilgili bir diđer alıřma yeni medyanın eđitimdeki roldr (Fons, Thomas ve Remko, 2001). İnsanların bilgisayar yardımıyla nasıl ğrendiklerini analiz etmeleri ve bu srete uyguladıkları ğrenme etkinlikleri nemlidir. ğrenim sreci, internet ve kurum ii ađ gibi yeni medya ile đrenciyi desteklemelidir. Bilgisayar destekli alıřmalarda đrencilerin beklentilerinin ne olduđunu bilmek ayrıca nem arz etmektedir. Bir ortam ğrenme srelerine yardımcı olma potansiyeline sahipse, insanlar otomatik olarak yazılımın bu potansiyeli kullanmasını bekler. Eđitimdeki asıl beklenti yeni medya alanındadır. Diđer medya aralarının bařaramadıklarını yeni medya eđitimde ğrenme srecinde nasıl bařaracaktır sorusuna yanıt vermek ile bu beklenti karřılanacaktır.

ğrencilerin yeni medyadan beklentileri, yeni medyadaki potansiyel iřlevsellik aısından ele alınmalıdır. nk yeni medya sahip olduđu farklı iřlevsellikler ile eđitim alanına hizmet etmelidir. Medyanın zelliklerini gz nne alırsak, yeni bir đretim ortamının tasarımı yalnızca yeni bir ortam karıřımının seimi deđil, bu medyanın iřlevsellikleri ve iřlevsizliklerinin seimi ile de ilgilidir. Yenilikiliđin nemli noktası, yeni bir aracın sahip olduđu potansiyel iřlevleri keřfetmektir. Bu konuyla ilgili en profesyonel grup đrencilerdir. Deneyimlerini ve ğrenme srelerini yeni medyayla tecrbe etmektedirler. Sahip oldukları btn bilgileri potansiyel iřlevselliklerle ilgili bilgiler haline dnřebilir. Okuldaki mfredata yansıtacak olan  nemli ğrenme sreci sayesinde đrenciler yeni medyadan daha fazla yararlanabilmektedir. Bunlar biliřsel, dzenleyici ve duygusal etki alanlarıdır. Bu alanların mfredat programlarına entegre edilebilmesi yine okullardaki yeni medya anlayıřı erevesinde gerekleřmelidir.

ARAŐTIRMANIN YNTEMİ

Bu arařtırmada stn zeklı ocukların yeni medya kullanım amaları ve kullanım dzeylerini tespit etmeye ynelik niceliksel arařtırma yntemi kullanılmıřtır. Nicel arařtırmalarda daha ok pozitivist bir dnya grř hkimdir. Paradigma olarak da nitelendirilen bu dnya grřleri, arařtırmalarda kullanılan tekniklere bađlılıđının ve farklı dnya algılarından kaynaklandıkları ne srlmektedir. Bazı arařtırmacılar paradigmanın arařtırma tekniklerinden daha nce geldiđini ve arařtırmaya bařlanmadan nce kararlařtırılması gerektiđini vurgulamaktadır. Aslında nicel arařtırmalara temel oluřturan pozitivist bilim anlayıřı ile yrtlen her arařtırmanın temelinde genelleme kaygısı mevcuttur. Deđiřkenler arasında elde edilen iliřkilerin genele yani evrene yayılması amalanmaktadır (Delice, 2010).

Niceliksel arařtırma yntemleri, olguların ve iliřkilerinin sistematik bir řekilde llebilen sayılarla uđrařan arařtırma yntemleridir. Bir olayı aıklamak, tahmin etmek ve kontrol etmek iin llebilir deđiřkenler iindeki iliřkiler hakkındaki sorulara cevap bulmak iin kullanılır (Leedy, 1993). Nicel bir alıřma genelde test edilen hipotezin onaylanması veya onaylanmaması ile sona erer. Nicel yntemi kullanan arařtırmacılar, arařtırma alıřmalarında kullanmak istedikleri bir veya birka deđiřkeni tanımlar ve bu deđiřkenlerle ilgili veri toplama iřlemlerini srdrrlr.

Bilişim ve iletişim teknolojileri alanında nicel yöntemler genellikle bilimsel bir yaklaşımla sonuç hesaplaması ve sistem analizi ile alakalıdır. Nicel yöntemin amacı, bilişim ve iletişim teknolojileri olgusunun doğasına ilişkin matematiksel yaklaşım, hipotezler ve teorilere dayanan modeller geliştirmek ve kullanmaktır. Ölçüm süreci, ampirik gözlem ile niceliksel ilişkilerin matematiksel ifadesi arasındaki bağlantısına bağlı olarak nicel yöntemin odak noktasıdır. Bu yöntem, kanıtların değerlendirildiği yinelemeli süreç olarak da bilinmekte ve istatistiksel yaklaşımı kullanarak bazı teknik ilerlemeler ile hipotezler ve teoriler rafine edilmektedir.

Nicel yöntem tipik olarak bir hipotez veya kuram temelli veri toplama ile başlar ve betimsel veya çıkarımsal istatistikler uygulanır. Anketler ve gözlemler istatistiksel ilişki ile yaygın olarak kullanılan bazı örneklerdir. Kerlinger (1973), anket araştırmalarını, istenen popülasyondan seçilen örnekler, dağılım ve ilişkileri keşfetmek suretiyle büyük ve küçük popülasyonlar üzerine bir çalışma olarak tanımlamıştır.

Bu çalışmada, üstün zekâlı öğrencilerin sosyal medyaya yönelik tutumlarını ölçen, beşli likert tipi modele uygun (Köklü, 1995'den aktaran Otrar ve Arın, 2015) şekilde tasarlanmış bir ölçek geliştirmek amacıyla geçerlik ve güvenilirlik işlemleri gerçekleştirilmiştir. 100 öğrenciye anket uygulanmıştır. Tüm maddeler, alt boyutlar ve ölçeğin tümü için Pearson Momentler Çarpımı Korelasyon Katsayısı hesaplanmıştır. Tüm geçerlik ve güvenilirlik analizleri için SPSS 20 (Statistical Package for the Social Sciences) istatistik programı ve veri analizinde cinsiyete göre T Testi ve Anova kullanılmıştır.

Problem Cümlesi

Türkiye'deki üstün zekâlı öğrencilerin yeni medyayı kullanım amaçları ve yeni medya kullanımlarına ilişkin tutumları nelerdir?

Alt Problemler

1. Öğrencilerin sosyal medya kullanım alışkanlıklarını ölçen sorulara verdikleri cevaplarda cinsiyete göre anlamlı bir farklılık var mıdır?
2. Öğrencilerin sosyal medya kullanım alışkanlıklarını ölçen sorulara verdikleri cevaplarda internet kullanım sıklığına göre anlamlı bir farklılık var mıdır?
3. Öğrencilerin sosyal medya kullanım alışkanlıklarını ölçen sorulara verdikleri cevaplarda sosyal medya kullanım sıklığına göre anlamlı bir farklılık var mıdır?
4. Öğrencilerin sosyal medya kullanım alışkanlıklarını ölçen sorulara verdikleri cevaplarda yeni medya kullanım sıklığına göre anlamlı bir farklılık var mıdır?
5. Öğrencilerin sosyal medya kullanım alışkanlıklarını ölçen sorulara verdikleri cevaplarda sınıf düzeyine göre anlamlı bir farklılık var mıdır?

Araştırma Modeli

Bu çalışma ile Türkiye'deki üstün zekâlı öğrencilerin hangi amaçlar doğrultusunda yeni medyayı kullandıklarının ve yeni medya kullanımına yönelik tutumlarının ne şekilde olduğunun tespit edilmesi hedeflendiğinden betimsel tarama modelinden faydalanılmıştır. Bu çalışmada veri; Otrar ve Arın (2015) öğrencilerin sosyal medyaya ilişkin tutum ölçeklerinden faydalanılarak geçerlik ve güvenilirlik işlemleri gerçekleştirilmiştir.

Karasar (2006)'a göre, olayların, nesnelerin, varlıkların, kurumların, grupların ve çeşitli alanların ne olduğunu tasvir etmeye, açıklamaya çalışan araştırmalar betimsel

çalışmalardır. Betimsel veya survey çalışmalarda mevcut olan durum saptanmak istendiğinden, bu tür çalışmalar genellikle doğal ortamda yapılmaktadır.

Betimsel araştırmalar çerçevesinde kullanılan teknikler ile çalışmanın isimleri; anket survey, mülakat survey, gözlem survey gibi isimler olarak değişebilmektedir. “Tarama modelleri, geçmişte ya da halen var olan bir durumu var olduğu şekilde betimlemeyi amaçlayan araştırma yaklaşımlarıdır. Araştırmaya konu olan olay, birey ya da nesne, kendi koşulları içinde ve olduğu gibi tanımlanmaya çalışılır. Onları herhangi bir şekilde değiştirme, etkileme çabası gösterilmez” (Karasar, 2015, s.77).

Evren

Araştırma evreni 2016-2017 Eğitim Öğretim yılı bahar döneminde Kocaeli İzmit Bilim ve Sanat Merkezi’nde eğitim alan 477 öğrenciden oluşmaktadır.

Örneklem

Rastgele örnekleme dayalı olarak İzmit Bilim ve Sanat Merkezi’nde eğitim gören 6-17 yaş arası 100 üstün zekâlı öğrenci seçilmiştir.

Veri Toplama Aracı

Otrar ve Argın tarafından 2015 yılında geliştirilmiş olan ‘Sosyal Medya Tutum Ölçeği (SMTÖ)’ kullanılmıştır. Üstün zekâlı öğrencilerin paylaşım ihtiyacı, sosyal yetkinliği, sosyal izolasyonu ve öğretmenlerle ilişki olmak üzere dört faktörü kapsayan ölçek beşli likert türünden oluşmaktadır. Veri toplama tekniği olarak anket kullanılmıştır. Güvenirlik bağlamında ölçeğin kararlılığını saptamak amacıyla üç hafta arayla test-tekrar test yöntemi Otrar ve Argın (2015) tarafından gerçekleştirilmiştir. Güvenirlik katsayıları da her bir alt boyut için (0.72 - 0.89; $p < .001$) manidar ve tüm ölçek için hesaplanan korelasyon katsayısı (0.83; $p < .001$) manidar bulunmuştur. Tüm geçerlik ve güvenirlik analizleri SPSS 20 (Statistical Package for the Social Sciences) paket programıyla yapılmıştır.

Veri Analizi

Araştırmadan elde edilen veri Excel programında kodlanarak, SPSS 20 (Statistical Package for Social Sciences) programında analiz edilmiştir. Elde edilen veri analizinde tanımlayıcı istatistiksel yöntemlerden yüzdelik, t testi ve tek yönlü anova kullanılmıştır.

Varsayımlar

1. Üstün zekâlı öğrenciler yeni medyayı bilinçli ve üretken bir biçimde kullanmaktadır.
2. Üstün zekâlı öğrenciler interneti verimli bir biçimde kullanmaktadır.
3. Üstün zekâlı öğrenciler dijital oyunlar içerisinde zekâ oyunlarına daha fazla zaman harcamaktadır.
4. Öğrenciler sorulara içtenlikle cevap vermiştir.

Sınırlılıklar

1. Araştırma, 2016-2017 Eğitim Öğretim yılı 2. dönemde Kocaeli ili İzmit Bilim ve Sanat Merkezi’nde eğitim gören 6-17 yaş arası üstün zekâlı öğrenciler ile sınırlıdır.
2. Araştırma, sosyal medya kullanım amaçları ve sosyal medya kullanımına ilişkin tutum ölçeği uygulanan anket soruları ile 6-17 yaş aralığındaki üstün zekâlı öğrencilere ve bu öğrencilerin ölçeklere verdikleri cevaplar ile sınırlıdır.

3. Araştırma, 477 öğrencisi bulunan İzmit Bilim ve Sanat Merkezi'nde rastgele seçilen 100 kişi ile sınırlıdır.

Tanımlar

Üstün Zekâlı Öğrenci: Ortalama üstü yetenek, göreve adanmışlık(motivasyon) ve yaratıcılık özelliklerine sahip olan öğrenci olarak tanımlanmaktadır (Renzulli, 1986).

Yeni Medya: Etkileşim, kitlesizleştirme ve eşzamansızlık özellikleri ile dijital kodlama sisteminde temellenen multimedya içeriği ile birlikte çok katmanlı etkileşimin gerçekleştiği yüksek hızda karşılık bulan iletişim araçlarıdır (Rogers, 2003).

Sosyal Medya: Dijital ortamda biliş, iletişim ve işbirliğine dayalı sosyal bilgi süreçleridir (Fuchs ve Marisol, 2014).

BULGULAR

Bu bölümde, araştırma kapsamında toplanan veri analizi sonucunda elde edilen yeni medya, internet ve sosyal medya kullanımları ile ilgili bulgulara yer verilmiştir. Anket çalışması İzmit Bilim ve Sanat Merkezi'nde eğitim gören 100 öğrenciye uygulanmıştır. Ankette verilen cevapların yüzdeleri hesaplanmıştır. Bulgular, araştırmanın alt amaçlarına uygun şekilde tablolar kullanılarak açıklanmıştır.

Sosyal Medya Kullanımına Yönelik: 1,2,8,16,18 ve 20. madde sosyal yetkinlik alt boyutu, 4,5,6,12,13,15,17 ve 21. madde paylaşım ihtiyacı alt boyutu, 9,10 ve 19. madde öğretmenlerle ilişki alt boyutu, 3,7,11,14,22 ve 23. madde sosyal izolasyon alt boyutu ifade etmektedir. Hesaplamalar aşağıdaki gibidir.

Tablo 1. Cinsiyet için T-Testi ($\alpha < 0,05$)
Independent Samples Test

	Levene's Test for Equality of Variances		t-test for Equality of Means						
	F	Sig.	t	df	Sig. (2-tailed)	Mean Difference	Std. Error Difference	95% Confidence Interval of the Difference	
								Lower	Upper
Sosyal Medya'yı akademik bilgi paylaşımı (ödev, proje vb.) amacıyla kullanırım.	1,728	,192	2,358	98	,020	,640	,271	,101	1,179
			2,358	95,774	,020	,640	,271	,101	1,179
Sosyal Medya'yı ilgi duyduğum konularda fikir alışverişi amacıyla kullanırım.	,000	,996	2,070	98	,041	,580	,280	,024	1,136
			2,070	97,968	,041	,580	,280	,024	1,136
Sosyal Medya'yı gündelik problemlerime çözüm bulmak amacıyla kullanırım.	1,172	,282	3,148	98	,002	,800	,254	,296	1,304
			3,148	97,698	,002	,800	,254	,296	1,304

Tablo 1'e göre hesaplanan α değeri ($\alpha:0,020 < \alpha:0,05$) 0,05'den küçük olduğu için "Sosyal Medya'yı akademik bilgi paylaşımı (ödev, proje vb.) amacıyla kullanırım. Sosyal Medya'yı ilgi duyduğum konularda fikir alışverişi amacıyla kullanırım. Sosyal Medya'yı gündelik problemlerime çözüm bulmak amacıyla kullanırım." sorularında cinsiyete göre anlamlı bir farklılık bulunmaktadır.

Tablo 2. Sosyal medyayı yeni arkadaş edinmek amacıyla kullanırım.

	Frequency	Percent	Valid Percent	Cumulative Percent
Kesinlikle katılmıyorum	42	42,0	42,0	42,0
Katılmıyorum	23	23,0	23,0	65,0
Valid Kararsızım	20	20,0	20,0	85,0
Katılıyorum	10	10,0	10,0	95,0
Kesinlikle katılıyorum	5	5,0	5,0	100,0
Total	100	100,0	100,0	

Tablo 2'ye göre "Sosyal Medya'yı yeni arkadaş edinmek amacıyla kullanırım" anket sorusuna cevap verenlerin %42'si (42 kişi) kesinlikle katılmıyorum, %23'ü (23 kişi) katılmıyorum, %20'si (20 kişi) kararsızım, %10'u (10 kişi) katılıyorum, %5'i kesinlikle katılıyorum cevabını vermiştir. Sonuç olarak katılımcıların %42'si sosyal medyayı yeni arkadaş edinmek amacıyla kullanmadıklarını belirtmiştir.

Tablo 3. Sosyal Medya'yı arkadaşlarımla iletişim kurmak amacıyla kullanırım.

	Frequency	Percent	Valid Percent	Cumulative Percent
Kesinlikle katılmıyorum	12	12,0	12,0	12,0
Katılmıyorum	8	8,0	8,0	20,0
Valid Kararsızım	17	17,0	17,0	37,0
Katılıyorum	33	33,0	33,0	70,0
Kesinlikle katılıyorum	30	30,0	30,0	100,0
Total	100	100,0	100,0	

Tablo 3'e göre "Sosyal Medya'yı arkadaşlarımla iletişim kurmak amacıyla kullanımım" anket sorusuna cevap verenlerin %12'si (12 kişi) kesinlikle katılmıyorum, %8'i (8 kişi) katılmıyorum, %17'si (17 kişi) kararsızım, %33'ü (33 kişi) katılıyorum, %30'u (30 kişi) kesinlikle katılıyorum cevabını vermiştir. Sonuç olarak katılımcıların % 33'ü sosyal medyayı arkadaşları ile iletişim kurmak amacıyla kullandıklarını belirtmiştir.

Tablo 4. Sosyal Medya'yı akademik bilgi paylaşımı (ödev, proje vb.) amacıyla kullanımım.

	Frequency	Percent	Valid Percent	Cumulative Percent
Kesinlikle katılmıyorum	17	17,0	17,0	17,0
Katılmıyorum	16	16,0	16,0	33,0
Valid Kararsızım	20	20,0	20,0	53,0
Katılıyorum	26	26,0	26,0	79,0
Kesinlikle katılıyorum	21	21,0	21,0	100,0
Total	100	100,0	100,0	

Tablo 4'a göre "Sosyal Medya'yı akademik bilgi paylaşımı (ödev, proje vb.) amacıyla kullanımım" anket sorusuna cevap verenlerin %17'si (17 kişi) kesinlikle katılmıyorum, %16'sı (16 kişi) katılmıyorum, %20'si (20 kişi) kararsızım, %26'sı (26 kişi) katılıyorum, %21'i (21 kişi) kesinlikle katılıyorum cevabını vermiştir. Sonuç olarak katılımcıların % 26'sı sosyal medyayı akademik bilgi paylaşımı (ödev, proje vb.) amacıyla kullandıklarını belirtmiştir.

Tablo 5. Sosyal Medya'yı fotoğraf paylaşımı amacıyla kullanımım.

	Frequency	Percent	Valid Percent	Cumulative Percent
Kesinlikle katılmıyorum	36	36,0	36,0	36,0
Katılmıyorum	18	18,0	18,0	54,0
Valid Kararsızım	23	23,0	23,0	77,0
Katılıyorum	12	12,0	12,0	89,0
Kesinlikle katılıyorum	11	11,0	11,0	100,0
Total	100	100,0	100,0	

Tablo 5'e göre "Sosyal Medya'yı fotoğraf paylaşımı amacıyla kullanımım" anket sorusuna cevap verenlerin %36'si (36 kişi) kesinlikle katılmıyorum, %18'i (18 kişi) katılmıyorum, %23'ü (23 kişi) kararsızım, %12'si (12 kişi) katılıyorum, %11'i (11 kişi)

kesinlikle katılıyorum cevabını vermiştir. Sonuç olarak katılımcıların % 36'sı sosyal medyayı fotoğraf paylaşımı amacıyla kullanmadıklarını belirtmiştir.

Tablo 6. Sosyal Medya'yı video paylaşımı amacıyla kullanım.

	Frequency	Percent	Valid Percent	Cumulative Percent
Kesinlikle katılmıyorum	34	34,0	34,0	34,0
Katılmıyorum	19	19,0	19,0	53,0
Valid Kararsızım	18	18,0	18,0	71,0
Katılıyorum	16	16,0	16,0	87,0
Kesinlikle katılıyorum	13	13,0	13,0	100,0
Total	100	100,0	100,0	

Tablo 6'ya göre "Sosyal Medya'yı video paylaşımı amacıyla kullanım" anket sorusuna cevap verenlerin %34'ü (34 kişi) kesinlikle katılmıyorum, %19'u (19 kişi) katılmıyorum, %18'i (18 kişi) kararsızım, %16'sı (16 kişi) katılıyorum, %13'ü (13 kişi) kesinlikle katılıyorum cevabını vermiştir. Sonuç olarak katılımcıların % 34'ü sosyal medyayı video paylaşımı amacıyla kullanmadıklarını belirtmiştir.

Tablo 7. Sosyal Medya'yı müzik paylaşımı amacıyla kullanım.

	Frequency	Percent	Valid Percent	Cumulative Percent
Kesinlikle katılmıyorum	34	34,0	34,0	34,0
Katılmıyorum	31	31,0	31,0	65,0
Valid Kararsızım	16	16,0	16,0	81,0
Katılıyorum	11	11,0	11,0	92,0
Kesinlikle katılıyorum	8	8,0	8,0	100,0
Total	100	100,0	100,0	

Tablo 7'ye göre "Sosyal Medya'yı müzik paylaşımı amacıyla kullanım" anket sorusuna cevap verenlerin %34'ü (34 kişi) kesinlikle katılmıyorum, %31'i (31 kişi) katılmıyorum, %16'sı (16 kişi) kararsızım, %11'i (11 kişi) katılıyorum, %8'i (8 kişi) kesinlikle katılıyorum cevabını vermiştir. Sonuç olarak katılımcıların % 34'ü sosyal medyayı müzik paylaşımı amacıyla kullanmadıklarını belirtmiştir.

Tablo 8. Sosyal Medya'yı anlık durum paylaşımı amacıyla kullanım.

	Frequency	Percent	Valid Percent	Cumulative Percent
Kesinlikle katılmıyorum	42	42,0	42,0	42,0
Katılmıyorum	17	17,0	17,0	59,0
Valid Kararsızım	21	21,0	21,0	80,0
Katılıyorum	11	11,0	11,0	91,0
Kesinlikle katılıyorum	9	9,0	9,0	100,0
Total	100	100,0	100,0	

Tablo 8'e göre "Sosyal Medya'yı anlık durum paylaşımı amacıyla kullanım" anket sorusuna cevap verenlerin %42'si (42 kişi) kesinlikle katılmıyorum, %17'si (17 kişi) katılmıyorum, %21'i (21 kişi) kararsızım, %11'i (11 kişi) katılıyorum, %9'u (9 kişi) kesinlikle katılıyorum cevabını vermiştir. Sonuç olarak katılımcıların % 42'si sosyal medyayı anlık durum paylaşımı amacıyla kullanmadıklarını belirtmiştir.

Tablo 9. Sosyal Medya'yı ilgi duyduğum konularda fikir alışverişi amacıyla kullanım.

	Frequency	Percent	Valid Percent	Cumulative Percent
Kesinlikle katılmıyorum	19	19,0	19,0	19,0
Katılmıyorum	11	11,0	11,0	30,0
Valid Kararsızım	19	19,0	19,0	49,0
Katılıyorum	28	28,0	28,0	77,0
Kesinlikle katılıyorum	23	23,0	23,0	100,0
Total	100	100,0	100,0	

Tablo 9'a göre "Sosyal Medya'yı ilgi duyduğum konularda fikir alışverişi amacıyla kullanım" anket sorusuna cevap verenlerin %19'u (19 kişi) kesinlikle katılmıyorum, %11'i (11 kişi) katılmıyorum, %19'u (19 kişi) kararsızım, %28'i (28 kişi) katılıyorum, %23'ü (23 kişi) kesinlikle katılıyorum cevabını vermiştir. Sonuç olarak katılımcıların % 28'si sosyal medyayı ilgi duydukları konularda fikir alışverişi amacıyla kullandıklarını belirtmiştir.

Tablo 10. Sosyal Medya'yı alışveriş tercihlerimi belirlemek amacıyla kullanımım.

	Frequency	Percent	Valid Percent	Cumulative Percent
Kesinlikle katılmıyorum	38	38,0	38,0	38,0
Katılmıyorum	19	19,0	19,0	57,0
Valid Kararsızım	18	18,0	18,0	75,0
Katılıyorum	11	11,0	11,0	86,0
Kesinlikle katılıyorum	14	14,0	14,0	100,0
Total	100	100,0	100,0	

Tablo 10'a göre "Sosyal Medya'yı alışveriş tercihlerimi belirlemek amacıyla kullanımım" anket sorusuna cevap verenlerin %38'i (38 kişi) kesinlikle katılmıyorum, %19'u (19 kişi) katılmıyorum, %18'i (18 kişi) kararsızım, %11'i (11 kişi) katılıyorum, %14'ü (14 kişi) kesinlikle katılıyorum cevabını vermiştir. Sonuç olarak katılımcıların % 38'i sosyal medyayı alışveriş tercihlerini belirlemek amacıyla kullanmadıklarını belirtmiştir.

Tablo 11. Sosyal Medya'yı gündelik problemlerime çözüm bulmak amacıyla kullanımım.

	Frequency	Percent	Valid Percent	Cumulative Percent
Kesinlikle katılmıyorum	24	24,0	24,0	24,0
Katılmıyorum	19	19,0	19,0	43,0
Valid Kararsızım	25	25,0	25,0	68,0
Katılıyorum	21	21,0	21,0	89,0
Kesinlikle katılıyorum	11	11,0	11,0	100,0
Total	100	100,0	100,0	

Tablo 11'e göre "Sosyal Medya'yı gündelik problemlerime çözüm bulmak amacıyla kullanımım" anket sorusuna cevap verenlerin %24'ü (24 kişi) kesinlikle katılmıyorum, %19'u (19 kişi) katılmıyorum, %25'i (25 kişi) kararsızım, %21'i (21 kişi) katılıyorum, %11'i (11 kişi) kesinlikle katılıyorum cevabını vermiştir. Sonuç olarak katılımcıların % 38'i sosyal medyayı gündelik problemlerine çözüm bulmak amacıyla kullanmak konusunda kararsız kaldıklarını belirtmiştir.

Tablo 12. Sosyal Medya'yı kendimi ifade etmek amacıyla kullanımım.

	Frequency	Percent	Valid Percent	Cumulative Percent
Kesinlikle katılmıyorum	30	30,0	30,0	30,0
Katılmıyorum	24	24,0	24,0	54,0
Valid Kararsızım	16	16,0	16,0	70,0
Katılıyorum	17	17,0	17,0	87,0
Kesinlikle katılıyorum	13	13,0	13,0	100,0
Total	100	100,0	100,0	

Tablo 12'ye göre "Sosyal Medya'yı kendimi ifade etmek amacıyla kullanımım" anket sorusuna cevap verenlerin %30'u (30 kişi) kesinlikle katılmıyorum, %24'ü (24 kişi) katılmıyorum, %16'sı (16 kişi) kararsızım, %17'si (17 kişi) katılıyorum, %13'ü (13 kişi) kesinlikle katılıyorum cevabını vermiştir. Sonuç olarak katılımcıların % 30'u sosyal medyayı kendini ifade etmek amacıyla kullanmadıklarını belirtmiştir.

Tablo 13. Sosyal Medya'yı bilgiye erişim amacıyla kullanımım.

	Frequency	Percent	Valid Percent	Cumulative Percent
Kesinlikle katılmıyorum	11	11,0	11,0	11,0
Katılmıyorum	8	8,0	8,0	19,0
Valid Kararsızım	13	13,0	13,0	32,0
Katılıyorum	30	30,0	30,0	62,0
Kesinlikle katılıyorum	38	38,0	38,0	100,0
Total	100	100,0	100,0	

Tablo 13'e göre "Sosyal Medya'yı bilgiye erişim amacıyla kullanımım" anket sorusuna cevap verenlerin %11'i (11 kişi) kesinlikle katılmıyorum, %8'i (8 kişi) katılmıyorum, %13'ü (13 kişi) kararsızım, %30'u (30 kişi) katılıyorum, %38'i (38 kişi) kesinlikle katılıyorum cevabını vermiştir. Sonuç olarak katılımcıların % 38'i sosyal medyayı bilgiye erişim amacıyla kullandıklarını belirtmiştir.

Tablo 14. Sosyal Medya'yı kişisel gelişimime katkı sağlamak amacıyla kullanımım.

	Frequency	Percent	Valid Percent	Cumulative Percent
Kesinlikle katılmıyorum	23	23,0	23,0	23,0
Katılmıyorum	23	23,0	23,0	46,0
Valid Kararsızım	32	32,0	32,0	78,0
Katılıyorum	9	9,0	9,0	87,0
Kesinlikle katılıyorum	13	13,0	13,0	100,0
Total	100	100,0	100,0	

Tablo 14'e göre "Sosyal Medya'yı kişisel gelişimime katkı sağlamak amacıyla kullanımım" anket sorusuna cevap verenlerin %23'ü (23 kişi) kesinlikle katılmıyorum, %23'ü (23 kişi) katılmıyorum, %32'si (32 kişi) kararsızım, %9'u (9 kişi) katılıyorum, %13'ü (13 kişi) kesinlikle katılıyorum cevabını vermiştir. Sonuç olarak katılımcıların % 32'si sosyal medyayı kişisel gelişimlerine katkı sağlamak amacıyla kullandıkları konusunda kararsız kaldıklarını belirtmiştir.

Tablo 15. Sosyal Medya'yı taraftarı olduğum kişi ve organizasyonları takip etmek amacıyla kullanımım.

	Frequency	Percent	Valid Percent	Cumulative Percent
Kesinlikle katılmıyorum	21	21,0	21,0	21,0
Katılmıyorum	14	14,0	14,0	35,0
Valid Kararsızım	20	20,0	20,0	55,0
Katılıyorum	24	24,0	24,0	79,0
Kesinlikle katılıyorum	21	21,0	21,0	100,0
Total	100	100,0	100,0	

Tablo 15'e göre "Sosyal Medya'yı taraftarı olduğum kişi ve organizasyonları takip etmek amacıyla kullanımım" anket sorusuna cevap verenlerin %21'i (21 kişi) kesinlikle katılmıyorum, %14'ü (14 kişi) katılmıyorum, %20'si (20 kişi) kararsızım, %24'ü (24 kişi) katılıyorum, %21'i (21 kişi) kesinlikle katılıyorum cevabını vermiştir. Sonuç olarak katılımcıların % 24'ü sosyal medyayı taraftarı oldukları kişi ve organizasyonları takip etmek amacıyla kullandıklarını belirtmiştir.

Tablo 16. Sosyal Medya'yı arkadaşlarıma yüz yüze söyleyemediğim şeyleri söylemek amacıyla kullanırım.

	Frequency	Percent	Valid Percent	Cumulative Percent
Valid Kesinlikle katılmıyorum	46	46,0	46,0	46,0
Katılmıyorum	20	20,0	20,0	66,0
Kararsızım	14	14,0	14,0	80,0
Katılıyorum	7	7,0	7,0	87,0
Kesinlikle katılıyorum	13	13,0	13,0	100,0
Total	100	100,0	100,0	

Tablo 16'ya göre "Sosyal Medya'yı arkadaşlarıma yüz yüze söyleyemediğim şeyleri söylemek amacıyla kullanırım" anket sorusuna cevap verenlerin %46'sı (46 kişi) kesinlikle katılmıyorum, %20'si (20 kişi) katılmıyorum, %14'ü (14 kişi) kararsızım, %7'si (7 kişi) katılıyorum, %13'ü (13 kişi) kesinlikle katılıyorum cevabını vermiştir. Sonuç olarak katılımcıların % 46'sı sosyal medyayı arkadaşlarıma yüz yüze söyleyemediğim şeyleri söylemek amacıyla kullanırım sorusuna katılmadıklarını belirtmiştir.

Tablo 17. Sosyal Medya'yı mutsuz olduğumda beni mutsuz eden etkenlerden uzaklaşmak amacıyla kullanırım.

	Frequency	Percent	Valid Percent	Cumulative Percent
Valid Kesinlikle katılmıyorum	23	23,0	23,0	23,0
Katılmıyorum	12	12,0	12,0	35,0
Kararsızım	20	20,0	20,0	55,0
Katılıyorum	25	25,0	25,0	80,0
Kesinlikle katılıyorum	20	20,0	20,0	100,0
Total	100	100,0	100,0	

Tablo 17'ye göre "Sosyal Medya'yı mutsuz olduğumda beni mutsuz eden etkenlerden uzaklaşmak amacıyla kullanırım" anket sorusuna cevap verenlerin %23'ü (23 kişi) kesinlikle katılmıyorum, %12'si (12 kişi) katılmıyorum, %20'si (20 kişi) kararsızım, %25'si (25 kişi) katılıyorum, %20'si (20 kişi) kesinlikle katılıyorum cevabını vermiştir. Sonuç olarak katılımcıların % 25'i sosyal medyayı mutsuz olduklarında kendilerini mutsuz eden etkenlerden uzaklaşmak amacıyla kullandıklarını belirtmiştir.

Tablo 18. Yaş İçin Anova Testi

		Sum of Squares	df	Mean Square	F	Sig.
Sosyal Medya'yı kendimi ifade etmek amacıyla kullanırım.	Between Groups	12,218	2	6,109	3,221	,044
	Within Groups	183,972	97	1,897		
	Total	196,190	99			
Sosyal Medya'yı mutsuz olduğumda beni mutsuz eden etkenlerden uzaklaşmak amacıyla kullanırım.	Between Groups	15,922	2	7,961	4,010	,021
	Within Groups	192,588	97	1,985		
	Total	208,510	99			

Tablo 18'e göre hesaplanan α değeri ($\alpha:0,044, 0,21 < \alpha:0,05$) 0,05'den küçük olduğu için "Sosyal Medya'yı kendimi ifade etmek amacıyla kullanırım" anket sorusunda 10-13 ile 14-17 yaşları arasında anlamlı bir fark bulunmaktadır. "Sosyal Medya'yı mutsuz olduğumda beni mutsuz eden etkenlerden uzaklaşmak amacıyla kullanırım" anket sorusunda 6-9 ile 14-17 yaşları arasında ve 10-13 ile 14-17 yaşları arasında anlamlı bir fark bulunmaktadır.

Tablo 19. Sınıf Düzeyine Göre Anova Testi

		Sum of Squares	df	Mean Square	F	Sig.
Sosyal medya sitelerindeki içerikler hakkında yorum yapmak hoşuma gidiyor.	Between Groups	14,401	2	7,200	3,683	,029
	Within Groups	189,639	97	1,955		
	Total	204,040	99			

Tablo 19'a göre hesaplanan α değeri ($\alpha:0,029 < \alpha:0,05$) 0,05'den küçük olduğu için "Sosyal medya sitelerindeki içerikler hakkında yorum yapmak hoşuma gidiyor" anket sorusunda 2-4. ile 5-7. sınıf düzeyleri arasında anlamlı bir fark bulunmaktadır.

Tablo 20. Yeni Medya Kullanım Sıklığına Göre Anova Testi

		Sum of Squares	df	Mean Square	F	Sig.
Sosyal Medya'yı kişisel gelişimime katkı sağlamak amacıyla kullanırım.	Between Groups	16,970	4	4,242	2,733	,033
	Within Groups	147,470	95	1,552		
	Total	164,440	99			
Sosyal Medya'yı taraftarı olduğum kişi ve organizasyonları takip etmek amacıyla kullanırım.	Between Groups	23,860	4	5,965	3,128	,018
	Within Groups	181,140	95	1,907		
	Total	205,000	99			

Tablo 20'ye göre hesaplanan α değeri ($\alpha:0,033$ ve $018 < \alpha:0,05$) $0,05$ 'den küçük olduğu için "Sosyal Medya'yı kişisel gelişimime katkı sağlamak amacıyla kullanırım" ve "Sosyal Medya'yı taraftarı olduğum kişi ve organizasyonları takip etmek amacıyla kullanırım" anket sorularına cevap veren katılımcıların ayda birkaç defa yeni medya kullanımı ile her gün bir defadan fazla yeni medya kullanımı arasında anlamlı bir fark bulunmaktadır.

Tablo 21. İnternet Kullanım Sıklığına Göre Anova Testi

		Sum of Squares	df	Mean Square	F	Sig.
Sosyal medya sitelerinde gördüğüm paylaşımları arkadaşlarımla sohbet konusu yapmak hoşuma gidiyor.	Between Groups	25,351	4	6,338	3,371	,013
	Within Groups	178,609	95	1,880		
	Total	203,960	99			

Tablo 21'e göre hesaplanan α değeri ($\alpha:0,013 < \alpha:0,05$) $0,05$ 'den küçük olduğu için "Sosyal medya sitelerinde gördüğüm paylaşımları arkadaşlarımla sohbet konusu yapmak hoşuma gidiyor" anket sorusuna cevap veren katılımcıların haftada 1-2 gün ile her gün internet kullanım sıklığı arasında anlamlı bir fark bulunmaktadır.

Tablo 22. Sosyal Medya Kullanımına Göre Anova Testi

		Sum of Squares	df	Mean Square	F	Sig.
Sosyal Medya'yı taraftarı olduğum kişi ve organizasyonları takip etmek amacıyla kullanırım.	Between Groups	18,644	3	6,215	3,201	,027
	Within Groups	186,356	96	1,941		
	Total	205,000	99			
Sosyal medya sitelerinde gördüğüm paylaşımları arkadaşlarımla sohbet konusu yapmak hoşuma gidiyor.	Between Groups	18,523	3	6,174	3,196	,027
	Within Groups	185,437	96	1,932		
	Total	203,960	99			

Tablo 22'ye göre hesaplanan α değeri ($\alpha:0,027 < \alpha:0,05$) 0,05'den küçük olduğu için "Sosyal Medya'yı taraftarı olduğum kişi ve organizasyonları takip etmek amacıyla kullanırım" ve "Sosyal medya sitelerinde gördüğüm paylaşımları arkadaşlarımla sohbet konusu yapmak hoşuma gidiyor" anket sorularına cevap veren katılımcıların facebook kullanımı ile instagram kullanımı arasında anlamlı bir farklılık bulunmaktadır.

TARTIŞMA VE SONUÇ

Bu araştırmada Türkiye'de üstün zekâlı öğrencilerin yeni medyaya karşı tutumları ve yeni medyayı kullanım düzeylerini belirlemek için; yeni medya kullanım amaçları ve sosyal medya tutum ölçeği anket soruları İzmit Bilim ve Sanat Merkezi'nde eğitim gören 477 öğrenciden rastgele örneklem ile 50 erkek öğrenci ve 50 kız öğrenci olmak üzere toplamda 100 kişiye uygulanmıştır. Katılımcıların % 21'i (21 kişi) 6-9 yaş, %63'ü (63 kişi) 10-13 yaş, %16'sı (16 kişi) 14-17 yaş aralığındadır. Katılımcıların %7'si (7kişi) 2.sınıf, % 10'u (10 kişi) 3.sınıf, %28'i (28 kişi) 4.sınıf, %8'i (8 kişi) 5. sınıf, %9'u (9 kişi) 6.sınıf, %22'si (22 kişi) 7.sınıf, %13'ü (13 kişi) 8.sınıf, %2'si (2 kişi) 9.sınıf, %1'i (1 kişi) 10.sınıf öğrencilerinden oluşmaktadır.

Cinsiyet için uygulanan t testi sonucunda "Sosyal Medya'yı akademik bilgi paylaşımı (ödev, proje vb.) amacıyla kullanırım. Sosyal Medya'yı ilgi duyduğum konularda fikir alışverişi amacıyla kullanırım. Sosyal Medya'yı gündelik problemlerime çözüm bulmak amacıyla kullanırım" anket sorularında hesaplanan α değeri ($\alpha:0,020 < \alpha:0,05$) 0,05'den küçük olduğu için cinsiyete göre anlamlı bir farklılığın olduğu sonucuna ulaşılmıştır.

Yeni medya kullanımlarına göre katılımcılardan %3'ü (3 kişi) facebook, %68'i (68 kişi) youtube, %10'u (10 kişi) instagram, %19'u (19 kişi) whatsapp kullanmıştır. 68 kişi ile en çok youtube kullanılmaktadır. İnternet kullanım sıklığına göre %51'i (51 kişi) her gün, %20'si (20 kişi) haftada 1-2 gün, %23'ü (23 kişi) haftada 3-5 gün, %4'ü (4 kişi) ayda 1-2 gün,

% 2'si (2 kişi) ayda 3-5 gün interneti kullanmaktadır. Katılımcıların %34'ü (34 kişi) her gün bir defadan fazla, %20'si (20 kişi) her gün bir defa, %19'u (19 kişi) haftada birden fazla, %4'ü (4 kişi) haftada bir defa, % 23'ü (23 kişi) ayda birkaç defa yeni medyayı kullanmaktadır. 6-9 ile 14-17 yaşları arasında ve 10-13 ile 14-17 yaşları arasındaki katılımcıların sosyal medyayı kendilerini ifade etme ve kendilerini mutsuz eden etkenlerden uzaklaşmak için kullandıkları; sosyal medya içerikleri hakkındaki yorumların 2-4. ile 5-7. sınıfları arasında farklılık gösterdiği sonucuna ulaşılmıştır.

Anket sorularında Otrar ve Argın'nın (2015) sosyal medya tutum ölçeğinden yararlanılmıştır. Tüm ölçeğin ve alt boyutlarının güvenilirlik katsayıları (Cronbach α), faktör bazında ayırt edicilik işlemleri, madde-kalan ve madde-toplam korelasyonları, faktörler arası ilişki analizleri ve test-tekrar test yöntemi ile devamlılık katsayısı hesaplamaları yapılmıştır. Belirlenen faktörler "paylaşım ihtiyacı", "sosyal yetkinlik", "sosyal izolasyon" ve "öğretmenlerle ilişki" olarak adlandırılmıştır. Faktörler arası ilişkileri belirlemek için yapılan korelasyon analizi sonucunda faktörler arasında ve tüm faktörlerle toplam puan arasında pozitif yönde anlamlı ilişki olması, ölçekteki tüm faktörlerin aynı yapı içinde olduklarını ortaya koymaktadır. Test tekrar test güvenilirlik katsayıları da her bir alt boyut için anlamlı ve tüm ölçek için hesaplanan korelasyon katsayısı anlamlı bulunmuştur.

TWENTY-SEVEN YEARS OF TECHNOLOGY IN PRACTICE: A META-ANALYSIS AND SYSTEMATIC REVIEW ON BLENDED LEARNING

Malissa Maria MAHMUD

Centre for American Education, Sunway University, No. 5, Jalan Universiti, Bandar Sunway,
47500 Petaling Jaya, Selangor, Malaysia
malissam@sunway.edu.my

ABSTRACT

Over the past decades, radical change in underlying beliefs or theory in the context of teaching and learning has instigated significant presence and emergence of web-based instruction termed as blended learning. Current literature juxtaposes that blended learning has inevitably permeated and transformed the topography and landscape of educational practices by becoming one of the paramount game changers. However, in the same disposition, it also depicts less consideration given to the imminent gaps in the blended learning experience, consequently indicating a scarcity of evidence in the context of these technological interventions. With the objective of synthesizing existing researches on blended teaching and learning, ninety-six samples were included through the employment of meta-analysis encompassing a meticulous and thorough search plan and strategy which resulting a priori; to reduce biasness and ambiguity as well as to improve transparency and rigor in order to probe into the magnitude and power of effect sizes (ESs). The ESs yielded from the 96 samples were acquired from the application of Cohen's *d* formula (1988; 1992) by which the estimation was done using the standardized mean difference score, divided by the standard deviation pooled across the treatment and control group. Collectively, the findings suggest that blended learning is highly potent in increasing learners' performance; however, it could well be attributed to the majority of samples focusing on performance as either their primary or sole dependent variable. It is asserted that the secondary dependent variables of blended learning found from the 96 samples should not be disregarded as they could potentially lead to improved performance. However, it is important to note that samples which yielded a negative ES; the adversity of the treatment incorporated in the blended learning approach, had in a way contributed to the inverse repercussions that the intervention had resulted onto the treatment groups.

Keywords: Blended Learning, Meta-analysis, Effect Sizes (ESs), Cohen's *d*

INTRODUCTION

Education is a design-oriented field like engineering or architecture; it is concerned with tradeoffs involving cost, efficiency, and effectiveness, and the foundational challenge of blended learning research is seeking to understand what humans do very well and what machines do very well, so that the strengths of both can be maximized as they are blended in the service of learning. In this context, a huge amount of budding literature investigates how blended learning is incrementally becoming an alternative for many classroom instructional strategies. In addition, it has also been suggested that blended learning is considered the perfect approach since it is a marriage of the best elements of two practices (Bele & Rugelj, 2007). More recently, empirical literature has emerged that offers fascinating findings about blended learning with the disquisition of numerous blended learning approaches (Boyle, Bradley, Chalk, Jones, & Pickard, 2003; Garrison & Vaughan, 2011; Hoic-Bozic, Mornar, & Boticki, 2009; Huang & Zhou, 2005; McCarthy, 2010; Newcombe, 2011). Over the past decades, technology has been regarded as an apparatus that possess the capability to encourage and foster better achievement and simultaneously scaffold and strengthen existing teaching and learning pedagogies. The recent trends of teaching and learning inclines towards technology in which various Information Communication Technology (ICT) and Computer-Assisted Interventions (CAI) have been introduced (Archer, Savage, Sanghera-Sidhu, Wood, Gottardo, & Chen, 2014). Nevertheless, the exact position or role of technology, in particular in creating prolific learning processes, is yet to be ascertained even though extensive studies have been carried out since the 1960s.

THE STUDY

With more than 60 meta-analyses available since the 1980s, each of the analyses have successfully focused on questions addressing diverse features including subject matter, grade level and category of diverse technology employed in the context of teaching and learning by providing precious compositions of data. To date, there is only one meta-analysis devoted to blended learning (Means, Toyana, Murphy, & Baki, 2013) and this study was conducted fundamentally on the meta-analysis of the US Department of Education which was originally

published in 2009, subsequently was updated in 2010 (Means, Toyana, Murphy, Bakia, & Jones, 2010) and it was discovered that blended learning conditions were found to hold significant advantages and benefits over classroom instruction. Due to this, many institutions are beginning to employ blended learning to participate in this revolutionary concept. Despite the snowballing number of researchers and educators eagerly implementing blended learning, some failed to understand and realize its fundamental philosophy, implications and transformative potential. Furthermore, with the widespread adoption of blended learning as the new traditional instructional model; the pedagogical approach indubitably has the potential to be a game changer in the landscape of teaching and learning. Thus, with the objective of synthesizing existing researches on blended teaching and learning, this study aims to examine the powerful effect sizes in the identified blended learning studies through the employment of meta-analysis encompassing a meticulous and thorough search plan and strategy.

METHODOLOGY

This study utilized meta-analysis as the instrument to reap a thorough understanding of the posted research problems. Theoretically, meta-analysis applies a statistical approach to coalesce findings from multiple studies in an attempt to obtain a better indication of the significance or magnitude of these combined studies, rather than just referring to individual studies; hence, this would improve estimates of the strength or magnitude of the ES and resolve ambiguity and equivocality when reports differ in findings. Greenberg, Robins, and Walker (2005) state that meta-analytical procedures assist the synthesis of quantitative research findings. The existing data coming from numerous sources offers robust and comprehensive findings. According to Christmann and Badgett (2003), the procedures involved in the statistical process of meta-analysis could facilitate in answering new research questions and narrowing gaps in the existing data. Hence, it was deemed apt to use statistical meta-analysis as an investigative procedure to gauge the effect of a myriad of instructional approaches in the context of blended learning. Under the conditions presented, the strength of the calculated ES for the included blended learning samples was gauged to yield a strength of either small, medium or large.

To obtain eligible studies, Wiley Online Library, Taylor & Francis Online, Springer, ERIC, Elsevier, ScienceDirect, ResearchGate, ProQuest, JSTOR, IEEE, Sage Journals, APA PsycNET, CALICO Journal, Penn State University Library, Editlib, IGI Global, anitacrawley.net, ascilite.org.au / ajet.org.au, and Questia were scanned systematically from the year 1988 to 2015. When scanning the databases, keywords such as “control vs. treatment groups”, “blended learning” and “dependent measures” were used to examine existing and published studies. Keywords for “control” and “treatment” involved definite interventions such as computer-assisted programs and courseware. Keywords for “blended learning” included the use of technology in the aspect of delivery and approach. Keywords for “dependent measures” included how the dependent variable was measured against the independent variable. A total of 3,558 titles were scanned before a thorough read was done. The titles acquired from the searches were carefully scrutinized prior to study selection to eliminate those that clearly did not meet the inclusion criteria. Eligible and potential studies were found via local library and inter-library databases as well as via Google and Google Scholar searches. In addition to the searches, the reference or bibliography list of obtained studies were also reviewed and scrutinized to look for any potential and eligible studies. Table 1 below entails the detailed statistics of the search and inclusion process from databases.

Inclusion Criteria

All the included blended learning samples were highly relevant and pertinent to this study. This was crucial in obtaining a robust representation of the study of blended learning. The number of scholarly research articles chosen for the study was 96 samples, all selected between the years of 1988 to 2015. According to Glass (1977), in a meta-analysis, “the number of studies needed to estimate accurately an aggregate effect size is partly a function of the variance of effect sizes” (p. 377). Therefore, if the studies are relatively homogeneous, then a few studies “may determine accurately the effect” (Glass, 1977, p. 377); likewise, if studies are found to be heterogeneous, then a bigger number of studies are essential. Henceforth, a total of 96 samples were sufficiently robust to obtain the facets presented in the blended learning studies. These 96 samples comprised of studies allied to experimental research studies since the values attained from the studies were converted into ES. In this circumstance, the total of 96 samples which comprised of articles pertaining to language related blended learning studies and other subjects related to blended learning studies, were deemed as pertinent to gauge the ES.

Studies published in the early 1980s were not selected since technology during that period of time was relatively unsophisticated compared to current circumstances. In addition, all articles were ensured pertinent by recognizing the commissioning of terms acknowledged in the literature on blended learning (Graham, 2006), which contained (a) blended, (b) hybrid, and (c) technological intervention. These terms primarily include “technology”, “computer”, “web-based instruction”, “online”, “Internet”, “blended learning”, “hybrid course”, “simulation”, “electronic”, “multimedia”, “Second Language Acquisition (SLA)”, “second language learning”, “grammatical”, “lexical”, “oral”, “reading”, “writing”, “speaking”, and “vocabulary”. The samples encompassed in the meta-analysis were carefully chosen based on a set of detailed criteria adapted from pertinent meta-analysis studies (Bernard et al., 2009; Means et al., 2013; Tamim et al., 2011; Means et al., 2010; Sitzmann et al., 2006; Cook et al., 2008). The criteria are as follows:

1. There must be some intervention or treatment used in the study.
2. Intervention effectiveness must be measured in terms of the mean for both experimental and controlled groups.
3. Quantitative data must be reported; means, standard deviations, results of statistical tests, *p* values, etc. from which an ES could be calculated for any related outcome variable.
4. Studies which used experimental or quasi-experimental designs that equated subject groups attaining identifiable treatments with one or more control conditions. Control conditions may have received “no treatment,” “instruction as usual,” or arrangement as a distinction to the treatment condition that did not signify a determined effort to produce change.
5. Studies must be reported in English.

Meta-analysis encompasses a meticulous and thorough search plan and strategy which resulting a priori, with the aim to reduce biasness and ambiguity. The search plan and strategy are performed by ascertaining, evaluating, and synthesizing all relevant studies on a specific topic. In this context, by means of statistical methods to synthesize the data from the included samples into a quantitative estimate or ES (Petticrew & Roberts, 2006). One of the regulating factors of the search plan and strategy is to establish and determine the inclusion criteria to avert or and minimize ambiguity and biasness, as well as to improve transparency and rigour. The criteria are typically set a priori and on the basis of a framework (Moher, Liberati, & Tetzlaff, 2010). However, forming extremely narrow inclusion criteria would lead to the possibility of eligible evidence being excluded and inaccurate inclusion criteria would consequently produce poor results. Thus, deciding on the key components to be included as the criteria is essential before the review. For instance, this study determined the priority of the

outcome and types of intervention. In addition, it is also critical to operationalize the definitions of what types of studies to include and exclude, for example quasi-experimental designs. At this juncture, the retrieval and review of abstracts to meet the inclusion criteria would result in a full review.

Included Samples

The 96 included samples were derived from 18 specific databases and one miscellaneous database. It was observed, from various meta-analysis studies, that there was no indication of the minimum or maximum number of studies required for pooled analysis. According to Valentine, Pigott, and Rothstein (2010), “researchers will need to postulate a typical within-study sample size and will also need to either (a) determine the smallest important effect size given the research context or (b) make an educated guess about the effect size that is likely to be found” (p. 233). The selection of samples was grounded on the basis of the established inclusion criteria and was done on the basis that the final pool of samples robustly represented the blended learning research. A total of 96 scholarly research articles, ranging from the years 1988 to 2015, were purposively selected as samples for this study. To meet the criterion of comprehensiveness and minimize what is known as the publication bias phenomenon, it was necessary to look beyond the published literature to include grey literature encompassing (a) conference presentations, (b) dissertations, (c) theses, (d) research reports for grants and government agencies, (e) organizational archives and so forth. For a complete picture of the literature, a diversity of bibliographic and full-text databases was searched comprehensively, including those in related fields. Table 2 below encapsulates the 96 samples included in this study according to range of year, clustered by three identified and established cohorts.

Calculation of Effect Sizes (ESs)

To calculate treatment versus control ES, the indicator used for the purpose of this study was the standardized mean difference score, defined as the difference between the posttest mean of the treatment group and the posttest mean of the control group divided by the standard deviation pooled across the treatment and control groups (Cohen, 1988; Mark, Lipsey & Wilson, 2001). The mean difference ESs were computed independently for each treatment versus control group, in relevance to samples that comprised of one treatment and one control group, as well as samples that comprised of a number of treatment and control groups. Hence, some samples interposed a number of ESs due to the several treatment groups and several outcome measures. However, it has to be noted that there were some ESs yielded from this study that were inflated or categorized as having a small ES. This is due to the small sample sizes, predominantly sample sizes smaller than 20 (Hedges, 1981). At this juncture, the juxtaposition of samples with a small ES would not compromise the findings of this study as the ESs across the included 96 samples were not compared to one another. Instead, any included sample was treated as an independent sample where the comparison was done between the control versus the experimental group, which belong in the same sample.

The 96 samples of this study were categorized into two groups: (a) single-variable, and (b) multi-variable samples. The distinction between both groups comes from the number of dependent variables that a sample is identified with. For example, Heiman (2008) contains more than one dependent variable: (a) satisfaction, and (b) performance. Therefore, it was categorized as a multi-variable sample. The differentiation between these two groups proved to be crucial in a calculation that involved averaging the ES as multiple variables were being investigated. Though averaging the multiple ESs in a sample may not provide its specific intent and findings in terms of definite variables, the overall effectiveness of the intervention was able to be deduced. According to Rosenthal (1991), the ES is calculated when the mean difference between experimental and control groups are the numerator and the Pooled Standard Deviation (PSD) is the denominator. Samples with data in the form of t value, F value, p level and frequency are calculated using formulas provided by Mark, Lipsey and Wilson (2001). The calculation of ES is executed to indicate the power of the facets investigated. ES is a means of quantifying the variance between two groups, which could provide benefits over the other tests of statistical significance; thus, it highlights the size of the difference rather than confounding with sample size. For this study, the calculation of the ES employed Cohen's d (1988; 1992, p. 157) formula where the value was derived from the subtraction between the mean value of the experimental group and the mean value of the controlled group, and subsequently divided with the standard deviation of the experimental group. However, if the value was not provided, a pooled value from both groups were utilized. Formula 1 and 2 were employed as follow.

Formula 1: The ES is the standardized mean difference between two groups

$$d = \frac{\text{Mean}(\text{experimental}) - \text{Mean}(\text{control})}{\text{pooled: Std. dev.}}$$

Alternatively, if the mean values were not given, the t -test was used instead. Cohen's d in relation to t -test could be employed as the formula.

Formula 2: Cohen's d in relation to t -test is used as formula

$$d = \frac{t}{\sqrt{df}}$$

- Where t is the value of t -test and df is the degree of freedom.
- Degree of freedom is computed by the following formula:

$$df = n1 + n2 - 2$$

- Where $n1$ is the sample size of the 1st group, and $n2$ is the sample size of the 2nd group.

As mentioned above, the number of ESs yielded by a sample correlates with the number of dependent variables identified. Due to the multiple ESs associated, multi-variable samples such as Dracopoulos (2012) and Adileh (2012) would need to undergo an additional step in calculation, as opposed to single-variable samples like Fuente (2003) which only require the application of either Formula 1 or 2. In this context, for every multi-variable sample, the average ES was calculated by taking the sum of each ES yielded by the respective

dependent variable, and dividing the values by the number of corresponding dependent variables as shown in calculation 1 below.

Calculation 1: Average ES of multi-variable samples
Interpretation of ES

$$\text{Average Effect Size} = \frac{\text{Sum of Effect Size}}{\text{Number of Dependent Variables}}$$

- Where *Effect Size(ES)* are the individual ES associated with the different dependent variables of a multi-variable sample

Table 3: Cohen's Interpretation of Effect Sizes

Cohen's Standard	Effect Size (ES)	Percentile Standing	Percentage of Non-Overlap
	2.0	97.7	81.1%
	1.9	97.1	79.4%
	1.8	96.4	77.4%
	1.7	95.5	75.4%
	1.6	94.5	73.1%
	1.5	93.3	70.7%
	1.4	91.9	68.1%
	1.3	90	65.3%
	1.2	88	62.2%
	1.1	86	58.9%
	1.0	84	55.4%
Large	.9	82	51.6%
	.8	79	47.4%
	.7	76	43.0%
Medium	.6	73	38.2%
	.5	69	33.0%
	.4	66	27.4%
Small	.3	62	21.3%
	.2	58	14.7%
	.1	54	7.7%
	.0	50	0%

Note: Cohen (1988, p. 25).

Table 3 illustrates the interpretation of strength, a benchmark supplemented by Cohen (1988) that is used to gauge and to interpret the strength of ES. Cohen cautiously defined ES as (a) "small, $d = .2$ ", (b) "medium, $d = .5$ ", and (c) "large, $d = .8$ ", stating that "there is a certain risk inherent in offering conventional operational definitions for those terms for use in power analysis in as diverse a field of inquiry as behavioural science" (p. 25). Later in the year 1996, Rosnow and Rosenthal added a category of "very large" which is equivalent to or greater than $d = 1.30$ (p. 37). ES can also be interpreted using the average percentile standing of the average of the experimental group compared to the average of the controlled group. For instance, an ES of .0 shows that the mean of the experimental group is at the 50th percentile of the controlled group. In addition, ESs can also be interpreted in terms of the percentage of non-overlap of the experimental group's scores with those of the controlled group. An ES of .0 indicates that when the distribution of scores for the treated group overlaps completely with the distribution of scores for the untreated group, there is 0% of non-overlap.

FINDINGS AND DISCUSSION

The findings show that all the ESs generated from the 96 samples were acquired from the application of Cohen's d formula (1988; 1992) by which the calculation was done using the standardized mean difference score, defined as the difference between the posttest mean of the treatment group and the posttest mean of the control group divided by the standard deviation pooled across the treatment and control groups. However, some samples had interposed a number of ESs due to the several treatment groups and several outcome measures; these multi-variable samples had their ESs averaged to obtain the final ES for interpretation.

Firstly, a small effect shows that there is a minimal difference between the mean scores of both the control and treatment groups, meaning the intervention yielded little effect. Cohen (1969) described a small effect as the difference in height between girls in United States aged 15 and 16. Meanwhile, a medium effect depicts a

considerable improvement for the treatment group after the intervention. For instance, the height difference between 14-year-olds and 18-year-olds is “large enough to be visible to the naked eye” (Cohen, 1969, p. 23). On the other hand, a large effect signifies a difference “grossly perceptible” (Cohen, 1969, p. 23), proving that the intervention is considerably successful and effective. For this, Cohen (1969) exemplified with the difference in performance on an IQ test between PhD degree holders and college freshmen. Similarly, other researchers also offer their respective examples and benchmarks, apart from Cohen’s interpretation, to provide a clearer picture in interpreting the strengths of ES. For instance, Glass, McGaw and Smith (1981) associated an ES of 1.0 with the difference of one year of schooling on elementary students’ performance in achievement tests, while Vincent and Crumpler (1997) proposed that an ES of .3 is observed during “the increase in a spelling age from 11 to 12” (Coe, 2002, p. 6). In addition, an improvement of one England GCSE grade corresponds to an ES of .5 to .7 (Coe, 2002). Cohen (1988, p. 25) cautioned on the use of the terms like “small”, “medium” and “large” that are applied out of context. A small ES does not mean that the samples in question are poor or bad; it simply means the positive effects of intervention were marginally visible between the treatment and control groups. A negative ES however, does indicate the control group outperformed the treatment group, suggesting that the intervention backfired. Nevertheless, one must be careful with the interpretation of ESs.

Table 4: Samples with a Large Effect Size

Cohort	No.	Sample	Dependent Variable(s)	Effect Size
Language (n=14)	1	Behjat, Yamini, & Bagheri (2011)	Performance	3.000
	2	Hlas, Schuh, & Alessi (2007)	Performance	2.920
	3	Satar & Özdener (2008)	Performance	1.630
	4	Al-Qahtani & Higgins (2013)	Performance	1.350
	5	Al-Sorailey-Alqahtani (2010)	Performance	1.350
	6	Toro (1995)	Performance, Attitude	1.210
	7	Mioduser, Tur-Kaspa, & Leitner (2000)	Performance	1.200
	8	Al-Jarf (2007)	Performance	1.180
	9	Owston, Murphy, & Wideman (1991)	Performance, Attitude	1.135
	10	Cahill & Cantazaro (1997)	Performance	1.060
	11	Adas & Bakir (2013)	Performance	1.000
	12	Nicolson, Fawcett, & Nicolson (2000)	Performance	1.000
	13	Sequeira (2009)	Performance	.860
	14	Vollands, Topping, & Evans (1999)	Performance	.820
Science and Technology (n=2)	15	Gardner, Simmons, & Simpson (1990)	Performance, Attitude	1.510
	16	Schaad et al. (1999)	Satisfaction	.850

Table 4 depicts the samples with large ESs for all three cohorts: language, social science, and science and technology. It is observed that for the language cohort, 14 out of 59 samples yielded large ESs. The social science cohort had no sample, while the science and technology cohort yielded two of 59 samples. It is noteworthy to highlight that from the findings, 15 samples reported performance as the dependent variable, potentially suggesting a high significant impact of the treatment incorporated in the context of teaching and learning. The findings are consistent with those of Rossett, Douglass, and Frazee (2003) who noted on the “speedier performance on real world tasks by people who learned through a blended strategy” (p. 1). Besides that, Dziuban, Moskal and Hartman (2005) also posited that performance of students engaged in blended learning is “as good as, or in some cases better, than face-to-face” (p. 6). In other words, the findings suggest that blended learning is highly effective in improving learners’ performance. In addition, the findings are fairly foreseeable because many of the blended learning practitioners and instructors leverage on blended environments to improve students’ outcome and performance, in ways that may not be materialized through the face-to-face context. Thus, this finding corroborates with samples done by Garrison & Kanuka (2004); Gray & Tobin (2010), & Ahmad (2016) that blended learning enables the attainment of competency.

Table 5: Samples with a Medium Effect Size

Cohort	No.	Sample	Dependent Variable(s)	Effect Size
Language (n=10)	1	Masters, Kramer, O'Dwyer, Dash, & Russell (2010)	Knowledge	.760
	2	Shany & Biemiller (1995)	Performance	.760
	3	Fujishiro & Miyaji (2009)	Performance	.750
	4	Uzun & Senturk (2010)	Performance, Attitude	.740
	5	Payne & Whitney (2002)	Performance	.690
	6	Reber (2005)	Motivation, Satisfaction	.682
	7	Zhang, Song, & Burston (2011)	Learning Efficiency	.620
	8	BAŞ & Kuzucu (2009)	Performance, Attitude	.555
	9	Liou, Wang, & Hung-Yeh (1992)	Performance	.550
	10	Farrah & Tushyeh (2010)	Performance, Attitude	.525
Social Science (n=3)	11	Adileh (2012)	Performance, Attitude	.740
	12	López-Pérez, Pérez-López, Rodríguez-Ariza, & Argente-Linares (2013)	Performance	.670
	13	Fung & Ma (2013)	Performance	.630
Science and Technology (n=4)	14	Basturk (2005)	Performance	.700
	15	Lim, Kim, Chen, & Ryder (2008)	Performance, Satisfaction	.580
	16	Sun Jeong & Sun Kim (2014)	Attitude, Satisfaction, Knowledge	.557
	17	Akpan & Andre (1999)	Performance, Attitude	.535

Table 5 illustrates the samples with medium ESs. The majority of dependent variables reported by samples is performance. The language cohort has seven out of 10 samples reporting on performance as the dependent variable, while the remaining cohorts each have all samples concerned with performance. Herein, the findings yielded seem to suggest that performance is a common variable to measure the efficacy of blended learning's implementation. Students' outcome is popularly used by researchers to gauge performance in the context of blended learning approaches, using either formative or summative assessment, or both (Drysdale, Graham, Spring, & Halverson, 2013). Thai, De Wever, & Valcke, (2017) resonate similar sentiment that learners exposed to blended learning environment performed better compared to e-learning setting. In addition to the performance variable, other dependent variables, for example attitude, motivation and learning efficiency, were also yielded. Undoubtedly, the performance variable is one if not, the most common dependent variable investigated by blended learning researchers. To further explain this, samples are typically mediated with either performance, achievement or engagement demonstrated by the students. The literature advocates that students who have had the experience of and exposure to blended subjects are inclined to perceive a considerably higher quality of learning, as opposed to those with a face-to-face format (Melton, Bland, & Chopak-Foss, 2009). However, learner outcomes encompass more than simply grades and scores. Additional research attention should be given to the sub-topics of student engagement and motivation, as well as student satisfaction, the latter being one of the five pillars found in Sloan-C Quality Framework (Bourne & Moore, 2002). The subjective nature of measuring these forms of outcomes may be the primary reason for the overall lack of interest from blended learning researchers. With great focus placed on the performance variable, it can be seen as the primary dependent variable, while the rest of the variables can be seen as secondary dependent variables. Thus, it is imperative for stakeholders to look into other aspects of blended learning rather than merely analyzing the performance potential to make the approach truly holistic.

Table 6: Samples with a Small Effect Size

Cohort	No.	Sample	Dependent Variable(s)	Effect Size

Table 6 shows the 55 samples that yielded small ESs. At first glance, this large pool of small-effect samples may seem to suggest that the blended learning approaches implemented were ineffective, especially in the social science cohort where 15 out of 18 samples yielded a small ES. However, it is unwise to blatantly equate small ESs with ineffectiveness; instead, in the context of meta-analysis, it simply suggests that there is minimal statistical difference between the samples. Nevertheless, one must not gloss over the fact that once again, a big chunk of samples reported performance as the sole dependent variable. Essentially, this means that the researches involved did not examine the secondary dependent variables of blended learning, as discussed previously. An approach that does little to improve the learners' performance does not necessarily equate to a failed approach; it might be immensely effective in improving a student's attitude towards a subject. One sample found that mobile learning encouraged students to transform "from passive learners to truly engaged learners who are behaviourally, intellectually and emotionally involved in their learning tasks" (Wang, Shen, Novak, & Pan, 2009, p. 674), or in other words, improved attitude. Even though a given blended learning approach may have failed to see drastic improvements in performance in the short term experiment, the learners' improved attitude towards learning, something the researches might have overlooked, could eventually translate to greater performance in the long run when fully implemented. This notion is supported by researchers who suggest that motivated students show greater achievement (White, 1989; Roth & Paris, 1991; Roderick & Engel, 2001; Haydel & Roeser, 2002; Gulek, 2003; Reeve, 2013; Mega, Ronconi, & De Beni, (2014).

Table 7: Samples with Multiple Dependent Variables

34		Salyers (2007)	Performance: 1.035; Satisfaction: -.700	.168	Small
35		Schumacker, Young, & Bembry (1995)	Performance: -.740; Attitude: -.030; Confidence: .010	-.253	Small
36		Salyers (2005)	Performance: -.270; Satisfaction: -.330	-.300	Small

Note: The 36 samples above were identified with more than one dependent variable (multi-variable). Hence, they have multiple ESs. The table is used to calculate the average ES and subsequently, the strength.

Table 7 depicts samples from all cohorts with multiple dependent variables documented in this study. Therefore, they produced and fashioned multiple ESs. Besides the ES, the table also shows the estimation of the calculated average ES, which consequently resulted in one absolute ES for a sample. For the language cohort, 2 large ESs,

4 medium ESs and 8 small ESs were reported, making the total samples for the multiple dependent variables 14. As for the science and technology cohort, one sample generated a large ES, three samples with medium ESs and seven with small ESs. Finally, for the social science cohort, a total of 11 samples were included however, none of the samples yielded a large ES and only one sample generated a medium ES. Three samples were found with negative ESs: (a) Cheng, Lehman, & Armstrong (1991), (b) Salyers (2005), and (c) Schumacker, Young, & Bembry (1995). Once again, the root cause may be the intervention used in the treatment group backfiring, compared to the control group. Respectively, the average experimental mean and control mean for (a) Cheng et al. (1991), (b) Salyers (2005) and (c) Schumacker et al. (1995) were 73.38 and 75.54, 16.98 and 17.39, and 28.35 and 29.75. Due to the said factor, the samples obtained a negative small ES as part of the samples illustrated for this cohort. It is noteworthy to highlight that there are two samples, (a) González & Birch (2000) and (b) Kunkel (2003), that reported repeating dependent variables. For instance, González & Birch (2000) implemented two separate modules to study the same set of three dependent variables. Hence, there are two instances of performance, attitude and need for structure with dependent variables respectively yielding different ESs. Herein, the average was calculated to obtain the individual ES for each respective dependent variable before the average ES for the multi-variable sample could be determined.

Table 8: Samples with a Negative Effect Size

Cohort	No.	Sample	Dependent Variable(s)	Effect Size
Language (n=5)	1	Blake, Wilson, Cetto, & Pardo-Ballester (2008)	Performance	-.020
	2	Hu, Hui, Clark, & Tam (2007)	Satisfaction	-.040
	3	Moore & Jones (2014)	Performance	-.110
	4	Rovai & Jordan (2004)	Performance	-.440
	5	Cheng, Lehman, & Armstrong (1991)	Performance, Attitude	-.480
Science and Technology (n=3)	6	Schumacker, Young, & Bembry (1995)	Performance, Attitude, Confidence	-.253
	7	Salyers (2005)	Performance, Satisfaction	-.300
	8	Alzafiri (2000)	Performance	-.630

Table 8 highlights the eight samples from all three cohorts that yielded negative ESs. Although it may be uncommon to have treatments backfiring, there are actually plausible reasons as to why this occurred. Cheng, Lehman, & Armstrong (1991) in one of the samples listed, concluded that the control group's unexpectedly-high performance "may have resulted from over compensatory behaviour or other factors" (p. 62); in other words, unaccounted or uncontrollable factors may have played a role. In concurrence with that notion, Konetes (2009) goes as far as to posit that there are far greater, external "cultural, industrial and global forces that act to influence the field of distance learning and how programs develop" (p. 59). Simply put, an experiment is always at risk of producing unexpected results when certain factors, important yet elusive, are carelessly overlooked. One such hidden factor comes in the form of the Hawthorne Effect, or more commonly referred to as the observer effect. The term was first coined when discovered in the Hawthorne Western Electric Company Plant, Illinois, from 1924-1932; an experiment was run to determine whether the productivity of workers would increase when working conditions were altered (Mayo, 1949). It turned out that irrespective of what changes were made to the conditions, the workers' productivity always improved. In other words, the Hawthorne Effect renounces the purpose of having an experimental group versus a control group in experimental research. However, some researchers argue that the inevitability of behavioural change in the context of blended learning research is expected, therefore affecting the outcome of transmuting learning (Brown, 1992; Jones, 1992). Furthermore, another acceptable explanation is the role of confounding variables in the samples included, for instance existing knowledge, which may have contributed to the results. A fair experiment is done on the assumption that both experimental and control groups are at par in knowledge or skills, but the reality may be that the control group happened to possess the pre-requisite knowledge to outperform the experimental group.

CONCLUSION

The powerful ESs for each of the 96 samples were probed to grasp the effectiveness of blended learning in relation to various dependent variables. The ESs were calculated using the difference between the posttest mean of the treatment group and the posttest mean of the control group, subsequently divided by the overall standard deviation. Then, the numbers were interpreted using Cohen's (1988) Benchmark to yield a strength of either small, medium or large. Collectively, the findings suggest that blended learning is highly potent in increasing learners' performance; however, it could well be attributed to the majority of samples focusing on performance as either their primary or sole dependent variable. In fact, researchers should not ignore the secondary dependent

variables of blended learning as they eventually lead to improved performance. Also, researchers need to take note of confounding variables that may adversely affect the results of the experiment, one such as the Hawthorne Effect (Mayo, 1949) where subjects change behaviourally when being observed. Lastly, the integration of technology into language teaching and learning creates a holistic learning setting on top of enhancing the four imperative proficiencies in acquiring language competency.

UNDERGRADUATE MULTICULTURAL EDUCATION IN THE CZECH REPUBLIC

Roman ŠPAČEK¹, Martina CICHÁ²
Department of Health Care Sciences, Faculty of Humanities
Tomas Bata University in Zlín
Czech Republic

¹rspacek@fhs.utb.cz, ²cicha@fhs.utb.cz

ABSTRACT

This paper focuses on undergraduate multicultural education in the education of primary school teachers in the Czech Republic. The aim of this paper is to show the current range of study disciplines focused on this topic and also to compare the frequency and contents with competence that should be acquired by becoming teachers during their study.

Key words: education, multicultural education, multicultural competence, teacher's education, undergraduate education

INTRODUCTION

The current situation of increased cultural diversity mostly affects the field of helping professions including pedagogical, health, social and psychological disciplines. The aim of these professions is to provide a support and help during intensive contact with their clients. Daily contact with individuals and groups of different cultures, ethnicities, nationalities or beliefs is not unusual for the people of these disciplines. On the contrary, it can be said that because of today's migration crisis, the frequency of such contacts may even increase. (Hladík, 2014)

Therefore, our aim is to provide an overview of multicultural education in the undergraduate level of becoming primary school teachers in the Czech Republic as an example of a possible form how to be prepared for worldwide cultural plurality.

It is necessary for social development to educate future teachers for practice, where diversity is understood as something enriching and helping to shape the value system of individuals and societies. (Preissová Krejčí, Cichá, Gulová, 2012)

Multicultural education is mostly implemented at faculties that provide teaching specialization in the form of optional courses. This situation has been discussed for more than 10 years with the opinion that it should be included as a compulsory subject in all study programs.

The Varianty Educational Program of People in Need did a research in 2007 that evaluated programs of multicultural education in the Czech Republic, focusing on providers from non-profit organizations, universities and other organizations. According to the results, the most problematic area was the area of education. Respondents claimed low preparedness of teachers for leading multicultural education, including an unsatisfactory education at faculties of education, where the way of preparing future teachers in the area of multicultural education was inadequate. Students were not familiar with key concepts of multicultural topics and they also were not able to master pedagogical methods of their teaching. According to the respondents, only a few graduates of the faculties of education were able to independently set up and lead multicultural education. In addition, a significant percentage of other graduates suffer from prejudice against certain minorities. (Bořkovcová, Hájská, 2008)

School psychologist Lukas (2008) states that multicultural education still does not have a comprehensive concept applicable to different levels of education in our country. This education is mostly taught in a frontal form in terms of enumeration of minority specifics without showing effective ways to handle these specifics. Multicultural education mostly focuses only on the Roma minority.

Nakládalová (2012), who referred about the lack of offer and inconsistency in terms of terminology and content of study subjects of multicultural education in the preparation of primary school teachers, also examined this topic. She confirmed the fact that multicultural education has a status of optional courses, which generally leads to a lack of professional readiness for pluralist class composition.

MULTICULTURAL COMPETENCES OF BECOMING TEACHERS

Multicultural competences are the sum of knowledge, skills, abilities and attitudes that are acquired by students during multicultural education, which is the main objective of this type of education. (Hladík, 2006)

Acquiring and developing these competences is a lifelong process. It depends on age, culture and social environment of an individual. They can be observed in behavior or activities and developed by mutual sharing. (Veteška, Tureckiová, 2008)

Haapanen (1999) claims that becoming multicultural competent is a complicated process that can be described in 3 degrees. The first one is the effort to seek “multiculturalism” in yourself – being opened to diversity. The ability to analyze and understand the values and principles of a culturally diversified society is the second one. The last degree is willingness towards multicultural development. The author also describes this process as a lifelong journey.

This journey leads through real knowledge of cultures, including their specific contexts. (Preissová Krejčí, Cichá, Gulová, 2012)

The increasing efforts to unify requirements for graduates in the field of education have been reflected also among multicultural competences.

Table 1: Multicultural competences of graduated teachers (Hladík, 2006)

Knowledge	Skills	Attitudes
- in the area of respect for human rights	- orientation in multicultural reality	- respect for socio-cultural diversity
- of socio-cultural specifics of national and ethnic minorities	- to didactically process topics related to life in a multicultural society	- respecting the need to follow human rights
- of methods and forms of teaching suitable for multicultural education	- to work with a student from different socio-cultural background	- standing up against intolerance and racism
	- to solve problems of coexistence of different socio-cultural groups through a nonconflict and peaceful way	
	- to be active in the fight against intolerance and racism	
	- to connect the knowledge from multicultural education with the knowledge from other subjects	

The purpose of this paper is to show an overview of undergraduate multicultural education of becoming primary school teachers in the Czech Republic with the focus on the frequency and possible differences among goals and contents of this type of education. The reason is to identify the readiness of becoming teachers for the current migration crisis in Europe because of the possible contact and work with these people of different nationalities and cultures.

METHODS

In accordance with the goals of this paper to examine undergraduate multicultural education, the content analysis was used to find the frequency and possible differences or consistency between goals and contents of this type of education.

Information portals of each university were searched in order to find out whether multicultural education is provided in study plans or not. By multicultural education was meant a separate study discipline primarily related to this topic. The research was focused on public, private and state universities.

The keyword was the adjective *multicultural* as a valid term for this type of education in the Czech Republic since the 1990s. Other possible adjectives or titles of these study disciplines were also examined and detected.

Discovered study disciplines were part of study plans in academic year 2016/2017.

FINDINGS

The importance of multicultural education as a form of preparation for life in culturally diverse society is shown among all universities that provide education of primary school teachers in the Czech Republic. This type of education is implemented in 9 universities, mostly at faculties of pedagogy but also at Faculty of Science at University in Hradec Králové and at Faculty of Science, Humanities and Education at Technical University of Liberec.

Table 2: The overview of Czech universities where multicultural education is implemented in the education of primary school teachers

University	Faculty	Study discipline
Masaryk University (Brno)	Faculty of Education	Multicultural education
Charles University (Prague)	Faculty of Education	Intercultural education
Jan Evangelista Purkyně University in Ústí nad Labem	Faculty of Education	Multicultural education Social exclusion
Palacký University in Olomouc	Faculty of Education	Multicultural education
University of South Bohemia in České Budějovice	Faculty of Education	Multicultural education in the Czech Republic and European Union
University of Ostrava	Faculty of Education	Multicultural education
University of Hradec Králové	Faculty of Education Faculty of Science	Multicultural education
University of West Bohemia (Plzeň)	Faculty of Education	Multicultural education
Technical University of Liberec	Faculty of Science, Humanities and Education	Multicultural education

As for the terminology of study disciplines, there can be seen 2 adjectives “multicultural and intercultural” among all universities with the exception of Faculty of Education at Jan Evangelista Purkyně University in Ústí nad Labem, where this type of education is also provided in subject called *Social exclusion*.

The most typical status of this education is optional course in the range of 2 hours a week in forms of seminars. This research also shows different approaches and directions these study disciplines. It can be caused by the relative novelty of this type of education because it was implemented in academic year 1993/1994 at the Department of Pedagogy of the Faculty of Philosophy at Charles University in Prague.

The introductory lessons are mostly identical in defining basic terms and concepts and other and then it differs among each university. Practical concept of multicultural education is increasing because of many requests by experts and student themselves. Especially, Faculty of Pedagogy at Palacký University in Olomouc can be seen study disciplines Multicultural education 1 and 2, where students are able to acquire multicultural competences on the theoretical and practical level. Multicultural education 1 provides basic knowledge of various socio-cultural groups in Czech and European societies and Multicultural education 2 is mainly oriented on the skills connected with practicing multicultural competences in reality.

CONCLUSIONS

The indispensability of multicultural education, as a possible form how to be prepared for worldwide cultural plurality, was confirmed by our analysis that shown the existence of this type of education among all examined universities in the Czech Republic. Differences are in terminology and contents of these study disciplines.

The awareness of the difference between declared and real content is clear. It is not entirely possible to ensure the results of any education as it is written in study plans. It depends on many circumstances that can affect this process.

However, it is necessary for every becoming teacher to have the opportunity to complete a study discipline that helps with the preparation for culturally pluralistic composition of the class. This fact is based on the findings that majority of these disciplines are optional courses, although the discussion about changing the status to obligatory

study disciplines lasts more than 10 years.

Another problem is the predominant theoretical focus of this education. Future teachers have limited opportunities during their study to acquire multicultural competences in educational reality. This fact requires constant work.

UNDERSTANDING TECHNOLOGICAL PEDAGOGICAL CONTENT KNOWLEDGE OF PRESERVICE TEACHERS IN TEACHING ACROSS SUBJECTS: A CASE STUDY IN HONG KONG

Elson SZETO

The Education University of Hong Kong
eszeto@eduhk.hk

ABSTRACT

Little research on preservice teachers' pedagogies in Technological Pedagogical Content Knowledge (TPACK) across subjects has been conducted. Broad and in-depth understandings of the teachers' TPACK patterns are imperative to enhance subject teaching in schools. This article aims to explore preservice teachers' pedagogic practices of integrating technology for teaching. By examining their pedagogies through the TPACK framework, the key question is: What pedagogic patterns do the preservice teachers interweave into their subject teaching? We explore preservice teachers' pedagogies across subjects in Hong Kong as a cross-case study. The findings suggest that the teachers preferred to use technology as various pedagogic strategies and representations for teaching. The majority preferred to integrate technologies in teaching in support of students' understanding and construction of subject knowledge. Implications of preservice teachers' TPACK practices for policymakers and teacher educators aiming to enhance teacher education are also discussed.

INTRODUCTION

Professional teachers not only need to attain content and pedagogical knowledge (Shulman, 1986), but also relevant technological knowledge to gain a wider repertoire of teaching strategies for students' learning needs in the teaching process (Ottenbreit-Leftwich, Glazewski, & Newby, 2010). Given the various pedagogical preferences, decisions and characteristics in teaching with ICT tools (Jimoyiannis & Komis, 2007), it is imperative to gain in-depth understandings of preservice teachers' pedagogy of integrating technology in teaching. As such, this proposal aims to explore preservice teachers' pedagogic patterns of integrating technology for teaching through Technological Pedagogical Content Knowledge (TPACK). Although many studies on teachers' TPACK practices have been conducted in Western societies, in-depth understandings of preservice teachers' pedagogic patterns in TPACK across subjects in different parts of the world are limited. Specifically, the following questions are addressed:

RQ1. What are the preservice teachers' preferences for technological tools used in teaching across subjects?

RQ2. How do the preservice teachers integrate TPACK for teaching across subjects?

RQ3. What pedagogic patterns do the preservice teachers interweave into their teaching across subjects?

THEORETICAL FRAMEWORK

Shulman (1986; 1987) first proposed the concept of Pedagogical Content Knowledge (PCK) which refers to a synthesis of three knowledge bases: subject matter knowledge, pedagogical knowledge, and knowledge context, to examine teachers' knowledge for teaching. Recognising the contribution of technology to teaching, Niess (2005) advocated preservice teachers' development of a conception of technology in teaching different subject matter. Adapting a fourth component into Shulman's PCK, she further contextualised technology as an integral part of PCK which was enhanced as Technological Pedagogical Content Knowledge (TPCK) in which technology played a key role in teaching. Technological knowledge has become an essential part of teacher knowledge.

As a theoretical framework, Thompson and Mishra (2007) further renamed the TPCK acronym as Technological Pedagogical and Content Knowledge (TPACK) to better reflect this construct as a 'Total PACKage' that helps teachers improve student learning and emphasise 'intelligent integration of technology' in teaching. Indeed, the three types of knowledge are interrelated components of teaching. Figure 1 shows the three knowledge domains and their sub-domains in TPACK.

Such classification of the knowledge domains is debatable. Angeli and Valanides (2009) suggested viewing TPACK as a distinct form of knowledge which is different from its constituent components, while Cox and Graham (2009, p.64) defined TPACK as "a teacher's knowledge of how to coordinate the use of subject-specific activities or topic-specific activities". Nonetheless, the notion of TPACK has been widely studied across the field of integration of technology (e.g., Tømte, Enochsson, Buskqvist & Kårstein, 2015; Voogt et al., 2013).

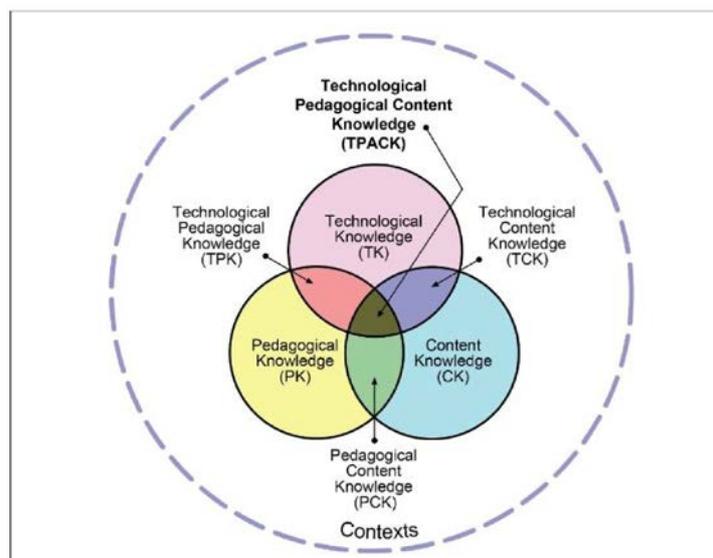

Figure 1. The three knowledge domains and their sub-domains in TPACK. (Koehler & Mishra, 2008, source <http://www.tpack.org/>)

THEMATIC UNDERSTANDINGS OF TPACK PRACTICES ACROSS SUBJECT AREAS

A number of studies have used Koehler and Mishra's (2008) TPACK to understand teachers' knowledge across a range of specific subject domains, such as mathematics (e.g., Jang & Chen, 2010; Graham et al., 2009), science (e.g., Niess, 2005) and social science (e.g., Hammond & Manfra., 2009). The findings of these studies reflect that teachers' TPACK varies across different subject domains. Subsequent studies (e.g., Chai, Koh, & Tsai, 2010) did not further investigate the differences in the preservice teachers' TPACK integration or pedagogical patterns across various subject domains.

Instead of simply integrating individual T, P and C knowledge components as per Koehler and Mishra's (2008) conception, Niess et al. (2009) adapted Grossman's (1990) central components of PCK, and further proposed the major themes of TPACK for teacher development: "Curriculum and Assessment", "Learning", "Teaching" and "Access". These themes focus on examining teachers' TPACK as the pedagogical standards that consider how teacher knowledge is incorporated into technology through which teachers' knowledge of teaching develops and is reflected. We specifically conceptualise these themes as a theoretical framework of the four-theme TPACK development for teachers. Table 1 shows the framework.

Table 1: A four-theme TPACK development for teachers.

Theme of TPACK Development	Description	Pedagogic Focus
T1 Curriculum and Assessment	<ul style="list-style-type: none"> Curriculum, the plan and treatment of the subject matter/content. Assessment, assessing the students' understandings of learning subject content. 	<ul style="list-style-type: none"> - Integrate technologies into curriculum, instruction and assessment for students' understanding of subject knowledge.
T2 Learning	<ul style="list-style-type: none"> Focus on understanding subject matter/content through technology. Demonstrate how students learn, such as development of students' thinking and other generic learning skills by technology. Ensure students make appropriate use of technology for learning. 	<ul style="list-style-type: none"> - Facilitate students' use of technological tools and digital materials for individual and collaborative exploration. - Understand specific subject domains through technology for students' construction of knowledge.
T3 Teaching	<ul style="list-style-type: none"> Focus on delivering subject matter/content with or without the use of technology Design instructional approaches Cultivate a technology-enabled classroom environment Participate in professional development 	<ul style="list-style-type: none"> - Develop instructional strategies that integrate technology in teaching and cultivating an IT-enabled learning environment in schools. - Engage in professional learning in schools.
T4 Access	<ul style="list-style-type: none"> Convenient usage (whether or not students are allowed to use technology) Reduced barriers (how teachers address barriers to technology integration) High availability (how technology supports higher levels of learning and teaching) More adjustment of specific subject content available for increasing numbers of diverse students' learning needs. 	<ul style="list-style-type: none"> - Allow students access to appropriate use of technology for learning in schools. - School administration may be relaxed to facilitate learning within and beyond the walls of a school. - Teachers' barriers to integrating technology can be addressed by building professional learning communities in schools.

Adapted from Niess et al. (2009).

METHODS

We adopted a cross-case study approach (Yin, 2014) to gain an in-depth understanding of the preservice teachers' pedagogies in teaching practicums. As a major curriculum component of teacher education, teaching practicums are about learning to teach in an authentic school setting (Lave & Wenger, 1991; Putnam & Borko, 2000). This is a significant part of teacher education programmes during which pre-service teachers are required to put their technological, pedagogical and content knowledge into practice. Thereby, the three research questions were answered.

DATA COLLECTION AND ANALYSIS

Multiple data sources were collected. First, the interviews with the preservice teachers ($n = 23$) who accepted our invitation to take part in the study were conducted in a university in Hong Kong. The teachers were asked to talk about their teaching and learning experiences as well as their rationales for integrating ICT tools into their teaching. Each interview lasted about an hour and was digitally recorded with field notes, and then transcribed verbatim. Second, a researcher observed one lesson of each participant to understand their use of ICT tools in an authentic teaching context so as to develop further questions for the interviews. Field notes were taken to record the sequence of activities, and comments were added after the observation. Third, each participant was also asked to voluntarily provide lesson plans of their teaching practicum for triangulation purposes.

Although the data were mainly collected based on the participants' self-reports, this approach was appropriate as the teachers' first-hand experiences were collected in authentic settings (Creswell, 2012). These data collected from multiple sources could provide different perspectives and triangulation for the participants' patterns of TPACK in their teaching that formed the case study. The data analysis consisted of several iterative cycles. First, the interview data were categorised into the preferences of technological tools used by each participant and subject as listed in Table 4. Second, the four themes of interweaving TPACK into teaching shown in Table 1 guided the second round of data analysis for each case. It should be noted that some data might fall into more than one theme of TPACK practice. Third, cross-case comparisons were conducted across subjects that allowed us to see patterns emerging within each subject teaching (Yin, 2014) (see Tables 5 & 6).

The constant comparative method (Strauss & Corbin, 1997) was used throughout the process of data analyses in NVivo, computer-aided data analysis software. As the data were coded separately, the inter-rater reliability between the two researchers' coding by Cohen's Kappa (Cohen, 1960) was 0.80, which suggested a high agreement among the coding. Any disagreements were resolved through discussion. Table 2 shows a sample of the coding categories and relevant quotes used for data analysis.

Table 2: A sample of the coding categories and relevant quotes.

Themes of Teacher TPACK Development	Quotes
T1 Curriculum and Assessment	<ul style="list-style-type: none"> - For teaching Art, I would link my pedagogy to the subject content of each lesson and the appropriate ways for student learning. Technology is an effective bridge between content and learning activities. - For the subject of Art, it is important to share each other's work and exchange ideas. - I would use the stop watch in PowerPoint to count the time for their discussion. This reflects their familiarity with the topic. - I used a ready-made e-learning platform to assess student learning.
T2 Learning	<ul style="list-style-type: none"> So, I set up blogs and discussion boards to allow students to share their art works. - For learning music, I used the pictures and lyrics from the Internet websites or YouTube videos to help the students understand the mood of the song.
T3 Teaching	<ul style="list-style-type: none"> - When I wanted them to discuss a subject, I would put the question posed in the PowerPoint and ask them to discuss it. - In addition, I would post some relevant art news for them to read on these platforms.
T4 Access	<ul style="list-style-type: none"> - I used a ready-made e-learning platform and other online applications to facilitate student learning.

RESULTS

In Hong Kong, the initial teacher education requires the secondary preservice teachers to choose one subject as their major, while the primary preservice teachers may choose one or two subjects as their major to study in the teacher education programme. Twenty-three preservice teachers ($n = 23$; 12 primary and 11 secondary) of a cohort of the four-year full-time Bachelor of Education programme from a university in Hong Kong voluntarily participated in this cross-case study. Each participant represented a case for examination. The participants were

all ethnic Chinese, their ages ranged from 21-26, and they were purposefully selected from a variety of subject domains. Their teaching experiences in schools were mainly gained from two rounds of practicum lasting six weeks in Year 3 and eight weeks in Year 4. There were 12 who taught in primary schools and 11 who taught in secondary schools.

Those who chose two subjects (i.e., 8 out of 12 primary preservice teachers) needed to teach both subjects in primary school during their teaching practicums. Thus, the total of subjects taught was counted as 31 rather than 23 ($n = 31$). The seven major subjects that the preservice teachers covered in primary and secondary education in this study included: Mathematics, Chinese (as a first language), English (a compulsory foreign language), Music, Physical Education, Visual Arts and General Studies. 'General Studies' is a core subject taught in Hong Kong primary schools that integrates science, technologies, personal, social and humanities education (Education Bureau, 2011). Table 3 shows the aggregation of the teachers' subject profiles.

Table 3: Aggregation of the teachers' subject profiles.

The Preservice teachers	Chinese (CHI)	English (ENG)	Physical Education (PE)	Music (MU)	Visual Arts (VA)	General Studies (GS) [†]	Mathematics (MAT)	Sub-total of teachers teaching the subjects*
Primary ($n = 12$)	1	3	3	2	2	5	4	20
Secondary ($n = 11$)	3	2	2	2	2	n/a	n/a	11
Total	4	5	5	4	4	5	4	31**

* Eight out of twelve primary preservice teachers chose to teach two subjects (e.g., one studied both Mathematics and Music). Thus, the sub-total of primary teachers teaching the subjects was 20 instead of 12.

** As the primary preservice teachers chose to teach two subjects, the total number of subject teachers was 31.

† General Studies is a subject that includes science, technologies, personal, social and humanities education (Education Bureau, 2011).

We further present the results in three sections: (1) preferences for technological tools for teaching specific subjects; (2) interweaving of the four themes of TPACK into teaching various subjects; and (3) preservice teachers' pedagogical patterns across subjects by TPACK.

PREFERENCES FOR TECHNOLOGICAL TOOLS FOR TEACHING SPECIFIC SUBJECTS

To answer the first question, the preservice teachers' preferences for technological tools used during their teaching practicums were categorised by different subjects. Table 4 summarises the choices of technological tools used by specific subjects.

Table 4: Preservice teachers' perceived levels of using technology in teaching.

Specific subject	No. of subject teachers	Levels of using technology in teaching**		
		Light User (Below 20%)	Moderate User (between 20%-40%)	High User (above 40%)
Physical Education	5	5	0	0
Chinese	4	1	2	1
English	5	2	1	2
Mathematics	4	1	1	2
Visual arts	4	1	1	2
General Studies	5	1	1	3
Music	4	0	1	3
Total	31*	11	7	13

* Eight out of twelve primary preservice teachers chose to teach two subjects, thus the total number of teachers teaching the subject is 31.

** Those teachers who chose two subjects might have different levels of using technology in teaching the two different subjects.

Interestingly, all participants incorporated YouTube in different subject teaching in one way or another during their teaching practicums. As a common practice among the teachers, one student recalled that "I can easily search for information about up-to-date artists' work to illustrate the music concepts from YouTube" (PT 2, MU). English, Chinese and General Studies teachers explained that one major reason for choosing YouTube was because "students usually feel more interested and engaged when we use lively and up-to-date videos found on YouTube to teach" (PT 1, ENG).

INTERWEAVING THE FOUR THEMES OF TPACK INTO TEACHING VARIOUS SUBJECTS

Various subject preservice teachers demonstrated how the teachers interwove the four themes of TPACK into their teaching. Table 5 shows the aggregation of interweaving the four themes into teaching various subjects.

Table 5: Choice of technological tools for teaching specific subjects.

Specific subject	No. of teachers teaching the subject	Choice of technological tools**						
		CD/DVD	E-book	PowerPoint	YouTube	Blogs	Discussion board	Websites [†]
Physical Education	5	3	0	1	5	0	0	2
Chinese	4	0	1	4	4	0	0	3
English	5	2	2	5	4	1	0	3
Music	4	3	1	4	4	0	0	1
Visual Arts	4	0	0	4	4	0	1	4
General Studies	5	1	3	4	4	0	0	3
Mathematics	4	0	4	4	3	0	0	2
Total	31*	9	10	26	28	1	1	18

* Eight out of twelve primary preservice teachers chose to teach two subjects, thus the total number of subject teachers was 31.

** More than one type of technological tool might be used in each subject by individual teachers.

† Websites include any form of website except social media such as YouTube, Discussion board and Blogs

According to Table 5, the number of subject teachers was 31 due to eight out of twelve primary teachers choosing to teach two subjects. Regardless of the subject taught, the preservice teachers preferred to use technology as instructional strategies and representations for teaching (T3). Besides, the rationale of the majority for using technologies in teaching was to facilitate students' understanding and construction of subject knowledge (T2), while only nine participants liked to incorporate technology for immediate class assessment or subject curriculum (T1). Some subject teachers recalled that there were difficulties in allowing students access to technologies (T4) because the computers and network connection were not available for student use in the placement schools.

PEDAGOGICAL PATTERNS IN THE FOUR-THEME TPACK DEVELOPMENT FOR TEACHERS

By comparing the teachers' cases, patterns of TPACK practices in the teaching practicum across subjects were identified as shown in Table 6. The table illustrates that the preservice teachers' patterns of practising TPACK in teaching the seven subjects occurred to a relatively wide extent, similar to Erixon's (2010) findings. This cross-case comparison has evidenced their relatively wider choice of different technological hardware and software tools in teaching various subjects in the primary and secondary placement schools.

Table 6: Integration of four themes TPACK in teaching various subjects.

Specific subject	No. of subject teachers	Theme of teacher TPACK for teaching various subjects**			
		T1	T2	T3	T4 [†]
Physical Education	5	0	4	5	0
Chinese	4	1	4	4	0
English	5	1	3	5	0
Music	4	2	3	4	2
Visual Arts	4	2	2	4	2
General Studies	5	1	4	5	3
Mathematics	4	2	3	4	3
Total	31*	9	23	31	10

* Eight out of twelve primary preservice teachers chose to teach two subjects, thus the total number of subject teachers is 31.

** Individual teachers may choose more than one theme of TPACK in teaching various subjects.

† T1: Theme 1 - Curriculum and Assessment; T2: Theme 2 - Learning; T3: Theme 3 - Teaching; T4: Theme 4 -Access

CONCLUSIONS

This is a small-scale, cross-case study in an Asian Chinese context of teacher education contributing to the in-depth understanding of the teachers' pedagogical patterns of technology integration in teaching different

subject domains. Although the results could not be generalised across different educational systems, this limitation implies that teachers' pedagogic development in TPACK can be context specific, subject to technological preferences, specific subject culture and individual school contexts. On the other hand, the results provide a broader perspective on other teachers' development of subject teaching and learning through the framework of the four-theme TPACK development for teachers. Teacher educators and policymakers can enhance and enrich the new generation of preservice teachers' TPACK practices in various preparation programmes.

UNIVERSITY LIBRARY'S ROLE AS A QUALITY INDICATOR OF ACADEMIC CURRICULUM QUALITY ASSURANCE

Malivan Praditteera, Ed.D.
Library director, Rangsit University
Pathumthani, Thailand
malivan@rsu.ac.th

ABSTRACT

The purpose of this study is to identify the critical roles and impacts of the university library services as a quality indicator on the teaching-learning support of the academic curriculums of Rangsit University. Rangsit University, established in 1985, is one of the large private universities in Thailand in term of the number of program offering. Currently there are total of 137 programs; 94 undergraduate programs, 34 master degree programs, and 9 doctoral degree programs. Rangsit University Library has a vision to be a digital learning resource center with excellent services. There are more than thirty millions pieces of information resources which mainly electronic ones. The Library has equipped the modern technology in information resource management and user services, for examples: integrated library system; RFID; mobile applications for e-Book, etc. The challenge of how much the Library does in serving the teaching-learning process has been raised and indicated as a quality assurance standard. This study used the analysis of document as a research methodology. The YR 2016 internal quality assessment (IQA) or self-assessment reports of every program were reviewed and analyzed. The IQA report was a quality self-assessment report comprised 6 quality standard elements. In this case, the 6th quality standard element and its indicator concerning with library and teaching-learning facilities was investigated and analyzed with content analysis into 4 following categories: 1) characteristics or types of library services and supports 2) level of library satisfaction of students and faculty members 3) comments or feedbacks on library services and supports and 4) suggestions for the future development. The findings of this study were beneficial to the Rangsit University Library in developing its own services and practices in order to serve the teaching-learning processes. Additionally, the Library could target the specific group of users in each program in managing and enhancing users' expectations and satisfactions.

KEYWORDS: university library, academic curriculums, academic programs, quality assurance, Rangsit University

INTRODUCTION

Rangsit University, established in 1985, is one of the large private universities in Thailand in term of the number of program offering. Currently there are total of 141 programs; 94 undergraduate programs for, 37 Master Degree programs, 1 Graduate Diploma and 9 Doctoral Degree programs. Rangsit University is the only private university which has been assessed on education standard quality by the Office for National Education Standards and Quality Assessment (Public Organization) and rated "Very good quality" (Rangsit University, 2017)

The curriculums are broadly categorized into five groups as follows;

- 1) Faculties of Medical and Health Sciences: College of Medicine, Faculty of Dentistry, Faculty of Pharmacy, Faculty of Medical Technology, Faculty of Nursing Science, Faculty of Physical Therapy, Faculty of Science, Faculty of Optology, College of Oriental Medicine and Faculty of Radiological Technology.
- 2) Faculties of Engineering and Technology: College of Engineering, College of Information and Communication Technology, College of Agricultural Innovation Food and Biotechnology and Institution of Aviation.

- 3) Faculties of Humanities and Social Sciences: College of Social Innovation, College of International, Institute of Diplomacy and International Studies, Faculty of Liberal Arts, Faculty of Communication Arts, Faculty of Law, Faculty of Education and Graduate School.
- 4) Faculties of Art and Design: Conservatory of Music, Faculty of Architecture, Faculty of Arts and Design and Faculty of Digital Art.
- 5) Faculties of Economics and Business Administration: College of Government, Faculty of Business Administration, Faculty of Accounting, College of Tourism and Hospitality and Faculty of Economics.

Every program or curriculum have been evaluated and assured the quality by the Internal Quality Assurance (IQA) for Higher Education Standard organized by the Commission on Higher Education, Ministry of Education. The IQA framework is consisting of six standard elements: 1) curriculum standardization 2) graduation 3) learners/students 4) faculties/instructors 5) learning-teaching process, learning outcome evaluating process and 6) learning facilities (Ministry of Education, 2014). Regarding to the IQA standard, the University has been required to assure its curriculum annually. One of those indicators is the quality of learning facilities which included laboratory, dormitory, technology support, library, books, journals, online databases and other electronic resources. All those facilities must be enough and ready for usage. The quality indicator shall be considered by the level of user's satisfaction and its continuous improvement process.

Rangsit University Library has a vision to be a digital learning resource center with excellent services. With its own 6 story-building, the Library houses more than thirty-five millions books and printed materials and more than thirty-four millions items of electronic resources. As a central library, it serves all academic programs in teaching-learning-researching process. The Library has equipped the modern technologies and tools in managing information resources and user services, for examples: library integrated system; single search tool; electronic interlibrary loan service; RFID; mobile applications for e-Book, etc. (Rangsit University Library, 2017)

The Library itself has done a standard LibQUAL+ survey on its user's satisfaction and needs annually. The result has been used for its library strategic development and enhancing the quality of services. In the year 2016, Rangsit University Library (2016b) did a survey on 1,307 user's samples and revealed the level of user's satisfaction at a good level (\bar{X} 3.77 out of 5). The samples were satisfied with library service staff (\bar{X} 3.93); library physical and facilities (\bar{X} 3.90); information access (\bar{X} 3.74); library technology (\bar{X} 3.73); information resources (\bar{X} 3.72); and library service communication (\bar{X} 3.62). Additionally, the modern technological application, information resource development; and information access skill development were insisted as the user's requirements.

Even though, the result of its survey was at a high level of satisfaction, the Library found there might not apparently serve the needs of the particular curriculum or programs. With the new challenges and expectations in higher education, university library must take part of learning outcome process. This led to this study in according to find to which extent the library support the quality of the university curriculum and their teaching-learning process.

THE STUDY

This research aimed to identify the critical roles and impacts of the university library services as a quality indicator on the teaching-learning support of the academic curriculums of Rangsit University. This study used the analysis of document as a research methodology. The YR2016 internal quality assessment (IQA) reports of 134 academic programs; specifically the report on the 6th quality standard element was analyzed and presented into 4 following categories: 1) characteristics or types of library services and supports 2) level of library satisfaction of students and faculty members 3) comments or feedbacks on library services and supports and 4) suggestions for the future development.

FINDINGS

The results of the IQA report reviewed and analyzed of 134 programs; 89 bachelor degrees, 36 master degrees and 9 doctoral degrees showed as following:

1. The characteristics or types of library services and supports

The results showed in Table 1, the library services used by the faculty members and students in most programs were 1) request for purchasing and usage the information resources (books, journals, e-resources, etc.); 2) Online database access services; 3) Library orientation, Information literacy & database searching trainings, respectively. There were 15 out of 134 programs do not mention any library facility or service used in teaching-learning process of their programs.

Table 1 Library services and supports

Library services and supports	Bachelor	Master	Doctoral	Total N=119
1. Request for purchasing and usage the information resources (Books, journals, e-resources, etc.)	76	28	7	111
2. Online database access services	25	24	8	57
3. Library orientation, information literacy & database searching trainings	30	14	6	50
4. Research support services	5	15	5	25
5. Interlibrary services	1	8	4	13
6. Other services (Library & reading promoting events, study room service, etc.)	3	3	-	6

2. The level of library satisfaction

The 76 programs were satisfied with the library services at a high to very high level (as shown in Table 2). However, there were 58 programs do not mention the certain level of library satisfaction in their reports.

Table 2 The level of library satisfaction

Programs N=76	Level of satisfaction		Translate	
	Lowest	Highest		
Bachelor (N=48)	3.70	4.80	High	Very high
Master (N=21)	3.71	4.83	High	Very high
Doctoral (N=7)	3.56	4.60	High	Very high

3. The comments or feedbacks on library services and supports

As shown in Table 3, the 52 programs had feedbacks on library services and supports as following: 1) not enough information resources, especially textbooks on specific fields; 2) lack of information access skill, especially online database searching (students); 3) more learning and tutoring areas needed; and 4) longer opening hours during final examination period.

Table 3 The comments or feedbacks on library services and supports

Comments/feedbacks	Programs			Total N=52
	Bachelor	Master	Doctoral	
Number of Information resources	19	10	3	32
Information access skills	1	5	2	8
Learning and tutoring areas	5	2	-	7
Opening hours	3	1	1	5

4. The suggestions for the future development

The suggestions for library mentioned in the thirty IQA reports were grouped into 4 issues as following: 1) more information resource purchasing; 2) more and frequently online database training courses providing; 3) learning common and research common areas providing; and opening hour extension during an examination period and summer term; and 4) developing an efficient communication channel between the programs and library.

CONCLUSIONS

Most of the programs of the Rangsit University were satisfied with the university library at high and very high levels. Nevertheless, the comments or feedbacks on library services and supports which specified by most of the programs were the less number of information resources, lack of information access skill, less learning and tutoring area, and inappropriate opening hours. In order to support the library future development, the programs suggested that the library needed to plan for information resource purchasing budget, organize the information searching and access training courses which suitable for various level of users. Additionally, the library should plan for physical renovation in order to provide more spaces for learning, tutoring and research services. Moreover, the library should consider extending its opening hour during the final examination period and summer term. Last but not least, the efficient communication between the programs and library should be developed in order to creating a better understanding and promoting the usage of library services.

DISCUSSIONS

The study indicated that the curriculums or programs needing the support in information resource purchasing or subject collection development. Most of them insisted the number of books, journals and other materials were not enough. This would be challenge for the library in cooperating with the programs in purchasing planning as same as studying the use of information resources in each programs,

The levels of satisfaction on library services were mostly rated at a high and very high level while the result of the satisfaction survey done by the Library was lower (Rangsit University Library, 2016b). However, not any program got the score lower than 3.51. Those results might be different from the sample size and survey instruments. The Library itself used the standard LibQUAL+ questionnaire (Kyrillidou and Maciel, 2015) while each program could develop their own.

However, revealing the problems, feedbacks, or comments from the members of programs which actually never been responded directly to the Library, was very important. When administrating the satisfaction survey, it was seldom that the library got the open-ended question answered. It was quite challenged for the Library on how to get the direct feedback or suggestion from its users. With the suggestion of creating more efficient communication channels between the library and users was very worth considering, especially via social network media such as Facebook, Line etc.

ACKNOWLEDGEMENT

The researcher would like to extend the gratitude to the Office of Quality Assurance, Rangsit University for the IQA Report data, and the Rangsit University Research Institute for the grant supporting in INTE2017Conference attending and presentation.

USING A TEXT SET OF AWARD-WINNING LITERATURE TO TEACH STEM AND ENGINEERING DESIGN

Sara Moore
sara@sdmlearning.com
William Bintz
wpbintz@gmail.com

Across the world teachers are trying to prepare students to hold good-paying jobs in the workplace. Complicating this work, many of these jobs do not exist today, and so it is difficult for teachers to know just what to teach that would best prepare students in the future. What teachers do know is that many of these future jobs will require high levels of literacy and be in the STEM fields (Science, Technology, Engineering, and Mathematics) where engineering design is an essential skill.

Given this emphasis on literacy and STEM, this session will share a text set of high-quality and award-winning literature paired with research and classroom-based instructional strategies, both of which are intended to promote positive dispositions in literacy and STEM, increase reading comprehension, and develop student understanding of engineering design. A text set is a collection of high-quality and award-winning literature, primarily picture books but also including wordless, nonfiction, informational, hybrid texts as well as graphic novels, that is related in some way, e.g. topic, theme, or perspective. Instructional strategies may include paired text, tri-texts, and consensus boards.

This text set will focus exclusively on STEM and engineering design, the problem solving process used to identify the best practical solution to a real world problem. These problems can be logistical (How do we plan the most effective rail schedule?) or more tangible (How do we build something which does what we need within our current constraints?). While we cannot predict what the future will be and therefore cannot know what specific problems students will face in their careers, we can develop the critical thinking skills and the important literacy processes which will make them successful problem-solvers. Our goal is to share literary resources about STEM that will help teachers and students be successful in an unknown future.

USING SYSTEMS THINKING AS AN EFFICIENT TOOL FOR TEACHING TRANSFER OF CREATIVE INNOVATIONS

Eva SVIRAKOVA
Faculty of Multimedia Communications
Tomas Bata University in Zlín
Czech Republic
svirakova@fmk.utb.cz

INTRODUCTION

The problem with each product and service a company wants to transfer to the market is that it has to be designed and manufactured so that it finds its customer. Therefore, a designer has to focus on the end user at the very beginning of the creative process. However, many examples from universities and technology transfer centres give evidence that it is so only in very few cases. To improve the situation is thus a task not only for universities, their students and teachers, but also for companies. Focusing design on the customer is a challenge of the education process at universities. That is why we decided to map out the design process in creative studios at the university in order to find out to what extent designers think about customers. We want to find out what barriers prevent transfer of innovations to the market and, vice versa, which steps allow for this process. The truth is that the approach to education in studios where students design their products for customers is not compulsory. However, it may be one of the motivators for students to come up with a better product but also to achieve better academic performance in the studio.

As Radomila Soukalová (2016) specified, an important part in the process of technology transfer, innovation and competitiveness development in the economic and social system is played by universities, particularly by their research and development centres and departments. Universities guarantee independent research and freedom of knowledge that has its rational and ethical dimension, morals and conscience shared by an independent community of teachers and students. Implementing results of research and development, thoughts and individual creativity in practice is a predisposition of continuous innovative activity and of increasing the competitiveness of national economies. Přemysl Strážnický (in Soukalová, 2016), however, points out certain pitfalls of transfer of creative innovations. He claims that the basic precondition of technology transfer is (1) knowledge that relates to the functionality of the transferred solution, (2) its applicability in the market and (3) willingness of the authors to disclose supporting information when negotiating with business partners. Přemysl Strážnický remarks that it is still true that design sells. That is due to the fact that most technical solutions repeat and a new design is a significant added value of a product that manufacturing companies are interested in.

Minaříková (2016) asserts that when applying design thinking within an organisation, the common characteristic is the user-oriented design). Innovation (i.e. change) is the objective that organizations want to achieve through design thinking. Design thinking should also help organizations when solving complex problems. Dorst (2011), among others, describes a complex problem as a situation when we know the required value, but we don't know through which product, service or system we can achieve it. We also don't know what such a product or service should look like. One of the ways how to define the design process is to describe its practical use. The label "Design process" can be perceived as a procedure aimed at achieving the desired change. This procedure starts with problem identification and continues by searching for the suitable solution (Minaříková, 2016). In a situation when we know the desired resulting value of the project, but we don't know which way we should take in order to achieve it, we find ourselves in the environment of creative project management.

Creative project management is a method of creating a new value which is based on the unique talent of the creator aspiring to create a high-quality product within pre-defined limits. The way of creating new value consists in setting relevant processes for creative project management. In addition to the processes of project management, a project manager of a creative project also needs to take into account the talent of the creator and uncertainty of future achievements that are based on the invention of the author of the design. A creative project is a temporary organization that is formed with the view to deliver original and formally perfect products that contain intellectual property and are delivered in accordance with the objective and within limits that have been mutually agreed in advance (Svirakova, 2014). Ambrose and Harris (2011) define seven stages of the design process that are in line with the proposed procedures for creative project management: (1) define, (2) research, (3) ideate, (4) prototype, (5) select, (6) implement, (7) learn. The objective of this paper is to find barriers and advantages in the design process at the university and propose solution that will facilitate transfer of innovations. We consider transfer of innovations to be successful in the following cases:

1) Transfer of a product or service to the market using transfer or the relevant licence to a commercial company that incorporates the product or service in its market portfolio.

2) Transfer of a product or service to the market when at least one customer buys the product or service.

We can also consider innovation to be successful when the product is displayed at an exhibition, in a catalogue or presented in some other relevant ways. This definition of successful innovation is based on educational and creative mission of universities. We cannot expect every product made by students to be intended for the market. The objective of creation in studios is to make a product that is potentially innovative, interesting and valuable in its field. Such products also include models, mock-ups and prototypes. Nevertheless, for the purposes of this article, we primarily focus on the students' outcome that has been successful in the market (if only partially).

RESEARCH METHODS

For the analysis of the design process and design thinking we chose to use qualitative research. We started collecting data through questionnaires in November 2016. With respect to the fact that our target group was rather peculiar, i.e. students of art studios, we used a specific graphic form. We presumed that students would find this way of expressing familiar and we would get relevant data in a more efficient way. The questionnaires did not contain any questions, but were in the form of a calendar. There were three milestones on a timeline, the first of them concerned the initiation of their common project at the faculty and the other two were check points of the project. We addressed 85 visual art students and received back 65 filled questionnaires from the following studios: graphic design, spatial design, industrial design, product and digital design, fashion and shoe design. Work of the students from these studios is capped at the end of each term by handing over a specific innovative product in 2D visualization or as a 3D mock-up, model or prototype, which is the third milestone in the calendar-like questionnaire. In our survey we assumed that the students' goal is to carry out the assignment of the supervisor and pass the studio exam and receive the credit hours. We asked, for instance, the following questions:

- What barriers and advantages do you see in your studio?
- Have you thought-out well the problem you're solving?
- Did you set your product target at the very start?
- Do you have an idea at what stage of the design process you currently are?
- Do you have a schedule for your further activity?

We analysed the data from the questionnaires using Grounded Theory and open coding process. Grounded theory is a qualitative research method that is typically used as a means of developing theoretic and conceptual understanding of social and interpersonal phenomena. We classified the answers received in the questionnaires by topics. Each topic represented a certain problem or challenge. For each challenge we grouped the relevant phrases and pieces of sentences. After completing the analysis, we selected a questionnaire filled by a student who was successful in innovation transfer and we proceeded to the second part of the survey: an interview with a selected author of a product. We decided to conduct the interview with the author of a specific design of a fashion collection. We recorded the interview and then transcribed it word for word. We analysed the sentences from the interview in the same manner as we did with sentences in the questionnaire: we grouped them using the open coding process by topics. During the analysis of the questionnaire and interview we dealt with every single sentence, which is in line with recommended processes of Grounded Theory. We asked: What is the gist expressed with this sentence? (Corbin and Strauss, 1990). After dividing the sentences into categories, we assessed the relation between them. We wrote down the results using the mental modelling technique during which we assessed the relation between two elements: A causes B. The relation between these two elements is also expressed with the polarity of the relation. Generally, we can say: If A happens, then B is greater; or if A happens, then B decreases. We marked the polarity using the (+) or (-) sign next to the arrow.

However, events around us are more complicated. Oftentimes, they have many reasons and simplified explanation using the cause and effect is insufficient. Such thinking is referred to as linear thinking. The mental model we recorded on the basis of the assessment of primary data is imperfect. The lack of feedback suggests we need to consider wider context. However, primary data did not allow us to do so, since the student only dealt with the problems or advantages in the design process from her own perspective. Yet, this poses no problem for the survey, quite on the contrary: opinions and experience of the students were a valuable basis that we intended to gather. We continued with the analysis by applying another research method: backward mapping (Glaser and Strauss, 1967).

The backward mapping method is a strategy for the analysis of policies and their implementation that starts with the description of the desired behaviour on the lowest level of intervention, in this case with the designer or in the studio (Elmore, 1980). The analysis may continue by defining the policies, resources and support that is necessary from the highest level if the analysed problem is to be solved. Backward mapping presumes that the closer a participant is to the source of the problem, the greater his/her ability to influence it. Therefore, backward mapping method asserts that the ability to solve problems of complex systems does not depend on the hierarchical structure

and system control, but rather on whether we delegate maximum powers to act at the moment when the problem occurs. Using the backward mapping method we extended the mental model of linear thinking and “closed its loops”. With this step we arrived at a better mental model that corresponds with the technique of systems thinking (Peter Senge, 2006). Summary of the ascertained conclusions resulting from the questionnaire and interviews was written using the Causal Loop Diagram (“CLD”), which contains, besides polarities, also specification of the loops (Reinforcing, Balancing). All the research methods we used are shown in the chart below (Figure 1). Particular use of mental modelling including systems thinking is described in the following parts of this article. Systems dynamic modelling is another logical step which can be used in order to further specify our mental systems model (Causal Loop Diagram). CLD is a basis for compiling a systems dynamic model as a Stock and Flow Diagram (“SFD”). Describing the SFD draft is beyond the possibilities of this article.

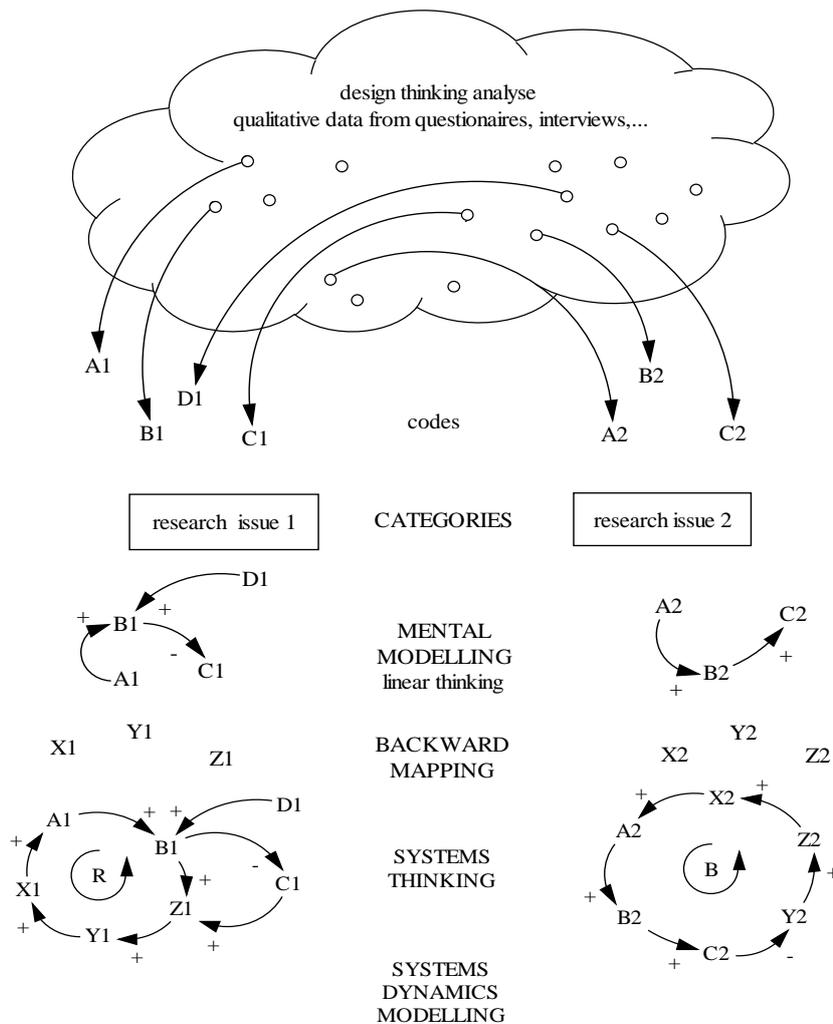

Figure 1: Research methods, inspired by Simonsen & Friberg, 2010 (own resource, 2017)

CASE STUDY FROM FASHION DESIGN STUDIO

Using the case study from the “Water for All” Project we show the possibilities of design thinking in the working process of authors creating a new innovative design. “Water for All” is a project by the Faculty of Multimedia Communication, Tomas Bata University in Zlín, which is based on the environment of cultural and creative industries. All studios under the faculty participated in it. Twelve studios, in a joint effort, dealt with “Water” as a topic of their creation from the beginning of the academic year (September 2016). The “Water for All” Project has two main objectives. The first one is systematic work with the general public. Students came up with a warning that concerned the gradual depletion of water on the Earth. They accentuated that the problems does not only concern developing countries, but also the Czech Republic and it needs to be addressed. The second objective is to instigate cooperation not only between the studios, but also between the faculty and companies that can help students implement their design drafts that concern the “Water” issue. Outcomes of the project are exhibitions,

fashion shows, websites, a catalogue, Facebook campaign, conference and scientific publication. A partial outcome of the fashion show is a collection of dresses inspired by the problem of the Aral Sea. Together with the author of the collection we prepared a survey that collected data about the development of the dress collection through questionnaires (see Figure 2 below) and interviews.

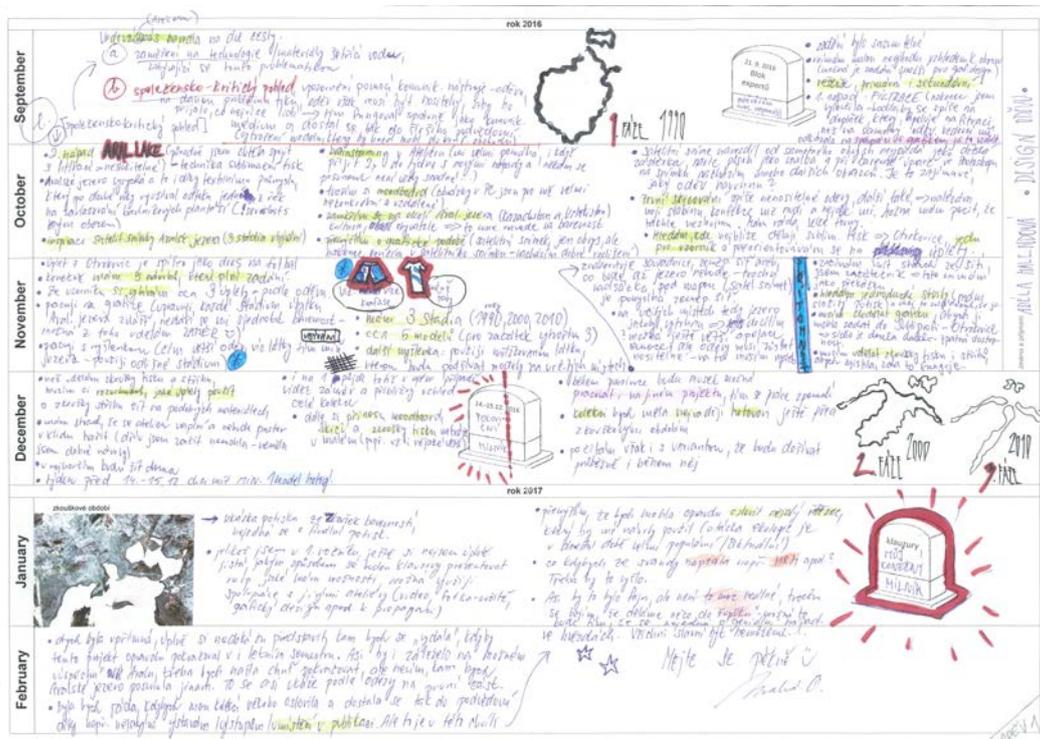

Figure 2: Questionnaire. Aral Sea. (Adela Malendova, 2016)

FINDINGS

From the primary data we identified several research problems using coding and formulated research questions. The research problems are as follows: (1) Problematic transfer of innovation to the market, (2) Pitfalls of assigning the project to the students, (3) Negative assessment by the student of the studio, (4) Designer’s lack of funds to manufacture a prototype, (5) Insufficient craftsmanship competences of the designer, (6) Unclear specific experience of the designer. For further analysis using the backward mapping method we selected the first of the above defined research problems. Following the experience of IDEO, a design agency (Knapp, Zeratsky, Kowitz, 2016) we reformulated the problem so that is sounded rather open and optimistic. It is a good predisposition so that we do not get overwhelmed by problems that sound negativistic right at the beginning. That is why we formulated the research question in the following way: How might we get innovation to the market? As it showed, the answer to this question is not obvious at first sight. Introducing a product to the market was simplified to that extent that in our case it is the moment when the first customer buys the product and there is demand of other customers for the same or similar product made by the same designer. If we were to solve all the research problems, our systems model would become far too extensive. We divided designers’ answers into segments and grouped them under headings, as you can see below.

Designers have their own vision, it doesn’t matter if it is naive

“What if I wrote, for instance, to H&M, just to try it? It might work fine, good, but it’s not very realistic, I’m afraid I’m doing something just for the drawer, I guess it’s not a brilliant idea, I’d like to make an impression on somebody with my collection so that people are aware of me, for instance through exhibitions, being in a publication. God only knows what will happen, all of us cannot be famous.” [AM - Questionnaire] “I wanted to get to that store. No, it didn’t work out. The initial enthusiasm is gone. The problem is that many of the shops are international, they want to work with more famous names. But it certainly caught some attention, also with respect to the fact that the (female) dean opened the exhibition in that dress. That’s the best thing that can happen. This way we transfer something about us and something about our thinking.” [AM - Interview]

Product attractiveness

“...but later, as time passed, when I had great feedback from people that concerned the styles that are popular, for

instance longer shirt dresses. These are clothes that are comfortable to wear and people have them in their wardrobes, wear such design, so there was a huge number of friends who contacted me and then even the dean. Well, many other people were excited about it and wanted to promote the idea and that was my point. I didn't want to draw attention to myself as the designer, but to the story about the Aral Sea.” [AM - interview]

The direct speech is followed by reduced rephrasing of the statements in order to compile a mental map of linear thinking: If the product is attractive, it has a good idea and customers are interested in it, then the designer's motivation to offer it to the H&M chain store increases. There is a lack of competences necessary for negotiating with international chains and the designer doesn't have a portfolio that would be tested by the market. If the product is popular because of its shape and it is well-known in a way and linked to a strong story, it is attractive and appeals to people. It is strong motivation for the designer who is ready to present the (environmental) problem using such a product.

Figure 3 below is a mental map that shows dependences of most of the variables from the above quotes said by the designer. The mental map was made on the basis of the rephrasing of the designer's statements. The polarity of relations between all the selected elements is positive, therefore the (+) symbol. It means that the following element has the same growth (and also decrease) tendency as compared with the preceding element. If there is the (-) symbol next to the arrow pointing at the following variable, it means that the following element has the opposite growth tendency when compared with the preceding element. The elements in the figure are linearly dependent, that means they simplify the relation between cause and effect.

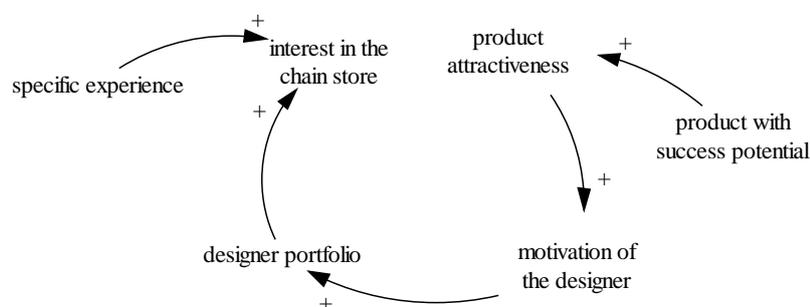

Figure 3: Mental model, linear thinking (own resource, 2017).

Explanation of Figure 3 (above): If I extend my portfolio by three more products that already sell in the market, then I'll have more chance that a chain store, for instance H&M, might be interested in my fashion designs. However, the interest in my portfolio is, among others, conditioned by specific experience, in this case by the ability to communicate with business representatives of H&M. If this ability (cause of the following event) is zero, then the effect will also be zero. As soon as I increase my specific experience, I'll increase my chance to succeed in the clothing industry. The designer's motivation increases hand in hand with the attractiveness of the product. The product attractiveness depends on its success potential.

We stated an example of linear thinking in which we used the following pattern: "A causes B" as a simplified model of reality. As it has been said, the problem of linear thinking rests in the fact that it only seldom captures the complexity of multiple causes and effects that form the reality of our story. A designer's specific experience and high-quality portfolio will probably not be enough so that their product makes its way through to a chain store. Even a designer's motivation is probably not only caused by product's attractiveness to customers. And in no case can we claim that motivation is sufficient so that designers have a wide and market-proven portfolio, while motivation will certainly be one of the factors that contribute to such a situation. Following the same principle, we analysed other sentences (primary data) of the research in the selected category (1) "Problematic transfer of innovation to the market". We went on to rephrase the selected sentences and interconnected them into one mental model.

Subsidies for designers

"Each person got CZK 5,000 for the collection, we counted it this way and that's what everyone got. It was a kind of a motivational source. This money just covered my expenses. Those who had a more expensive collection had to cope with it somehow. So I was glad I didn't have to restrict myself because of the money. We were the only studio that happened to get this money. But it was a big problem even with us, I must say for myself we didn't even know there were some restrictions on the side of the suppliers. I was lucky, because I was the first to go there, so I picked everything they had there for the one thing, the others who went there couldn't buy from them anymore. It was a

great advantage for all of us, but later we found out it wasn't for everyone." [AM - interview]

Rephrasing: The grant from the studio as subsidies for a designer will increase the quality of the prototype. The restriction lies in requirements for the administrative selection of suppliers, which is due to high demands of the faculty concerning the studio's administration.

The luck of Craftsmanship

"I'm starting to be afraid of sewing. I'm a beginner and I see it as a hindrance. [AM - Questionnaire] I definitely had big problems with graphics and I couldn't choose much, I needed big resolution. It was hard to find an image that could be graphically processed so that it were in high resolution." [AM - interview]

Rephrasing: Low competences of designers decrease the quality of the designer's prototype. Such low competences concern the field of graphic design and dressmaking.

The role of the prototype presentation

Personally, I really liked it (the collection). It's such a distinct thing. It certainly caught interest because the problem of the Aral Sea impressed itself on people's mind partly also thanks to the fact that the dean opened the "Water for All" Exhibition in that dress. That's the best thing that can happen. This way we transfer something about us and about our thinking." [AM - interview]

Rephrasing: If there is interest in the product, it is also presented by authorities from the faculty and if it is presented, there is sufficient public and more and more orders are placed by customers.

The luck of capacity

"I wanted to make more dresses, but there was no time for that. If there was an opportunity to improve the dresses, I know it would be beyond my possibilities. Another problem would be that I couldn't have that made somewhere because I wouldn't have the money for that, while I wouldn't be able to make it all by myself, as it requires care and time. I think that at least my classmates would help me, we help each other, so it is a certain advantage, but definitely not over the long term. I would also have to figure out the printing technology. I would also have to print it on a different material and that would be the way. That material is not nice. The dress has a great potential to become a favourite piece. We can still work with that material. It can be adjusted by adding more colours. I know that from my customers. They say: It's a pity you don't have more of that, I'd buy the trousers straight away and I'd immediately buy such a skirt or bag. They like the printing and they would probably like to choose something on which they'd like the printing, so in the future there may be an e-shop, a website, where we could offer some pieces, something really bomber simple. I think this is how we could make use of it." [AM - interview]

Rephrasing: The number of orders exceeds the designer's capacity. Products have to be made by a competent team so that their high quality is maintained. Following customers' requirements, it is necessary to change some parameters of the prototype (fabric). In order to make these changes, more designers are needed. It is necessary to further present the product.

We drew all the above stated observations of design thinking in a mental map, the result is shown in the diagram below (Figure 4). As most of the variables of this mental model lack feedback, it is a model that is based on linear thinking. Systems thinking (in another mental model) is comprehensive and describes more aspects of reality.

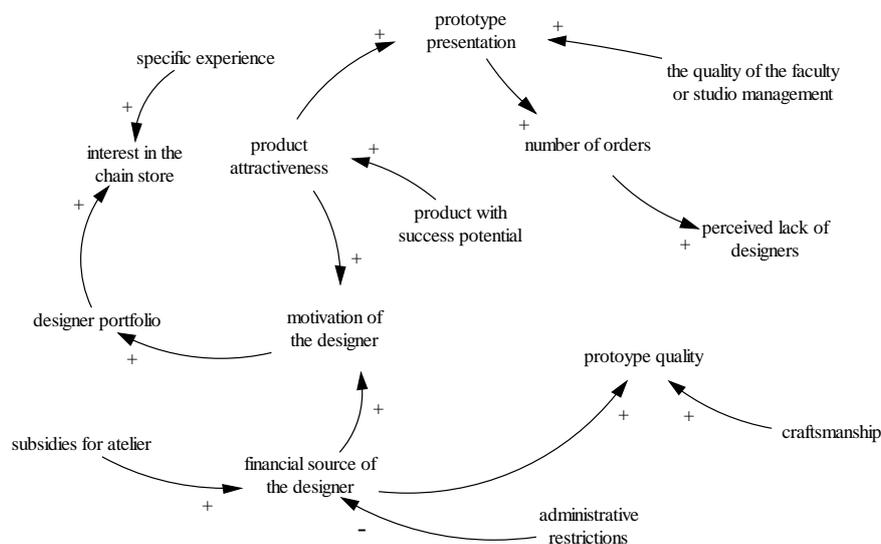

Figure 4: Mental model, all designers' opinion (own resource, 2017)

All the mentioned relations between elements (Figure 4) are strictly based on the records of the questionnaire and interview with the designer. However, these opinions do not give us, for the time being, the answer to our research question: How might we transfer innovation to the market?

RESULTS

Using backward mapping, we suggested the solution to the problem that is addressed by the research question. We investigated which elements we can include in the design process in the implementation stage and which ones we cannot. The elements we did not include in the model (right column of Table 1 below) are also discussed, but they cannot solve our problem and they are beyond the possibilities of our solution implementation.

Action and resources needed to implement new product on the market: How might we transfer innovation to the market?	
Those you would discuss with the faculty or studio management and try to model	Those you would discuss with the faculty or studio management but not try to model
<ul style="list-style-type: none"> • Increasing the studio’s production capacity • Sale of products / prototypes • Sharing the income from sale • Making use of the prototype presentation 	<ul style="list-style-type: none"> • Increasing the competence of students in the field of graphic design and other crafts

Table 1: Backward mapping method, inspired by David Wheat (own resource, 2017)

On the basis of all the findings stated above and of the backward mapping method we prepared a back-loop diagram that is shown in the figure below. In our case, it is just a part of the project, which is why it contains exogenous variables. We chose the following variables as exogenous parameters:

- Specific experience
- The quality of faculty or studio management
- Craftsmanship
- Designers availability
- Product success potential

The *Product success potential* parameter is the result of another Causal Loop Diagram, which is subjected to a detailed analysis under the research problem (2) “Problematic assignment of the project to students” from a part of the Findings section of this article. All conclusions resulting from the backward mapping method were recorded into the mental model that we can call systemic, as it contains closed back-loops, see Figure 5 below. Blue dashed arrow marks added relations between elements we identified using the Backward mapping method.

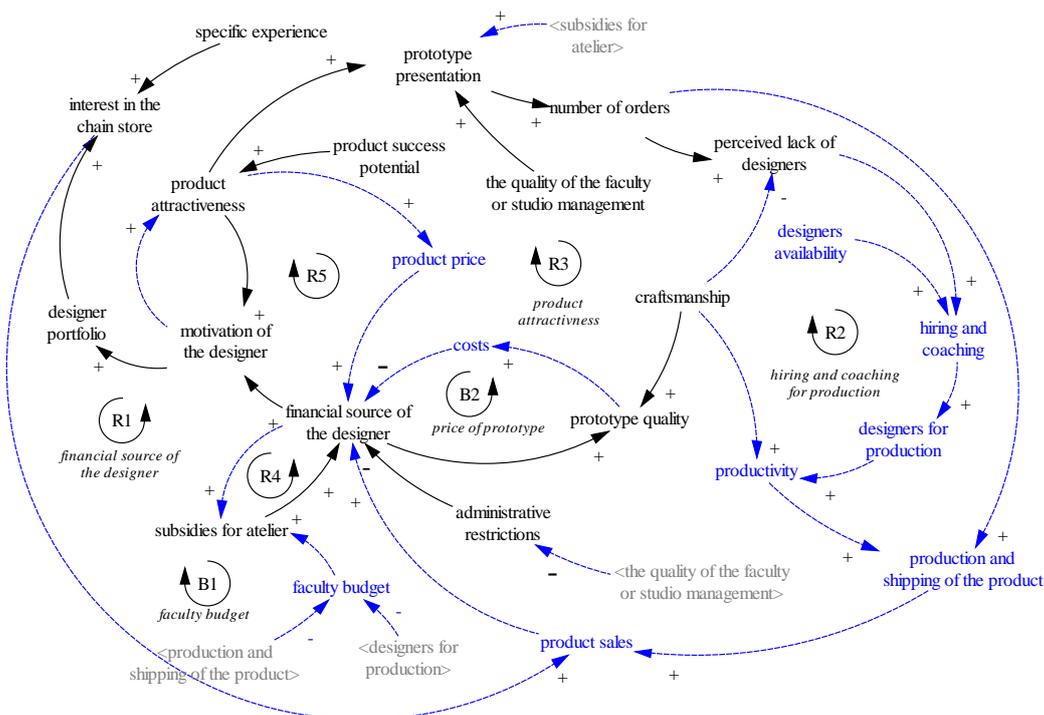

Figure 5: Mental model as a Causal Loop Diagram (own resource, 2017)

In accordance with the systems thinking method (Senge, 2006) and in order to make the back-loop diagram easy to understand, we marked all closed loops with two symbols: (1) with R for reinforcing, which means that with every new circulation through the loop all the elements within have the tendency to grow; (2) with B for balancing, which means that the Loop has a balancing task, or – to be precise - rather counteracting, and it contains an odd number of minuses. As these are back-loops, it does not matter from which element we start telling their story. A systematic creative project does not have any explicitly defined beginning or end.

Loop R1. If the designer receives a grant, for instance from the studio, it means an increased motivation for the preparation of a better prototype. With a new prototype, designers expand their portfolio and have better chance to receive an order from a chain store. If a designer wins such an order, he/she start to sell his/her outcomes. That increases the designer's income, which means funds for his/her further work.

Loop R2 consists of ten interdependent elements of the system. The faculty's management sees there is a lack of designer in the studio with a specific task to make successful prototypes for the market. It supports a new designer who is going to make other products and the designer (the author of the idea and prototype) increases his/her possibility to sell. By selling the products, the financial situation of the designer's (author of the innovation) as well as of the studio improves, as we presume that the profit from sale will be shared by the designer and the studio. The studio increases its presentations thanks to the funds, which increases the number of orders together with the need for new designers.

Loop R3. If the designer succeeds in increasing the attractiveness of its productivity in the eyes of the customer, the designer may then expect improved possibilities of presentation of the prototype. This leads to an increased number of orders and results in a greater pressure on the manufacture and sale of the products, which, in turn, results in more money for the designer. Receiving more money motivates the designer to design new attractive prototypes.

Loops R4, R5 are complementary. R4: If the studio has higher income, it also allows higher income for the designer. R5: If the product is more attractive, customers will be willing to pay a higher price for it: this way the designer's funds increase together with the product attractiveness.

In the Causal Loop Diagram (Figure 5) we have two counteracting loops. **Loop B1** acts against the growth of designers and purchase of materials necessary for making creative products for the market. The mental model works with the presumption that the material for production and the designer are paid from the faculty budget. That means that there is less money in the faculty budget that can be used for the support of designers' new ideas. **Loop B2** is complementary and acts towards the increasing funds for the designer. The better prototype a designer wants to make, the more expensive it will be. Costs decrease the funds of the designer and the studio.

How might we...?

Now it is time to answer the research question: How might we transfer innovation to the market? According to the Causal Loop Diagram, there are two possible strategies how it can be implemented. We called the first strategy "Hiring and Coaching". It is based on increasing the capacity of designers in the studio for further production of new products intended for sale. However, such a step will be linked with an increase of costs. The faculty or studio has to buy the material necessary for manufacturing and pay for the increased capacity of the designers. We should decide whether the extra costs will exceed the income from an increased sale or not. If it were so, then the chosen way how to get innovation to the market is ineffective. A good intent leads to bad assessment, incorrect decision and deterioration of the financial situation of the designer, faculty and studio. The second strategy is based on the development of designers' portfolio and their specific experience so that they are able to negotiate with an external company, for instance with H&M. The interest of a chain store may also result in an increased sale of products. Nevertheless, specific abilities are an exogenous parameter in the Causal Loop Diagram, so they will be the result of solving a different category that is not part of this diagram (see a part of the Findings section of this article "Findings" and problem (6) "Unclear specific experience of the designer").

CONCLUSIONS

As Šusta (2015) points out, an analysed problem may be described as a system structure, which means interlinking all the components of the system. The only demonstration of the structure that we are able to capture using our senses are events. Qualitative research is based on the analysis of events, as we ask about what happened and we get answers (e.g.: "I wanted to make more dresses, but there was not time for that...; each of us got five thousand for the collection...; I know it from customers..."). We try to capture a past event in a questionnaire and recording of the interview. However, if we want to understand the system, in our case design processes in a creative project, and support them, we need to go further. We have to reveal the structure of the researched system, which is partly invisible. As we have shown, using certain techniques, the invisible structure may be revealed and – to a certain extent – described. We chose the backward mapping method and so we could adjust the mental model of linear thinking. We complemented it with variables and closed loops and thus created the Causal Loop Diagram as a new mental model. That is one of the tasks of systems thinking. Everything that we perceive on the level of events and that we can capture on the level of behaviour patterns is evoked by the structure of the system. One of the basic

sentences of the systems approach is: The structure determines behaviour (Šusta, 2015). So if we want to influence the resulting behaviour, we need to influence the systems structure. All the research methods used led us to reveal the structure of the system and enabled us to take advantage of the fact that we understand it so that we could solve the research problem. It is systems thinking. It is a process of analysis and synthesis. Synthesis may further continue by compiling the Stock and Flow Diagram (SFD) which can numerically model scenarios of how a particular problem could be solved. System dynamics model is beyond the possibilities of this article.

We found two answers, two strategies, to our research problem, which was “How might we get innovation to the market?” One of them operates with the option to sell the prototype to a chain store. However, this strategy is hindered by low specific competences of the designer. Their development is not elaborated in more detail in the article (how the solution could be implemented, specific experience is an exogenous parameter of the mental model). The second strategy “Hiring and Coaching” requires an increase in the production capacity of the studio. The strategy consists of two loops: R2 (*hiring and coaching for production*) and B1 (*faculty budget*). The two loops are counteracting, the first Loop increases the funds available for the designer, whereas the second Loop acts against the increase. The suitability of implementing the proposed strategy will depend on assessing the effectiveness of a managerial decision. It depends whether the costs invested in production at the faculty will (or will not) weaken the faculty budget to such an extent that they completely paralyse its activity. Without a sufficient faculty budget it is impossible to develop the studio and it is impossible to contribute to the support of designers’ product innovations. If the “Production Loop” is stronger, then the faculty may expect development in several spheres, e.g. development of designers’ competences, their motivation and more innovations.

ACKNOWLEDGEMENTS

I would like to thank the author of the fashion collection Adéla Malendová for exemplary filling of the questionnaire and for the interview. I would like to thank David Wheat who taught me how to close loops. The article was supported by Project No. 4/2017/FSR which was financed from the strategic development fund of Tomáš Baťa University, Zlín.

USING VOCABULARY LEARNING STRATEGIES TO DEVELOP VOCABULARY MEANING UNDERSTANDING OF MATHAYOMSUKSA 6 STUDENTS OF DEMONSTRATION SCHOOL KHONKAEN UNIVERSITY

Nujaree Sukasame

Demonstration School , Faculty of Education

Khonkaen University , Thailand

E-mail : nsuk8122@hotmail.com

ABSTRACT

The purpose of this research was to construct and test the students' efficiency of vocabulary learning strategies exercises for Mathayomsuksa six students to compare students' using English vocabulary learning strategies to develop vocabulary meaning understanding ability layer and after using the exercises constructed. The sample group consisted of 29 of the 12th Grade Students of Demonstration School of KhonKaen University randomized by Purposive Sampling; during the second semester, academic year 2016. Two types of instruments were used; a vocabulary learning proficiency test used as a pretest and posttest together with 10 lesson plans. The research design used was as follow: One group Pre-test, Posttest Design method, and analyzed percentage and means. The result showed that in the pretest and posttest the means scores were 22.5 and 43.6 respectively. The result of t-test indicated statically $t = 25.129$ %. From the above result, it was noticed that the students' using vocabulary strategies to develop vocabulary meaning understanding improved significantly.

Keywords: Using Vocabulary Learning Meaning Understanding

INTRODUCTION

Vocabulary knowledge plays an important role in learning English as second Language (ESL). Read (2000, p.1) stated that "words are the basic building block of language, the units of meaning from which larger structures such as sentences, paragraphs and whole text are formed" The previous statement shows the importance of vocabulary in expressing thoughts and conveying meanings and it can also be an indicator that communication will poorly be understood without a large number of words. English proficiency has been found to be closely related to vocabulary knowledge (e.g., Laufer,1998; Nation and Meara,2002). This strong relationship can be explained by the role of vocabulary in language learning. Vocabulary is considered as a very essential component of any language (Waring and Nation ,1997. To be able to achieve high language performance, learners need large and rich vocabulary repertoire to use language effectively McCarthy, 1990 and 1998). Lack of vocabulary obstructs learners' language development as a higher language level requires a higher amount of words (Waring and Nation, 1997. Hu and Nation , 2000) Nandy (1994) asserts that " The more words one is able to use correctly , the better one will be able to express oneself easily and with self-confidence and to understand the world one lives in " (p.1) Insufficient vocabulary emerges as a major problem among L2 learners, including Thai learners , causing their poor language performance in 4 skills: reading, listening, speaking, and writing skills (awangwarorose,1984 and Sukkrong 2010) Consequently , in recent years many researchers have paid more attention on finding ways to develop learners' vocabulary level. Using vocabulary learning strategies is one effective tools to enhance learners' vocabulary (e.g. Cunningsworth, 1995: Nation, 2001)

According to Nation (2001), large vocabulary can be acquired with the help of vocabulary learning strategies and they are useful for learner develop their vocabulary learning strategies is a powerful approach to help learners acquire large vocabulary repertoire. The main advantage of vocabulary learning strategies is that they allow learners to take more control of their own learning (Scharle and Szabo, 2000 ; Nation 2001) and also develop " learner autonomy , independence, and self-direction " (Oxford and Nyikos, 18,p.291) A number of scholars, for exam,Gairns and Redman (1986) and Sokmen (1997) , have recognized the importance of learners' independence in vocabulary learning. According to Gairns and Redman (1986), after the elementary level where student are provided with plenty of new English words in class. It is difficult for teacher to choose all useful words of them, so learners must have more responsibilities for their own learning of vocabulary. Sokmon (1997) believes that it is impossible for learners to remember all words they need in class and to acquire large vocabulary they need they need to take responsibilities for their own learning. Using vocabulary learning strategies to develop vocabulary

meaning understanding is chosen to be taught in this current study based on the understanding that it is useful teaching method approved by several researchers. Furthermore, it is a method of systematic training in strategies that assists learners to enhance their learning and vocabulary knowledge (Soonthornmanee , 2002)

As discussed above, using vocabulary learning strategies to develop vocabulary meaning understanding has been shown to help learners develop their vocabulary knowledge. Thus, it is worthwhile to study vocabulary learning strategies used by Mathayamsuksa 6 students Demonstration school Khonkaen University.

LITERATURE REVIEW

The Meaning of “Knowing a word”

What does “Knowing a word” mean? Does “knowing a word” mean being able to recognize its written form and its meaning? The definition is sufficient. This is because it refers to only form and meaning, not all the other aspects of vocabulary knowledge. Vocabulary knowledge involves more than just the link between meaning and form, it is multifaceted (Lauer and Goldstein,2004). This idea is consistent with that Oxford and Crookall (1990) who indicate that “knowing an L2 word” involves not just the ability to recognize the word or to match it with its L1 counterpart. Ling (2005) states that words are interwoven in a complex system in which knowledge of various levels of a lexical item is required in order to achieve adequate understanding in listening and reading or produce ideas successfully in speaking and writing .

According to Richard (1976), knowing a lexical item includes knowledge of word frequency, collocation, register, case relation, underlying form, word association, and semantic structure. Alongside form and meaning. There is a distinction between receptive and productive knowledge that is used by researchers when investigating vocabulary learning (Milton, 2009). Nation (2001) also applies the terms “receptive and productive” to vocabulary knowledge description covering all the aspects of what is involved in knowing a word. Therefore, we can say that receptive and productive knowledge is another aspect which is useful in understanding the L2 vocabulary learning process. Vocabulary learning strategies are considered a part of language learning strategies (Nation,2001). For Cameron (2001) Vocabulary learning strategies are “the actions that learners take to help themselves understand and remember vocabulary items.” (p.92) Catalan (2003) based on Rubin’s (1987), Wenden’s (1987), Oxford’s (1990), and Schmitt’s (1997) definition , defines vocabulary learning strategies “ the mechanism used in order to learn vocabulary learning strategies ” as well as steps or actions taken by students (a) to find out the meaning of unknown words, (b) to retain them in long-term memory, (c) to recall them at will, and (d) to use them in oral or written mode (p.56). According to Intaraprasert (2004), vocabulary learning strategies are “ any set of techniques or learning behaviors , which language learner reported using in order to discover the meaning of new word, to retain the knowledge of newly-learned word , and to expand one’s knowledge of vocabulary ” (p.53) Many classifications of vocabulary learning strategies have been proposed by scholars (Oxford,1990 ; Gu and Johnson,1996 ; Schmitt,1997) Among these classifications, one of the well-known and well-accepted among researchers, (Hamzah and Kafipour and Abdulla,2009 ; Sripetpun ,2000) is that by Schmit (1997) who divided vocabulary learning strategies into 5 sub categories :

- 1) Memory strategies – connecting strategies – similar to memory learned knowledge,
- 2) Cognitive strategies – similar to memory but focusing on manipulative mechanical process
- 3) Metacognitive strategies – process of ; learning and making decisions about planning , monitoring, and evaluating the best way to study,
- 4) Determination strategies – used by individuals to discover a word’s meaning without consulting other people
- 5) Social strategies – a way to learn a new word by interacting with other people

The study

To study the result of vocabulary strategies in improving the understanding the meaning of words and to compare the differences in the English language vocabulary understanding Mathayom 6 students at the Demonstration School of KhonKaen University.

Research hypothesis

Students using vocabulary learning strategies in learning English vocabulary will increase their ability in understanding the meaning of words.

METHODOLOGY

Participants The participants of the study are 29 students in Mathayomsuksa 6 students ; particularly Class M.6/1, at Demonstration School of Khon Kaen University.

Research instruments and procedures

Ten prepared lesson plans on vocabulary for Mathayomsuksa 6 students. And A 50 question ability test on the students' understanding of English vocabulary. The study consisted of three phases. The first phase was a pre-test in which the subjects' vocabulary proficiency, vocabulary learning strategies were measured through the vocabulary test. The second phase was instruction in vocabulary learning strategies based on the results of the pre- test, which will be explained in detail in the following part. The third phase was a post-test in which the subjects were not only reexamined on their vocabulary proficiency and vocabulary learning strategies with the same instruments

FINDINGS AND DISCUSSIONS

In order to get the result, data was analyzed using SPSS (Statistical Package for Social Science) Descriptive statistic (means and standard deviation) are used to proving the research hypothesis. The analyzed data has been summarized demonstrated on different tables. On the basis of descriptive statistics, Table 1 and 2 have been reproduced. Table 2 shows the results of the pretest and the post-test score.

Table 1: Descriptive results of students' performance on the pretest and the posttest.

N 29	Pretest	Post test
1	21	44
2	22	43
3	20	43
4	22	44
5	22	43
6	21	44
7	29	44
8	20	43
9	22	43
10	23	44
11	21	43
12	19	44
13	18	43
14	23	44
15	21	44
16	22	44
17	31	46
18	20	43
19	19	42
20	22	43
21	21	43
22	38	43
23	21	44
24	37	47
25	22	44
26	20	43
27	18	44
28	17	43
29	22	44

Table 2-3 illustrates below:

Table 2: The results of Paired Sample Statistics

Pair 1		N	Mean	Std. Deviation	Std. Error Mean
	Pretest	29	22.55	5.004	0.929
Post test	29	43.66	0.974	0.181	

Table 2 shows that the means score on the pretest is 22.55 (S.D. = 5.004) and (S.D. Error Mean = 0.929) The mean score on the post –test is 43.66 (S.D. =0.974) and (S.E.D. = 0.181)

Table 3: The results of Pearson Correlation Analysis

Pair 1	Pretest	Post test	N	Correlation	Sig
			29	0.568	0.001

Table 3 reveals that the correlation coefficient is 0.568 by Sig. (0.001) The result suggests that there is positive significant correlation.

Table 4: The results of Paired Samples T Test

	Mean	S.D.	Mean of Difference	Std. Deviation	T	df	Sig 1 tailed
Pretest	22.55	5.004	21.10	4.523	25.129	28	0.000
Post test	43.66	0.974					

Table exhibits that there were significant differences on students' performance on the pretest mean score and standard deviation ($M = 22.55$) (S.D. 5.004) and the means score the post-test was 43.66 (S.D. 0.974) and the mean of difference (21.10), (Std=4.523) since the T value reached 25.129 by sig 0.000 The results denote that there was a significant difference between the pre-test and the post-test means. That is using learning vocabulary strategies have been changed through the instruction in significant

CONCLUSIONS

In summary, we can say that vocabulary is an indispensable of linguistic competence. This study has endeavored to help the Mathayomsuksa 6 students using vocabulary learning strategies to develop vocabulary meaning understanding how to learn English words in a more effective way through integrated instruction in vocabulary learning strategies. The instruction was conducted in a context of Mathayomsuksa 6 students at Demonstration School of Khonkaen University. The change in strategy used and vocabulary proficiency was measured by comparing the pre-test and the post test data collected through a vocabulary test. In the basis of data analysis, the study draws the following conclusions. Firstly, the instruction in vocabulary learning strategies is effective for the Mathayomsuksa 6 students who are not adopted at using vocabulary learning strategies to develop vocabulary meaning understanding is equal to the retention of form meaning associations and have an awareness of what to do for using a word communicatively. In addition, their strategy used and vocabulary proficiency have been improved. Finally, their feedback on the instruction shows that they support the learners.

Secondly, different types of subjects benefit differently from the instruction. The subjects whose vocabulary proficiency is high and those vocabulary test scores have increased the post-test make the most progress in strategy use. Thirdly, the process of absorbing vocabulary learning to develop vocabulary meaning understanding into part of subjects' own learning ability is a long process. Although there is a significant change in the subjects' use of vocabulary learning strategies through the instruction, the results reveal the post-test score which was higher than the pre-test score supporting the hypothesis that the students' vocabulary meaning understanding is reached the higher score because of the implemented instruction. Thus strategy instruction should be continual and integrated into regular classroom teaching. Finally, using vocabulary learning strategies to develop vocabulary meaning understanding should be important factors to take into account for the design of instruction in learning strategies.

RECOMMENDATIONS FOR TEACHERS

Implementing a program to enhance using vocabulary learning strategies to develop vocabulary meaning understanding in students does not have to be overwhelming. Teachers can easily take current practices to the classroom and fit in the two recommended elements to increase word knowledge.

First, to encourage students to ask questions when new and interesting words are encountered that do not become immediately familiar. Read and discuss the same text more than one time allowing student to take ownership of the language in the environment. Second, select more words than currently recommended by basal curriculum to teach directly. Give students simplified definitions and again have opportunities for frequent and repeated use of the words, providing student the opportunities to encounter and learn more vocabulary which should be very helpful for them in the future education and also the career path.

FURTHER STUDIES

This study aimed to examine the result of vocabulary learning strategies of more research should be done with various groups of students to better understand the roles of vocabulary learning strategies. In addition to using the questionnaire, further studies should include other methods such as interview, observation, in order to get in-depth information about students' use of vocabulary learning strategies. This may also allow researchers to discover

further aspects such as students' attitudes towards learning English and student's problems with the use of vocabulary learning strategies.

Bu çalışmada üniversite öğrencilerinin, genel öz-yeterlik algıları incelenmiş ve genel öz-yeterlik algılarının cinsiyet, yaşam yeri, gelir durumu ve aile tutumları gibi değişkenlere göre farklılık gösterip göstermediği araştırılmıştır. Çalışma grubu dört farklı üniversitede okuyan 844 öğrenciden oluşmaktadır. Araştırmada veri toplama aracı olarak Kişisel Bilgi Formu ve Vardarlı (2005) tarafından uyarlaması yapılan Genel Öz-yeterlik Ölçeği kullanılmıştır. Sonuç olarak, araştırma bulguları üniversite öğrencilerinin genel öz-yeterlik inanç düzeylerinin çeşitli değişkenler açısından farklı özellikler gösterdiğini ortaya koymuştur.

ÖZET

Giriş

Herkes tarafından bilinmesi ve gerekli durumlarda uygulaması gereken ilk yardım, yaşamın tehlikede olduğu bir durumda sağlık görevlileri yardıma ulaşmaya kadar hayatın kurtarılması ya da daha kötüye gitmesinin önlenmesi için yapılanlardır. Bu çalışmada üniversite öğrencilerinde ilk yardım bilgi düzeylerinin ve bunu etkileyen bazı değişkenlerin belirlenmesi amaçlandı.

Gereç Yöntem

Sakarya Üniversitesi Tıp Fakültesi girişimsel olmayan etik kurulundan alınan onayın ardından 15-30 Mart 2017 tarihleri arasında yapılan ve evrenini Sakarya Üniversitesinde öğrenim görüp ilk yardım dersi almayan meslek yüksekokulu öğrencilerinin oluşturduğu çalışmada öğrencilerden 1167'sine ulaşıldı. Kesitsel tipteki araştırmada, demografik özellikleri belirlemeye ve bilgi düzeyini ölçmeye yönelik 40 sorudan oluşan anket uygulanarak veri elde edildi. SPSS 20 istatistik programı kullanılarak yapılan analizde tanımlayıcı istatistikler (ortalama, ortanca) yapıldı. Sürekli değişkenlerin normal dağılıma uygunluğu Shapiro-Wilks testi kullanılarak denetlendi, ki kare analizi yapıldı. $p \leq 0,05$ olması durumunda anlamlı farklılığın olduğu kabul edildi.

Bulgular

Katılımcıların 539'u (%46,1) kadın, 629'u (% 53,9) erkekti. Yaş ortalaması $20,23 \pm 2,48$ ss, ortancası 20,0 idi. Katılımcıların 158'i (%13,5) daha önce ilk yardım müdahalesi yapmak zorunda kaldığını ancak 87'si (%7,5) ilk yardım konusunda yeterli bilgiye sahip olduğunu belirtti. İlk yardım konusunda bilgiye erişim yolu olarak 151 (%12,9) kişinin TV, radyo, internet kullandığı; 146 (%12,5) kişi eğitim/kurstan bilgi aldığı tespit edildi. Acil sağlık durumunda aranması gereken telefon numarasını 30 (%2,6) kişi yanlış bilirken, baygın bir kişiye ilk müdahaleyi 797 (%68,3), bilinci kapalı hastaya ilk müdahale sırasını 600 (%51,4) kişi, yetişkinde göğüs kompresyonu-suni solunum oranını 167 (%14,3) kişi, önerilen göğüs bası hızını 848 (%72,7) kişi doğru bildi. Kalp masajının yapılacağı yeri 651 (%55,8) kişi yanlış cevapladı.

Bilgi sorularının tamamını doğru yanıt verenin olmadığı araştırmada, 'Epilepsi nöbeti geçiren kişiye nöbetinin sonlanması için soğan koklatılır' ifadesine 312 (%26,7) kişi doğru diyerek yanlış cevap verdi. 'Asit veya petrol ürünü maddeleri (gaz yağı, benzin...) yanlışlıkla içen bir kişi derhal kusturulmalıdır' ifadesine 209 (%17,9) kişi yanlış diyerek doğru cevap verdi. 'Epilepsi nöbeti geçiren bir kişinin çenesi kilitlenmiş ise ağzına çatal, kaşık gibi cisimler konularak açılmaya çalışılmalıdır' ifadesine 367 (%31,4) kişi doğru, 339 (%29,0) kişi fikrim yok diyerek doğru cevabı bilemedi. Kadınlarla erkekler arasında bugüne kadar ilk yardım müdahalesi yapmak zorunda kalmaları yönünden anlamlı fark vardı, kadınların %10,4'ü erkeklerin % 16,2'si müdahale yapmak zorunda kaldı ($p=0,004$). Kadınlarla erkeklerin acil sağlık durumunda aranması gereken numarayı bilme durumları arasında anlamlı fark vardı, erkeklerin yanlış bilme oranı (%3,9) kadınlardan (2,6) yüksekti ($p=0,008$).

İlk yardım konusunda yeterli bilgiye sahip olduğunu düşünenlerle düşünmeyenler arasında göğüs kompresyon oranını bilme açısından anlamlı fark vardı, yeterli bilgiye sahip olduğunu düşünenlerin %64,4'ü düşünmeyenlerin 87,4'ü oranı yanlış bildi ($p=0,000$).

Sonuç

İlk yardım konusunda eğitim almış olmak önemlidir. Bununla birlikte çalışmamızda bu konuda eğitim alanların oranı %12,5 gibi düşük bir oranda tespit edildi. Riskli meslek gruplarında çalışacak olan öğrencilere verilen ilk yardım eğitiminin yeterli düzeyde olmadığı görülmektedir. Yapılan literatür taramasında da görüldüğü üzere ilk yardım konusundaki bazı uygulamalar zaman içerisinde değişebildiğinden eğitim almış olan öğrencilerin dahi bilgilerinin güncellenmesi gerekmektedir.

Anahtar Kelimeler: İlk yardım, üniversite öğrencisi, bilgi düzeyi

ABSTRACT

Introduction

First aid refers to the interventions made to save life, or to avoid deterioration in a life-threatening situation until health professionals arrive. Everybody should have knowledge about first aid and be able to apply it when necessary. The present study aims to assess first aid knowledge level of university students and identify some of the variables that influence first aid knowledge.

Material and Method

After approval of the study by a non-interventional ethical committee of Sakarya University Faculty of Medicine, the study was conducted between 15-30 March 2017 on students of the vocational high school, who attended Sakarya University but did not take any prior lesson on first aid. Totally 1167 students were included in the study. In this cross-sectional study, data collection was performed with a questionnaire comprised of 40 items aimed at assessment of demographical properties and first aid knowledge level. Statistical analyses were carried out with SPSS 20 statistics software, and descriptive statistics (mean, median) were calculated. Normality assessment was made with Shapiro-Wilk test, and the chi-square test was applied. $p \leq 0.05$ was accepted as statistically significant.

Results

Of all study participants, 539 (46.1%) were female and 629 (53.9%) were male. Mean age was 20.23 ± 2.48 years, with a median of 20.0. 158 (13.5%) participants stated that they have encountered an occasion before that they had to apply first aid, but only 87 (7.5%) stated that they had adequate knowledge on first aid. As means of access to knowledge on first aid, 151 (12.9%) subjects used television, radio, and internet; and 146 (12.5%) subjects acquired knowledge from a training course. 30 subjects (2.6%) did not know the correct emergency call number. 797 subjects (68.3%) gave a correct answer regarding the first aid in an unconscious person, and 600 (51.4%) subjects correctly identified the order of first aid in a case having loss of consciousness. 167 subjects (14.3%) gave a correct answer regarding the chest compression-artificial ventilation ratio in an adult; whereas 848 subjects (72.7%) knew the speed of chest compression. 651 subjects (55.8%) gave false answers regarding the site of cardiac massage.

None of the subjects could answer all first aid knowledge questions correctly. 312 subjects (26.7%) misidentified the statement "the smell of onion can be used to terminate seizure attack" as being correct, and thus gave a false answer. 209 subjects (17.9%) misidentified the statement "a person who ingested acid or petroleum products (kerosene, gasoline, etc.) should vomit immediately" as being correct. The statement "if a person's mouth is locked during a seizure, his/her mouth should be opened using objects like fork and spoon" was misidentified as being correct by 367 subjects (31.4%), whereas 339 subjects (31.4%) stated they had no idea on this.

There was a significant difference between male and female sex regarding whether they had to apply first aid before. 10.4% of females and 16.2% of males stated that they had to apply first aid before ($p=0.004$). There was also a significant difference between the sexes regarding whether they knew the emergency call number; males were more prominent to give false answers (3.9%) than females (2.6%) ($p=0.008$).

There was a significant difference between subjects who thought they had adequate knowledge on first aid and those who thought their knowledge level was inadequate regarding whether they had correct knowledge on the ratio of chest compression. 64.4% of those who thought they had adequate knowledge gave false answers, while this rate was 87.4% among those who thought their knowledge level was inadequate ($p=0.000$).

Conclusion

It is important to be trained in first aid. However, only 12.5% of participants had prior training on first aid in our study. It is apparent that first aid training instructed to the students, who will work in high-risk occupations, is inadequate. As it is previously stated in the related literature, even the knowledge of students who have been trained before should be updated, since some first aid applications can be modified over time.

Key words: First aid, University Students, Knowledge level.

Üniversite Öğrencilerinin Marka Algısı Üzerine Bir Çalışma: Sakarya Üniversitesi İletişim Fakültesi Örneği

ÖZET

Günümüzde “marka” tanımını duyunca artık aklımızda canlanan tek şey kıyafet veya aksesuar değil neredeyse her şey... Eşyalardan insanlara kadar artık her şeyin bir markası var insanlar kendilerini bir markaya dönüştürmek veya bir marka ile kendini gerçekleştirmek için adeta bir yarış içerisine girmiş durumdadır. Peki toplumsallaşma sürecinin son aşamasına adım atmış olan üniversite öğrencileri yükselmekte olan bu marka veya marka olma yarışının tam olarak neresinde yer alıyor? Araştırmamızı bu sorunun cevabını alabilmek amacıyla yapmış bulunmaktayız.

Anahtar Kelimeler: Marka, pazarlama, reklam, tüketim

Giriş

Günümüz dünyasında teknolojinin gelişmesinin de etkisiyle ürün, hizmet ve mal pazarında büyük değişimler, gelişimler yaşanmış ve eşsiz bir rekabet ortamı olmuştur. Bu rekabet ortamında üreticiler tüketicilerin gözünde farklılaşma ve rakiplerinin önüne geçme yolları aramaktadır. Rakiplerinin önüne geçebilmek için ise kendi ürün/hizmet/mallarına standartlar belirlemektedirler. Bu standartların başında ise ürün/hizmet/mal markası, imajı ve kurum/kuruluş itibarı gelmektedir. Peki nedir bu marka? Alan yazın da 100’den fazla tanımlı bulunan marka terimini:

Amerikan Pazarlama Derneği; “Bir satıcı veya bir grup satıcının ürün ve hizmetlerini rakiplerinden ayırmak için belirledikleri isim, terim, işaret, sembol, dizayn veya bunların kombinasyonu” (Keller 1998’den Aktaran: Işık, M, 2015 s.9) olarak tanımlamıştır.

Kemal Yamankaradeniz İse markayı; “Temelde ürünün tüketiciye kendini ifade ediş biçimidir.” (Yamankaradeniz, K. 2007 s.10). Olarak tanımlamıştır.

İngiltere'nin marka planlama gurusu Paul Feldick'te Yamankaradeniz'e yakın bir tanımda bulunarak markayı; " Bir, Marka tüketici zihninde oluşan algıların bütünüdür." Olarak tanımlıyor. (Ercan, M. K. ve Öztürk, M. B. vd. 2011 s.3).

Bu tanımlardan da yola çıkarak markayı "ürünlerin birbirinden ayırt edilmesi amacıyla üretici ya da satıcıyı farklılaştıracak arayış olarak tanımlayabiliriz. (Ercan. M, 2010 s.3). Markanın tanımını yaptıktan sonra önemine geçebiliriz. Değişen pazarlama sektöründe tüketiciler artık seçeneklerinin farkında, gelişen teknolojinin de sayesinde istedikleri her ürünü ve istedikleri her ürüne dair bilgiye çok kolay ulaşabiliyorlar. Bu duruma ek olarak her gün piyasaya sürülen yeni ve benzer ürünler karşısında üreticiler bu karmaşık ve yoğun ortamda tercih edilebilmek için "farklılaşmak" zorunda olduklarının farkındalar. Farklılaşmak, fark edilir olmak artık bir seçenek değil zorunluluk çünkü yaptığımız her ürünün birebir aynısı, bir benzeri veya daha iyisi siz ürününüzü piyasaya sürer sürmez çıkabiliyor. Sadece tuvalet kağıdı almak için bir markete girdiğinizde bile o kadar çok seçeneğiniz var ki; hayatlarını devam ettirebilmek için üreticiler tüketicinin gözünde bir şekilde tercih sebebi olmak zorunda. Bu farklılaşma ortamına gençlerin yaklaşımı nedir? Bu soruya cevap bulabilmek için çalışmamızda üniversite öğrencilerinin marka algısını ölçmeye çalıştık.

Literatür Taraması

"Marka" ile ilgili alanyazın tarandığında bu konu ile daha önce yapılmış çok sayıda çalışma olduğunu görüyoruz bu çalışmalardan bazıları şöyledir;

DİKMEN tarafından 2006 yılında yazılmış olan bu doktora tezinde marka konumlandırma stratejilerinin tüketici davranışları üzerindeki etkilerinin hızlı tüketim malları pazarında, ulusal ve özel marka kapsamında incelenmesi amacıyla, kolayda mallar pazarını temsilen seçilen tuvalet kağıdı ürün grubunda gerçekleştirilmiştir. Bu amaca ulaşmak için yapılan yerli ve yabancı kaynak taramasından sonra, Migros, Tansaş ve Gima marketlerinde tüketicilerle 300 kişilik bir anket çalışması gerçekleştirilmiş ve sonuçlar lojistik regresyon ve t-testi analizleri uygulanarak değerlendirilmiştir. Araştırmada tüketicilerin satın alma kararında ulusal ve özel marka tercihlerini etkileyen faktörleri ortaya koymak amacıyla, tüketici davranışlarının sosyal, kültürel, demografik, psikolojik, davranışsal ve durumsal faktörlerden, konumlandırma stratejilerinden ve satın alma risklerinden etkilendiğine dayanan bir tanımlayıcı model geliştirilmiştir. (Dikmen, G. Ö.2006 s.211).

Taşçı tarafından yapılan çalışma ise şöyledir; Marka kimliği önceleri ürünün ve işletmenin görsel unsurları ile eş anlamlı olarak kullanılmış, ancak zaman içinde kavram genişletilmiştir. Marka kimliği artık vizyon, felsefe, kurum kültürü, görsel kimlik, kurum iletişimi ve kurum davranışını da içermektedir. Diğer bir ifade arık ürün özelliklerinin yanı sıra, kurumun yer aldığı sosyal sorumluluk faaliyetleri, markanın kimliğinin oluşmasında rol oynamaktadır.

TAŞÇI tarafından 2010 yılında yazılan bu yüksek lisans tezinde belirlenen bir kurum üzerinden marka bilinirliği oluşturulmaya çalışırken insanların tepkileri ve istekleri 5 demografik soru, 3 Tüketim Eğilimi sorusu ve 44 sorudan oluşan “Algılanan Marka Kişiliği Ölçeği” yapılandırılmış 150 kişiye anket formu uygulanarak veriler toplanmıştır. Sonuçlar ise % 95 güven aralığında, anlamlılık $p < 0,05$ düzeyinde çift yönlü olarak değerlendirilmiştir. (Taşçı, C. 2010 s. 90).

Yazgan tarafından yapılan çalışma ise şöyledir; “Marka, yıllardır var olan bir süreç. İlk insandan bugüne kadar, insanoğlu farklı cisimleri anlatmak için farklı semboller kullanmış, dikkat çekmek için renklerden yararlanmış. İçinde bulunduğumuz enformasyon çağında ise, dikkatimizi çekmeye çalışan onlarca rengi, binlerce uyarıcıyı beynimiz yakalayamaz durumda. Durum böyleyken; firmaların satış ekiplerini kuvvetlendirmek, onlarca satış kampanyası düzenlemek, tesislerin üretim kapasitesini arttırmak satıcıyı pazarda kalıcı hale getirmemektedir. Bunun yerine firmalarda pazarlama bölümleri aktif hale getirilmeli, markalaşma ile ilgili yoğun mesai harcanmalı, tüketicinin kalbi nasıl kazanılır sorusunun cevabı aranmalıdır.” (Yazgan, S. 2010 s.3.) YAZGAN tarafından 2010 yılında yazılan bu yüksek lisans tezinde çalışmada kuramsal çerçevenin oluşturulmasında genel tarama yöntemlerinden olan alanyazın taraması yöntemi kullanılmıştır. (Yazgan, S. 2010 s.3).

Doğan tarafından yapılan bir diğer çalışma ise şöyledir; Değişmeyen tek şeyin değişim olduğu günümüzde, tüketici istek ve ihtiyaçları sürekli değişimler göstermektedir. Bu değişime cevap verebilmek ise işletmelerin yaşamlarını sürdürebilmeleri adına önem arz etmektedir. Değişime yönelebilmek için işletmelerin tüketicilerin istekleri, zevk ve alışkanlıkları üzerine yoğunlaşması ve söz konusu etmenler çerçevesinde ürünlerine yeni özellikler yüklemesi gerekmektedir. Bu durum markalaşma çabalarının ve olgusunun en temel özelliğidir. DOĞAN tarafından 2012 yılında yapılan bu çalışma, tüketicilerin markaya duyduğu güven ve marka bağlılığı arasındaki ilişkiyi incelemek ve tüketicilerin demografik özelliklerine göre markaya duyulan güven ve marka bağlılığının farklılaşma gösterip göstermediğini ortaya koymak amacıyla 2012 yılı Mart ve Nisan ayında, rastgele örneklem seçme yöntemi ile Karabük İl merkezinden 242 kişiye ve Safranbolu İlçe merkezinden 208 kişiye ulaşılarak toplamda 450 kişi ile yüz yüze anket yöntemiyle araştırma gerçekleştirilmiş ve kullanılabilir düzeydeki 417 anketten veriler elde edilmiştir. (Doğan, M. 2012 s.137).

Göksel tarafından yapılan başka bir çalışma ise şöyledir; Küreselleşen dünyada yaşanan değişimlerle beraber ürünler arasındaki fiziksel farklılıklar ortadan kalkmaya başlamıştır. Bu gelişmeyle birlikte ürün veya hizmetleri diğerlerinden ayıran söz, sembol, işaret, terim, dizayn, isim ya da bütün bunların birleşimi olan “marka” rekabet avantajı sağlamada önemli bir yere sahip olmuştur. Marka kavramının öneminin artmasıyla var olan marka değeri ve başarısı üzerinden marka genişletme stratejileri uygulanarak bu başarı arttırılmaya, yayılmaya çalışılmıştır. Marka genişletme stratejisi güçlü marka imajı, kimliği ve değeri yaratan, pazarda belli bir paya sahip olan markaların tercih ettiği stratejilerden biri haline gelmiştir. Göksel tarafından 2013 yılında yapılmış olan bu çalışma üniversite öğrencilerinin Apple marka ürünleri kullanması üzerine yapılan bir nicel marka konulu çalışmadır. Toplamda 478 kişiye anket uygulaması yapılmış 306 kişinin anketi değerlendirilmeye alınmış ve sonuca ulaşılmıştır. (Göksel, G. 2013 s.142).

Köse tarafından yapılan çalışma şöyledir; Firmalar açısından kalıcı ve uzun vadeli başarının anahtarlarından birisi olarak görülen marka sadakati, son zamanlarda üzerinde en çok durulan ve araştırılan konulardan birisidir. Bu çalışmada da marka güveni, müşteri memnuniyeti ve algılanan hizmet kalitesinin, marka sadakatini ne şekilde etkilediğinin incelenmesi amaçlanmıştır. Marka sadakati, tüketicinin başka alternatif markalarında bulunduğu bir durumda, onlar arasından gerekirse daha fazla emek, para ve zaman harcayarak, müşterilerin tercihlerinde bir değişikliğe neden olabilecek durumlara rağmen ısrarla belli bir markayı tercih etmesidir. (Dereli ve Baykasoğlu, 2007:96; Yılmaz, 2005; Chaudhuri, Halbrook,2001; Palumbo, Herbig,2000). KÖSE tarafından 2015 yılında yapılan bu çalışmada tüketicinin marka sadakati konusunu incelenmiştir. Hangi durumlarda tüketicinin markaya güvendiği ve nasıl sadakat geliştirdiğinin incelendiği çalışma 260 kişilik bir grupla yüz yüze anket tekniği kullanılarak hazırlanmıştır. (Köse, N. 2015 s.38).

Dursun tarafından 2009 yılında yapılan çalışmada marka kişiliği yaratma süreci konu edinilmiş, marka kişiliğinin ne olduğu ve insanların neden marka kişiliklere sahip olmak istediği hakkında bir araştırma yapılmıştır. Dursun araştırması için Maltepe Üniversitesi İİBF öğrencilerinden 277 kişilik bir grupla çalışma yapmış ve o marka kişiliği, pazarlama iletişimi uygulamalarına ve mesajlarına rehberlik eden markaya yüklenen, tüketicileri duygusal açıdan uyaran, insana özgü karakteristik özellikler ve nitelikler bütünüdür. Markanın bir insan gibi değerlendirilmesidir sonucuna ulaşmıştır. (Dursun, D. 2009 s.89).

Eren ve Erge tarafından 2011 yılında yapılan bu çalışmada marka güveni marka değeri ve marka sadakati üzerine yapılan çalışmada Bolu ilinden 600 kişi üzerinde anket çalışması yapılmış 442 kişinin anketi değerlendirmeye alınmış ve çalışmanın etkin geri dönüş oranı %73 olarak gözlemlenmiştir. Çalışmada temel amaç tüketicilerin davranışsal ve tutumsal marka sadakati üzerine marka güveni, marka memnuniyeti ve müşteri değeri gibi değişkenleri tespit etmektir. (Eren, S. S. ve Erge, A. 2011 s.1,8).

Başgöze ve kazancı tarafından 2015 yılında yapılan çalışma marka konusuna çok farklı bir pencereden bakarak sosyal medya algısının satın alma davranışı üzerindeki etkilerini incelemiştir. 455 kişiye anket uygulaması yapılmış bu verilerden 417 tanesi işlenerek sonuca ulaşılmıştır. (Başgöze, P. ve Kazancı, Ş. 2015 s.11).

Cengiz tarafından 2016 yılında yapılan çalışma marka farkındalığının marka imajı ve marka güvenine etkisini incelemektir. Söz konusu inceleme, akıllı cihazlar için planlanmış ve yürütülmüştür. Araştırmada marka farkındalığının marka imajını etkileyip etkilemediği; etkiliyorsa bu etkinin yorumunun yapılması hedeflenmiş bu doğrultuda 456 kişiye anket uygulaması yapılmış sonuçlar anlamlı bulunmuştur. Sonuçlara göre marka farkındalığı, marka imajını; marka imajı da marka güvenini olumlu yönde etkilemektedir. (Cengiz, O. 2016 s.22).

Bizim çalışmamızın bu çalışmalardan farkı ve alanyazına katkısı ise tek bir ürün/hizmet veya kuruluş incelemesi olarak değil de genel olarak marka kavramı üzerine yapılmış bir çalışma olmasıdır.

Kuram

Kullanımlar ve Doymalar Kuramı: Kullanımlar ve Doymalar (Uses and Gratifications) Kuramı denildiğinde akla ilk gelen medya kullanımı ve izler kitlenin tercihleri olsa da biz marka kullanımını da tüketicilerin belirli doymalara ulaşmak amacıyla tercih ettiğini bildiğimiz için araştırmamızın temelini kullanımlar ve doymalar kuramı üzerine kurduk. Çünkü kullanımlar ve doymalar yaklaşımının temelinde de hedef kitle medyadan aldıkları bilgiler arasından kendi gereksinimlerini karşılamaya yarayanları seçer, alır ve kullanır. (Güngör, N. 2013 s.123).

Kullanımlar ve doymalar yaklaşımına göre insanlar medyayı kendi gereksinimleri doğrultusunda kullanır. Buna göre medyanın izleyici tarafından nasıl ve ne ölçüde kullanıldığının öğrenilmesi için izleyicinin gereksinimlerinden hareketle analizlerin yapılması gerekir. (Güngör, N. 2013 s.123).

Kullanımlar ve doymalar kuramı iletişim araçları üzerine temellendirilmiş bir kuram olmasına karşın bu kuramı hayatın her alanına uygulamak mümkündür. Çünkü insan sosyal bir varlıktır ve doğası gereği kullandığı her şeyden genel olarak bir doyuma ulaşmak ister. Bu tanımı ‘’marka’’ ya uyarlamamız gerekirse öncelikle tüketicinin gereksinimlerini, tercihlerini ve ne istediğini bilmek (kendini gerçekleştirmek, hayat tarzını göstermek, kişiliğini sergilemek, mal varlığını göstermek, sadece rahat etmek vb.) tüketicinin aldığı markadan tam bir doyuma ulaşmasına böylece o markayı her zaman tercih etmesine neden olur.

Bu durumda kullanımlar marka doymalar ise o markanın bize sağladığı pozitif ve negatif değerlerdir diyebiliriz.

Araştırmanın Amacı

Marka; tüketicilerin hislerinde belirli bir fayda temin etmeye yönelik ve bilinen bir kaynaktan elde edilen (bir ürün, bir hizmet, bir şirket vb.) ve genellikle standartlaştırılmış ve sembolik tanımlarla birleştirilmiş (isim, logo, renk, amblem, etiket, hayal, vb.) bir beklentidir. (Herman, D. 2006 s.69)

Markalaşmanın rolü 20. Yüzyılın sonlarında değişmeye başlamıştır. Eski zamanlar da kurum/kuruluşlar bir ürünü/hizmet geliştirir bunu hedef kitleye cazibeli kılarak "marka" yapma yoluna gidilirdi. Yeni sisteme göre ise değişen tüketici profili ile birlikte artık kurum/kuruluşların kendi istekleri doğrultusunda geliştirdikleri ürün/hizmet değil tüketicilerin istek ve ihtiyaçlarına göre geliştirdikleri ürünler "marka" oluyor. Artık "marka" iyi yönde farklılaştırılmış bir yolla sunulan ve niteliği itibarıyla zor bulunan faydadır. (Herman, D. 2006 s.67) Burada zor bulunan kısma dikkat çekmek istiyorum. "Zor bulunması" veya "zor taklit edilmesi" bir ürün/hizmetin marka olmasını kolaylaştırıyor. Çünkü artık tüketiciler istedikleri her ürün/hizmete kolaylıkla sahip olabiliyor ve kolay ulaşılan değersizleşiyor.

Araştırmamızın amacı artık hayatımızın her alanında vazgeçilmez bir parça olan "marka" kavramının üniversite öğrencileri üzerindeki etkilerini ölçmektir. Gündelik hayat içerisinde çoğu zaman fark edemesekte sabah gözümüzü açtığımız andan akşam gözümüzü kapattığımız zamana kadar her yerde ve her şekilde karşımıza çıkan markaların saldırısı altındayız. Evimizde başlayan bu saldırı yolda, sokakta, trafikte, işte kısaca hayatımızın her adımında bizi takip ediyor. Bu tanım şuan okuyunca size çok abartılmış gibi gelebilir. O halde isterseniz sabah evden çıkıp işe veya okula gidene kadar kaç tane marka gördüğünüzü saymak zahmetine girin. Trafikte ki araba markalarından evinizdeki eşyaların, kıyafetlerinizin veya karşılaştığınız insanların kıyafet ve aksesuarları dahil hayatımızdaki hemen her şey bir "marka" (Herman, D. 2007 s.7).

Marka kavramı hayatımızda bu kadar önemli bir yerdeyken biz bunu ne kadar farkındayız? Bir ürünü alırken nelere dikkat ediyoruz? Bir ürünü /hizmeti tercih ederken o ürünü/hizmeti üreten kurum/kuruluşun bizim için bir önemi var mı? Sakarya Üniversitesi İletişim Fakültesi öğrencilerinin örneklem olarak seçildiği bu araştırma da amacımız bu soruların genç tüketiciler tarafından nasıl cevaplandırılacağıdır.

Araştırmanın Önemi

Marka günlük hayatımızda adeta vazgeçilmez bir unsur haline gelmiştir. Giyimine dikkat eden biri gösterildiğinde "e tabi marka giyiyor" denildiğini duyarız. (Odabaşı, Y. 2002 s.159). Oysaki her ürünün doğal olarak ta giydiğimiz her şeyin bir markası vardır. Fakat burada kastedilen tanınmış prestijli (genellikle pahalı) markaları giyiyor olmasıdır. (Odabaşı, Y. 2002 s.159). Bu durum o ürünü diğerlerinin önüne geçirmektedir.

Tüketiciler açısından marka ürün kullanmakta bazı risklerden kaçınma, kendini ifade etme, saygınlık, prestij kazanma gibi farklı sebeplerden ötürü tercih edilmektedir. Çünkü marka her şeyden önce ürüne olduğu kadar tüketicisine de değer katan bir unsurdur. (Taşoğlu, N. 2014 s.197).

Marka özvarlığı; bir ürün ya da hizmet tarafından bir firmaya veya o firmanın müşterilerine sağlanan değeri artıran (ya da azaltan), bir markanın ismine ve sembolüne bağlı aktif ve pasif varlıklar (yükümlülükler) topluluğudur. (Aaker, D. 2009 s.22). Marka değeri ya da marka öz varlığı, kısaca isim bilinirliği, sadık müşteriler, algılanan kalite ve markaya (adına ve sembolüne) bağlı olan ve ürüne veya sunulan hizmete değer katan (veya ondan çalan) çağrışımlar gibi değerler dizesidir. (Aaker, D. 2007 s.21).

Bu durumda bir ürünün tüketici tarafından tercih edilmesinde marka değeri ilk ve en önemli unsurdur diyebiliriz. Bir ürünün kendisine maksimum fayda sağlayacağına inanan tüketiciler o ürün/markaya karşı sadece satın alma davranışı sergilemekle kalmayacak aynı zamanda o ürün/markaya karşı duygusal bir bağda kuracaklardır.

Örneğin; *Nike* işlevsel ve prestijli bir marka olarak algılanmaktadır. *Zippo* çakmakları salt yakma işlevini değil, statü imajını da taşımaktadır ya da *Harley Davidson* sahipleri için bu motosikletler sadece işlevsel olarak tatmin edici araçlar değil, bir deneyim, tutum, bir yaşam biçimi ve kim olduklarını açıklama araçlarıdır. (Bhat ve Reddy 1998'den Aktaran: Odabaşı, Y. 2002 s.371). Bu örneğe satın alma davranışı gerçekleştirirken sadece bir ürüne/hizmete/markaya ücret ödemeyiz bir yaşam biçimine, prestije, duygusal ve toplumsal tatmine de para öderiz bu yüzden hayatımız için marka kavramı çok önemlidir.

Araştırmanın Yöntemi

Bu araştırmada nicel bir araştırma yöntemi olan anket kullanılmıştır. Araştırma ile ilgili veriler anketle toplanmıştır.

Araştırmanın Problem Cümlesi: Sakarya Üniversitesi İletişim Fakültesi öğrencilerinin ‘’marka’’ algısı ne düzeydedir?

Alt Problemler

AP1) Sakarya Üniversitesi İletişim Fakültesi öğrencilerinin cinsiyete göre marka algısı ne düzeydedir?

AP2) Sakarya Üniversitesi İletişim Fakültesi öğrencilerinin yaşa göre marka algısı ne düzeydedir?

AP3) Sakarya Üniversitesi İletişim Fakültesi öğrencilerinin gelir durumuna göre marka algıları ne düzeydedir?

Araştırma Modeli: Bu araştırma genel tarama modellerinden deneme modeli örnek alınarak hazırlanmıştır.

Araştırmanın Evreni: Araştırmamızın evreni Sakarya Üniversitesi İletişim Fakültesinin 677 öğrencisidir.

Araştırmanın Örnekleme: Örneklem olarak ise Sakarya Üniversitesi İletişim Fakültesinin 677 öğrencisi arasından evrenimize uygun olarak kartopu örneklem yöntemiyle 116 öğrenci seçilmiştir.

Veri Toplama Aracı: Bu araştırma ERDAL'ın "Marmara Bölgesi tüketicilerinin "marka" "itibar" ve "imaj algısı üzerine bir araştırma" başlıklı makalesi örnek alınarak üniversite öğrencilerinin gözünde "marka" algısını ölçmek amacıyla yapılmıştır. 116 kişiye basit rastlantısal örneklem yöntemi ile anket uygulanmış elde edilen veriler SPSS programında işlenerek yorumlanmıştır. Veri toplama aracı olarak anket kullanılmıştır. 116 öğrenci ile anket yapılmıştır. Bu 116 öğrenciye 2016-2017 Eğitim/Öğretim yılının Bahar Döneminde uygulanmıştır.

Veri Analizi: Elde edilen veriler IBM SPSS Stastics version 20 programında işlenerek yüzdeler, anova ve t-testi yapılarak yorumlanmış ve sonuca ulaşılmıştır.

Varsayımlar: Anketimize öğrenciler içtenlikle cevap vermiştir ve birebir anketör kontrolünde sorular cevaplandırılmıştır.

Sınırlılıklar: Bu çalışma 3-7 Nisan 2017 tarihleri arasında Sakarya Üniversitesi İletişim Fakültesi öğrencilerinden 116 tanesine bahar döneminde uygulanmıştır.

Tanımlar;

Marka: "Temelde ürünün tüketiciye kendini ifade ediş biçimidir." (Yamankaradeniz, K. 2007 s.10).

Pazarlama: : Bir ürünün, bir malın, bir hizmetin satışını gerçekleştirmek amacıyla tanıtmayı, paketlemeyi, satış elemanlarının yetişmesini, piyasa gereksinimlerini belirlemeyi ve karşılamayı içeren etkinliklerin bütünü. (www.tdk.com.tr)

Reklam: Bir şeyi hedef kitleye tanıtmak, göstermek ve satışını yapmak için denenen yollar bütünü.

Tüketim: Yaşamımızı idame ettirebilmemiz için temel şartlardan biri olan arzu. Üretilen şeylerin kullanılması.

SONUÇ VE BULGULAR

BULGULAR

Ankete cevap verenlerin yüzdeleri hesaplanmıştır. Bu hesaplamalar aşağıdaki gibidir.

Tablo 1 Yaşınız

	Frequency	Percent	Valid Percent	Cumulative Percent
Valid 17-24	99	85,3	85,3	85,3
25-34	16	13,8	13,8	99,1
35-44	1	,9	,9	100,0
Total	116	100,0	100,0	

Tablo 1'e bakıldığında ankete cevap veren kişilerin %85'i (99 kişi) 17-24 yaş aralığında %13 'ü (16 kişi) 25-34 yaş aralığında %0.9'u ise (1 kişi) 35-44 yaş aralığındadır. %85 ile en yüksek yaş aralığı 17-24 yaş aralığıdır.

Tablo 2 Cinsiyetiniz

	Frequency	Percent	Valid Percent	Cumulative Percent
Valid kadın	59	50,9	50,9	50,9
erkek	57	49,1	49,1	100,0
Total	116	100,0	100,0	

Tablo 2'ye bakıldığında ankete cevap verenlerin %50'si (59 kişi) kadın, %49'u (57 kişi) erkektir.

Tablo 3 Mesleğiniz

	Frequency	Percent	Valid Percent	Cumulative Percent
Valid öğrenci	116	100,0	100,0	100,0

Tablo 3'e bakıldığında ankete cevap verenlerin %100'ü (116 kişi) öğrencidir.

Tablo 4 En son mezun olduğunuz okul

	Frequency	Percent	Valid Percent	Cumulative Percent
Valid lise	82	70,7	70,7	70,7
üniversite	34	29,3	29,3	100,0
Total	116	100,0	100,0	

Tablo 4'e bakıldığında ankete cevap veren kişilerin %70'i (82 kişi) lise mezunu %29'u ise (34 kişi) üniversite mezunudur. %70 ile ankete katılan kişilerin çoğunlukla lise mezunudur.

Tablo 5 Hangi ilde yaşıyorsunuz?

	Frequency	Percent	Valid Percent	Cumulative Percent
Sakarya	64	55,2	55,2	55,2
İstanbul	33	28,4	28,4	83,6
Kocaeli	4	3,4	3,4	87,1
Valid Hatay	3	2,6	2,6	89,7
Bursa	10	8,6	8,6	98,3
Rize	2	1,7	1,7	100,0
Total	116	100,0	100,0	

Tablo 5'e bakıldığında ankete cevap veren kişilerin %55'i (64 kişi) Sakarya da, %28'i (33 kişi) İstanbul da %3'ü (4 kişi) Kocaeli'nde, %2'si (3 kişi) Hatay'da, %8'i (10 kişi) Bursa da, %1'i (2 kişi) Rize de ikamet etmektedir. %55 ile ankete cevap veren kişilerin büyük çoğunluğu Sakarya ilinde yaşamaktadır.

Tablo 6 Aylık ortalama geliriniz hangisidir?

	Frequency	Percent	Valid Percent	Cumulative Percent
Valid 1000'den az	78	67,2	67,2	67,2
1000-3000	38	32,8	32,8	100,0
Total	116	100,0	100,0	

Tablo 6'ya bakıldığında ankete cevap veren kişilerin %67'si (78 kişi) aylık 1000 TL'den az %23'si (38 kişi) aylık 1000-3000 TL arasında gelire sahip olduğunu görüyoruz. %67 ile ankete cevap veren kişilerin büyük çoğunluğunun aylık geliri 1000 TL'den azdır.

Tablo 7 İtibar deyince aklınıza ilk gelen nedir?

	Frequency	Percent	Valid Percent	Cumulative Percent
güven	19	16,4	16,4	16,4
saygınlık	69	59,5	59,5	75,9
değer	8	6,9	6,9	82,8
Valid dürüstlük	12	10,3	10,3	93,1
finansal güç	6	5,2	5,2	98,3
sorumluluk	2	1,7	1,7	100,0
Total	116	100,0	100,0	

Tablo 7'ye bakıldığında itibar deyince aklımıza gelen ilk şey nedir? Sorusuna cevap veren kişilerin %59'u (69 kişi) saygınlık, %16'sı (19 kişi) güven, %10'u (12 kişi) dürüstlük, %6'sı (8 kişi) değer %5'i (6 kişi) finansal güç, %1'i (2 kişi) ise sorumluluk cevaplarını vermiştir. %59'la ankete cevap veren kişilerin büyük çoğunluğu İtibar deyince aklımıza ilk gelen şey nedir? Sorusuna saygınlık cevabını vermiştir.

Tablo 8 İmaj deyince aklınıza ilk gelen nedir?

	Frequency	Percent	Valid Percent	Cumulative Percent
marka	23	19,8	19,8	19,8
görünüş	38	32,8	32,8	52,6
algı	21	18,1	18,1	70,7
farklılık	17	14,7	14,7	85,3
izlenim	17	14,7	14,7	100,0
Total	116	100,0	100,0	

Tablo 8'e bakıldığında imaj deyince aklınıza gelen ilk şey nedir? Sorusuna cevap veren kişilerin %32'si (38 kişi) görünüş, %19'u (23 kişi) marka, %18'i(21 kişi) algı % 14'ü (17 kişi) farklılık ve izlenim cevaplarını vermiştir. %32 ile ankete cevap veren kişilerin büyük çoğunluğu İmaj deyince aklınıza ilk gelen nedir? Sorusuna görünüş cevabını vermiştir.

Tablo 9 Marka deyince ilk aklınıza gelen nedir?

	Frequency	Percent	Valid Percent	Cumulative Percent
kalite	61	52,6	52,6	52,6
prestij	14	12,1	12,1	64,7
tecrübe	8	6,9	6,9	71,6
imaj	12	10,3	10,3	81,9
itibar	10	8,6	8,6	90,5
güven	3	2,6	2,6	93,1
standart ürün	8	6,9	6,9	100,0
Total	116	100,0	100,0	

Tablo 9'a bakıldığında marka deyince aklınıza gelen ilk şey nedir? Sorusuna cevap veren kişilerin %52'si (61 kişi) kalite, %12'si (14 kişi) prestij, %10'u (12 kişi) imaj %8'i (10 kişi) itibar, %6'sı (8 kişi) tecrübe ve standart ürün, %2'si (3 kişi) ise güven cevaplarını vermişlerdir. %52 ile ankete cevap veren kişilerin büyük çoğunluğu Marka deyince aklınıza ilk gelen nedir? Sorusuna kalite cevabını vermiştir.

Tablo 10 Benim için kullandığım markanın imaj ve itibarı önemlidir.

	Frequency	Percent	Valid Percent	Cumulative Percent
kesinlikle katılmıyorum	13	11,2	11,2	11,2
katılmıyorum	8	6,9	6,9	18,1
kararsızım	9	7,8	7,8	25,9
katılıyorum	51	44,0	44,0	69,8
kesinlikle katılıyorum	35	30,2	30,2	100,0
Total	116	100,0	100,0	

Tablo 10'a bakıldığında benim için kullandığım markanın imaj ve itibarı önemlidir sorusuna cevap veren kişilerin %44'ü (51 kişi) katılıyorum, %30'u (35 kişi) kesinlikle katılıyorum, %11'i (13 kişi) kesinlikle katılmıyorum, %7'si (9 kişi) kararsızım, %6'sı (8 kişi) katılmıyorum cevaplarını vermişlerdir. % 44 ile ankete cevap veren kişilerin büyük çoğunluğu Benim için kullandığım markanın imaj ve itibarı önemlidir. Sorusuna katılıyorum cevabını vermiştir.

Tablo 11 Bir ürün/hizmetin marka değerinin imaj ve itibarla ilgisi vardır.

	Frequency	Percent	Valid Percent	Cumulative Percent
kesinlikle katılmıyorum	7	6,0	6,0	6,0
katılmıyorum	10	8,6	8,6	14,7
kararsızım	14	12,1	12,1	26,7
Valid katılıyorum	57	49,1	49,1	75,9
kesinlikle katılıyorum	28	24,1	24,1	100,0
Total	116	100,0	100,0	

Tablo 11'e bakıldığında Bir ürün/hizmetin marka değerinin imaj ve itibarla ilgisi vardır sorusuna ankete katılan kişilerin %49'u (57 kişi) katılıyorum, %24'ü (28 kişi) kesinlikle katılıyorum, %12'si (14 kişi) kararsızım, %8'i (10 kişi) katılmıyorum, %6'sı (7 kişi) kesinlikle katılmıyorum cevaplarını vermişlerdir. % 49 ile ankete cevap veren kişilerin büyük çoğunluğu Bir ürün/hizmetin marka değerinin imaj ve itibarla ilgisi vardır. Sorusuna katılıyorum cevabını vermişlerdir.

Tablo 12 Kullandığım markanın isim logo vb. kurumsal kimlik unsurları benim için önemlidir.

	Frequency	Percent	Valid Percent	Cumulative Percent
kesinlikle katılmıyorum	10	8,6	8,6	8,6
katılmıyorum	22	19,0	19,0	27,6
kararsızım	17	14,7	14,7	42,2
Valid katılıyorum	45	38,8	38,8	81,0
kesinlikle katılıyorum	22	19,0	19,0	100,0
Total	116	100,0	100,0	

Tablo 12'ye bakıldığında Kullandığım markanın isim logo vb. kurumsal kimlik unsurları benim için önemlidir sorusuna ankete katılan kişilerin %38'i (45 kişi) katılıyorum, %19'u (22 kişi) kesinlikle katılıyorum %19'u (22 kişi) katılmıyorum ve %14'ü (17 kişi) kararsızım cevaplarını vermişlerdir. %38 ile ankete cevap veren kişilerin büyük çoğunluğu Kullandığım markanın isim logo vb. kurumsal kimlik unsurları benim için önemlidir. Sorusuna katılıyorum cevabını vermiştir.

Tablo 13 Sizin için bir markanın itibarını ne oluşturur?

	Frequency	Percent	Valid Percent	Cumulative Percent
kendi deneyimlerim	58	50,0	50,0	50,0
sosyal sorumluluk projeleri	15	12,9	12,9	62,9
Valid hakkında çıkan olumlu haberler	34	29,3	29,3	92,2
reklamlarda çok fazla görünmesi	9	7,8	7,8	100,0
Total	116	100,0	100,0	

Tablo 13'e bakıldığında Sizin için bir markanın itibarını ne oluşturur? Sorusuna ankete katılan kişilerin %50'si(58 kişi) kendi deneyimlerim, % 29'u (34 kişi) hakkında çıkan olumlu haberler %12'si (15 kişi) sosyal sorumluluk projeleri, %7'si (9 kişi) reklamlarda çok fazla görünmesi cevaplarını vermişlerdir. % 50 ile ankete cevap veren kişilerin büyük çoğunluğu Sizin için bir markanın itibarını ne oluşturur? Sorusuna kendi deneyimlerim cevabını vermiştir.

Tablo 14 Bir ürün veya hizmetin itibarının yüksek olması o ürün veya hizmetin maliyetinin yüksek olmasıyla doğrudan alakalıdır.

	Frequency	Percent	Valid Percent	Cumulative Percent
kesinlikle katılmıyorum	15	12,9	12,9	12,9
katılmıyorum	33	28,4	28,4	41,4
Valid kararsızım	29	25,0	25,0	66,4
katılıyorum	28	24,1	24,1	90,5
kesinlikle katılıyorum	11	9,5	9,5	100,0
Total	116	100,0	100,0	

Tablo 14'e bakıldığında Bir ürün veya hizmetin itibarının yüksek olması o ürün veya hizmetin maliyetinin yüksek olmasıyla doğrudan alakalıdır. Sorusuna ankete katılan kişilerin %28'i (33 kişi) katılmıyorum, %25'i (29 kişi) kararsızım, % 24'ü (28 kişi) katılıyorum, %12'si (15 kişi)kesinlikle katılmıyorum, %9'u (11 kişi) kesinlikle katılıyorum cevaplarını vermişlerdir. %28 ile ankete cevap veren kişilerin büyük çoğunluğu Bir ürün veya hizmetin yüksek olması o ürün veya hizmetin maliyetinin yüksek olmasıyla doğrudan ilgilidir. Sorusuna katılmıyorum cevabını vermiştir.

Tablo 15 Bir kurumun saygınlığını artıran özelliği nedir?

	Frequency	Percent	Valid Percent	Cumulative Percent
sosyal sorumluluk projeleri	20	17,2	17,2	17,2
satış sonrası hizmetler	23	19,8	19,8	37,1
kanun ve etik değerlere uyma	17	14,7	14,7	51,7
Valid tüketici fikrini sorma	11	9,5	9,5	61,2
ürün ve hizmetten memnun kalma	45	38,8	38,8	100,0
Total	116	100,0	100,0	

Tablo 15'e bakıldığında Bir kurumun saygınlığını artıran özelliği nedir? Sorusuna ankete katılan kişilerin % 38'i (45 kişi) ürün ve hizmetten memnun kalma, %19'u (23 kişi) satış sonrası hizmetler, % 17'si sosyal sorumluluk projeleri, %9'u (11 kişi) tüketicinin fikrini sorma cevaplarını vermişlerdir. %38 ile ankete cevap veren kişilerin büyük çoğunluğu Bir kurumun saygınlığını artıran özelliği nedir? Sorusuna ürün veya hizmetten memnun kalma cevabını vermiştir.

Yaş için uygulanan anova sonuçları, normal α 0,05'ten büyük olduğu için herhangi bir cevabın yaşla arasında anlamlı bir farklılık olmadığını ortaya koymuştur.

Yapılan anket sonuçlarına göre t-test ve anova uygulanmıştır. Cinsiyet için uygulanan t-test sonuçları, normal α 0,05'ten büyük olduğu için herhangi bir cevabın cinsiyetle arasında anlamlı bir farklılık olmadığını ortaya koymuştur.

Tablo 16 ANOVA					
	Sum of Squares	df	Mean Square	F	Sig.
İmaj deyince aklınıza ilk gelen nedir?	17,148	4	4,287	2,525	,045
	188,464	111	1,698		
	205,612	115			

Tablo 16'ya göre hesaplanan α 0,045, normal α 0,05'ten küçük olduğu için meslek durumuyla İmaj denince akla gelen nedir sorusuna verilen cevaplar arasında anlamlı bir farklılık olduğu tespit edilmiştir.

Tablo 17 ANOVA					
	Sum of Squares	df	Mean Square	F	Sig.
Bir ürün/hizmetin marka değerinin imaj ve itibarla ilgisi vardır.	13,167	4	3,292	2,910	,025
	125,549	111	1,131		
	138,716	115			

Tablo 17'ye göre hesaplanan α 0,025, normal α 0,05'ten küçük olduğu için meslek durumuyla bir ürün/hizmetin marka değerinin imaj ve itibarla ilgili olduğunun düşünülmesi arasında anlamlı bir farklılık olduğu saptanmıştır.

Tablo 18 ANOVA					
	Sum of Squares	df	Mean Square	F	Sig.
Kullandığım markanın isim logo vb. kurumsal kimlik unsurları benim için önemlidir.	15,578	4	3,895	2,695	,034
	160,379	111	1,445		
	175,957	115			

Tablo 18'e göre hesaplanan α 0,034, normal α 0,05'ten küçük olduğu için meslek durumuyla kullanılan markanın isim logo vb. kurumsal kimlik unsurlarının önemli olduğunun düşünülmesi arasında anlamlı bir farklılık olduğu tespit edilmiştir.

Tablo 19 ANOVA					
	Sum of Squares	df	Mean Square	F	Sig.
Marka deyince ilk aklınıza gelen nedir?	42,416	4	10,604	3,031	,021
	388,368	111	3,499		
	430,784	115			

Tablo 19'a göre hesaplanan α 0,021, normal α 0,05'ten küçük olduğu için mezun olunan okul durumuyla marka denince akla gelen cevaplar arasında anlamlı bir farklılık olduğu saptanmıştır.

Tablo 20 ANOVA					
	Sum of Squares	df	Mean Square	F	Sig.
Kullandığım markanın isim logo vb. kurumsal kimlik unsurları benim için önemlidir.	15,093	4	3,773	2,604	,040
	160,864	111	1,449		
	175,957	115			

Tablo 20'ye göre hesaplanan α 0,040, normal α 0,05'ten küçük olduğu için mezun olunan okul durumuyla kullanılan markanın isim logo vb. kurumsal kimlik unsurlarının önemli olduğunun düşünülmesi arasında anlamlı bir farklılık olduğu tespit edilmiştir.

Tablo 21 ANOVA					
	Sum of Squares	df	Mean Square	F	Sig.
Bir ürün/hizmetin marka değerinin imaj ve itibarla ilgisi vardır.	15,449	5	3,090	2,757	,022
	123,266	110	1,121		
	138,716	115			

Tablo 21'e göre hesaplanan α 0,022, normal α 0,05'ten küçük olduğu için gelir durumuyla bir ürün/hizmetin marka değerinin imaj ve itibarla ilgili olduğunun düşünülmesi arasında anlamlı bir farklılık olduğu saptanmıştır.

Tablo 22 ANOVA					
	Sum of Squares	df	Mean Square	F	Sig.
Kullandığım markanın isim logo vb. kurumsal kimlik unsurları benim için önemlidir.	17,316	5	3,463	2,401	,042
	158,641	110	1,442		
	175,957	115			

Tablo 22'ye göre hesaplanan α 0,022, normal α 0,05'ten küçük olduğu için gelir durumuyla kullanılan markanın isim logo vb. kurumsal kimlik unsurlarının önemli olduğunun düşünülmesi arasında anlamlı bir farklılık olduğu tespit edilmiştir.

Tablo 23 ANOVA					
	Sum of Squares	df	Mean Square	F	Sig.
Bir kurumun saygınlığını artıran özelliği nedir?	32,556	5	6,511	2,876	,018
	248,996	110	2,264		
	281,552	115			

Tablo 23'ye göre hesaplanan α 0,018, normal α 0,05'ten küçük olduğu için gelir durumuyla kurumun saygınlığını artıran özelliği sorusuna verilen cevaplar arasında anlamlı bir farklılık olduğu saptanmıştır.

SONUÇ VE DEĞERLENDİRME

Marka kavramı günümüz tüketim toplumunda insanların vazgeçilmez unsurlarından biri haline gelmiştir. Artık insanlar ihtiyaçlarını gidermek için değil tüketmek ihtiyacını karşılamak için tüketmektedirler. Bu ortam içerisinde marka kavramı kişilerin kendilerini, kişiliklerini ve statülerini çevrelerine gösterebilmek için tükettikleri bir meta haline gelmiştir. Bu çalışmada sosyalizasyon sürecinin son evresinde olan üniversite öğrencilerinin marka kavramı hakkındaki düşüncelerini belirleyebilmek için yapılan anket çalışması sonucunda veriler işlenmiş ve yorumlanmıştır. SPSS programında yüzdellik, anova ve t-test uygulanmıştır. Elde edilen veriler değerlendirilmiş ve genel olarak ankete katılan Sakarya Üniversitesi İletişim Fakültesi öğrencilerinin marka algısı cinsiyete ve yaşa göre herhangi bir değişiklik göstermemektedir. Öğrencilerin marka algısı gelir düzeyi, meslek ve eğitim faktörleri arasında anlamlı bir farklılık göstermiştir.

T-test sonucunda Sakarya Üniversitesi İletişim Fakültesi öğrencilerinin cinsiyete göre marka algılarında $\alpha 0,05$ 'ten büyük olduğu için herhangi anlamlı bir farklılık bulunamamıştır. Yani buradan Sakarya Üniversitesi İletişim Fakültesi Öğrencilerinin marka algısı cinsiyete göre değişmemektedir sonucuna varabiliriz.

Alt problemlerimizden öğrencilerin yaş ile marka algısı arasında bir farklılık var mıdır? Sorusu için yaş ile ilgili uygulanan anova sonuçları, normal $\alpha 0,05$ 'ten büyük olduğu için herhangi bir cevabın yaşla arasında anlamlı bir farklılık olmadığını bulunmuştur.

SPSS programında yapılan anova testin sonucuna göre ise meslek ile marka algısı arasında anlamlı bir farklılık vardır sonucuna ulaşılmıştır. Bir ürün/hizmetin marka değerinin imaj ve itibarla ilgisi vardır. Sorusuna büyük çoğunluk katılıyorum cevabını vermiştir, gelir durumu kurumun saygınlığını artıran özelliğidir. Sorusuna ankete cevap veren kişilerin büyük çoğunluğu katılıyorum cevabını vermiştir. Son olarak markanın isim logo vb. kurumsal kimlik unsurlarının önemlidir. Sorusuna ise ankete cevap veren kişiler katılıyorum olarak vermiş ve bu üç soru ile marka algısı arasında arası da anlamlı bir farklılık olduğu saptanmıştır.

Son alt problemimiz olan eğitim durumuna göre yaptığımız anova testinin sonucuna göre ise gelir durumu ile marka algısı arasında anlamlı bir farklılık olduğu sonucuna ulaşılmıştır. Eğitim durumuyla marka denince ilk akla gelen nedir? Sorusuna ankete katılan kişiler kalite cevabını vermiştir. Kullanılan markanın isim logo vb. kurumsal kimlik unsurları benim için önemlidir. Sorusuna ankete katılan kişilerin büyük çoğunluğu katılıyorum cevabını vermiştir ve bu iki soru ile marka algısı arasında anlamlı bir farklılık olduğu saptanmıştır. Bu konuyla ilgili birçok farklı araştırma yapılabilir. Başka bir araştırmada geçerliliği ve güvenilirliği fazla olan başka veri toplama araçları kullanılabilir.

ÖZET

Teknolojinin gelişmesiyle birlikte geleneksel reklamların etkisi zayıflamıştır. Tüketicie ulaşmak ve zihninde yer edebilmek amacıyla reklamcılar ve pazarlamacılar yeni ve etkili yöntem arayışına girmişlerdir. Tüketicie ulaşırken reklamların tüketici algısındaki iticiliğini de kırabilmek adına ‘ürün yerleştirme’ etkili bir yöntem olarak tercih edilmeye başlamıştır. Günümüzde ürün yerleştirme reklamdan kaçan tüketici ve tüketicisine ulaşmak isteyen reklamcılar arasında arabuluculuk görevi üstlenmektedir. Çalışma, ürün yerleştirmenin, ilgili alan yazın çalışmaları ışığında Klasik Şartlanma ve Model Alma Paradigmasına dayanmak koşuluyla, tüketici zihnindeki yerini Sakarya Üniversitesi İletişim Fakültesi öğrencilerine yapılan anket çalışmasıyla ölçümlenmiştir.

Anahtar Kelimeler: Ürün yerleştirme, reklam, izlerkitle.

GİRİŞ

“Genel anlamıyla reklam; kişilerin, kurumların, malların ve hizmetlerin kamuya tanıtılıp benimsetilmesi eylemi olarak tanımlanmaktadır” (Okay, s.6). Reklamların, işletmelerin büyümelerine tüketicilerin de seçim yapmalarını kolaylaştırmaya faydası vardır (Şimşek, 2006, s.17). Reklamların ilk hedefi, yeni çıkan ürünleri duyurmak iken (Şimşek, 2006, s.46), ana hedef işletmenin daha fazla kar elde etmesini sağlamaktır (Tekler, 2003’ten aktaran: Köse, 2012, s.1). “Reklam en geniş anlamıyla, satış politikasını destekleyen ve insanları bir ürün hakkında bilgilendirirken, zorlamaksızın o ürünü satın almaya yöneltmeye çalışan ve bu arada iletişim araçlarını kullanan bir etkileme yöntemidir” (Okay, s.7).

Reklam stratejisi, tüketiciye ulaşmakla sınırlı kalmaksızın satın alma davranışına yönlendirebilecek şekilde belirlenmelidir. Söz konusu stratejide reklamın sunulacağı ortam mesajla tüketicinin bulunduğu nokta olması sebebiyle hayati önem taşımaktadır (Şimşek, 2006, s.49).

3 Mart 1952’de TRT’nin ilk televizyon reklamını kabul etmesiyle (Mutlu’dan (1995) aktaran: Şimşek, 2006, s.8) ürünlerin izler kitlenin duygusal ihtiyaçlarını karşılayacağını ima eden imgeler Türkiye’de kullanılmaya başlanmıştır. Eric From’a göre izlerkitle, reklam iletilerinin abartı olduğunu bilmekle birlikte reklamdaki iletinin gerçekleşebileceğini düşünmekte ve dilemektedir (Adler’dan aktaran: Şimşek, 2006, s.9). Dolayısıyla izlerkitle üzerinde reklamların gücü inkar edilememektedir. Ancak kitle iletişim araçları ve onların iletileriyle bombardıman altında olan tüketiciler günde yaklaşık 3000-5000 reklama maruz kalmakta ve dolayısıyla bu reklamlardan hemen hemen hiçbiri satın alma davranışı gerçekleştirmeye yeterli olmamaktadır (Petrecca’dan (2006) aktaran: Güler, 2010, s.4). Çünkü söz konusu sosyo-ekonomik kitleler televizyondaki reklamlara karşı büyük bir dirence sahiplerdir (Nebenzahl ve Secunda’dan (1993) aktaran: Güler, 2010, s.4). Televizyon karşısında reklamlardan kaçma olanağına sahip izlerkitlenin sinema salonlarında tutsak izleyici konumunda olmaları sinemayı görece değerli hale getirmektedir (Gürel ve Alem, 2016, s.5).

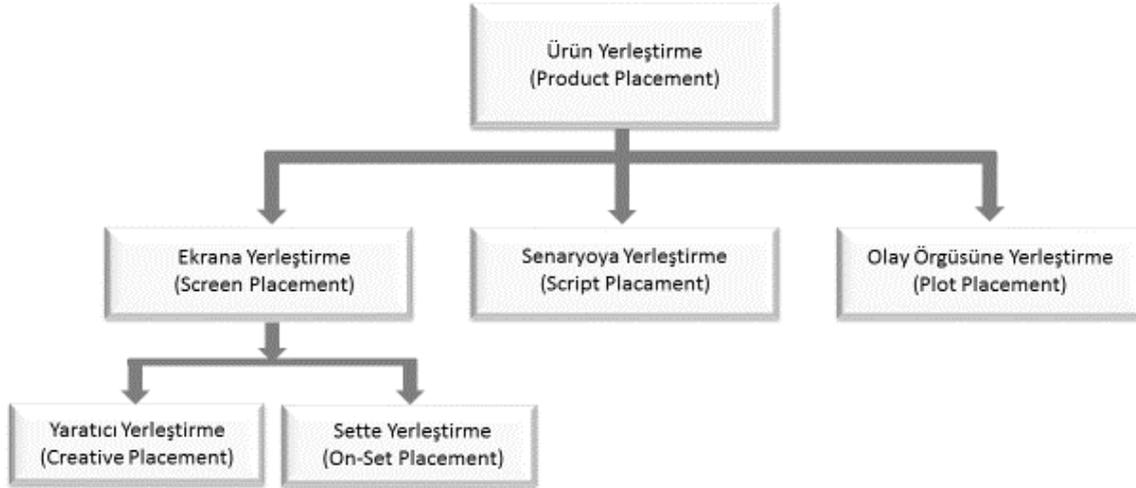

Ürün yerleştirme; konulu filmlerde markalı bir ürünün ya da ürüne ilişkin reklamın yer alması, televizyon programlarında sunucunun markalı bir ürün taşıması gibi reklam olduğu belirtilmeden yapılan reklam olarak tanımlanmaktadır. (Gülsoy 1999’dan aktaran: Gürel ve Alem, 2016, s.5)

RTÜK’ün 6112 sayılı Yayın Hizmeti Usul ve Esasları Hakkında Yönetmeliği’nde ürün yerleştirme; “Bir ürün, hizmet veya ticari markanın, ücret veya benzeri bir karşılıkla program içine dahil edilerek veya bunlara atıf yapılarak, program içinde verildiği her tür ticari iletişimdir.” şeklinde tanımlanmıştır (www.rtuk.org.tr). 01 Nisan 2011 tarihinde yürürlüğe giren bu kanunla, sinema ve televizyon için yapılmış filmler, diziler ile spor ve genel eğlence programlarında ürün yerleştirme uygulamalarının önü açılmıştır.

Literatür incelendiğinde ürün yerleştirme uygulamalarının farklı türlere ayrılarak uygulandığı görülmektedir: Graham Murdock’a göre ürün yerleştirme, ürünlerin filmlere dolaylı olarak sokulduğu yaratıcı ortamda

gerçekleştirilenler ve ürünün doğal çevresi içerisinde görüldüğü doğal ortamda gerçekleştirilenler olarak ikiye ayrılmaktadır. Steward Shapiro söz konusu ürün yerleştirmeyi 4'e ayırmaktadır: sadece açık bir görünürlülük sağlayan ürün yerleştirmeler, ürünün fil içinde aktör tarafından kullanıldığı ürün yerleştirmeler, film içinde bir markaya atıfta bulunarak gerçekleştirilen ürün yerleştirmeler ve ürünün aktör tarafından hem kullanıldığı hem de sözünün edildiği ürün yerleştirmeler (Gürel ve Alem, 2016 s.11-12).

En yaygın bir biçimde kullanılan ürün yerleştirme ise, görsel (visual) yerleştirme, sözel (audio) yerleştirme ve hem sözel hem de görsel (audiovisual) yerleştirme olarak 3 temel stratejiden oluşmaktadır:

Tablo 1: Cristel A. Russell'e Göre Ürün Yerleştirme Türleri (Gürel ve Alem, 2016, s.61)

- Görsel Ürün Yerleştirme: Görsel içeriğin herhangi bir sahnesinde görüntünün arka planına çekim esnasında ya da sonradan dijital tekniklerle bir ürünün yerleştirilerek uygulanır.
- İşitsel/Sözel Ürün Yerleştirme: İçerikte geçen bir diyalogda ürün/markadan söz edilmesi suretiyle uygulanır.
- Görsel ve İşitsel Ürün Yerleştirme: Görsel ve işitsel bileşenlerin bir karması olarak hem üründen sözlü olarak bahsedilir hem de sahneye görsel olarak yerleştirilir (Çakır ve Kınıt'tan (2014) aktaran: Keskin ve Kurtuldu, 2017).

Ürün yerleştirme sosyo-kültürel yaşam dinamiklerine paralel olarak gelişimini sürdürmektedir. Yöntem olarak ürün yerleştirme, pazarlama iletişimi karması elemanlarıyla doğru bir şekilde kullanıldığında istenilen farklılığı ve farkındalığı yaratacaktır (Gürel ve Alem, 2016, s.19).

Literatür Taraması

Gerçek (2012) çalışmasında, Türk sinema filmlerinde marka farkındalığı yaratmak için ürün yerleştirme uygulamalarına yer verildiğini ve ürün yerleştirmenin bir amacının da marka farkındalığı yaratmak olduğunu saptamıştır.

Öztürk (2014) çalışmasında ürün yerleştirmenin olumlu ve olumsuz etkileri ile ürün yerleştirme stratejilerinin başarısı üzerinde hangi faktörlerin rolü olduğu konusunda yapılan çalışmaları ele almıştır (Öztürk, 2014, s.3). Reklam verenler açısından öncelikli olarak iletişim hedeflerine de bağlı olmak kaydıyla, dizi ve televizyon programlarında markalarının yer almasının, söz konusu markanın akılda kalıcılığını artırmaya yönelik bir çaba olduğunu saptamıştır. Bununla birlikte reklam verenlerin negatif algılamalara sebep olabilecek olan durumları dikkate alarak, hedef kitlenin kişilik, yaşam tarzı ve kültürel özelliklerini de göz önünde bulundurarak en uygun stratejileri izlemeleri gerektiğini vurgulamıştır. (Öztürk, 2014, s. 27).

Kınay (2014) çalışmasında teknolojinin gelişmesiyle birlikte kitle iletişim araçlarının da gelişmiş ve paralel şekilde toplum hayatında daha önemli bir yere sahip olmuş olduğundan bahsetmektedir (Kınay, 2014, s. 93). Tüketim toplumuna eleştirel bakan bu çalışmada bilginin küreselleşmesi ve tüketim olgusu kitle iletişim araçları açısından incelenmiş, bu yargılar yine ürün yerleştirmenin en güzel örneklerinden biri olan Fight Club filmiyle örneklendirilmiştir (Kınay, 2014, s. 102). Söz konusu makale eleştirse de günümüz şartlarında markalaşmak çağın getirisi ve marka olmanın zorunluluğudur.

Barut (2009) çalışmasında, ürün yerleştirmenin uygulanma şekilleri ve etkileri ile bu uygulamanın etkinliği, yöntemi ve sayılabilen niceliksel bazı unsurlar irdelenmiş; filmde, senaryoda doğal ve yaratıcı yolla yerleştirilmiş, görsel, işitsel, görsel/işitsel izleyicinin dikkatine sunulmuş birçok değişik marka/ürün yerleştirmeleri bulgulanmıştır. Diğer çalışmalardan farklı olarak filmde yer alan bu yerleştirmelerin süre açısından da önemli bir yer tuttuğuna dikkat çekerek çalışma sonucunda filmin yaklaşık %10'unda ürün yerleştirme yoluna gidildiği saptanmıştır (Barut, 2009, s. 159). Ürün yerleştirmenin iyi yapıldığında ürünün imajını ve marka değerini güçlendirdiği; kötü yapıldığında, marka açısından gerçek bir risk olabildiği saptanmıştır.

Gültekin (2014) çalışmasında sosyalleşme araçlarından ebeveyn ve akranlarla iletişim sıklığı ile televizyondaki dizi ve eğlence programlarını seyretme sıklığının ergenlerin ürün yerleştirmeye yönelik tutumuna ve yerleştirilen ürünlere yönelik davranışlarına etkisini araştırmıştır. Ayrıca, ergenlerin ürün yerleştirme tutumlarının, ürünlere yönelik davranışlara etkisi de incelenmiş olup bu kapsamda günümüzde kitlelere yönelik mesaj veren tutundurma yöntemlerinin, tüketiciler üzerindeki etkisinin tartışmalı olduğu sonucuna varılmıştır (Donaton'dan aktaran: Gültekin, 2014, s. 114). Şöyle ki, firmaların reklam ve halkla ilişkiler gibi kitlelere yönelik tutundurma karması elemanlarını sıklıkla kullanması mesaj karmaşasını (clutter) ortaya çıkarmıştır (Gültekin, 2014, s. 116). Ergenlerin ebeveynleri ve akranları ile satın alma konularındaki iletişim sıklığı ürün yerleştirmeye yönelik tutumu etkilemekte olduğu ancak, televizyondaki dizi ve eğlence programlarını seyretme sıklığının ürün yerleştirmeye yönelik tutuma etkisi bulunmadığı saptanmıştır. Ayrıca, ebeveynler ve akranlar ile satın alma konularındaki iletişim sıklığı, televizyondaki dizi ve eğlence programlarını seyretme sıklığı ve ürün yerleştirmeye yönelik tutum ergenlerin yerleştirilen ürünlere yönelik davranışlarını etkilememektedir (Gültekin, 2014, s.113).

Sarıyer (2013) çalışmasında ürün yerleştirmeyi 'çocuk müşteri' perspektifinden ele almış çocuklara yönelik filmlere yerleştirilen markalar incelenmiştir. Çalışmada kendilerine yönelik bir filmi izleyen çocukların yerleştirilen markaları hatırladıkları tespit edilmiştir. Ayrıca çocuklar markayı ebeveynlerine satın aldırma isteği duymaları sebebiyle hatırlamaktadırlar (Sarıyer, 2013, s. 82).

Argan (2007) tarafından ürün yerleştirmenin olumlu yerleştirme ve uygun stratejiler ile etkili olabileceğini öngörerek yapılan bu çalışmada, Türkiye'de profesyonel anlamda marka yerleştirme stratejilerinin başarılı bir biçimde uygulanabileceği ve marka yerleştirme stratejilerinin etkinliğinin hem film yapımcıları için hem de markayı yerleştiren firmalar için önemli olabileceği saptanmıştır (Argan, 2007, s. 174).

Yolcu (2006) yapılan bir çalışma sinema filmlerindeki sigara sahnelerinin izleyicilerin/tüketicilerin sigaraya başlamasında etken rol üstlenip üstlenmediğinin ortaya çıkarılmasını amaçlamış, sonucunda sinema filmlerindeki sigara içme sahnelerinin sigara içmeye özendirdiği ortaya çıkmıştır. Sigaraya başlama için bir neden olarak temel teşkil etmekte olduğu saptanmıştır (Yolcu 2006, s. 48).

Kuramlar

Klasik Şartlanma Teorisi (Classical Conditioning Theory)

Bir ürünün (koşullu uyarıcı) son derece itibar sahibi bir ünlü kimseyle (koşulsuz uyarıcı) defalarca ilişkilendirildiği durumlarda arzulan bir tüketici tepkisi meydana gelebilmektedir. Örneğin, bir sinema filminde Marlboro marka sigara içen oyuncu, sigara kullanma davranışına ilişkin ikna mesajını geleneksel reklamın yapabileceğinden daha doğal ve ucuz bir şekilde iletebilmektedir (Aktaran: Tokgöz 2009, s. 149).

Klasik şartlanma ile öğrenmenin temel unsurlarından biri olan "tekrar", ürün yerleştirme uygulamalarında da önem teşkil etmektedir. Çünkü öğrenme, genellikle bir seferde gerçekleşmeyen ve tekrarlar maruz kalınarak yürütülen bir süreçtir. Bu açıdan ürünü çağrıştıran sahnelerin tekrarı ya da filmde ürünü kullanan oyuncunun daha sonra ürünün geleneksel reklam kampanyasının yüzü olarak tekrar tekrar izleyiciyle buluşması, ürün yerleştirme uygulamalarında önemlidir.

Model Alma Paradigması (Modeling Paradigm)

Dolaylı öğrenme (vicarious learning) olarak da adlandırılan bu kurama göre bireyler, diğer kişileri gözlemleyerek öğrenmektedirler. Bir sinema filminde ünlü oyuncular, belirli marka ürünleri kullandıktan sonra memnun kaldıklarında, izleyici kendisini de arzu edilen sonuçlara götürecek bu davranışı model olarak almaktadır. Bu durum izleyicinin, filmde kullanılan markayı dolaylı olarak tecrübe etmesini mümkün kılmaktadır. Bu tecrübe filmi izlerken ve daha sonra da ürünü bizzat kullandığında izleyicinin oyuncunun rolünün anlamını özümsemesine ve bu anlamı yerleştirilen ürünle ilişkilendirmesine yardım etmektedir.

Model alma paradigmasına göre neredeyse tüm davranışlar edinilebilmekte, sürdürülebilme veya iyi planlanmış bir sosyal pekiştirme vasıtasıyla söndürülebilmektedir (Russell'den aktaran: Tokgöz 2009, s. 150). Bandura'nın, çocukların çeşitli iletişim araçlarından (çizgi film, sinema filmi ve gerçek yaşam örnekleri) gözlemledikleri eylemleri taklit ettiklerinin görüldüğü "BoBo Doll" çalışmalarından sonra gözlemsel öğrenme, modern reklam çabalarının bel kemiğini teşkil etmeye başlamıştır (Johnstone ve Dodd, 2000'den aktaran: Tokgöz 2009, s. 150).

Araştırmanın Amacı ve Önemi

Araştırmanın amacı Sakarya Üniversitesi İletişim Fakültesi öğrencilerinin ürün yerleştirme algılarını ölçmektir. Reklamın arka planını da görece bildikleri ve kavrama yabancı olmadıkları varsayımına dayanarak özellikle iletişim fakültesi öğrencilerine uygulanmıştır. Sektöre hazırlanmaları sebebiyle hem tüketici hem üretici konumunda olduklarından çalışma önem arz etmektedir.

Araştırmanın Yöntemi

Araştırmanın Problem Cümlesi: Sakarya Üniversitesi İletişim Fakültesi öğrencilerinin "ürün yerleştirme" algısı ne düzeydedir?

Alt Problemler

H1) Sakarya Üniversitesi İletişim Fakültesi öğrencilerinin cinsiyete göre ürün yerleştirme algısı arasında anlamlı bir farklılık vardır.

H2) Sakarya Üniversitesi İletişim Fakültesi öğrencilerinin gelir düzeyiyle ürün yerleştirme algısı arasında anlamlı bir farklılık vardır.

H3) Sakarya Üniversitesi İletişim Fakültesi öğrencilerinin sinemaya gitme sıklığı ile ürün yerleştirme farkındalığı durumu arasında anlamlı bir farklılık vardır.

Araştırma Modeli: Bu çalışma için nicel araştırma modellerinden "Genel Tekli Tarama Modeli" kullanılmıştır.

Araştırmanın Evreni: Araştırmamızın evreni Sakarya Üniversitesi İletişim Fakültesi öğrencilerinden (677 kişi) oluşmaktadır.

Araştırmanın Örnekleme: Örneklem olarak ise Sakarya Üniversitesi İletişim Fakültesi'nin 677 öğrencisi arasından evrenimize uygun olarak rastgele örneklem yöntemiyle 106 öğrenci seçilmiştir.

Veri Toplama Aracı: Bu araştırma Ayşe Tokgöz 2009'un "Tüketicilerin Sinema Filmlerindeki Ürün Yerleştirmelerine İlişkin Tutumlar" başlıklı yüksek lisans tezi ölçek alınarak üniversite öğrencilerinin gözünde "ürün yerleştirme" algısını ölçmek amacıyla yapılmıştır. 106 kişiye rastgele örneklem yöntemi ile yüz yüze anket uygulanmış elde edilen veriler SPSS programında işlenerek yorumlanmıştır.

Veri toplama aracı olarak anket kullanılmıştır. 106 öğrenci ile anket yapılmıştır. Bu 1176 öğrenciye 2017 yılı Nisan ayında yüz yüze, anketör aracılığı ile anket uygulanmıştır.

Veri Analizi: Elde edilen veriler SPSS Statistics 20 programında işlenerek yüzdeler, anova ve t-testi yapılarak yorumlanmış ve sonuca ulaşılmıştır.

Varsayımlar: Anketimize öğrenciler içtenlikle ve doğru cevap vermiştir ve birebir anketör kontrolünde sorular cevaplandırılmıştır.

Sınırlılıklar: Bu çalışma 23-25 Nisan 2017 tarihleri arasında Sakarya Üniversitesi İletişim Fakültesi öğrencilerinden 106 tanesine bahar döneminde uygulanmıştır.

Tanımlar

Ürün Yerleştirme: Markalı bir ürünün sinema filmine veya televizyon programlarına planlı ve göze çarpmayan girişleri yoluyla sinema veya televizyon izleyicilerini etkilemeyi amaçlayan ücretli bir ürün mesajıdır. (Balasubramian'dan aktaran: Tokgöz, 2009, s.1).

İzlerkitle: Ortak bir amaçla bir araya gelen ya da aynı iletiye maruz kalan bir grup insandır. (Şimşek, 2001 s.8)

Sonuç ve Araştırma Bulguları

Ankete verilen cevapların yüzdeleri hesaplanmıştır. Bu hesaplamalar aşağıdaki gibidir:

1.Katılımcıların Sinema Tüketicisi Olma Düzeyleri

Bu bölümde ankete cevap veren katılımcıların sinema filmleri ile ilişki düzeyleri ele alınmıştır.

Tablo 1: Ankete Katılanların Sinemaya Gitme Sıklığı

	Frequency	Percent	Valid Percent	Cumulative Percent
Haftada 1kez	3	2,8	2,8	2,8
Haftada birkaç kez	1	,9	,9	3,8
Ayda 1 kez	36	34,0	34,0	37,7
Ayda birkaç kez	22	20,8	20,8	58,5
Yılda birkaç kez	39	36,8	36,8	95,3
Hiç gitmem	5	4,7	4,7	100,0
Total	106	100,0	100,0	

Tablo 1'e bakıldığında ankete cevap veren katılımcıların %2.8'i (3 kişi) haftada bir kez; %0.9'u (1 kişi) haftada birkaç kez; %34'ü (36 kişi) ayda 1 kez; %20.8'i (22 kişi) ayda birkaç kez; %36,8'i (39 kişi) yılda birkaç kez sinemaya gitmekte olup %4.7'si (5 kişi) ise hiç gitmemektedir.

Tablo 2: Ankete Katılanların DVD, VCD Ve Başka Kanallarla Film İzleme Sıklığı

	Frequency	Percent	Valid Percent	Cumulative Percent
Haftada 1kez	10	9,4	9,4	9,4
Haftada birkaç kez	27	25,5	25,5	34,9
Ayda 1 kez	19	17,9	17,9	52,8
Ayda birkaç kez	20	18,9	18,9	71,7
Yılda birkaç kez	22	20,8	20,8	92,5
Hiç izlemem	8	7,5	7,5	100,0
Total	106	100,0	100,0	

Tablo 2'ye bakıldığında ankete cevap veren katılımcıların %9.4'ü (10 kişi) haftada bir kez; %25.5 (27 kişi) haftada birkaç kez; %17.9'u (19 kişi) ayda 1 kez; %18.9'u (20 kişi) ayda birkaç kez; %20.8'i (22 kişi) yılda birkaç kez dvd,vcd ve başka kanallarla film izlemekte olup %7.5'i (8 kişi) ise hiç izlememektedir.

Tablo 3: Ankete Katılanların DVD, VCD Ve Başka Kanallarla Film İzlemek İçin Yaptıkları Harcamalar

	Frequency	Percent	Valid Percent	Cumulative Percent
0-25	83	78,3	78,3	78,3
26-50	18	17,0	17,0	95,3
51-75	3	2,8	2,8	98,1
76-100	1	,9	,9	99,1
101+	1	,9	,9	100,0
Total	106	100,0	100,0	

Tablo 3'e bakıldığında ankete cevap veren katılımcıların %78.3'ü (83 kişi) 0-25 TL; %17'si (18 kişi) 26-50 TL ; %2.8'i (3 kişi) 51-75 TL ; %0.9'u (1 kişi) 76-100TL aralığında DVD, VCD ve başka kanallarla film izlemek için harcama yaparken %0.9'u (1 kişi) 101TL ve üzerinde harcama yapmaktadır.

Tablo 4: Ankete Katılanların Film Seçiminde Dikkat Ettiği Unsurlar

	Frequency	Percent	Valid Percent	Cumulative Percent
Filmin yapıldığı ülke	15	14,2	14,2	14,2
Filmin yönetmeni	8	7,5	7,5	21,7
Filmin oyuncularını	8	7,5	7,5	29,2
Filmin türüne	40	37,7	37,7	67,0
Filmin konusu	28	26,4	26,4	93,4
Fark etmez	7	6,6	6,6	100,0
Total	106	100,0	100,0	

Tablo 4'e bakıldığında ankete cevap veren katılımcıların %14.2'si (15 kişi) filmin yapıldığı ülkeye göre; %7.5'i (8 kişi) filmin yönetmenine göre; %7.5'i (8 kişi) filmin oyuncularına göre; %37.7'si (40 kişi) filmin türüne göre; %26.4'ü (28 kişi) filmin konusuna göre film seçerken %6.6'sı (7 kişi) için film seçiminde herhangi bir unsur önem teşkil etmemektedir.

Tablo 5: Ankete Katılanların İlgilendikleri Film Türleri

	Frequency	Percent	Valid Percent	Cumulative Percent
Belgesel	18	17,0	17,0	17,0
Western	1	,9	,9	17,9
Komedi	18	17,0	17,0	34,9
Macera	8	7,5	7,5	42,5
Bilim kurgu	26	24,5	24,5	67,0
Gerilim	6	5,7	5,7	72,6
Romantik Komedi	16	15,1	15,1	87,7
Aşk	5	4,7	4,7	92,5
Dövüş	3	2,8	2,8	95,3
Savaş	3	2,8	2,8	98,1
Çizgi Animasyon	2	1,9	1,9	100,0
Total	106	100,0	100,0	

Tablo 5'e bakıldığında ankete cevap veren katılımcıların %17'si (18 kişi) belgesel; %0.9'u (1 kişi) western; %17'si (18 kişi) komedi; %7.5'i (8 kişi) macera; %24.5'i (26 kişi) bilim kurgu; %5.7'si (6 kişi) gerilim; %15.1'i (16 kişi) romantik komedi; %4.7'si (5 kişi) aşk; %2.8'i (3 kişi) dövüş; %2.8'i (3 kişi) savaş; %1.9'u (2 kişi) çizgi-animasyon seyretnmeyi tercih ediyor.

2. Araştırmaya Katılan Üniversite Öğrencilerinin Tutumsal ifadelerle ilişkin Katılma Durumları

Tablo 6: Reklam seyretmekten hoşlanırım.

	Frequency	Percent	Valid Percent	Cumulative Percent
Kesinlikle Katılıyorum	12	11,3	11,3	11,3
Katılıyorum	34	32,1	32,1	43,4
Kararsızım	21	19,8	19,8	63,2
Katılmıyotum	16	15,1	15,1	78,3
Kesinlikle Katılmıyotum	23	21,7	21,7	100,0
Total	106	100,0	100,0	

Tablo 6'ya bakıldığında ankete cevap veren katılımcıların "Reklam seyretmekten hoşlanıyorum." tutumuna katılım oranları %11.3 ile (12 kişi) kesinlikle katılıyorum; %32.1 ile (34 kişi) katılıyorum; %19.8 ile (21 kişi)

kararsızım; 15.1 ile (16 kişi) katılmıyorum; %21.7 ile (23 kişi) kesinlikle katılmıyorum şeklinde saptanmıştır.Sonuç olarak katılımcıların çoğunluğu %43.4 ile (46 kişi) reklam seyretmekten hoşlanmaktadırlar.

Tablo 7: Markalı ürünlerin gösterilmesi filmi gerçekçi kılar.

	Frequency	Percent	Valid Percent	Cumulative Percent
Kesinlikle Katılıyorum	13	12,3	12,3	12,3
Katılıyorum	33	31,1	31,1	43,4
Kararsızım	17	16,0	16,0	59,4
Katılmıyotum	29	27,4	27,4	86,8
Kesinlikle Katılmıyorum	14	13,2	13,2	100,0
Total	106	100,0	100,0	

Tablo 7'ye bakıldığında ankete cevap veren katılımcıların "Markalı ürünlerin gösterilmesi filmi gerçekçi kılar." tutumuna katılım oranları %12.3 ile (13 kişi) kesinlikle katılıyorum; %31.1 ile (33 kişi) katılıyorum; %16 ile (17 kişi) kararsızım; 27.4 ile (29 kişi) katılmıyorum; %13.2 ile (14 kişi) kesinlikle katılmıyorum şeklinde saptanmıştır.Sonuç olarak katılımcıların çoğunluğu %43.4 ile (46 kişi) markalı ürünlerin gösteriminin filmi gerçekçi kıldığını düşünmektedir.

Tablo 8: Sinema filmlerinde markaların ticari amaçlarla kullanıldıklarını biliyorum.

	Frequency	Percent	Valid Percent	Cumulative Percent
Kesinlikle Katılıyorum	42	39,6	39,6	39,6
Katılıyorum	42	39,6	39,6	79,2
Kararsızım	11	10,4	10,4	89,6
Katılmıyotum	4	3,8	3,8	93,4
Kesinlikle Katılmıyorum	7	6,6	6,6	100,0
Total	106	100,0	100,0	

Tablo 8'e bakıldığında ankete cevap veren katılımcıların "Sinema filmlerinde markaların ticari amaçlarla kullanıldıklarını biliyorum." tutumuna katılım oranları %36.9 ile (42 kişi) kesinlikle katılıyorum; %39.6 ile (42 kişi) katılıyorum; %10.4 ile (11 kişi) kararsızım; %3.8 ile (4 kişi) katılmıyorum; %6.6 ile (7 kişi) kesinlikle katılmıyorum şeklinde saptanmıştır.Sonuç olarak katılımcıların çoğunluğu %80.2 ile (84 kişi) sinema filmlerindeki söz konusu ürün yerleştirmenin ticari amaç taşıdığını farkındadır.

Tablo 9: Ürünün filmde kullanım şekli ürünle ilgili algıyı etkiler.

	Frequency	Percent	Valid Percent	Cumulative Percent
Kesinlikle Katılıyorum	14	13,2	13,2	13,2
Katılıyorum	31	29,2	29,2	42,5
Kararsızım	29	27,4	27,4	69,8
Katılmıyotum	21	19,8	19,8	89,6
Kesinlikle Katılmıyorum	11	10,4	10,4	100,0
Total	106	100,0	100,0	

Tablo 9'a bakıldığında ankete cevap veren katılımcıların "Ürünün filmde kullanım şekli ürünle ilgili algıyı etkiler." tutumuna katılım oranları %13.2 ile (14 kişi) kesinlikle katılıyorum; %29.2 ile (31 kişi) katılıyorum; %27.4 ile (29 kişi) kararsızım; %19.8 ile (21 kişi) katılmıyorum; %10.4 ile (11 kişi) kesinlikle katılmıyorum şeklinde saptanmıştır. Sonuç olarak katılımcıların çoğunluğu %42,4 (45 kişi) ürünün filmde kullanım şeklinin ürünle ilgili algıları etkilediğine katılmaktadır.

Tablo 10: Film yapımcıları ürün gösterimi için bedel almazlar.

	Frequency	Percent	Valid Percent	Cumulative Percent
Kesinlikle Katılıyorum	24	22,6	22,6	22,6
Katılıyorum	19	17,9	17,9	40,6
Kararsızım	17	16,0	16,0	56,6
Katılmıyorum	21	19,8	19,8	76,4
Kesinlikle Katılmıyorum	25	23,6	23,6	100,0
Total	106	100,0	100,0	

Tablo 10'a bakıldığında ankete cevap veren katılımcıların "Film yapımcıları ürün gösterimi için bedel almazlar." tutumuna katılım oranları %22.6 ile (24 kişi) kesinlikle katılıyorum; %17.9 ile (19 kişi) katılıyorum; %16 ile (17 kişi) kararsızım; %19.8 ile (21 kişi) katılmıyorum; %23.6 ile (25 kişi) kesinlikle katılmıyorum şeklinde saptanmıştır. Sonuç olarak katılımcıların çoğunluğu %43,4'ü (46 kişi) söz konusu ürün yerleştirmenin bir bedel karşılığı yapıldığını farkındadırlar.

Tablo 11: Filmdeki markalar bilinçaltına etki etmektedirler.

	Frequency	Percent	Valid Percent	Cumulative Percent
Kesinlikle Katılıyorum	38	35,8	35,8	35,8
Katılıyorum	44	41,5	41,5	77,4
Kararsızım	11	10,4	10,4	87,7
Katılmıyorum	8	7,5	7,5	95,3
Kesinlikle Katılmıyorum	5	4,7	4,7	100,0
Total	106	100,0	100,0	

Tablo 11'e bakıldığında ankete cevap veren katılımcıların "Filmdeki markalar bilinçaltına etki etmektedirler." tutumuna katılım oranları %35.8 ile (38 kişi) kesinlikle katılıyorum; %41.5 ile (44 kişi) katılıyorum; %10.4 ile (11 kişi) kararsızım; %7.5 ile (8 kişi) katılmıyorum; %4.7 ile (5 kişi) kesinlikle katılmıyorum şeklinde saptanmıştır. Sonuçlar değerlendirildiğinde katılımcıların çoğunluğu %77.3'ü (82 kişi) gösterilen markaların bilinçaltını etkilediğine katılmaktadırlar.

Tablo 12: Ürün yerleştirme olduğunu bildiğim filme gitmem.

	Frequency	Percent	Valid Percent	Cumulative Percent
Kesinlikle Katılıyorum	5	4,7	4,7	4,7
Katılıyorum	14	13,2	13,2	17,9
Kararsızım	31	29,2	29,2	47,2
Katılmıyorum	39	36,8	36,8	84,0
Kesinlikle Katılmıyorum	17	16,0	16,0	100,0
Total	106	100,0	100,0	

Tablo 12'ye bakıldığında ankete cevap veren katılımcıların "Ürün yerleştirme olduğunu bildiğim filme gitmem." tutumuna katılım oranları %4.7 ile (5 kişi) kesinlikle katılıyorum; %13.2 ile (14 kişi) katılıyorum; %29.2 ile (31 kişi) kararsızım; %36.8 ile (39 kişi) katılmıyorum; %16 ile (17 kişi) kesinlikle katılmıyorum şeklinde saptanmıştır. Sonuç olarak %52.8 (56 kişi) çoğunluğunun ortaya çıkarmaktadır ki, ürün yerleştirme olduğunun bilinmesi filme gitme kararını olumsuz yönde etkilememektedir.

Tablo 13: Filmde gördükten sonra kullanmaya başladığım ürünler oldu.

	Frequency	Percent	Valid Percent	Cumulative Percent
Kesinlikle Katılıyorum	8	7,5	7,5	7,5
Katılıyorum	26	24,5	24,5	32,1
Kararsızım	35	33,0	33,0	65,1
Katılmıyotum	23	21,7	21,7	86,8
Kesinlikle Katılmıyorum	14	13,2	13,2	100,0
Total	106	100,0	100,0	

Tablo 13'e bakıldığında ankete cevap veren katılımcıların "Filmde gördükten sonra kullanmaya başladığım ürünler oldu." tutumuna katılım oranları %7.5 ile (8 kişi) kesinlikle katılıyorum; %24.5 ile (26 kişi) katılıyorum; %33.0 ile (35 kişi) kararsızım; %21.7 ile (23 kişi) katılmıyorum; %13.2 ile (14 kişi) kesinlikle katılmıyorum şeklinde saptanmıştır. Sonuç olarak değerler birbirine çok yakın olsa da %34.9'u (47 kişi) filmde gördükten sonra o ürünü kullanmaya başlamamıştır.

Tablo 14: Ürün yerleştirme ile seyirciyi etkilemek ahlaki değildir.

	Frequency	Percent	Valid Percent	Cumulative Percent
Kesinlikle Katılıyorum	5	4,7	4,7	4,7
Katılıyorum	20	18,9	18,9	23,6
Kararsızım	40	37,7	37,7	61,3
Katılmıyotum	30	28,3	28,3	89,6
Kesinlikle Katılmıyorum	11	10,4	10,4	100,0
Total	106	100,0	100,0	

Tablo 14'e bakıldığında ankete cevap veren katılımcıların "Ürün yerleştirme ile seyirciyi etkilemek ahlaki değildir." tutumuna katılım oranları %4.7 ile (5 kişi) kesinlikle katılıyorum; %18.9 ile (20 kişi) katılıyorum; %37.7 ile (40 kişi) kararsızım; %28.3 ile (30 kişi) katılmıyorum; %10.4 ile (11 kişi) kesinlikle katılmıyorum şeklinde saptanmıştır. Sonuç olarak ürün yerleştirmenin ahlaki olup olmamasına dair katılımcıların %38.7'si (41 kişi) ahlaki açıdan bir sakınca olmadığını belirtmişlerdir.

Tablo 15: Filmde gördüğüm ürünleri daha sonra mağazalarda ararım.

	Frequency	Percent	Valid Percent	Cumulative Percent
Kesinlikle Katılıyorum	5	4,7	4,7	4,7
Katılıyorum	18	17,0	17,0	21,7
Kararsızım	41	38,7	38,7	60,4
Katılmıyotum	23	21,7	21,7	82,1
Kesinlikle Katılmıyorum	19	17,9	17,9	100,0
Total	106	100,0	100,0	

Tablo 15'e bakıldığında ankete cevap veren katılımcıların "Filmde gördüğüm ürünleri daha sonra mağazalarda ararım." tutumuna katılım oranları %4.7 ile (5 kişi) kesinlikle katılıyorum; %17 ile (18 kişi) katılıyorum; %38.7 ile (41 kişi) kararsızım; %21.7 ile (23 kişi) katılmıyorum; %17.9 ile (19 kişi) kesinlikle katılmıyorum şeklinde saptanmıştır. Sonuç olarak 39.6 ile (42 kişi) katılmadıklarını belirtmiştir.

Tablo 16: Filmler aracılığıyla bazı markalara yönelik bilgiler kazandığım oldu.

	Frequency	Percent	Valid Percent	Cumulative Percent
Kesinlikle Katılıyorum	15	14,2	14,2	14,2
Katılıyorum	43	40,6	40,6	54,7
Kararsızım	24	22,6	22,6	77,4
Katılmıyorum	18	17,0	17,0	94,3
Kesinlikle Katılmıyorum	6	5,7	5,7	100,0
Total	106	100,0	100,0	

Tablo 16'ya bakıldığında ankete cevap veren katılımcıların "Filmler aracılığıyla bazı markalara yönelik bilgiler kazandığım oldu." tutumuna katılım oranları %14.2 ile (15 kişi) kesinlikle katılıyorum; %40.6 ile (43 kişi) katılıyorum; %22.6 ile (24 kişi) kararsızım; %17 ile (18 kişi) katılmıyorum; %5.7 ile (6 kişi) kesinlikle katılmıyorum şeklinde saptanmıştır.Sonuç olarak %54.8 aritmetik ortalamayla (58 kişi) filmler aracılığıyla bazı markalara yönelik bilgi kazanmıştır.

Tablo 17: Filmde ürün yerleştirme tümüyle yasaklanmalıdır.

	Frequency	Percent	Valid Percent	Cumulative Percent
Kesinlikle Katılıyorum	12	11,3	11,3	11,3
Katılıyorum	8	7,5	7,5	18,9
Kararsızım	30	28,3	28,3	47,2
Katılmıyorum	27	25,5	25,5	72,6
Kesinlikle Katılmıyorum	29	27,4	27,4	100,0
Total	106	100,0	100,0	

Tablo 17'ye bakıldığında ankete cevap veren katılımcıların "Filmde ürün yerleştirme tümüyle yasaklanmalıdır." tutumuna katılım oranları %11.3 ile (12 kişi) kesinlikle katılıyorum; %7.5 ile (8 kişi) katılıyorum; %28.3 ile (30 kişi) kararsızım; %25.5 ile (27 kişi) katılmıyorum; %27.4 ile (29 kişi) kesinlikle katılmıyorum şeklinde saptanmıştır. Sonuç olarak %52.9 ile ankete katılanlar arasında ürün yerleştirmenin yasaklanmasına katılmayanlar çoğunluktadır.

Tablo 18: Filmde belli markalara gereğinden çok önem verilmemelidir.

	Frequency	Percent	Valid Percent	Cumulative Percent
Kesinlikle Katılıyorum	20	18,9	18,9	18,9
Katılıyorum	43	40,6	40,6	59,4
Kararsızım	27	25,5	25,5	84,9
Katılmıyorum	9	8,5	8,5	93,4
Kesinlikle Katılmıyorum	7	6,6	6,6	100,0
Total	106	100,0	100,0	

Tablo 18'e bakıldığında ankete cevap veren katılımcıların "Filmde belli markalara gereğinden çok önem verilmemelidir." tutumuna katılım oranları %18.9 ile (20 kişi) kesinlikle katılıyorum; %40.6 ile (43 kişi) katılıyorum; %25.5 ile (27 kişi) kararsızım; %8.5 ile (9 kişi) katılmıyorum; %6.6 ile (7 kişi) kesinlikle katılmıyorum şeklinde saptanmıştır.Sonuç olarak belli markaların abartılarak gösterilmesine %59.5 ile (63 kişi) karşı çıkmaktadır.

Tablo 19: Film yıldızlarının kullandıkları markaları satın alırım.

	Frequency	Percent	Valid Percent	Cumulative Percent
Kesinlikle Katılıyorum	3	2,8	2,8	2,8
Katılıyorum	15	14,2	14,2	17,0
Kararsızım	32	30,2	30,2	47,2
Katılmıyotum	32	30,2	30,2	77,4
Kesinlikle Katılmıyorum	24	22,6	22,6	100,0
Total	106	100,0	100,0	

Tablo 19'a bakıldığında ankete cevap veren katılımcıların "Film yıldızlarının kullandıkları markaları satın alırım." tutumuna katılım oranları %2.8 ile (3 kişi) kesinlikle katılıyorum; %14.2 ile (15 kişi) katılıyorum; %30.2 ile (32 kişi) kararsızım; %30.2 ile (32 kişi) katılmıyorum; %22.6 ile (24 kişi) kesinlikle katılmıyorum şeklinde saptanmıştır.Sonuç olarak katılımcıların film yıldızlarının kullandıkları markaları satın alma eğilimlerinin %52.8 aritmetik ortalamayla (56 kişi) olmadığı saptanmıştır.

Tablo 20: Belli bedeller karşılığında markaların gösteriminin gizli reklam olduğunu düşünüyorum.

	Frequency	Percent	Valid Percent	Cumulative Percent
Kesinlikle Katılıyorum	18	17,0	17,0	17,0
Katılıyorum	47	44,3	44,3	61,3
Kararsızım	22	20,8	20,8	82,1
Katılmıyotum	11	10,4	10,4	92,5
Kesinlikle Katılmıyorum	8	7,5	7,5	100,0
Total	106	100,0	100,0	

Tablo 20'ye bakıldığında ankete cevap veren katılımcıların "Belli bedeller karşılığında markaların gösteriminin gizli reklam olduğunu düşünüyorum." tutumuna katılım oranları %17 ile (18 kişi) kesinlikle katılıyorum; %44.3 ile (47 kişi) katılıyorum; %20.8 ile (22 kişi) kararsızım; %10.4 ile (11 kişi) katılmıyorum; %7.5 ile (8 kişi) kesinlikle katılmıyorum şeklinde saptanmıştır.Sonuç olarak ürün yerleştirme kavramının %61.3 aritmetik ortalamayla (65 kişi) bilinmekte olduğu sonucu ortaya çıkmıştır.

Tablo 21: Film izlemekten nefret ederim.

	Frequency	Percent	Valid Percent	Cumulative Percent
Kesinlikle Katılıyorum	3	2,8	2,8	2,8
Katılıyorum	11	10,4	10,4	13,2

Uygun değil	2	1,9	1,9	98,1
Hiç uygun değil	2	1,9	1,9	100,0
Total	106	100,0	100,0	

Tablo 55'e bakıldığında ankete cevap veren katılımcıların ürün yerleştirme uygunluğuna “**Kıyafet**” için katılım oranları %50 ile (53 kişi) çok uygun; %36.8 ile (39 kişi) uygun; %9.4 ile (10 kişi) kararsızım; %1.9 ile (2 kişi) uygun değil; %1.9 ile (2 kişi) hiç uygun değil şeklinde saptanmıştır. Sonuç olarak %86.8 aritmetik ortalamayla (92 kişi) kıyafet markalarının ürün yerleştirmeye uygun görüldüğü saptanmıştır.

Tablo 56: Saat

	Frequency	Percent	Valid Percent	Cumulative Percent
Çok uygun	49	46,2	46,2	46,2
Uygun	43	40,6	40,6	86,8
Kararsızım	9	8,5	8,5	95,3
Uygun değil	1	,9	,9	96,2
Hiç uygun değil	4	3,8	3,8	100,0
Total	106	100,0	100,0	

Tablo 56'ya bakıldığında ankete cevap veren katılımcıların ürün yerleştirme uygunluğuna “**Saat**” için katılım oranları %46.2 ile (49 kişi) çok uygun; %40.6 ile (43 kişi) uygun; %8.5 ile (9 kişi) kararsızım; %0.9 ile (1 kişi) uygun değil; %3.8 ile (4 kişi) hiç uygun değil şeklinde saptanmıştır. Sonuç olarak %86.8 aritmetik ortalamayla (92 kişi) saatin ürün yerleştirmeye uygun görüldüğü saptanmıştır.

Tablo 57: Cep telefonu

	Frequency	Percent	Valid Percent	Cumulative Percent
Çok uygun	54	50,9	50,9	50,9
Uygun	41	38,7	38,7	89,6
Kararsızım	5	4,7	4,7	94,3
Uygun değil	3	2,8	2,8	97,2
Hiç uygun değil	3	2,8	2,8	100,0
Total	106	100,0	100,0	

Tablo 57'ye bakıldığında ankete cevap veren katılımcıların ürün yerleştirme uygunluğuna “**Cep Telefonu**” için katılım oranları %50.9 ile (54 kişi) çok uygun; %38.7 ile (41 kişi) uygun; %4.7 ile (5 kişi) kararsızım; %2.8 ile (3 kişi) uygun değil; %2.8 ile (3 kişi) hiç uygun değil şeklinde saptanmıştır. Sonuç olarak %89.6 aritmetik ortalamayla (95 kişi) cep telefonunun ürün yerleştirmeye uygun görüldüğü saptanmıştır.

Tablo 58: Spor Malzemeleri

	Frequency	Percent	Valid Percent	Cumulative Percent
Çok uygun	50	47,2	47,2	47,2
Uygun	44	41,5	41,5	88,7
Kararsızım	5	4,7	4,7	93,4
Uygun değil	2	1,9	1,9	95,3
Hiç uygun değil	5	4,7	4,7	100,0
Total	106	100,0	100,0	

Tablo 58'e bakıldığında ankete cevap veren katılımcıların ürün yerleştirme uygunluğuna "**Spor Malzemeleri**" için katılım oranları %47.2 ile (50 kişi) çok uygun; %41.5 ile (44 kişi) uygun; %4.7 ile (5 kişi) kararsızım; %1.9 ile (2 kişi) uygun değil; %4.7 ile (5 kişi) hiç uygun değil şeklinde saptanmıştır. Sonuç olarak %88.7 aritmetik ortalamayla (94 kişi) spor malzemelerinin ürün yerleştirmeye uygun görüldüğü saptanmıştır.

4. Demografik Faktörler

Tablo 59: Cinsiyet

	Frequency	Percent	Valid Percent	Cumulative Percent
Kadın	53	50,0	50,0	50,0
Erkek	53	50,0	50,0	100,0
Total	106	100,0	100,0	

Tablo 59'e bakıldığında ankete cevap veren katılımcıların cinsiyetlerine göre ayrımı %50 oranıyla (53 kişi) kadın ve %50 oranıyla (53 kişi) erkek olmuştur.

Tablo 60: Gelir Durumu

	Frequency	Percent	Valid Percent	Cumulative Percent
0-250	11	10,4	10,4	10,4
251-500	38	35,8	35,8	46,2
501-750	23	21,7	21,7	67,9
751-1000	15	14,2	14,2	82,1
1001+	19	17,9	17,9	100,0
Total	106	100,0	100,0	

Tablo 59'e bakıldığında ankete cevap veren katılımcıların %10.4 oranıyla (11 kişi) 0-250 tl; %35.8 oranıyla (38 kişi) 251-500 tl; %21.7 oranıyla (23 kişi) 501-750tl; %14.2 oranıyla (15 kişi) 751-1000 tl; %17.9 oranıyla (19 kişi) 1001-+ gelirine sahip oldukları saptanmıştır.

Araştırmaya katılan öğrencilerin cinsiyete göre ürün yerleştirmeye ilişkin tutumlarının t-test sonuçları ve değerlendirilmesi

Anlamlı farklılık bulunan veriler sunulmuştur:

:

Tablo 61: Cinsiyete Göre Sinemaya Gitme Sıklığının Değerlendirilmesi

	Equality of Variances		t-test for Equality of Means						
	F	Sig.	t	df	Sig. (2-tailed)	Mean Difference	Std. Error Difference	Interval of the	
								Lower	Upper
Sinemaya gitme sıklığınız nedir?	6,977	,010	-,530	104	,597	-,113	,213	-,537	,310
			-,530	91,810	,597	-,113	,213	-,537	,311

Tablo 61'e bakıldığında hesaplanan α 0.010, normal α 0.05'ten küçük olduğu için cinsiyete göre sinemaya gitme sıklığı arasında anlamlı bir farklılık bulunmuştur. Erkeklerin aritmetik ortalaması 4,08 olduğundan kadınlara oranla daha sık sinemaya gittikleri saptanmıştır.

Tablo 62: Cinsiyete Göre İzlenen Film Türünün Değerlendirilmesi

	Equality of Variances		t-test for Equality of Means						
	F	Sig.	t	df	Sig. (2-tailed)	Mean Difference	Std. Error Difference	Interval of the	
								Lower	Upper
İzlemeyi en çok tercih ettiğiniz film türü nedir?	4,016	,048	,989	104	,325	,509	,515	-,512	1,531
			,989	94,540	,325	,509	,515	-,513	1,532

Tablo 62'ye bakıldığında hesaplanan α 0.048, normal α 0.05'ten küçük olduğu için cinsiyete göre izlenen film türleri arasında anlamlı bir farklılık bulunmuştur. Erkeklerin aritmetik ortalaması 5.04 ile macera türünde tercih edildiğini gösterirken kadınların aritmetik ortalaması 4.53 ile komedi türünün tercih edildiğini göstermektedir.

Tablo 63: Cinsiyete Göre Reklamlardan Hoşlanma Durumunun Değerlendirilmesi

	Equality of Variances		t-test for Equality of Means						
	F	Sig.	t	df	Sig. (2-tailed)	Mean Difference	Std. Error Difference	Interval of the	
								Lower	Upper
Genelde reklam seyretmekten hoşlanırım.	5,398	,022	-1,305	104	,195	-,340	,260	-,856	,177
			-1,305	99,732	,195	-,340	,260	-,856	,177

Tablo 63'e bakıldığında hesaplanan α 0.022, normal α 0.05'ten küçük olduğu için cinsiyete göre reklamlardan hoşlanma arasında anlamlı bir farklılık bulunmuştur. Kadınların verdiği cevapların aritmetik ortalaması 2.87 olup erkeklere oranla reklamlardan daha fazla hoşlandıklarını belirtmişlerdir.

Tablo 64: Cinsiyete Göre Film İzlemekten Nefret Etme Durumunun Değerlendirilmesi

	Equality of Variances		t-test for Equality of Means						
	F	Sig.	t	df	Sig. (2-tailed)	Mean Difference	Std. Error Difference	Interval of the	
								Lower	Upper
Film izlemekten nefret ederim.	5,403	,022	1,329	104	,187	,302	,227	-,149	,752
			1,329	99,996	,187	,302	,227	-,149	,753

Tablo 64'e bakıldığında hesaplanan α 0.022, normal α 0.05'ten küçük olduğu için cinsiyete göre filmlerden nefret edilmesi arasında anlamlı bir farklılık bulunmuştur. Erkeklerin verdikleri cevapların aritmetik ortalamasına bakıldığında 4.11 ile kadınların verdikleri cevapların aritmetik ortalaması (4.42) karşılaştırıldığında, bu soruya kadınların daha fazla katılmadığı ortaya çıkmaktadır.

Tablo 65: Cinsiyete Göre Alkollü İçeceklerin Gösterimine Karşı Tutumların Değerlendirilmesi

	Equality of Variances		t-test for Equality of Means						
	F	Sig.	t	df	Sig. (2-tailed)	Mean Difference	Std. Error Difference	Interval of the	
								Lower	Upper
Alkollü içeceklerin sinema filmlerine yerleştirilmesi uygundur.	7,014	,009	1,329	104	,187	,396	,298	-,195	,987
			1,329	99,610	,187	,396	,298	-,195	,988

Tablo 65'e bakıldığında hesaplanan α 0.009, normal α 0.05'ten küçük olduğu için cinsiyete göre alkollü içeceklerin gösterimine karşı tutum arasında anlamlı bir farklılık bulunmuştur. Erkeklerin aritmetik ortalaması 2.81 olup kadınlara oranla alkollü içeceklerin gösterimini daha uygun bulmuşlardır.

Tablo 66: Cinsiyete Göre Şekerleme-Atıştırma Ürünlerinin Gösterimine Karşı Tutumların Değerlendirilmesi

	Equality of Variances		t-test for Equality of Means						
	F	Sig.	t	df	Sig. (2-tailed)	Mean Difference	Std. Error Difference	Interval of the	
								Lower	Upper
Şekerleme-atıştırma ürünlerinin sinema filmlerine yerleştirilmesi uygundur.	4,613	,034	,084	104	,933	,019	,225	-,426	,464
			,084	100,736	,933	,019	,225	-,427	,464

Tablo 66'ya bakıldığında hesaplanan α 0.034, normal α 0.05'ten küçük olduğu için cinsiyete göre şekerleme-atıştırma ürünlerinin gösterimine karşı tutum arasında anlamlı bir farklılık bulunmuştur. Kadınların 2.02 aritmetik ortalamayla erkeklere oranla şekerleme-atıştırma ürünlerinin gösterimini daha uygun bulmaktadırlar.

Anova Sonuçları

Anket sonuçlarına göre anlamlı farklılık saptanan veriler sunulmuştur:

1.Araştırmaya katılan öğrencilerin sinemaya gitme sıklığına göre ürün yerleştirmeye ilişkin tutumlarının değerlendirilmesi

Tablo:67

	Sum of Squares	df	Mean Square	F	Sig.
Filmler aracılığıyla bazı markalar hakkında bilgi edindim.	16,583	5	3,317	2,989	,015
	110,974	100	1,110		
	127,557	105			

Tablo 67'ye bakıldığında hesaplanan α 0,015 normal α 0,05 değerinden küçük olduğu için filmler aracılığıyla markalar hakkında bilgi edinme durumu sinemaya gitme sıklığı ile anlamlı bir farklılık göstermektedir.

Tablo:68

	Sum of Squares	Df	Mean Square	F	Sig.
Filmlerde sahte markalardan ziyade gerçek markaların ürünlerini görmeyi tercih ederim.	19,506	5	3,901	4,168	,002
	93,598	100	,936		
	113,104	105			

Tablo 68'e bakıldığında hesaplanan α 0,002 normal α 0,05 değerinden küçük olduğu için filmlerde sahte markalardan ziyade gerçek markaların ürünlerini görmeyi tercih etme durumu sinemaya gitme sıklığı ile anlamlı bir farklılık göstermektedir.

2. DVD VCD ve başka kanallarla film izleme sıklığına göre ürün yerleştirmeye ilişkin tutumlarının değerlendirilmesi

Tablo 69

ANOVA					
	Sum of Squares	Df	Mean Square	F	Sig.
Aralarda gösterilen reklamlardan kaçmak için sinemaya gitmem.	18,041	5	3,608	2,405	,042
	150,043	100	1,500		
	168,085	105			

Tablo 69'a bakıldığında hesaplanan α 0,042 normal α 0,05 değerinden küçük olduğu için aralarda gösterilen reklamlardan kaçmak için sinemaya gitmeme düşüncesine katılım durumu, DVD VCD ve başka kanallarla film izleme sıklığı ile anlamlı bir farklılık göstermektedir.

Tablo 70

ANOVA					
	Sum of Squares	Df	Mean Square	F	Sig.
Sigara	26,575	5	5,315	2,588	,030
	205,387	100	2,054		
	231,962	105			

Tablo 70'e bakıldığında hesaplanan α 0,030 normal α 0,05 değerinden küçük olduğu için ürün yerleştirmeye uygun ürünler arasından sigaraya karşı tutumun DVD VCD ve başka kanallarla film izleme sıklığı ile anlamlı bir farklılık göstermekte olduğu saptanmıştır.

3. Gelir durumu

Tablo 71

ANOVA					
	Sum of Squares	df	Mean Square	F	Sig.
Film Seçimimde Dikkat Ettiği Unsurlar	32,916	4	8,229	4,347	,003
	191,207	101	1,893		
	224,123	105			

Tablo 71'e bakıldığında hesaplanan α 0,003 normal α 0,05 değerinden küçük olduğu için film seçiminde dikkat edilen unsurların gelir durumu ile anlamlı bir farklılık gösterdiği saptanmıştır.

Tablo 72

ANOVA					
	Sum of Squares	Df	Mean Square	F	Sig.
Filmde gördüğüm ürünleri daha sonra mağazalarda ararım.	12,156	4	3,039	2,679	,036
	114,570	101	1,134		
	126,726	105			

Tablo 72'ye bakıldığında hesaplanan α 0,036 normal α 0,05 değerinden küçük olduğu için filmde görülen markaların mağazalarda aranmasıyla gelir durumu arasında anlamlı bir farklılık saptanmıştır.

Tablo 73

ANOVA					
	Sum of Squares	Df	Mean Square	F	Sig.
Film yıldızlarının kullandıkları markaları satın alırım.	16,878	4	4,219	4,048	,004
	105,283	101	1,042		
	122,160	105			

Tablo 73'e bakıldığında hesaplanan α 0,004 normal α 0,05 değerinden küçük olduğu için filmlerdeki film yıldızlarının kullandıkları markaları satın alma durumu, gelir durumu ile anlamlı bir farklılık göstermektedir.

Tablo 74

ANOVA					
	Sum of Squares	Df	Mean Square	F	Sig.
Bedel alınarak gösterilen markalar filmin başında açıkça belirtilmelidir.	16,431	4	4,108	3,136	,018
	132,295	101	1,310		
	148,726	105			

Tablo 74'e bakıldığında hesaplanan α 0,018 normal α 0,05 değerinden küçük olduğu için bedel alınarak gösterilen markalar filmin başında açıkça belirtilmelidir düşüncesi ve gelir durumu ile anlamlı bir farklılık göstermektedir.

Alkollü içecek	25,170	4	6,292	2,839	,028
	223,821	101	2,216		
	248,991	105			

Tablo 78'e bakıldığında hesaplanan α 0,028 normal α 0,05 değerinden küçük olduğu için alkollü içeceklerin filmlerde gösterimi ile gelir durumu ile anlamlı bir farklılık göstermektedir.

Sonuç

Sakarya Üniversitesi İletişim Fakültesi öğrencilerine yapılan anket sonucu, üniversite öğrencilerinin ürün yerleştirme kavramına hakim oldukları saptanmıştır. Ürün yerleştirmenin geleneksel reklamların alternatifi olabileceğini ve sinema sektörü için gerekli olduğunu düşündükleri saptanmıştır. Kadınlara oranla erkeklerin daha çok film izledikleri cinsiyete göre anlamlı bir farklılık olduğunu göstermektedir. Bir diğer sonuç, gelir durumu arttıkça marka reklamlarına olan dikkatle orantılı olarak mağazalarda arama ve satın alma isteği oluşturma; markaların kişilik ifadesinde ve algılanmasında etkili olma oranları da artmaktadır. Ayrıca sinemaya gitme sıklığının reklamlardan etkilenme, marka farkındalığı oluşturma durumuyla ve reklamların gerçek markalarla olması gerektiğini düşünmeleri arasında doğru orantı olduğu saptanmıştır.

ABSTRACT

The aim of this study is to reveal the views of pre-service science teachers about nanotechnology. The participants of the study were 20 pre-service science teachers attending to the fourth grade of Afyon Kocatepe University's faculty of educational sciences. The study was designed as a qualitative research. The data collection tool was an interview form with seven open-ended items which was developed by the authors. It was reviewed by field experts and used in a pilot study before finalizing. Semi-structured interviews were conducted with the participants. The data were examined using the descriptive analysis method and the frequency of the answers of participants were identified. The findings of the study showed that more than half of the participants could not define nanotechnology using a scientific language. They mostly reported that nanotechnology did not have a place in our life and it emerged due to needs. Most of the participants stated that nanotechnology is mostly used in textile industry and that there is not enough studies on nanotechnology in Turkey. It is also found that the participants had actual information about nanotechnology, not scientific knowledge about it.

Key words: science, pre-service teachers, nanotechnology.

INTRODUCTION

The word "Nano" originates from Latin and Greek, meaning to "dwarf". The terms with the prefix "nano" such as "nanotechnology", "nanoscience" are the derivatives of the word "nanometre" which refers to a length units indicating a meter's equal in a billion (Sharifzadeh, 2006). Given that nanoscience and nanotechnology are both related to different disciplines, including physics, chemistry, biology as well as materials science, electronics, and computer sciences they require an interdisciplinary approach (Drane, 2009; Meyyappan, 2004; Özdoğan, Demir & Seventekin, 2006; Luther, 2004). The essence of nanotechnology is to work at a level from 1nm to 100nm atomic, molecular and sub molecular patterns; the aim is to create, use and process small sized devices, materials and basic systems. Nanotechnology deals with physical, chemical and biological characteristics and the changing materials and systems of patterns having nanoscale sizes. Basic goals of nanoscience and nanotechnology are to produce both the devices and materials of these devices with nanoscale and to make these devices used in daily life (Erkoç, 2008). The significance of nanotechnology depends on the fact that physical norms have different functions at the nanoscale of materials and that both substances and energy have different characteristics at nanoscale (TÜSİAD, 2008). The studies on nanoscience and nanotechnology have been supported and increased. In the 2003-2023 strategy document issued by Turkey Scientific and Technological Research Institution (TÜBİTAK, 2004) the national science and technology strategies to be followed in the period of 2003-2023 were outlined. The report identifies eight major strategical technological fields and one of them is nanotechnology. It emphasizes that Turkey should have scientific, technological and industrial background to create radical changes in nanoscience and nanotechnology. Science education programs should be updated and expanded to cover these goals. Many developed nations have updated their educational programs taking into account these developments. In Turkey the related attempts are also initiated (Erkoç, 2008). Given that individuals come across these topics in near future the awareness about nanoscience and the need for it are all related to science literacy (Sabelli, 2005; Stevens, Sutherland & Krajcik, 2009; Zenner & Crone, 2008: cited in Aslan & Şenel, 2015). The educational goal is to understand the procedures at nanoscale, nanostructures and

* This study was supported by Afyon Kocatepe University BAP, Project number: 17.Kariyer.01.

topics at nanoscale (Roco, 2003). One of the parts of science literacy is nano literacy which refers to an understanding of nanotechnology research and applications. Covering nanotechnology in the science education program makes it possible to produce science literate individuals who are aware of these advances in technology. Producing such individuals will make it possible to consume nanotechnological products consciously, make correct decisions about them and produce new ideas about actual developments (Akaygün, 2010; Hingant & Albe, 2010; Laherto, 2012; Sahin & Ekli, 2013). Educating primary and secondary students about nanoscience and nanotechnology may affect their future career decisions and their academic identities. Yawson (2012) argues that such an education will make it possible to adopt nanotechnology in society and at the individual level as future careers and to have political background for educational reforms. It is certain that in such processes both science teachers and pre-service science teachers have critical roles to play.

In the study student science teachers' perceptions and views about nanotechnology were analysed.

Method

The study was designed as a qualitative research. Major characteristics of qualitative research include an integrated approach, revealing perceptions, flexible research design and using an inductive analysis (Yıldırım & Şimşek, 2005). The participants of the study were 20 student teachers attending to the fourth grade of Afyon Kocatepe University's faculty of educational sciences. The participants were selected using purposeful sampling technique. Pre-service science teachers were selected due to the fact that they will teach science course. The data of the study were collected through semi-structured interviews, one of the data collection ways used in qualitative research. In semi-structured interviews both structured and not structured items are asked to the participants. The most significant advantage of this technique is that it gives systematical and comparable information to researchers (Yıldırım & Şimşek, 2008). The data collection tool was developed by the authors. It was reviewed by field experts and used in a pilot study before it was finalized. The tool is an interview form with seven open-ended items. The interviews were conducted in an environment where the participants could express their views and at the time periods identified by them. The interviews were recorded. Then these recordings were transcribed. In order to establish the reliability of the data they were also reviewed by another expert and the transcriptions produced by the authors and reviewer were compared.

The interview form consisted of the following items:

1. What do you understand from the term nanotechnology?
2. Where do we use nanotechnology?
3. What do you think about the reasons for the emergence of nanotechnology?
4. What is place of nanotechnology products in our life?
5. What do you think about nanotechnology products?
6. What is the status of nanotechnology in Turkey?
7. Should nanotechnology be taught at schools?

The data obtained were examined using descriptive analysis. In descriptive analysis the data obtained are summarized and interpreted based on the pre-determined conceptual framework or themes, direct quotations are used to support the findings and the findings are interpreted based on the cause-effect relations (Yıldırım and Şimşek, 2008). The answers of the participants to the interview items were compared and similarities and difficulties were identified. Finally, the categories were determined. These are used in the tables. Tables cover frequencies of the answers. In order to support the findings the direct quotations are given. The quotations are given using codes such as student teacher 5 (S.T.5) or student teacher 8 (S.T.8).

FINDINGS

The data obtained were categorized under thematic frameworks and their frequency is given.

Answers of the participants to the item "What do you understand from the term nanotechnology?"

As stated earlier the first item in the interview was "What do you understand from the term nanotechnology?". Table 1 presents the answers of the participants and frequency of these answers.

Table 1. Views of student teachers about the definition of nanotechnology

<i>Views of student teachers about the definition of nanotechnology</i>	<i>F</i>
(a) working with units at the level of nanoscale and producing technological products with these units,	6
(b) nanotechnology products and their use in daily life	14
Total	20

As can be seen in Table 1 fourteen student teachers defined nanotechnology as products and their use in daily life. (S.T.4): “I understand nanotechnology as the use of it in cleaning materials and in military field. Its use in medicine, biotechnology.” (S.T.18): “I understand nanotechnology as uncontaminated dress, non-wet fabric and many innovations in medicine. Cancer cure etc.”

Six participants defined nanotechnology as working with units at the level of nanoscale and producing technological products with these units. (S.T.1): “I understand nanotechnology as transforming atoms into molecules as the smallest pattern to produce new technological products.” (S.T.12): “I understand it as a technological work made at smaller sizes. It is a discipline dealing with materials having smaller sizes.”

Answers of the participants to the item “Where do we use nanotechnology?”

The second item asked to the participants was “Where do we use nanotechnology?”. Table 2 show their answers and the frequency of these answers.

Table 2. Answers of the participants to the item “Where do we use nanotechnology?”

<i>Views of student teachers about the use of nanotechnology</i>	<i>F</i>
(a) In textile industry and military,	14
(b) In health-related fields,	13
(c) In construction materials and electronics,	4
(d) In industry and painting materials,	3
(e) In cleaning products,	2
(f) In biotechnology, at homes, in foods, agriculture, biochemistry, physics, chemistry, biology, technology and education.	1
Total	37

As can be seen in Table 2 fourteen participants thought that it is used “in textile and military”. Thirteen participants thought that it is used “in medicine”, four “in construction materials and “in electronics”, three “in industry and painting”, two “in cleaning materials” and one “in biotechnology, at homes, in foods, agriculture, biochemistry, physics, chemistry, biology, technology and education”. (S.T.6): “We use it in textile industry, foods, paints.” (S.T.9): “We use it in cleaning materials, textile, military, agriculture.” (S.T.12): “In waterproof dress, industry, military, cameras.” (S.T.15): “I think that nanotechnology is used in military fields, constructions, in textile. I know that it is used in medical fields to produce micro devices for heart.” (S.T.17): “We use nanotechnology in the fields such as military, medicine, physics, chemistry, biology, computer devices and electronics.”

Answers of the participants to the item “What do you think about the reasons for the emergence of nanotechnology?”

Another items asked to the participants in the interview was What do you think about the reasons for the emergence of nanotechnology? Table 3 presents the answers of the participants to this question and the frequency of these answers.

Table 3. Answers of the participants to the item “What do you think about the reasons for the emergence of nanotechnology?”

<i>Views of the participants about the reasons for the emergence of nanotechnology</i>	<i>F</i>
(a) needs,	10
(b) to make life easier,	7
(c) for treatments,	3
(d) to be productive and for security purposes,	2
(e) for cleaning, military and quality life purposes,	1
(f) I do not know.	1
Total	24

Table 3 shows that ten participants reported that nanotechnology emerged due to “needs”, seven to “make life easier”, three for “treatment of illness”, two for “to be productive and for security purposes” and one stated that it emerged due to for “cleaning, military and quality life purposes”. One participant did not state any view about it. (S.T.3): “It emerged due to the fact that new and better products were needed especially for the field of medicine.” (S.T.7): “Nanotechnology emerged in order to meet the needs of people.” (S.T.10): “It emerged in order to make life easier.” (S.T.13): “It emerged in order to make devices more functional.”

Answers of the participants to the item “What is place of nanotechnology products in our life?”

In the interviews the participants were also asked to answer the following question: “What is place of nanotechnology products in our life?” Table 4 indicates their answers and the frequency of these answers.

Table 4. Answers of the participants to the item “What is place of nanotechnology products in our life?”

<i>Views of the participants about the place of nanotechnology in their life</i>	<i>F</i>
(a) no place,	10
(b) everywhere,	8
(c) in textile industry,	5
(d) in the fields of medicine and military,	2
(e) in physics, chemistry, biology,	1
(f) in cleaning materials, furniture, electronics, construction.	1
Total	27

As can be observed in Table 4 there were ten participants who argued that nanotechnology had no place in their life. However, eight of them suggested that it was everywhere. The others cited the major fields in which nanotechnology is used such as textile (5 participants), medicine and military (2 participants), physics, chemistry, biology (1 participant) and cleaning materials, furniture, electronics, construction (1 participant). (S.T.1): “Maybe it is used in all fields, but not in my life.” (S.T.7): “In fact it is used everywhere. Today nanotechnology is used for everything in daily life from shoes to beds.” (S.T.8): “In military field. It is also used in medical fields. Also in physics, chemistry, biology.” (S.T.19): “We also use it in daily life. In paints, glasses.”

Answers of the participants to the item “What do you think about the products of nanotechnology?”

The participants were also asked to answer the following question: What do you think about the products of nanotechnology? The answers by the participants and the frequency of their answers are given in Table 5.

Table 5. Answers of the participants to the item “What do you think about the products of nanotechnology?”

<i>Views of student teachers about the products of nanotechnology</i>	<i>F</i>
(a) useful,	11
(b) making life much easier,	9
(c) no harmful,	5
(d) useful due to the fact that these products make the treatment of illness much easier,	4
(e) I do not know its damages,	3
(f) It may have damages,	3
(g) It may be hazardous due to radiation and internal structure.	1
(h) useful due to the fact that these products decrease environmental pollution	1
Total	38

As can be seen in Table 5 eleven participants considered the products of nanotechnology as “useful”. Nine of them thought that “it is useful to make life much easier”. Five of them stated that nanotechnological products are “not harmful”. Four participants argued that “useful due to the fact that these products make the treatment of illness much easier”. Three of them did not have any information about these products. Three of them assumed that “nanotechnological products may be harmful”. One participant further argued that “it may be hazardous due to radiation and internal structure”. On the other hand, another participant stated that “nanotechnological products are useful due to the fact that these products decrease environmental pollution”. (S.T.13): “Nanotechnological products are very useful. These products are mostly functional. They are durable, and therefore, significant. Uncontaminated rugs and windows provide effective time management.” (S.T.14): “I think that nanotechnology is not harmful. Because it makes life much easier. People effectively manage their time when they use nanotechnological products.” (S.T.3): “They have no damage. These products should be used in every domain of daily life. But it may be expensive.” (S.T.2): “I do not know its damages but I know the advantages which are mostly in the field of medicine.”

Answers of the participants to the item “What is the status of nanotechnology in Turkey?”

One of the interview items was What is the status of nanotechnology in Turkey? The answers of the participants and the frequency of these answers are given in Table 6.

Table 6. Views of student teachers about the use of nanotechnology in Turkey

<i>Views of student teachers about the use of nanotechnology in Turkey</i>	<i>F</i>
(a) In Turkey there is no nanotechnology studies,	18
(b) I am searching for studies in Turkey,	7
(c) I do not have any idea about it,	7
(d) nanotechnology studies in Turkey are at the level of development,	5
(e) I follow the nanotechnology studies in Turkey,	2
(f) in military fields there are nanotechnology studies,	2
(g) in medicine and paint there are nanotechnology studies in Turkey.	1
Total	42

Table 6 shows that eighteen of the participants reported that “there is no study on nanotechnology”. There were seven participants who stated that they searched for nanotechnology studies in Turkey. The same number of participants did not have any information about the nanotechnology studies in Turkey. There were five participants who reported that “the nanotechnology studies in Turkey were at the level of development”. Two participants stated that “they followed the nanotechnology studies in Turkey”. One participant maintained that “the nanotechnology studies in Turkey were in the fields of medicine and paint”. (S.T.1): “I know that such studies are not well developed in Turkey. I do not come across such studies in Turkey. When I see a related study I follow it.” (S.T.9): “I think that many people do not have enough information about the nanotechnological studies in Turkey. I think these studies have become common in recent years.” (S.T.8): “I think that there is no widespread place for such studies. I do not have much information about it.” (S.T.17): “Again on this topic Turkey is not developed. But I know there are nanotechnology studies in Turkey. I heard that there is a TÜBİTAK project. Again in Gebze there is another project.”

Answers of the participants to the item “Should nanotechnology be taught at schools?”

Table 7 shows the distribution of the answers of student teachers about the question concerning the teaching of nanotechnology in schools.

Table 7. Views of student teachers about teaching of nanotechnology in schools

<i>Views of student teachers about teaching of nanotechnology in schools</i>	<i>F</i>
(a) It should be taught,	20
(b) all students should be given updated information about it,	6
(c) It should be taught in detail at the university level.	2
Total	28

Table 7 indicates that all participants reported that “nanotechnology should be taught at schools”. On the other hand, six participants reported that “actual information about it should be given to all students”. Two participants argued that “teaching of nanotechnology should be more detailed”. (S.T.2): “I think that it should be taught. Because it is one of the significant development of future.” (S.T.5): “Yes, it should be taught, and it must be given to all students. Because it makes many things easier. Uncontaminated rugs and dress. It helps us in many fields. So it should be taught at schools.” (S.T.12): “Maybe it is taught at universities, but students should know the functions of it. I think that they could understand its functions. In the universities teaching of nanotechnology should be much more detailed.” (S.TA.17): “It should be explained. I think that people should be conscious at schools. For instance, I am 22 years old and I did not have any information about it before the presentation. I think that students should be made conscious about it.”

CONCLUSIONS

In the study it was found that the participants defined nanotechnology as the product and its use in daily life. More than half of the participants could not define nanotechnology using a scientific language. Şenocak (2014) concluded that Turkish people did not hear the nanotechnology related concepts and were not familiar with it. Aydın Sayılan & Mercan (2016) found that nursery students did not have sufficient information about the concept of nanotechnology and its use in medicine.

The participants thought that nanotechnology is mostly employed in the fields of textile, military and medicine. Kadioğlu (2010) found that university students, including those attending science teaching departments had lower levels of knowledge about nanotechnology and has their knowledge about nanotechnology through media outlets, especially radios and television channels. Ekli (2010) also concluded that most of the students samples

did not have enough information about nanotechnology and the most significant source for their information was media outlets.

Half of the participants thought that nanotechnology emerged due to the needs of people. The others thought that it emerged as a way to make life easier. There also participants who thought that nanotechnology emerged for treatment purposes and other purposes, including cleaning, military, quality life. There are also participants who did not state any view about the reasons for the emergence of nanotechnology. Aslan & Şenel (2015) analysed the awareness of pre-service secondary and high school science teachers (science, physics, chemistry, biology) and found that their awareness was at the level of “no idea”/medium.

Half of the participants reported that nanotechnology had no place in their life. The other half of the participants stated that it was everywhere. Retzbach, (2011) examined the perceptions about science and nanotechnology, scientific roles, methodological knowledge, epistemological beliefs and beliefs about science and concluded that most of Americans do not have information about nanotechnology. Elmarzugi ,(2014) analysed the awareness of academics and students concerning nanotechnology and found that their awareness level is low. However, most of them reported that they were aware of its significance and that they wanted to improve their knowledge about the topic.

Concerning the products of nanotechnology more than half of the participants reported that such products are useful. Some of them described these products as not harmful. There are also some participants who did not have any information about the products of nanotechnology.

Regarding the status of nanotechnology in Turkey nearly all participants reported that there is no sufficient study on nanotechnology in Turkey. Although nanotechnology is very popular term in science, technology, industry and even in politics, research suggests that there are many teachers and students who do not know it in detail and that it is not taught at universities and schools at the desired level (Enil & Köseoğlu 2016).

All of the participants emphasized that nanotechnology should be taught at schools. Gököz-Sagun & Akaygün (2014) reported in the study on high school students that in early ages skills, information and awareness about nanoscience and nanotechnology should be acquired. Atabaş (2012) found that primary school students regarded the topic of nanotechnology attractive and did not experience difficulty in learning about it. The author also suggested that this topic may be added to the educational programs. However, research suggests that nanotechnology may be taught as a separate topic or it can be integrated with science education program through concepts and facts which makes it possible to teach it using an interdisciplinary approach (Ak, 2009; Daly, Hutchinson & Bryan, 2007; Stevens, Sutherland, Schank & Krajcik, 2007). In order to teach nanotechnology-related topics to students in a productive way science teachers should have necessary background information about it.

ABSTRACT

Building sector in Nigeria has suffered skill erosion overtime. Foreigners with special skill has mobilized their skill into the sector and there had been mass exodus of imported skills into the sector thereby forcing citizens to jettison idea of engaging indigenous artisans in the face of superior skills and knowledge. The aim of the study is to appraise the vocational skills and competence of the indigenous and foreign artisans, vocational mobility in building sector, job mobility pattern among artisans, sectors involved, attendant effects, both favorable and unfavorable, and possible ways of addressing identified threat.

The study engaged 120 questionnaire using random sampling technique. The questionnaire was designed in Likert scale, structured on semantic rating scale 1 to 5. The study identified the following reasons among others reasons behind the disparity in occupational engagement among artisans in Nigeria building sector, the reasons include: inadequate skill and knowledge by indigenous artisans, no vocational focus, half-baked knowledge of the work, poor workmanship and poor finishing and poor education background or lack of former education among others.

The study recommended the following factors as panacea to the problem; reinvigoration of artisans competence, continuous training of the artisans, value reorientation of artisans, promoting technology transfer among indigenous artisans and foreign artisans.

Key words: Vocation, Value, Orientation, Mobility, Engagement.

This research was sponsored by Covenant University and Covenant university Centre for Innovation and discovery, Cannaland, Ota Ogun State Nigeria. Covenant University Centre for Research, Innovation and Discovery

1.0 INTRODUCTION

Construction sector determines pattern of economy of nation, it is reputed to have been major provider of employment in a nation workforce. Construction industry is widely acknowledged as the capital intensive active sector through execution of capital project thereby diffusing money into system. However, in recent times there have been labour shortages in various segment of the industry.

Notwithstanding labour shortages, there have been strict competition thereby mounting pressure on the sectors in the industry. Many workers are inter switching from one sector to the other thereby creating differential availability of workforce across board. In lieu of the overbearing pressures in meeting manpower needs, training of workforce was inevitable, therefore, tradesmen, artisans, skilled labour semi-skilled labour and low-skilled migrant workers are often allowed into the sector.

This method has tendency of reducing manpower difficulty. However, in most of the construction sector all over the world without prejudice to Nigeria construction sector, migrant-transnational workforces from Togo, Ghana, Cameroon and Republic of Benin are variously employed at much lower rates of remuneration also often with less better working conditions, sometimes are engaged on temporary work visas or without any visas restriction because of ECOWAS pact of no restriction in trade and bilateral relation. However, the industry resolve to augment labour shortage with migrant craftsmen has created imbalance in the workforce gradually pushing the local skill men and artisan out of trade in the face of migrant craftsmen and artisan superior skill. It is to this end that the study appraised the vocational skills and competence of the indigenous and foreign artisans, vocational mobility in building sector, job mobility pattern among artisans, sectors involved, attendant effects, both favorable and unfavorable, and possible ways of addressing identified threat.

1.2 STATEMENT OF PROBLEM

Building construction companies in recent times have suffered severely at the hands of poor performing indigenous artisans and craftsmen. This has caused distrust among various stakeholders in the building construction industry and in some cases forced companies out of business (Beach 2003). Nowadays, construction companies in Nigeria have resulted to seeking for better performing artisan and craftsmen from neighbouring West African countries. This is as a result of poor work carried out by indigenous artisans and craftsmen. According to Buchanan, Baldwin & Wright 2011; D'Arcy, Gustafsson, Lewis & Wiltshire (2012) also Bill, Mitchell & Welters, (2007), indigenous

craftsmen and artisans have for long failed to perform optimally as required. The poor performance of craftsmen has for a long time had tremendous negative effect on the projects and this has become worrying. According to Kinetic Group (2012a), most construction firms in Nigeria are very narrow, because they seem to focus on the financial gains forgetting the people that make the job and money. This might also be a factor that has led to the decline of artisan and craftsmen performance and it would be evaluated so as to devise strategies for improvement.

The various challenges faced in the training of artisans and the types of trainings they undergo would be thoroughly evaluated. This would enable us determine the root cause and provide strategies for improvement.

2.0 RESEARCH METHODOLOGY

Random sampling technique was used in this project, contingency approach was deployed using composite approach, and the approach involves the use of qualitative and quantitative methods to examine the intricacies of skills and migration in the construction industry,

Similarly, A profile of the industry over a 4 year period from 2012 to 2015 was compiled using data from Bureau of employment this toes the line of submission of Morgan (2004), It was combined with interview survey of small and medium-sized construction companies and indigenous construction firms.

a) Sampling Method: Samples are picked at random using Random sampling method with a sample of 80 students. The sampling was done from population frame of students offering technical-based courses.

b) Sample size: Sample size of 80 students of technical based courses and programme was adopted in the study

c) Data Collection Instrument: A structured questionnaire in Likert scale was administered on student of technical based discipline, Eighty (40) questionnaires was administered on the students to harvest their perspective. The responses were further collated, analyzed with SPSS software, processed with Mean Item Score method and presented in tables and charts (Amusan, Oluwunmi, Owolabi and Joshua 2013)

d) Methods of Data Analysis: Mean item scores was used in processing the summarized questionnaire. Simple percentages was used to present percentage composition of student performance, number of male and female graduating from programmes and percentage of male and female over the period of three years winning award in the technical related programmes.

Also, academic performance index factor was processed with mean item scores. Data were presented in tables and other modes. A scale 1 to 5 was adopted for questionnaire calibration, with 1 representing "strongly disagree (SD)" 2 – being disagree (D) 3 – being neither agree nor disagree (N), 5- being strongly agree (SA). Agreement index of the respondents was generated using the relation $M.A.I = 5S.A + 4A + 3S.D + 2D + 1N/5(S.A + A + S.D + D + N)$.

$$M.A.I = \frac{1 \sum(A_{ij})}{N \sum(A_{ij})}$$

.. where M.A.I = Mean Agreement Index A=

Agreement variable i = Lower boundary, j = Upper boundary

N = Frequency of Variable Σ = Summation Notation.

3.0 SCOPE AND LIMITATION OF THE STUDY

The study and the data used are limited to the frequency of migrant tradesmen, craftsmen, skilled labour and semi-skilled labour.

4.0 RESULTS AND DISCUSSIONS

In this section results of the analysis is presented in tables. The following measured variables are analyzed and commented; vocational skills and competence of the indigenous and foreign artisans, vocational mobility in building sector, job mobility pattern among artisans, sectors involved, attendant effects, both favorable and unfavorable, and possible ways of addressing identified threat.

4.1 CROSS SECTIONAL COMPONENT OF RESPONDENTS

S/N	RESPONDENT IDENTITY	FREQUENCY	PERCENTAGE(%)
1	Professional	30	25.00
2	Masons	10	8.33
3	Tilers	10	8.33
4	Plasterer	10	8.33
5	Roofers	10	8.33
6	Concreters	10	8.33
7	Carpenters	10	8.33
8	Steel workers	10	8.33
9	Plumbing	10	8.33
10	Painting	10	8.33

Table 4.1 presents the component of the respondents. 30 percent was allocated to professionals while 8.3% was allotted to each of the trades. The selected trades includes; mason, plasterers, tillers, roofers, concreters, carpenters, steel workers, plumbing and painting. Highest percentage was allocated to professionals because of the fact that they are more knowledgeable about all the trades. Equal percentages was allocated to other trades in turns for fair and equal opportunity.

4.1 VOCATIONAL SKILLS AND COMPETENCE OF THE INDIGENOUS AND FOREIGN ARTISANS

S/N	VOCATIONAL SKILL	Indigenous[%]	Ghana[%]	Togo[%]	Republic of Benin[%]	Cameroun[%]
1	Project management	80	5	4	6	5
2	Masonry	45	40	5	5	5
3	Tilling	25	3	4	65	3
4	Plastering	45	40	6	4	5
5	Roofing	45	40	5	5	5
6	Concreting	60	30	5	5	-
7	Carpentry	47	23	10	10	10
8	Steel work	45	40	6	6	3
9	Painting	45	7	40	3	5
10	Plumbing	60	25	5	5	5

Vocational skills and what each of the countries are noted to be popular for are presented in table 4.1 above. 80% of the respondents belong to project management cadre and they are indigenous professionals, that is, Nigeria. The following trend was observed, Indigenous masons and Ghanaian masons shared the masonry sector in 45 and 40 percent respectively. It was observed that Ghanaians are competing with Nigeria in this sector. Similar trend was observed in Plastering, Roofing, Steel work and Painting. Also, Beninois competed with Nigerian in sharing Tilling jobs in the Tilling sector, while Togolese competed with Nigerian in executing jobs in Carpentry and painting sector.

4.2 VOCATIONAL MOBILITY IN BUILDING SECTOR

S/N		Masonry	Tilling	Plastering	Roofing	Concreting	Carpentry	Steel work
1	Masonry	-----	Yes	Yes	----	Yes	Yes	-----
2	Tilling	Yes	-----	Yes	-----	Yes	-----	-----
3	Plastering	Yes	Yes	-----	-----	Yes	-----	-----
4	Roofing	--	---	---	-----	-----	Yes	Yes
5	Concreting	Yes	Yes	Yes	Yes	-----	Yes	Yes
6	Carpentry	-----	-----	----	Yes	Yes	-----	-----
7	Steel work	-----	-----	-----	-----	Yes	Yes	-----
8	Painting	Yes	Yes	Yes	yes	----	Yes	---
9	Plumbing	-----	Yes	-----	-----	Yes	-----	-----

Table 4.2 presents extent of mobility of different vocations presented among the sampled artisans on site. The survey cut across different nationals. This borders about inter-operability of different vocations. The implication of this is that a trade could be practiced by more than one tradesmen. For instance, in table 4.2, a mason, tiller and plasterer, are working as tiller, plasterer, concreter and carpenter. Similarly, concreter, mason and plasterers also works as tiller, carpenters and steel worker, while plasterers are working as painter. The reason could be that the trades are interdependent on one another. In construction work the operations are executed in sequential order and one trade sometimes have to wait on other trade to complete their task before continuing, in this way on-job learning and skill transfer usually take place. Another reason is scarcity of job or trade in a sector that could lead to trade migration (Buchanan, Baldwin & Wright 2011; D'Arcy, Gustafsson, Lewis & Wiltshire 2012).

4.3 JOB MOBILITY PATTERN AMONG ARTISANS AND GEOGRAPHICAL SPREAD (COMPARATIVE ANALYSIS)

S/N	Occupational Engagement	GEOGRAPHICAL SPREAD (%)					
		Nigeria	Togo	Ghana	Cameroun	Benin Republic	Others
1	Masonry	15	64	5	5	5	6
2	Tilling	11	79	5	3	2	--
3	Plastering	10	10	10	10	60	-
4	Roofing	30	10	50	5	5	-
5	Concreting	64	10	10	6	7	-
6	Carpentry	60	10	10	10	5	5
7	Steel work	50	10	5	79	5	5
8	Painting	74	5	6	5	5	5
9	Plumbing	70	5	7	6	5	7

Closely related to presentation in table 2 about job mobility is table 3 which is about pattern of job mobility among artisan within the geographical spread. Comparative analysis of the geographical spread of the artisan was presented within the context of their occupational engagement. In masonry, masonry and tilling work was prevalent among the Togo and Benin republic migrant tradesmen in Nigeria on 64%, 79% and 60%. From the table it was discovered that, in masonry and tilling 64% and 79% of the tradesmen are from Togo respectively and while 15% and 11% are from Nigeria. Also, in roofing and steel work, 50% and 79% was occupied by Ghana and Cameroun respectively. However, tradesmen from Nigeria had higher percentage than other nationals in the following trades: concreting, carpentry, painting and plumbing.

4.4 SECTORS INVOLVED IN JOB MOBILITY

	Occupational Skill	M.I.S Score	Rank
1	Masonry	4.0	1 st
2	Tilling	4.2	4 th
3	Plastering	4.1	5 th
4	Roofing	3.9	6 th
5	Concreting	4.0	1 st
6	Carpentry	3.9	4 th
7	Steel work	3.8	6 th
8	Painting	3.5	7 th
9	Plumbing	4.0	1 st

In table 4.4, the component of available skills in the survey and sectors involved was presented in table 4.4, masonry, concreting and plumbing sectors has high level of mobility with mean item score of 4.0 respectively and are ranked first. Tilling sector was second sector that has high level of migrant incursion with mean item score of 4.2 and ranked fourth alongside carpentry. Plastering was ranked fifth, while roofing and steelwork ranked sixth and painting ranked seventh with mean item score of 3.5.

4.5 ATTENDANT INFLUENCE OF JOB MOBILITY ON CRAFTSMEN

	Factors	M.I.S	RANK
1	Depression	4.43	1 st
2	Lost of job engagement	4.42	2 nd
3	Loss of craftsmanship overtime	4.41	3 rd
4	Decayed knowledge	3.88	6 th
5	Lopsidedness in job spread	3.99	7 th
6	Tendency for violence	4.35	5 th
7	Sense of worthlessness	4.40	4 th

Attendant influence of job mobility on occupational engagement among tradesmen and craftsmen was presented in table 5. It was discovered that there is tendency for depression to occur on account of job migration, depression was ranked first with M.I.S value of 4.43. Loss of job engagement was ranked second with M.I.S value of 4.42, loss of craftsmanship over a period of time was ranked third. Also, Tendency to have decayed knowledge has M.I.S value 3.88 and ranked fourth. Lopsidedness in job spread, tendency for violence and sense of worthlessness has M.I.S values 3.88 and 3.99 and ranked sixth and seventh respectively. Loss of job engagement and depression top the list of the attendant challenges that follows the lopsided mobility, joblessness can create a chain reaction that can spark up further problems, there it should be prevented on account of good job spread.

Table 4.6 Factors Militating Against Adequate Skilled Labor Supply and Occupational Mobility

S/N	Factors	Professional Perception		Skilled Workers Perception	
		Mean	Rank	Mean	Rank
1	Inadequate Vocational training center	4.45	1	4.45	1
2	Non practice of traditional apprenticeship training	4.44	2	4.44	2
3	Youth no longer interested in vocational based training	4.42	5	4.42	3
4	Sense of low self esteem by construction craftsmen	4.42	5	4.42	3
5	Lack of adequate motivation by the organization and government.	4.43	3	4.42	3

6	Risk inherent in construction works	4.42	5	4.40	6
7	Low wages and income	4.40	8	3.99	7
8	Job insecurity	3.88	10	3.97	8
9	Free entry and exit nature of the trades.	3.99	9	3.88	9
10	Availability of quick money yielding alternatives	3.75	10	3.86	10
11	Inclusion of private firms in artisans training	4.42	5	4.41	5
12	Lack of legislation controlling foreign migrant entry in to the trade.	4.43	2	4.42	3
13	Lack of law defining extent of occupational engagement of indigenes and foreigners.	4.43	2	4.42	3

In table 4.6, factors militating against adequate skilled labour supply and occupational mobility was presented in table 4.6. Perspective of professionals and skilled workers as regards the factors was presented. Inadequate vocational training center with MIS value 4,45 was ranked first, followed with non practice of traditional apprenticeship training, M.I.S value 4.44 was ranked second. Youth no longer interested in vocational based training with M.I.S 4.42 was ranked as third alongside the following factors: Lack of law defining extent of occupational engagement of indigenes and foreigners, Lack of legislation controlling foreign migrant entry in to the trade, Lack of adequate motivation by the organization and government and sense of low self esteem by construction craftsmen.

Table 4.7: Reasons for choosing to work in current location

<i>Interview questions</i>	Frequency %	Interview questions	Frequency%
1. You grew up here/have always lived here?	55	8. Family Challenge?	15
2. Family reasons?	6		
3. Employer sent you here?	36	9. An employer sent you?	13
4. Came to the area to take up this or another job?	5	10. Availability of more regular opportunities?	35
5. There are more jobs available in this area?	6	11. More jobs are available here?	20
6. Construction work is better paid in this area?	3	12. Availability of better paid jobs?	5
7. Wanted to move to the area because you like it or not?	1	13. Prefer living here?	5

Interview was conducted among the migrated tradesmen and artisans, the result is presented in table 4.7. Major reason indicated was being born at the location of the job and grew up there. This was scored 55 percent, being sent by an employee to the job location where they were found was scored 36 percent, availability of more regular opportunities scored 35 percent. Availability of job opportunity was also accepted as one of the reasons adduced for the phenomenon of labour migration this is in line with Haukka, S (2011), Amusan L.M, Oluwunmi A.O., Owolabi J.D and Joshua O(2013)

Furthermore, the following reasons are also stated as one of the reasons for migrating to the location of job availability: There are more jobs available in the area; construction work is better paid in the area; wanted to move to the area because of good prospect; family challenge and availability of better paid jobs this toes line of submissions in Mavromaras. Mahuteau & Wei, (2013); Karmel, Lim, & Misko, (2011) and McGuinness & Wooden (2009).

RECOMMENDATION

The following facts are recommended as a way to proper management of vocational skill mobility and its effect on occupational engagement among tradesmen and craftsmen in building sector.

Government should enact a control law defining the extent of occupational engagement of indigenes and foreigners, enacting of law regulating entrant of foreign and migrant tradesmen into the construction sector, promulgation of protective decree for indigenous artisan.

Also, recommended includes; provision of adequate vocational training center, reopening of practice of traditional apprentice training programme, stimulating youth interest in traditional apprentice training, government and organization should adequately motivate people at the grass root for artisan training. Finally, the free entry and exit nature of the industry should be prevented and inclusion of

WATER CONSUMPTION STRATEGY FOR SUSTAINABLE SURFACE WATER QUALITY MANAGEMENT IN AMPHAWA DISTRICT, SAMUT SONGKRAM PROVINCE

Srisuwan KASEMSAWAT

Environmental Sciences Program, Faculty of Sciences and Technology,
Suan Sunandha Rajabhat University, Thailand

srisuwan.ka@ssru.ac.th

ABSTRACT

The purpose of this research were to identify strategies for sustainable surface water quality management for water consumption from October 2015 to July 2016. Data was obtained via community participation and integrated with the Water Quality in the Amphawa District, Samut Songkram Province. This study was divided into four components: degradation of surface water quality and land use pattern in Amphawa, Samut Songkram Province; community participation in surface water quality management for human consumption; identify the needs of the community for sustainable surface water quality management for water consumption; and the application of participatory geo informatics to determining the Water Quality Index in the Amphawa District, Samut Songkram Province. The results of the focus group were encouraged some mitigations such as releasing wastewater into pre-treatment grease trap before discharge directly in water resources. In addition, reuse of water for agriculture is recommended. The community also needs to construct a dam in order to protect the canal from leaving waste. So they legislated the regulations for homestay and resort and also needed to raise awareness and discharge fee. The major problems of water degradation were related with saline intrusion, water shortage in dry season, and waste littering into water body. The community needs to solve water issues through improvement in their knowledge of water management and conservation, as well as through collaboration to the project by local stakeholders and governments. Integrated water resource management can also be initiated by enhanced awareness, participation, volunteer activities and law enforcement to protect water resources by using geographic information systems.

INTRODUCTION

Amphawa is a center of agro-tourism as such, the Amphawa District has long term plans to capitalize on this, to develop and restore the environment (Utarasakul, 2013). Plans include the development of waterfront recreation and architectural tourism; and in the process to cultivate good moral traits into Amphawa villagers in order to retain their culture and environment. They intend to promote local tourism in the Amphawa District which now contains 3 types of aquatic ecosystems. Using a large amount of fertilizers and pesticides may induce irreversible disturbance to the natural habitats (Popradit et al., 2015). Therefore, restoring the pH balance is the primary aim in the development of the aquatic ecosystem, because Amphawa, which mostly consists of plains and canals, is currently best suited for agricultural development.

In 2010, the situation in the Mae Klong River and tributaries was critical. Neighbouring provinces located upstream were dumping wastewater treated into the Mae Klong River. As such, the Mae Klong River was not a suitable water source for drinking. In some areas, canal water and ground water had been directly consumed without verification from authorities as to its suitability for human consumption and so may have been harmful to the health of Amphawa's population. In 2011-2014, researchers studied surface water in Amphawa. They have found degraded water in Suan Luang Sub-district, which is close to community and industrial areas. The degraded water had been classified on 4th type of Water Quality of water pollution dept). The researchers (ref) (Kasemsawat et al., 2013) studied comparisons of surface water quality management in the orchard channels in the Lumpadong and Bang Nang Li Sub-districts, such as in lychee orchards, and coconut groves. have been standardized as 3rd type by PCD Water Quality Index of aquatic water quality (Kasemsawat et al., 2013, Kasemsawat et al., 2014) discovered the effects causing the degradation of surface water quality (which are?). According to overall description of Bang Nang

Li, Kwae Aom and Suan Luang, they had been classified in 4th type of aquatic water quality. The analysis of the degradation of surface water quality, land use in agriculture, and in the industry of Bang Nang Li Sub-district was at a lower average which could indicate it is near a degenerated crisis and the comparison of surface water quality is in the 4th type of aquatic water quality. The study mostly showed the factors the average level of the water quality index in the range of 31-60 which is classified as degraded water quality and the standard of surface water (Kasemsawat et.al, 2013) by PCD Water Quality Index of the degradation that effects to the water consumption (Kasemsawat et al., 2014). The analysis was conducted using the Water Quality Index need to introduce this earlier when first talking about water quality to assess the use of the water flowing through Bang Khon Thi District to Amphawa District. For Kaew Om Canal, the average water quality index of the water that passed through Bang Khon Thi District and Amphawa District were equal, which was degraded when compared by the standard surface water quality and was in 4th type of aquatic water quality. So, the aim of people needs were surface water quality management for community's sustainable water consumption in Amphawa. The purposes of this research were to identify strategies for sustainable surface water quality management for water consumption.

THE STUDY

Sampling Area Description were collected at Amphawa District, Samut Songkhram Province, Thailand. Data collection were composed of participatory method and was divided into four sub-research.

1. 180 samples were collected from community area and 120 samples were collected from agricultural area from May 2015 -December 2016 by grab sampler. Water quality was measured and analyzed by Water Quality Index.
2. A questionnaire was distributed to the sample which was 402 households in the area to collect the opinions of water use. The data was analyzed via the statistical package.
3. Primary data were collected from 400 household samples using questionnaires. Interview sessions with the communities were also held to gather. The data from questionnaires and from the interviews were then analyzed to elucidate the problems and the needs of communities.
4. The methodology of this research is water measurement index and get the location from GPS. A sampling of this survey has 50 points, and this research gets five values from water quality index. That consist of 5 value Oxygen, BOD, Coliform, Fecal Coliform Bacteria, Ammonia then interpolates spatial pattern.

Data Analysis

1. Descriptive statistics for each individual including gender, age ,career, status, how they obtain information about surface water quality management. Obtained from completion of the questionnaire.
2. Open-ended question of community's needs to surface water quality management and basic statistics by percentage and frequency.
3. Study issues and community's needs to surface water quality management by finding average, SD and correlation analysis.
4. Create Geographic Information System map of surface water quality database in Amphawa, Samut Songkram

Research procedure

- 1) Provide meeting ,work planning and sampling
- 2) Explore area with people in community
- 3) Making GIS database
- 4) Finding relation between land use and surface water quality for consumption
- 5) Making the surface water quality database
- 6) Discuss the opinions of people in community and organization involved and report progress

7) Summary and suggestion

5. Strategy finding for Sustainable Surface Water Quality Management

Provide meeting and suggest opinion form people in community by referring to this project. The meeting was held on Wednesday July 14th, 2016 in Bhummarin Temple, Amphawa District, Samut Songkhram.

FINDINGS

1. The result of degradation of water quality index (WQI) in Amphawa showed 5 factors of degradations such as : DO, BOD, TCB, FCB and NH₃-N from Pollution Control Department

Table 1: result of WQI degradation in Amphawa

WQI Degradation	Garden		Commnity	
	Amount of sample	percentage	Amount of sample	percentage
Good	3	2.5	0	0.0
Fair	9	7.5	10	5.6
Poor	108	90.0	165	91.7
Very poor	0	0.0	5	2.8

Table 1 result showed that WQI degradation is in the garden orderly such as 2.5% Good, 7.5% Fair and 90% Poor. In addition, the community such as 0.0% Good, 5.6% Fair, 91.7% Poor and 2.8% Very poor.

The improvement of people participation

The analysis of the improvement of people participation in order to provide information about the surface water resource management to people in Amphawa.

1. The way to send an information to people in Amphawa learning about water resource management that can make it variously for example set up the meeting, letter, announcement, advertisement and social network.
2. The way to make people participate in community activity that can set up by inviting the representative of each organization involved attend the meeting and discuss project and activity.
3. The way to make people decision to vote referendum by inviting the representative of each organization involved
4. The way make people know the advantage of activity and invite people attend the next meeting

Overviewed problems about the Surface Water Quality Management in Amphawa district

Table 2: The overall image of analysis result of surface water quality management problem

Surface water management problem	Average	SD	Level of problem
1. Consumption problem	2.98	0.78	Moderate
2. Community problem	3.42	0.80	Moderate
3. Water quality management for consumption problem	3.20	0.81	Moderate
4. Needs of consumption problem	3.56	0.90	High
5. The effect of consumption and others	3.51	0.83	High
Overall	3.33	0.72	Moderate

Figure 1: Map of Water Quality Index in Amphawa District

From Figure 1, the highest water quality index was located in Tha Ka District where as the lowest water quality index in Bang Chang, Muang District.

The participation of study strategy finding for Sustainable Surface Water Quality Management that summarized are as follows:

1. The results of the focus group were encouraged some mitigations such as releasing wastewater into pre-treatment grease trap before discharge directly in water resources.
2. Reuse water for agricultural use is recommended.
3. Community also needs to construct dam in order to protect waste into the canal.
4. Regulations for homestay and resort by community participation also needed to raise awareness and discharge fee.
5. The major problems of water degradation were related with saline intrusion, water shortage in dry season, and waste littering into water body.
6. The community needs to solve water issues by creating knowledge of water management and conservation and also develop contribution project between local stakeholders and governments.
7. Integrated water resources management can also initiated by enhance awareness, participation, volunteer activities and law enforcement to protect water resources by using geographic information systems.

CONCLUSION

The research can conclude as follows

The strategy for sustainable surface water quality management in Amphawa ,Samut Songkram Province with 4 projects can be summarized as

1. Water quality index in the agricultural area is still more quality than the community.
2. The participated behavior in surface water quality management of people found that is fair level, the study showed the factors of age ,education, career and living term ,in addition ,the meaning of people participation in order to realize the surface water resource issue is about 0.05%.
3. The water consumption issue that effects to community is moderate at 3.33 ,the overall image of community's needs for consumption is high at 4.02.
4. The good area is Tha Ka which is the highest water quality for consumption on the other hand Bang Chang is the lowest water quality.

Problem about the surface water quality management in Amphawa District was in the medium level with an average score of 3.33. Needs of communities in the practical surface water quality management for water consumption were in the high level with an average score of 4.02. It could be concluded that the communities desire to have public participation to solve the problems of water and water quality management

The result of this research is the best water quality index locates near Tha Ka District because this area is agriculture area and has no household not much in contrast Bang Chang District have low-water quality index because this field has a lot of tourism landmarks and has many household activities.

RECOMMENDATION

1. Local administrative organization should enhance awareness of water conservation for local people and enforce homestay and resorts to set up water treatment before discharge to water resources.
2. Water monitoring Patrol should be initiate in Mae Klong River and watershed.
3. Enforcement law and regulations in aquaculture and orchards for chemical using.
4. Control pesticides utilization in Ratchaburi and Kanchanaburi.
5. Identify point source and control SMEs activities in order to control water pollution in water resources.
6. Weed controls and removal along riverside.
7. Construct dam to protect erosion and saline intrusion.
8. Empowerment of people participation and youth for integrated water resources conservation in community

ACKNOWLEDGEMENT

This research was supported by National Research Council of Thailand and Suan Sunandha Rajabhat University. Special thanks is also extended to the Samut Songkram staff, and students of SSRU, who helped and supported this research.

WAYS TO PROMOTE WOMEN IN KEY LEADERSHIP POSITIONS

Ann Hilliard

draph1@juno.com

In order to promote women in higher level leadership positions, it is important for companies and organizations to be sensitive to the needs of women and other employees. Companies must make a purposeful effort to recruit, train, mentor, sponsor, support and trust women in key leadership positions. If companies are committed to helping women to advance to key leadership positions, companies need to craft their agendas to include gender diversity as a number one priority in their company's strategic plan. When women are underrepresented in key leadership roles in companies, it is the responsibility of company CEOs and other top managers to endorse women to join companies as a major focus through their recruitment efforts. If companies are transparent in their efforts to promote women to key leadership positions, companies need to create and maintain a culture that clearly communicates that women are on board and "women matter" and be able to show how women are able to contribute in a productive manner to the growth of their companies. The attitude of companies' organizational leaders and decision-makers in the public and private sector should be able to echo "may the best persons lead." Many studies have shown when women are in key leadership positions, the "bottom line" of companies improve economically; therefore, it is a value-added practice to have more women in key leadership positions. Unfortunately, it is a reality that women continue to encounter barriers when it comes to gaining access to key leadership positions in the public and private sector. However, at this time, there is a need to move the conversation to another level regarding "what can be done for women" and "what women can do for themselves" to help them to gain access to key leadership positions. Therefore, this study places mayor emphasis on citing ways how to promote women in leadership positions, why women are needed in key leadership positions, -education preparation of women, the advantage and benefits of women in leadership, public -opinion about women in leadership and citing data on women in key leadership positions in -global communities.

WHAT IS THE LEVEL OF INQUIRY SKILLS OF SCIENCE TEACHER CANDIDATES? DOES IT CHANGE BY GENDER AND CLASS LEVEL?

ABSTRACT

In today's education system, individuals who are searching, questioning, learning to learn, producing knowledge, reaching knowledge, analyzing information, choosing useful knowledge are needed instead of individuals who are waiting for memorizing and ready information. The expectation of these qualities can be reflected to the school process by differentiating the knowledge and skills to be gained to the students. One of the skills discussed as common basic skills is inquiry skill. In this study, it is aimed to determine the inquiry skills of science teacher candidates and to examine them in terms of gender and class level. The study constitutes a survey research conducted with the participation of a total 247 pre-service teachers receiving education in first, second, third and fourth grades at the Celal Bayar University's Faculty of Education in Turkey during the spring semester of 2014-2015 academic years. In the study, 'Inquiry Skills Scale' was used in determining the questioning skills of the teacher candidates. The aforementioned inquiry skills scale consists of 14 items and three sub-dimensions (information acquisition, information control and self-confidence). The Kruskal-Wallis and the Mann-Whitney U tests are used along with the descriptive statistics for the analysis of the data. According to the results of the analysis, the ability of the teacher candidates to inquiry skills was found in the 'above average' range. When examined in terms of gender, the inquiry skills of the students shows a significant difference in favor of male students according to the gender variable in the subscale of self-confidence. From here, it can be said that the students' self-confidence towards inquiry skill is higher in male students than in female students. According to the other sub-problem class level, there was no statistically significant difference between the classes. Although there is no significant difference, it is seen that the 4th grade level is higher than the other grade levels when the rank average scores are examined. Some suggestions have been made about the development of inquiry skills for these results.

Keywords: science education; inquiry skills; gender; grade level

INTRODUCTION

In order to keep pace with the developing and changing world conditions, individuals have to spend more effort to improve their knowledge and skills in recent years, when we are in the age of information. For this reason, there is a need for individuals who are researching, questioning, solving the problems they are faced with, having high level inquiry and scientific thinking skills instead of the individuals memorized by taking ready knowledge today. The expected qualities of future individuals play a shaping role in how science education should be given. On the basis of phenanthropes is to make sense of the events taking place in nature and it is a scientific discipline based on the question of science nature. It is extremely important for young learners to understand and learn the concepts related to science in a way that they will form the basis of science courses in advanced classes (Osborne, 2007). For this reason, some skills will be given to the students to acquire the right knowledge at the young age. The expectation of these qualities can be reflected to the school process by differentiating the knowledge and skills to be gained to the students. As it is known, according to 2004 education reform in Turkey, curriculum emphasizes cognitive and constructivist learning approach instead of behavioral approach. It is the skill of using correct, effective and beautiful Turkish language in the educational reform program which is aimed at making and learning the vision of the curriculums, common thinking skills, critical thinking skills, creative thinking skills, communication skills, *research and inquiry skills*, problem solving skills, information technology skills, entrepreneurial skills (Yetkin & Daşcan, 2008). As shown in the program, intended to gain common skills identified and one of these skills, the skill is expressed directly. The science program revision in 2013 and the science-based learning strategy in the science curriculum were based on the research inquiry-based learning strategy. Inquiry learning centered on meaningful and lasting learning is based on the process of inquiry, and students are also responsible for their own learning and development of their skills (Spronken-Smith, Angelo, Matthews, O'Steen & Robertson, 2007). In the process in which the interrogator learns, problems or questions are created and students try to solve the problems or to find answers to the questions (Wood, 2003). The process in which researches are conducted in the solution of the questions asked, the information is analyzed and the learning is carried out at the same time and the data obtained at the same time is converted into useful information is defined as questioning learning (Perry & Richardson, 2001). Inquiry-based learning environments can be described as environments where learners are active, questioned, confronted with problems, discovered by exploring scientific

concepts, and built into meaningful integrations in their minds. Skills are emphasized in the revised science program. This revision is included as one of the basic skills in interrogation. In the course of science lessons published in the past days, inquiry-based learning strategy continues to be used. There are three sub-domains within the skill learning area of the program. These skills are expressed under the headings of scientific process skills, life skills and engineering and design skills. In fact, it can be said that inquiry skill is a skill that every individual uses in every aspect of everyday life. The ability to inquiry students is younger and develops in a certain process. However, once these skills are gained, they can be used in any situation that is needed. It is evident that our teachers must make these skills effective for their students and they must first practice the points of complementing and acquiring skills that are present in them. Inquiry is a way of thinking, and thinking skills are the basic qualities that a person has and that he uses to live in harmony with nature, to meet the opportunities and needs of nature. It is possible to reach from Aristotle (Plato) to Dewey, James, Piaget and Thorndike when Plato (Plato) sources are examined. Research-inquiry skills, one of the common basic skills; is identify and understand the problem by asking the right and meaningful questions, to plan the research about what and how to do the problem, to predict the results, to take into consideration possible problems, to test the results and to develop ideas (MoNE 2004). According to Dewey, inquiry learning skills reflect on newly acquired knowledge and questions, asking questions about the subject, researching answers, generating and creating new information while collecting information on any subject, discussing experiences and experiences (Taşkoşyan, 2008). In this case we can define the skill of inquiry as a set of skills that helps the individual to think and solve problems about himself and his environment in different ways.

Our teachers, who have an important position in training new generations to contribute to the development of the country, have had great responsibilities. That is why teachers need to have some skills in order to fulfill these responsibilities. These skills include the ability to question, think critically, solve problems, think reflective, think creatively, and use information technologies (Şen & Erişen, 2002). It seems that the most important of the skills expected of a qualified teacher is the questioning ability (Kuhn & Pease, 2008). Teachers must have both these skills and they must make them learn effectively in their teaching practice (Yılmaz & Karamustafaoğlu, 2015). When analyzing the literature, it seems that there is not much work to examine the inquiry skill of teachers and teacher candidates. Often the studies focus on inquiry-based learning. In order for the inquiry-based learning to be carried out, the inquiry skills individuals to take part can be considered as the first precondition. Yılmaz and Karamustafaoğlu (2015) examine the inquiry skill of teacher candidates according to the variables of gender, class level and the program seen in education. It was found that there was no significant difference when the total scores of teacher candidates' inquiry skill scale were examined in terms of gender, class level and program variables seen in education. According to the findings of the research, the results of the teacher candidates' inquiry skills are at a good level. Arseven et al. (2015) aim to determine the relationship between the inquiry skills of history teacher candidates and their tendency to think critically. For this purpose, the screening method was used. As a result of the study, it is seen that teacher candidates' inquiry skills are moderate. Tanışlı (2013) study, elementary mathematics teachers studied the inquiry skills of candidates in the context of pedagogical content knowledge. Aldan Karademir (2013) examines the effect of teacher candidates' inquiry and critical thinking skills on teacher self-efficacy level in doctoral dissertation. Teacher candidates' inquiry skill and critically think is above average, teacher self-efficacy is average. It is seen that the teacher candidates do not differ significantly according to their inquiry skill, gender, education level, and mother education level.

As a result; Teachers are now a model and guiding place for information transfer. For this reason, it is necessary for teacher and teacher candidates to be informed about the importance of their inquiry and to be improved in terms of their competence. The development of teachers in this regard is a prerequisite for students to be able to encourage them to acquire these skills. However, in order to be able to develop a feature in any matter, the existing situation must first be determined. In this context, it is aimed to determine the inquiry skills of the teacher candidates. The questions to be answered in this direction are as follows.

- What is the level of inquiry skills of teacher candidates?
- Does the inquiry skills of teacher candidates differ significantly according to gender?
- Does the inquiry skills of teacher candidates differ significantly by class level?

THE STUDY

A large group of researchers gathered in the subject to be investigated, and the relationship between the measured variables can be examined (Büyükoztürk, Kılıç Çakmak, Akgün, Karadeniz & Demirel, 2010: 231-232). For this reason, in the study, the screening model was used from the qualitative research methods in order to determine the questioning skills of the pre-service teachers. Research; Celal Bayar University Faculty of Education with the participation of first, second, third and fourth grade prospective teachers who were educated in the spring term of

2014-2015 academic year. 247 candidates who were studying in the first, second, third and fourth grades of the science teacher education program participated in the research as volunteers.

Inquiry Skills Scale; It was developed by Aldan Karademir and Saracaloğlu. Likert type inquiry skills scale consists of 14 items, 3 factors (information acquisition, information control and self-confidence). The Cronbach-alpha reliability coefficient for the complete scale was .82. Scale aims to measure the inquiry skills of teacher candidates. For the reliability of the test, cronbach α reliability coefficient was calculated as .83 in the research conducted by 247 science teachers. 'Always', 'mostly', 'occasional', 'rarely' and 'never' are used for the expressions on the scale of the Likert-type scale of 5. When interpreting these items, they are given always 5, mostly 4, occasional 3, rarely 2, never 1. The lowest score that can be taken from the scale is 14 and the highest score is 70. SPSS package program was used for analyzing the data. First, it is examined whether the data obtained from the participants are distributed normally.

In this context, the results of analysis of the items in the dimensions of 'information acquisition', 'information control' and 'self-confidence' dimensions of the inquiry ability test of the answers given by the teacher candidates, the results of the normal distribution test of data (Kolmogorov-Smirnov Test) in the direction of the solutions ($p < .05$) Kurtosis, skewness coefficients and standard deviation values were examined and it was determined that they did not meet the assumption of normal distribution. Non-parametric tests were used in data analysis, since the assumption of normal distribution of data was not accepted. As a result, Kruskal Wallis test and Mann Whitney U-test were used together with descriptive statistics in the analysis of the data.

FINDINGS

In this section, descriptive statistical values related to total scores of science teacher candidates' inquiry skills scale are given firstly. There are 14 questions including 6 questions for information acquisition, 5 questions for information control and 3 questions for self-confidence in sub-factors included in the scale.

Table 1: Descriptive Statistics Results of Teacher Candidates' Scores on Inquiry Skills Scale

Factor	The lowest score	Highest score	\bar{X}	SS	Level
Information acquisition	13	30	24.2	3.0	Mostly
Information control	8	25	18.2	3.6	Mostly
Self-confidence	3	15	11.0	2.9	Mostly
Inquiry skills (Total)	34	70	53.4	7.6	Mostly

In the study, "Range Span (a) = Array Span / Number of Spool Groups" formula (Tekin, 2003: 262) was used to determine the range of points used in interpreting the arithmetic mean of participant's sub-dimensions and total scores. In this context, it is seen that the average of the information acquisition factor is 24.2 (SS = 3.0), the information control factor average is 18.2 (SD = 3.6), the self-confidence factor is 11.0 (SD = 2.9) and the mean total scale is 53.4 (SD = 7.6). When these values are examined, it was determined that the teacher candidates mostly performed the skills on the scale on factor and total points basis.

The Mann-Whitney U Test was used because it was determined that the data were not normally distributed in the solution direction of the sub-problem "Does the inquiry skills of teacher candidates differ significantly according to gender?". Table 2 presents the results from the analysis of this problem.

Table 2: Results of the Mann-Whitney U Test on the Analysis of Teacher Candidates' Inquiry Skills in Terms of Gender Variability

Factor	Gender	N	Average Rank	Rank Sum	U	Z	p
Information acquisition	Female	171	125.5	21467	6235	-.5	.610
	Male	76	120.5	9161			

Information control	Female	171	121.9	20842	6136	-.7	.483
	Male	76	128.8	9786			
Self-confidence	Female	171	114.5	19577	4871	-3.2	.002*
	Male	76	145.4	11051			
Inquiry skills (Total)	Female	171	120.5	20605	5899	-1.2	.247
	Male	76	131.9	10023			

* $p < .05$

According to the table 2, the students' inquiry skills showed a significant difference in the self-confidence scale compared to the gender variable ($p < .05$). Considering the average of the rankings, it is seen that male students have more confidence in their inquiry skills than female students. This finding can also be expressed as the fact that the students' self-confidence for inquiry is higher in male students than in female students.

It was determined that the data were not normally distributed in the solution direction of the sub-problem "Does the inquiry skills of teacher candidates differ significantly by class level?" and therefore the analyzes were carried out using the Kruskal Wallis test. The results obtained from the analyzes in Table 3 are given.

Table 3: Results of the Kruskal-Wallis H Test on the Analysis of Teacher Candidates' Inquiry Skills in Terms of Grade Level Variability

Factor	Class Level	N	Average Rank	sd	χ^2	p
Information acquisition	1st Class	74	106.7	3	6.6	.087
	2nd Class	69	128.6			
	3rd Class	42	130.6			
	4th Class	62	135.1			
Information control	1st Class	74	118.1	3	1.4	.697
	2nd Class	69	122.7			
	3rd Class	42	123.7			
	4th Class	62	132.6			
Self-confidence	1st Class	74	110	3	6	.111
	2nd Class	69	122.5			
	3rd Class	42	128.4			
	4th Class	62	139.4			
Inquiry skills (Total)	1st Class	74	109.7	3	6	.112
	2nd Class	69	123.9			
	3rd Class	42	126.1			
	4th Class	62	139.7			

* $p < .05$

When the results of the analysis in Table 3 are examined, there is no significant difference between the factor scores and the class of inquiry skills of the total puer students ($p < .50$). Although there is no meaningful difference when examining the ability of teacher candidates to inquiry skills according to the class level, it is seen that the level of inquiry skills increases as the class level increases.

CONCLUSIONS

Teaching in a didactic manner by presenting and transferring scientific information as it is involved in traditional teaching will not allow science literacy to raise individuals. However, science literacy requires that individuals understand their knowledge and knowingly apply the process by which all scientific knowledge is produced. The prerequisite for this to happen is for students to learn scientific inquiry. According to Gagne, which deals with questioning by induction, scientific inquiry is the most basic goal of science education. Scientific inquiry; A set of activities characterized by a problem-solving approach to each new phenomenon that must be considered. One of the skills that individuals must possess in order to carry out a scientific inquiry is inquiry skills. Inquiring ability involves planning and conducting researches about what and how to do, solving the problems by considering correct and meaningful questions, considering the problems that may arise, evaluating the results and developing ideas (MoNE, 2004). In this context, it was aimed to determine the level of inquiry skills of prospective teachers who will be future science teachers in the study. It is also the other problem of the study to determine whether there is a meaningful difference between science and science teacher candidates in terms of gender and class level variables.

As a result of the analysis, science teacher candidates have reached the result that they "mostly" performed their inquiry skills. When the field is examined in the literature, it is generally seen that the results of this study are parallel to the results, and that the students have "intermediate and above" inquiry skills. Arseven et al. (2015) in their study history teacher candidates perform with candidates inquiry skills are seen at the medium level. Unlike these, in the study conducted by Tanışlı (2013), it is stated that teacher candidates' ability to prepare and question the inquiry skills and thus the acquirement of knowledge is not generally sufficient. Aldan Karademir (2013) have reached the result that teacher candidates are above the average of their inquiry skills, that is, they have mostly accomplished their skills.

According to another finding of the study, there is not a statistically significant difference between teacher candidates' inquiry skills and their genders. When the sub-dimensions are examined, it is seen that there is a statistically significant difference in the self-confidence dimension of the teacher candidates. It is seen that boy students are more self-confident than girl students when the average is taken into consideration. This finding can also be expressed as the fact that the students' self-confidence for inquiry skills is higher in male students than in female students. When the literature is examined, it is seen that the inquiry skills of the teacher candidates does not differ significantly according to the gender. Yılmaz and Karamustafaoglu (2015) stated that the inquiry skills in the study conducted with the teacher candidates did not make any meaningful difference according to gender. Aldan Karademir and Saracaloglu (2013), on the other hand, found that the inquiry skills of male teacher candidates are higher than the scores of female teacher candidates in the other subscales other than the "information acquisition" subscale, and all of the scale, when the scores of inquiry skills scale and subscales are examined. Differing from these, in the master's thesis made by Işık (2011), the inquiry skills of primary school students were examined and it was determined that there is a meaningful difference between students' inquiry skills according to gender, in favor of female students.

Inquiry skills of teachers by grade level to another problem examined in this study does not differ significantly with respect to variable. Nevertheless, the average level of inquiry skills seems to increase as the class level increases. However, since the results are at a level that does not make any significant difference, the findings show that the grade level is not an effective factor in the teacher candidates' inquiry skills. Similar results are encountered when the field is examined in the literature. Likewise, Yılmaz and Karamustafaoglu (2015) investigated the teacher candidates' inquiry skills in terms of different variables. In the study, it is stated that the teacher candidates' inquiry skills did not show any significant difference compared to class level variables.

As a result, it can be stated that the science teacher candidates mostly perform the inquiry skills but not at the desired level. In relation to the importance of this situation, many of the science curricula that have been revised for many years (MoNE; 2004, 2013 and 2017 science programs) have had considerable relevance to their inquiry skills. Despite this, the desired level can not be reached. This can be expressed in terms of the study and field literature review so that students and prospective teachers can reach the required level in inquiry skills only by developing the inquiry skills of role model teachers. In this context, it is considered that giving more attention to the activities that improve the students' ability of inquiry in education faculties will be effective in raising individuals with high inquiry skills. However, it may be suggested to conduct research on the determination of inquiry skills by studying with a wider sample of teacher candidates who are trained in various programs of different universities of education faculties.

WHAT TO LEARN FROM THE PAST: THE CASE STUDY OF A SCIENTIFIC EDUCATIONAL LABORATORY

Verena ZUDINI

Department of Mathematics and Earth Science
University of Trieste, Italy
vzudini@units.it

ABSTRACT

The paper presents the case study of Venezia Giulia, with, in particular, its chief town Trieste – a region which, following the First World War, was annexed to the Kingdom of Italy after having been for a long time part of the Habsburg Empire. Precisely because of its special geopolitical situation, in the period of transition from the Habsburg Empire to the Kingdom of Italy (1918-1923), this region played the role of a didactic “laboratory”, where programmes and educational methodologies had already long been in place that were more suited to the new innovative ideas already at the fore in the international context compared to those normally used in the rest of the Kingdom of Italy. The paper illustrates some examples with particular attention to mathematics and science education.

1. THE HISTORICAL BACKGROUND

The beginning of the twentieth century, before the First World War, was a crucial moment in the development of mathematical education, for the innovation of the teaching methods as well as for the introduction of new subjects in the secondary school, first of all calculus (see Zuccheri & Zudini, 2014).

An opportunity to examine and discuss the situation of mathematics education in various countries was the Fourth International Congress of Mathematicians held in Rome (April 6-11, 1908). On that occasion, the “Commission Internationale de l’Enseignement Mathématique” (CIEM) or “Internationale Mathematische Unterrichtskommission” (IMUK) – thereafter, “International Commission on Mathematical Instruction” (ICMI) – was established, presided over by the German mathematician Felix Klein, with the aim of promoting and spreading the interest of the mathematicians in school education. Together with this commission, the journal “L’Enseignement Mathématique” played an important role allowing communication and cooperation among scholars at international level (see Schubring, 2003, 2008; Furinghetti, 2003; Furinghetti et al., 2008). It was a very fruitful period of research and deepening the understanding of teaching problems, in particular in the Middle-European cultural world.

At the end of the First World War, the city of Trieste and the surrounding region “Venezia Giulia” – now these territories belong to Italy, Slovenia, and Croatia – were annexed to the Kingdom of Italy after having been for a long time part of the Habsburg Empire and formed, with some exceptions, the so-called “Küstenland” (for a historical description of the political situation of this geographical area before and after the First World War, see Zuccheri & Zudini, 2007a, and its references). Consequently, in the period of transition from the Habsburg Empire to the Kingdom of Italy, many changes were necessary when dealing with the integration of these formerly Habsburgian territories, not only from the political, administrative, and economic, but also social, ethnic, and cultural point of view.

2. VENEZIA GIULIA AS A SCIENTIFIC EDUCATIONAL LABORATORY

Among the problems to be faced, there was the question of adapting Venezia Giulia’s school system, which differed from that of the Kingdom of Italy in many aspects (ranging from administrative rules and juridical status of the teachers to teaching programmes and curricula) (see, for more details on the subject, Zuccheri & Zudini, 2007a). In particular, concerning mathematics, the problem of changing the teaching programmes in the former Austrian territories was not of local interest, but was in response to the demands of global renewal which affected all contemporary mathematics education in the Kingdom of Italy, in the context of the international movement mentioned above.

Apart from the considerable discrepancies in content and time-tables, the fundamental difference between Venezia Giulia and the Kingdom of Italy in teaching mathematics (and scientific disciplines) lay in teaching methods, due to deep-set school principles. In fact, before the First World War, in Venezia Giulia, with, in particular, its chief town Trieste, familiarity with the German language and culture had been essential for academic studies and certain skilled professions – such as teacher in a secondary school. At that time there were no Italian universities in the Habsburg Empire, and Graz and Vienna were the usual choices of university for students from that region. Therefore, mathematics teachers of Venezia Giulia, including the Italian native speakers, had been trained at the Austrian universities and learned teaching methods based on Felix Klein’s ideas. So they were open and receptive to the Central European literature and philosophical thought, as well as scientific culture, although they generally had very strong Italian national feeling.

Encouraged to propose their ideas for the gradual transition to the programmes of the Kingdom of Italy – in preparation for a reform that was supposed to take into account their experience, but that did not ever occur as wished –, mathematics teachers of Venezia Giulia acted on the basis of their didactic and pedagogical convictions, which were inspired by the principles held by Klein (for more details on these principles see, for example, Klein, 1925), and which they had tested during their practical teaching.

Following this situation, Venezia Giulia played the very role of a didactic “laboratory”, where programmes and educational methodologies had already long been in place that were more suited to the new innovative ideas already at the fore in the international context compared to those normally used in the rest of the Kingdom of Italy. Some of these were destined to have rich developments in the twentieth century and still resound in current research in education.

3. EXAMPLES

While in the rest of the Kingdom of Italy more attention was given to a more theoretical and formally strict teaching, in Venezia Giulia a greater emphasis was put on exercises and practical application of theoretical subject-matter, considered very important in the context of a conception of teaching through examples and not theory.

Such a practical methodology aimed to impart to students a lively and interesting view of the material, to make their minds quick and show the interdisciplinary connections of mathematics with related sciences, first of all physics. This was all in line with Klein’s programme for improving the teaching of mathematics, and not by chance, considering the course of studies that teachers in Venezia Giulia had to follow in Austrian universities. Klein, in fact, had stressed the need to adjust the teaching methods and content to contemporary cultural trends, taking into account the progress of science and linking mathematical study to everyday life, and to demonstrate the way mathematics was applied in natural sciences and technology (see Klein, 1925, pp. 226ff.).

Among the theories which emerge as having great influence in this context are those of the Austrian physicist, physiologist, and philosopher Ernst Mach. After being professor of Mathematics and of Physics at the University of Graz and then of Physics in Prague (at that time part of the Habsburg Empire), he held the chair in the History and Theory of Inductive Sciences in Vienna and was also the inspiration for the melting pot of ideas which would become famous as the “Vienna Circle” and for the new generation of physicists that was growing up then (such as Albert Einstein).

Mach is well known as giving important contributions to mechanics, acoustics, optics, thermodynamics, and hydrodynamics, as well as to epistemology and the history of science, physiology of sensations and experimental psychology; he was a rigorous scholar of perception problems, in particular, perception of movement and visual contrast (see Blackmore, 1972, 1992; Blackmore et al., 2001; Blüh, 1967; Cohen, 1968; Haller & Stadler, 1988; Heller, 1964; Janik & Toulmin, 1973; Matthews, 1990; Zudini & Zuccheri, 2016a).

Mach started his scientific and philosophical programme with the development of a theory of biologically based knowledge. Heavily influenced by Darwinian evolutionism, this theory regarded knowledge construction as a product of universal evolution, therefore as an essentially adaptive process, placed in continuity with biological processes by which living beings adapt to their natural environment. The same principles that guide the adaptation of organisms to their environment also rule the biological and psychological dynamics of human beings, including the level of knowledge, both natural and scientific (Mach, 1886, Engl. transl. 1996, pp. 71ff.).

3.1 FROM SCIENCE TO SCIENCE AND MATHEMATICS EDUCATION

Also science (with its sophisticated conceptual and mathematical instruments) constitutes a strategy that humans have put in place with the practical aim of achieving greater and more complete control on reality (see Mach, 1906), and the scientist’s activity is nothing but an adaptive biological strategy, useful for practical purposes, not unlike others used by people to survive.

In so far as nature, according to Darwin’s conception, is structured in an organic and simple way – and each one of its elements finds its place without excess or waste, in an “economical” way –, science, in order to be of real use in helping guide human beings in the world around them, must be able to provide a description of nature that is as “economical” as possible.

According to Mach’s vision, science, once constructed, should be taught and disseminated. Mach’s commitment to modern teaching and effective propagation of knowledge at all social levels was, indeed, strong, both as a professor and as a conference speaker (see Blüh, 1967; Hohenester, 1988; Matthews, 1990; Siemsen, 2010; Zudini & Zuccheri, 2016a, 2016b). Playing the role of an advocate of a modern, scientific, interactive, anti-dogmatic and secular education, he was attentive to the need to educate the working class through the promotion of the “Volksbildungsverein” (“Association for popular culture”) and the “volkstümliche Vorlesungen” (“popular lectures”, i.e. the courses of lectures that were held by professors of the University of Vienna), as well as the edition of the “Populär-wissenschaftliche Vorlesungen” (1896), with the aim of communicating his conceptions and theories even to a non-expert reading public. Contained in the “Populär-wissenschaftliche Vorlesungen” there is the text of the conference “Über den relativen Bildungswert der philologischen und der mathematisch-naturwissenschaftlichen Unterrichtsfächer der höheren Schulen” (“On the relative educational value of the classics and the mathematico-physical sciences in colleges and high schools”) held by Mach in 1886, on the educational value of classical and scientific culture (Mach, 1896, Engl. transl. 1898, pp. 338-374). In this conference, Mach dealt with the relationship between humanities and sciences and their formative value (see Zuccheri & Zudini, 2016; Zudini & Zuccheri, 2016b), resounding modern treatises on the subject (among them, Snow, 1993). He recognized that, within the cultural development of his time – by then focused on the technical-scientific aspect –, humanities could no longer be considered the only (or even the better) means to offer a higher education. Studying science – in particular mathematics – was fundamental in helping human beings to observe and understand the world around them and thus to act in an “economic” way (see, e.g., Mach, 1889, Engl. transl. 1989, pp. 577ff.). Thus, scientific education should be consistently pursued (Mach, 1896, Engl. transl. 1898, pp. 360ff.).

3.2 SUGGESTIONS FOR THE IMPROVEMENT OF SCIENCE AND MATHEMATICS EDUCATION

Mach recommended a set of operational guidelines for improving mathematics and science education (Mach, 1896, Engl. transl. 1898, pp. 364ff.), which can be sketched out as follows (see Zudini & Zuccheri, 2016a, 2016b):

1. avoiding premature abstraction and reducing the amount of the subject matter, inasmuch as it was impossible to accumulate ideas beyond a certain level in a brain all at once;
2. using, in the presentation of a subject, examples (taken also from reading selected passages of the great classics of mathematics and science) and practical (manual and, generally, bodily) experiences to cause students to take an active part in their learning;
3. presenting, in the final classes of the higher schools, a division of the subjects into compulsory and optional, so as to enhance students' interests and inclinations;
4. preventing the most talented students, who, for some reason, had not been able to follow a regular curriculum, from being excluded a priori from entering university and academic professions; generally, there should be no restriction of access to education and the professions.

Mach (1896) suggested, in general, a non-dogmatic teaching of mathematics and science, in which the concepts should be introduced accompanied by an experience of the events that led to their formation, taking into account how they actually developed in the course of mathematics and science and hence following a historical and natural approach, with the aim of an "economical" adaptation of thoughts to facts. To this end, and with psychological attention to the development of intellectual abilities – which resounds in modern studies on learning processes – rigour should be reached in a gradual way, without an excessive use of formulas and chains of reasoning, so as not to burden students and prevent them from forming unnecessary or incorrect concepts. Everyday language and concepts in common use should be applied as much as possible, at least in the initial phase, and new concepts, hypotheses, and theories should be introduced only when actually needed for the handling of a subject.

3.3 THE "JACOB METHOD"

Much care was taken with teacher training. Based on Mach's ideas, a didactical method was developed, called the "Jacob method" – after Josef Jacob, who proposed it – and applied at the beginning of the twentieth century in the teaching of mathematics in the Austrian "Gymnasium" (pupils aged 11-18) (see Zuccheri & Zudini, 2007b, 2008, 2010; Zudini & Zuccheri, 2016a, 2016b). It was greatly esteemed by mathematics teachers of Venezia Giulia (in particular, of Trieste) who contributed to the above-cited process of adapting mathematics teaching in the secondary schools of Venezia Giulia to that of the Kingdom of Italy, after the First World War (see Zuccheri & Zudini, 2007a, 2010).

Jacob's "practical method", supported by his own teaching experience, was illustrated in a textbook to be used in training "Gymnasium" mathematics teachers and published in 1913 with a preface by Mach himself (Jacob, 1913).

The textbook proceeded step by step giving practical suggestions and including very precise didactical examples, explaining to the teachers, in a clear and practical manner, how to introduce any subject, ranging from simple arithmetical operations to calculus. This was achieved with the goal of a mathematical teaching method for secondary school level, which, conforming to Mach's ideas, had the following aims:

1. to make the mathematical "facts" (for instance, the sum of the angles of a triangle) and their interrelations comprehensible to young people as concisely as possible, with first simple, schematic representations;
2. to educate pupils on conceptual thought, encouraging intuition and avoiding premature abstraction;
3. to increase the value of mathematics by applying it in practical life, in technology and in science.

At every step of the process of teaching mathematical concepts, Jacob, in line with Mach's ideas, stressed the important role played by physical activities in the process of forming and elaborating the concepts themselves. In this perspective, as showed in Zudini & Zuccheri (2016a), the "Jacob method" supplies a historical example of mind-body grounded methodology that could be compared to some aspects of the modern theory of embodied cognition applied to mathematics teaching (see, e.g., Arzarello & Robutti, 2008, as well as Edwards et al., 2009, and, for more recent developments, Edwards et al., 2014).

3.4 A VOICE FROM THE PAST TOWARDS THE FUTURE

According to the above-mentioned innovative ideas (in particular, Mach's ideas), Giacomo Furlani, a teacher of mathematics and physics at secondary schools in Trieste, showing great modernity, said in his report entitled "Rapporti fra la matematica e la fisica nell'insegnamento" ("Relations between mathematics and physics in teaching") and presented at the Congress of "Mathesis" – "Italian Society of Mathematics and Physics" – held in Trieste (October 17-19, 1919):

While recognizing the high educational value of the study of classical languages... education may be considered as perfect as it is useful to develop harmoniously all faculties of the mind ... we must demand

that it is not unilaterally formative, that it does not excessively overlook the development of those faculties which can only be cultivated with a rational scientific study ...

Therefore [the school] will have to mature in the students' mind what time has matured in the life of humanity and especially in modern thought. If these are our ideals on education, then we must also claim ... a greater consideration of scientific teaching in school curricula ...

A language can be learned only by speaking and applying it ... You will be able to master your own language the better, the more its practice is varied, and especially in school, the more the expression in the various disciplines is attended to, through an appropriate study. So the study of mathematics ... and physics offer such opportunities in practice in one's own language that they can be not replaced by any other study. (Furlani, 1920, pp. 27-29; the English version of the Italian original text was made by the author of this paper.)

WHEN LEARNING BY PRACTICE COULD BE SITUATED LEARNING: EXPLORING IMPLICATIONS FOR CONTEXTUAL INSTRUCTIONAL DESIGN

Hyunyoung Cho

Inha University

This study intends to suggest a different approach for the design of education under a situational paradigm. Many educational designs under such programs still tend to approach the world in terms of irreducible dualisms between actor/system, social/material, body/mind, theory/action, and visible/invisible. In order to resolve this problem, this study introduces a practice-based approach to bring the situatedness of learning and instruction into view. The study of situated practices is expected to respond to the need for a better understanding of the differences between prescribed models and real practice. First, “context” can be viewed as the objects of direct actions. Knowledge in use, and learning by practice, proceed in unmediated perception and action with emotional interaction, in which practice makes the setting visible and hearable, and thereby accountable. This requires a different way of designing knowledge in use and learning by practice, while it reconsiders learning by doing. Second, context can be viewed as non-linear temporal sequences that inquire about relevancies between the current and the next situation. In the procedure of work, step-by-step inference and practical actions have demonstrated ad hoc inference and practical actions. Taking situational properties into consideration, problems and solutions are the characteristics of puzzle formation and its dissolution, in that a problem and its solution are occasionally negotiated and determined in situ. The problem formation and its dissolution are negotiated and improvised in a turn-by-turn procedure by emerging the situation in which the next inference finds its way; a turn-by-turn procedure provides a local environment. Key words : situational paradigm, turn-by-turn procedure, educational designs

YEREL YÖNETİMLERDE SOSYAL MEDYANIN KULLANIMI: İSTANBUL BÜYÜKŞEHİR BELEDİYESİ İLE KADIKÖY VE BEYOĞLU İLÇE BELEDİYELERİNİN TWİTTER KULLANIMLARI ÜZERİNE KARŞILAŞTIRMALI ANALİZ

ABSTRACT

Rapid developments in information and communication technologies have led to a significant change and transformation in our lives. This change reveals social media, one of the most important mass media of our time. Social media is defined as social interaction and sharing environments created through highly accessible means of communication and platforms. In other words, it is possible to define it as online areas where people stay in touch with each other and share their feelings, thoughts, observations, and experiences. And in terms of influence, it has established a very strong position within the mass media.

Social media has become a new area of communication and publicity for private and public institutions as it is the place where most people spend a great deal of time during the day. Nowadays, many institutions are making use of the power of social media, local governments have started to use this power to strengthen public relations and communication activities. The municipalities, which is one of the closest administrative units to citizens, are carrying out activities to develop strong relations with their target groups, to find solutions to their problems and to make their lives easier. They are trying to use social media effectively in order to make these activities easier. Because social media is an easy and powerful communication network of today, where the citizen can communicate with the municipality. In particular, local governments in Turkey are actively using Twitter as one of the world's most important social media networks. In this study, Istanbul Metropolitan Municipality twitter account was tried to be analyzed comparatively with Beyoğlu District Municipality which is the most number of followers of Twitter account in Europe side and Kadıköy District Municipality which is the most number of Twitter account followers in Anatolian side.

GİRİŞ

Bilgi ve iletişim teknolojilerinde yaşanan gelişmeler, insanoğlunun günlük yaşantısını derinden etkileyecek bir değişime uğratmış ve son on yılda ise etkisini artırarak gücünü çok daha ileri bir noktaya taşımıştır. İletişim teknolojilerindeki değişimin hızını ölçmek ya da değişimin insanoğlunun üzerindeki etkisini rakamlarla, zaman kavramlarıyla açıklamaya çalışmak oldukça zor bir hal almıştır. İletişimin sınırlarını neredeyse ortadan kaldıran bu iletişim teknolojilerinin ardındaki en büyük güç olan internet ve bunun en önemli uzantısı olan sosyal medya, insanoğlunun hayatının merkezinde kalıcı gibi görünen güçlü bir konum edinmiştir. Hayatın her bir noktasında varlığını hissettiren bu teknoloji gücü sadece bireylerin öznel faaliyetleri için değil, aynı zamanda markaların, özel sektör kuruluşlarının, kamu kurumlarının da iletişim tabanlı faaliyetlerinde etkin bir şekilde kullanılır hale gelmiştir.

Hayatımıza dokunan ya da dokunmaya çalışan her marka, kişi ya da kurum; sosyal ağlardaki yaygın kullanıma sahip mecralarda hedef kitleleri olan kullanıcılarla iletişime geçmeye ve bu iletişimi güçlü kılmak adına da yenilikçi yöntemler geliştirmeye çalışmaktadırlar. Özellikle temel fonksiyonu vatandaşa hizmet olan yerel yönetimlerin sosyal medyadan yararlanmaya çalışmasının ardında yatan en önemli etken sosyal medyanın geleneksel medyadan farklı olarak etkileşim özelliğine sahip olmasıdır. Etkileşim özelliğinin çok katmanlı bir iletişim olanağı sağlaması kullanıcıların iletişimin her iki yönünde de aktif bir şekilde rol almasına katkı sunmaktadır. Vatandaşın sunulan faaliyetlerin genişliği açısından yerel yönetimler içerisinde en fazla iletişime geçtiği yönetim birimleri bağlı oldukları belediyelerdir.

Belediyeler vatandaşla hızlı, doğrudan ve etkin bir iletişime geçemedikleri için uzun yıllar eleştiri oklarının hedefi olmuşlardır. Ancak sosyal medyanın hayatımıza girip de belediyelerce aktif bir şekilde kullanımının başlaması ile vatandaş-belediye ilişkilerinde olumlu sonuçların alındığı belirgin bir dönüşüm yaşanmaya başlamıştır diyebiliriz. Belediyelerin sosyal medya hesapları; alınan kararların, yapılacak uygulamaların ve gerçekleştirilen hizmetlere dönük duyuruların paylaşıldığı ortam olmanın ötesinde yapılacak yeni hizmetlerde ve alınacak kararlarda vatandaşın bireysel olarak dahil edilmesini sağlayan bir olanak da sunmaktadır. Vatandaşın sosyal, kültürel ve entelektüel düzeyde bilinci geliştikçe belediyelerden hizmet çeşitliliğine dönük beklentileri de çoğalmaktadır. Dolayısıyla belediyelerin halkla ilişkiler adı altında gerçekleştirdikleri tüm sosyal faaliyetleri her geçen gün genişlemekte ve bu faaliyetlere dönük etkileşim de sosyal medyanın katkısıyla güçlü bir şekilde gerçekleştirilmeye çalışılmaktadır.

Çalışma, sosyal medyanın önemli ve günümüzde oldukça yaygın bir şekilde kullanılan araçlarından biri olan Twitter'ın mercek altına aldığımız belediyelerce kullanımı üzerine odaklanmaktadır. Çalışmada vatandaş bilgilendirme, onların beklenti, öneri, istek, soru ve sorunlarına cevaplar üretme ayrıca karar alma süreçlerine vatandaş dahil etme gibi konularda söz konusu belediyeler resmi Twitter hesaplarını ne kadar aktif kullandıklarını sorgulanmaktadır. Bu hesapları sadece tanıtım, duyuru niteliğindeki amaçlar için mi yoksa hem tanıtım ve duyuru hem de vatandaşla karşılıklı diyalogların geliştirilmesi yönünde etkileşimli bir şekilde mi kullandıklarını incelenmesi amacını taşımaktadır. Çalışma 15 Mayıs 2017- 15 Haziran 2017 tarihleri arasında İstanbul Büyükşehir Belediyesi'nin, Kadıköy Belediyesi'nin ve Beyoğlu Belediyesi'nin resmi Twitter hesaplarını kapsamaktadır.

YEREL YÖNETİMLERDE HALKLA İLİŞKİLERİN ÖNEMİ

Günümüzde yerel yönetim kavramının kullanıldığı alanların, tartışmaların çoğunda, aslında söz konusu edilen belediye yönetimidir. Bu çalışmada da yerel yönetim kavramı belediye yönetimlerini kastetmek suretiyle kullanılmaktadır.

Yerel yönetimler, günümüzdeki anlamıyla il, köy veya belediye gibi belirli bir coğrafi alanda yaşayan yerel topluluğun üyelerinin, bir arada yaşamaları nedeniyle ihtiyaç duydukları kamusal hizmetleri karşılamak için kurulan, karar organları halk tarafından seçilerek oluşturulan, idari ve mali özerklikten yararlanan ve kamu tüzel kişiliği bulunan kuruluşlar olarak tanımlanmaktadır (Yıldırım,1990). Yerel yönetimler; gerek demokratik toplumlarda oynadıkları roller gerekse kamu hizmetlerinin halka sunulmasında ve erişiminde yüklenedikleri fonksiyonlar sebebiyle yerel halkın yönetime katılmasının ilk aşamasıdır (Toprak, 2014).

Yerel yönetimler vatandaşın ihtiyaçlarının karşılandığı, vatandaşa karşı sorumlulukları olan, seçimle iş başına gelen ama sorumlu olduğu bölgede kendisini seçene de seçmeyene de hizmet verme yükümlülüğü olan anayasal kuruluşlardır. Dolayısıyla yerel yönetimler için öncelik halktır ve onlarla güçlü iletişim kurarak hizmet faaliyetlerini yerine getirmek birincil görevdir. Söz konusu iletişim sürecini doğru yönetmek ve bu yönetimde başarıyı elde etmek için de halkla ilişkiler felsefesinden doğrudan yararlanmaya çalışırlar. Aksoy'a göre halkla ilişkiler çalışmalarının yerel yönetimler içinde değerlendirilmesinin birçok nedeni vardır. Bunlardan en önemlisi, idari yapının giderek büyümesi ve karmaşılaşması olarak gösterilebilir. Yerel yönetimler, kuralları ve formaliteleri ile halk için karmaşık ve anlaşılması güç yapılardır. Bu nedenle de günümüzde yerel yönetimlerin halk tarafından anlaşılma çabası içine girmesi zorunlu hale gelmiştir. Bunun sonucu olarak da, yerel yönetimler ile vatandaş arasındaki iletişimi gerçekleştirmeye yönelik çalışmalar yapılmaya başlanmıştır. Bu amaçla yapılan her türlü faaliyet, yerel yönetimlerin halkla ilişkiler faaliyetleri olarak isimlendirilmektedir (Aksoy, 2014).

Yerel yönetimler, çağdaş halkla ilişkiler anlayışını kendine ilke edinerek vatandaşla doğru, karşılıklı ve dürüst iletişim çabasına girer ve bu çaba doğrultusunda nihai bir amacı vardır. Bu amaç yerel yönetimin gerçekleştirildiği bölgeyi ve bölge halkını her anlamda kalkındırmak ve bunu halkla işbirliği içerisinde gerçekleştirmektir. Bu nihai amaca ulaşmada halkla ilişkiler disiplininin de belirli amaçlarıyla katkı sağladığını söylemek mümkündür. Tortop, yerel yönetimler için halkla ilişkilerin dört temel amacının olduğunu söyler. Bu amaçları da şu şekilde sıralar (Tortop,1998):

- 1) Vatandaşları yerel yönetimlerin politikasından ve günlük faaliyetlerinden haberdar etmek,
- 2) Yerel yönetimler tarafından kesin kararlar alınmadan önce, önemli yeni projeler hakkında vatandaşlara görüşlerini belirtme fırsatı vermek,
- 3) Yerel yönetimlerin işleyiş sistemi ile kendi hak ve sorumlulukları konusunda vatandaşları aydınlatmak,
- 4) Vatandaşlık gururunu aşılacak ve geliştirmek.

Yatkın ise yerel yönetimlerde halkla ilişkilerin işlevlerini temel noktalarıyla şu şekilde sıralıyor (Yatkın, 2009):

- Yerel yönetimi ve yerel hizmetleri halka tanıtmak,

- Yerel halkı tanımak, beklentilerini öğrenmek ve beklentilere yönelik hizmet vermek,
- Yerel halkın, yerel yönetim hakkında yanlış imaj edinmesini önlemek,
- Yerel halkın, yerel hizmetlere ve kararlara katılımını sağlamak,
- Yerel halkın işlerini kolaylaştırmak,
- Halkla ilişkiler çalışmaları ile yerel hizmetlerin etkinliğini ve verimliliğini artırmaya çalışmak,
- Yerel yönetim olarak halkla ilişkiler faaliyetlerinin getireceği yenilikler hakkında yerel halka aydınlatıcı bilgiler vererek halkın yasalara uymasını ve hizmetlere gönüllü katılmasını sağlamak.

Yerel yönetimlerde halkla ilişkiler faaliyetlerinin araştırma, planlama ve uygulama olarak doğru zamanlarda gerçekleştirilmesi, etkileşimli bir iletişim süreci şeklinde bilgi alışverişi ortamının oluşturulması ve tüm bu süreçlerin zamanın ruhuna uygun bir şekilde güncellenerek yönetilmesi gerekmektedir. Yayınoglu'na göre, yerel yönetimlerin halkla ilişkileri, iki tarafın yani yönetimin ve halkın gerek kendi sorumlulukları ve haklarını, gerek bu etkileşim sürecinin her iki taraf için sağlayacağı yararları iyi anladıkları ortamlarda etkili sonuçlar doğurabilir. Halkla ilişkiler alanındaki planlı ve etkili çalışmalar yerel yönetimlerin başarısını doğrudan etkileyecektir. Halkla hizmet götüren ve nispeten daha dar bir çevrede faaliyet gösteren yerel yönetimler halkla yakındır ve sürekli ilişki içindedir. Bu yakınlık yerel yönetimleri denetime açık kılar. Günlük yaşamla ilgili yürütülen hizmetler halkın gözü önünde gerçekleşir. Yerel yönetimler, halkla ilişkiler gereksinimini hizmetlerin ve halkın yapması gerekenlerin ilgili hedef gruplara duyurulması olarak görülen basit düzeydeki iletişim biçiminden, seçim dışı katılımcı demokrasi programlarının yürütülmesi olarak görülen karmaşık iletişim süreçlerine kadar geniş bir yelpazede planlı ve amaçlara yönelik bir iletişim yönetimi olarak gerçekleştirir (Eraslan Yayınoglu, 2005).

Yerel yönetimler uzun yıllardan bu yana sergiler, konferanslar, seminerler, paneller, sempozyumlar, söyleşiler, fuarlar, festivaller, konserler gibi kültürel ve sanatsal etkinlikler düzenleyerek halkla olan etkileşimi güçlendirmeye dönük faaliyetleri halkla ilişkiler çerçevesinde gerçekleştirmektedirler. Ayrıca bu faaliyetler sayesinde hedef kitleleri olan belediye halkına ulaşım yüz yüze iletişimi güçlü tutmaya çalışarak halkla ilişkiler sürecinde yaşanabilecek olası iletişim engellerini ortadan kaldırmayı öngörürler. Bu tür faaliyetleri düzenlemek isteyen kişi ya da kuruluşlara yer tahsis etme veya sponsorluk şeklinde maddi destek sağlama gibi yollarla katkıda bulunmaları da halkın sempatisini ve desteğini kazanmalarına yardımcı olurken, halkın yerel faaliyetlere duyarlı ve katılımcı olmasını da teşvik etmektedir. Tüm bu geleneksel halkla ilişkiler odaklı faaliyetler yerel yönetimlerin aktif olarak gerçekleştirdikleri faaliyetler olarak güncelliğini korumaktadır. Bu faaliyetlerin halka ulaşması için yapılan tanıtım çalışmaları ise artık geleneksel mecralarla birlikte yeni iletişim mecralarında kendine yer bulmaya başlamıştır. Bilgi ve iletişim teknolojilerindeki gelişmelerle internetin ve sosyal medyanın güçlü bir konuma ulaşması yerel yönetimlerin bu mecralardan fazlasıyla yararlanmaları yolunu açmış ve yönetim – vatandaş iletişiminde güçlü bir etkileşim ortamı doğmuştur diyebiliriz.

YEREL YÖNETİMLERDE HALKLA İLİŞKİLER UYGULAMASI OLARAK SOSYAL MEDYA

Yeni iletişim teknolojilerinin hayatımızda önemli bir yer kaplaması internette yaşanan büyük dönüşümle hız kazanmıştır diyebiliriz. Dönüşümün adı ise Web 2.0 olarak nitelendirilmiştir. Kara'ya göre, Web 2.0 kavramı ilk kez 2004 yılında düzenlenen uluslararası bir konferansta dillendirilmiştir. Konferansa ev sahipliği yapan iki şirketten birinin sahibi olan Tim O'Reilly katılımcıların ortak isteği ile internet dünyasında ortaya çıkan yeni duruma bir isim koyulması düşüncesinden hareketle yeni bir bakış açısı kazandıran web 2.0 tabirini dile getirmiştir (Kara, 2013). Web 2.0 uygulamalarının her iletişim disiplini tarafından rağbet görmesiyle birlikte halkla ilişkiler disiplini de geleneksel medya uygulamaları dışında artık sosyal medya araçlarında bulunmanın gerekliliğini anlamış ve bu alana özen göstermeye başlamıştır (Özgen, 2012). Web 2.0 uygulaması insanlara, web tasarımı ve teknikleri ile uğraşmak zorunda kalmadan sahip oldukları fotoğrafları ya da içerikleri paylaşmalarına olanak tanımaktadır. Web 2.0 adıyla da kullanılan sosyal medya; insanların görüşlerini, deneyimlerini ve perspektiflerini birbirleriyle paylaştıkları uygulamaları ifade etmektedir. İnternetin kullanıcı içerikli bir boyuta dönüşmesiyle ortaya çıkan Web 2.0 internet ortamını başka bir boyuta taşımıştır. Bu dönüşümle internet hem kullanıcıların tüketici konumdan üretici konuma geçmesini hem de kullanıcıların içeriklerini oluşturduğu ve paylaştığı büyük bir güce dönüşmüştür. İnternetin Web 2.0'a dönüşmesiyle birlikte halkla ilişkiler etkinliklerinin de internete taşınma boyutu değişmeye başlamıştır (Alıkılıç, 2011).

Sosyal medya, halkla ilişkiler uzmanlarının bilgiyi dağıtabilecekleri ve iştirak edebilecekleri aracısız bir kitle iletişim aracı olmasının yanı sıra hedef kitesini ve onların yaptıkları sohbetleri takip ederek geri bildirim alabilecekleri bir ortamdır (Alıkılıç, 2011). Sosyal medya, halkla ilişkiler uygulamalarında hedef kitleleri ikna etmek için kullanılan geleneksel medya araçlarının ulaşamadığı kitlelere ulaşmada önemli bir araçtır (Güçdemir, 2012). Ayrıca internet ya da sosyal ağ siteleri, halkla ilişkiler ve hedef kitlelerle iletişim kurma konusunda kurumlara fayda sağlamakta ve bu siteler kolay erişilebilir bir alan olması ile birlikte hedef kitlelere doğrudan mesaj gönderilebilmesini sağlamaktadır (Coşkun ve Başok, 2014).

Yeni iletişim teknolojileri kamu yönetimi açısından devlet ve vatandaş ilişkilerine de yeni boyutlar kazandırmıştır. Kamu yönetimi alanında internet kullanımı 2004 yılında 4982 sayılı Bilgi Edinme Kanunu'nun yürürlüğe girmesiyle önemli bir gelişme alanı kazanmıştır. Türkiye'deki birçok kamu kurumuna bakıldığında internet teknolojilerine hızlı bir uyum sağladıklarını görebilmekteyiz. Özellikle halkla ilişkiler anlayışıyla planlamalar yapıp, iletişim stratejileri üretmeye çalışan yerel yönetimlerin bu konuda oldukça daha özverili ve girişken olduklarını söyleyebiliriz.

İnternetin ortaya çıkışı, Web 2.0 olarak gelişimi ve bu gelişimin bir ürünü olarak doğan sosyal medya, vatandaşla sürekli etkileşim içinde olması gerekliliğinden ötürü yerel yönetimler açısından önemli bir iletişim aracı haline gelmiştir. Sosyal medyanın her geçen gün artan kullanıcı sayısı sayesinde çok büyük kitlelere seslenme olanağı sunmasının yanı sıra kişiye doğrudan hitap eden dili, duygusal ruhu, samimiyeti yerel yönetimlerin vatandaşla kurmak istediği etkileşimli ortam için ideal bir alan olarak görülmüştür. Yerel yönetimlerin sosyal medyadan aldığı güçle geliştirdikleri halkla ilişkiler faaliyetleri hedef kitleleriyle olan ilişkileri geliştirmekle birlikte diyalogları da daha güçlü hale getirmektedir. Geleneksel iletişimin sunduğu sıcaklığın ve samimiyetin benzerini sanal ortama taşıyan sosyal medya, yönetim ve vatandaş arasındaki etkileşime katkıda bulunduğu gibi gereksiz bürokrasinin devre dışı bırakılmasına da yardımcı olabilmektedir. Taşçı, sosyal medyanın yerel yönetimlerce kullanılacak temel alanları ve yararlarını şu şekilde sıralıyor (<http://www.bilisimdergisi.org/s126/pdf/72-75.pdf>):

- Engellilerle sosyal medya üzerinden bir iletişim köprüsü kurulup engellilerin sorunlarına yönelik yerel yönetim çalışmaları geliştirilebilir.
- Yöneticinin yani belediye başkanının faaliyetleri sosyal medyadan duyurularak takipçileri belediye başkanının faaliyetlerinden haberdar edilebilir.
- Sokak hayvanlarının sahiplendirilmeleri ve korunmaları yönündeki faaliyetlere katılımcılık sağlanabilir.
- Sosyal yardıma ihtiyaç duyan insanların desteklenmesi için topluluklar oluşturulabilir.
- Mahalle ve semt gurupları vasıtası ile mahalle ve semt sorunları tartışılabilir.
- Kısa tanıtım filmleri vasıtası ile yerel yönetimlerin icraatları geniş kitlelere duyurulabilir.
- Özellikle göç veren yerel yönetimlerin hemşeri gurupları ve lobileri ile iletişim kurup, yörelerine katkıları sağlanabilir.
- Son zamanlarda gelişen ve yeni trend haline gelecek lokasyon bazlı üyelik ve paylaşım gurupları ile yerel yönetimin acil durum ve afetlerde veya başka sosyal olaylarda halka ulaşmaları kolaylaşır.
- Yerel yönetimlerin denetim görevlerini destekleyici ve kent hayatında kaliteyi artırıcı bildirim ve tavsiyelerin alınması sağlanabilir.

Sosyal medya platformlarında kendi üyeliğini ve kimliğini oluşturmayan birey veya kurumlar, başkaları tarafından temsil edilmeye, şekillendirilmeye mahkumdur (Aksu vd., 2011). Bu açıdan bakıldığında yerel yönetimlerin, kurumsal anlamda doğrudan kontrol edebildiği bir araç olan sosyal medyadaki varlığı zorunluluk haline dönüşmüştür; bu zorunluluk başkaları tarafından açılan ve yönetilen sahte hesapların veya sosyal medya ortamında yapılan olumsuz eleştirilerin giderilmesi açısından önemlidir. Web 2.0 odaklı düşünen ve sosyal medya aracılığıyla vatandaşla iletişime geçmek isteyen belediyelerin ve belediye başkanlarının izlemesi gereken doğru süreci ve atılacak adımları Taşçı şu şekilde sıralıyor (<http://www.bilisimdergisi.org/s126/pdf/72-75.pdf>):

- *Önce izlemeye başlayın:* Sosyal medya araçlarını belediyelerin halkla ilişkiler birimi ve bilgi teknolojileri birimlerinin işbirliği içerisinde izlemeye başlaması iyi bir başlangıçtır. İnternet'teki sosyal medya araçları üzerinden belediyenin ve belediye başkanının sosyal medyada nasıl algılandığını ve yansıtıldığını görmüş olacaksınız.
- *Yönlendirici ekip ve bütçe oluşturun:* Belediyenin büyüklüğüne, insan kaynakları imkânlarına ve bütçe imkânlarına bağlı olarak sosyal medya araçlarını kullanacak yönlendirici ekip ve bütçe oluşturun. (Sosyal medya araçlarından sıfır bütçe ile yararlanmak mümkün olduğu gibi, bütçe imkânlarına bağlı olarak çok etkin katkılar verilebilecek profesyonel içerikler de oluşturulabilir.)
- *Etik Kuralları oluşturun:* Sosyal medya araçlarından yararlanmanın ve aktif kullanımın etik kurallarını ve kurumsal sınırlarınızı doğru bir şekilde oluşturun.
- *Katılımcılığı teşvik edin:* Tüm çalışanları ve onların sosyal çevrelerini olumlu katkı verecek şekilde motive edin ve olumlu katkıyı teşvik edecek içerikler oluşturun.
- *Web 2.0 araçları oluşturun:* Belediyenin faaliyetlerini, yapmak istediklerini, yapamadıklarını, halka aktarmak istediklerini ve halkın görüşlerini yansıtmaya aracılık eden nitelikli bloglar, microbloglar, forumlar ve sosyal medya profilleri oluşturun.
- *Kalıcı bilgiler ve tanımlamalar oluşturun:* Web tabanlı büyük ansiklopedilerde yörenizi ilgilendiren bilgiler, maddeler girin ya da var olana katkı verin.
- *Zengin, güncel, faydalı ve doğru bilgiler ve içerikler girin ve yayın:* İmkânlar ölçüsünde video blogları, Youtube ve diğer sosyal medya araçları gibi görsel paylaşım ortamlarında ilgi çekici görüntüler koyun.

Ayrıca belediye tarafından onaylı hesapların oluşturulması vatandaşların bu hesaplara güven duymasını sağlayacaktır. Belediyelerde sosyal medya uygulamalarında içeriğin oluşturulması ve yönetimi kuruma ait olmalı, süreç bilinçli uzman kişiler tarafından yürütülmelidir. Belediye sosyal medya hesaplarında, halkla sürekli etkileşim halinde olmalıdır. Zaman ve mekan sınırlaması olmadan mesai saatleri içinde veya dışında yapılan paylaşımlar, etkileşimli bir biçimde sürdürülmeli, tartışmaya ve eleştirilere açık bir ortam hazırlanmalıdır.

TWITTER VE YEREL YÖNETİMLER

Twitter, 2004 yılında teknoloji meraklısı aktivist bir grubun bazı siyasi kararları ve düşünceleri protesto etmek amacıyla insanların cep telefonlarına SMS türü kısa mesajlarla kararlarını anlatmak ve ikna etmek amacıyla başlattıkları girişimin bir sonucu olarak doğmuştur. TXTmob olarak adlandırılan araçtan esinlenerek ortaya çıkan Twitter, 2006 yılında yazılım mühendisi Jack Dorsay tarafından kurulmuştur (Zarella, 2010). Twitter, sosyal medya araçları arasında mikroblog servisi olarak hizmet veren oldukça popüler bir sosyal kanaldır. Bu mikroblog sayesinde insanlar gerçek hayat içinde olan biten her şeyi 140 karakterlik metinler halinde ya da görsel olarak birbiriyle bu ağ içerisinde paylaşmaktadır.

Son yıllarda bireysel kullanımın dışında kurumsal amaçlı kullanımlar da popüler hale gelmiştir. Birçok marka ya da kurum kendi resmi Twitter hesaplarını oluşturarak takipçileriyle iletişime geçmekte ve müşteri ilişkileri yönetimine dair birçok faaliyetini de buradan yürütmektedir. Kurumsal iletişim faaliyetlerinin en önemli parçalarından biri olarak görülmeye başlanan Twitter, özel markaların ve kurumların yanı sıra devlet teşkilatı içerisinde yer alan birçok kamu kurumu tarafından da tercih edilen bir mecra haline gelmiştir.

Twitter, kamu kurumları içerisinde özellikle yerel yönetimlerin vatandaşla iletişim kurmak, onlarla işbirliği yapmak ve tanıtım faaliyetlerini duyurmak vb. amaçlar için başvurdukları günümüzün en verimli sosyal medya araçlarından biridir. Yerel yönetimler açısından, eski iletişim yöntemleriyle kıyaslandığında Twitter çok önemli fırsatlar sunmakla birlikte yerel yöneticilerin vatandaşla doğrudan iletişim ve işbirliği kurması açısından da her geçen gün son derece verimli bir mecra haline gelmektedir.

Ayrıca Twitter, anlık iletilen gönderilerin vatandaşlarca nasıl algılandığının tespit edilmesini sağlayarak geribildirim etkili bir şekilde alma olanağı da sunan bir uygulamadır (Bonsón vd., 2012). Dolayısıyla bu yönüyle etkileşimli bir iletişim ortamı sunan Twitter, hem haber verme açısından en az maliyetli duyuru ve tanıtım işlevini yerine getirmekte hem de vatandaştan aldığı geribildirimler sayesinde faaliyetlerine onların beklentileri doğrultusunda yön verme şansını elde etmektedir.

Yerel yönetimlerin kurumsal Twitter hesaplarının iletişim açısından vatandaşlara sunduğu olanakları şu şekilde sıralayabiliriz: (Wigand, 2010):

1. Takipçi vatandaşlarla işbirliğini ve buna bağlı gelişecek değişimi etkin kılar,
2. Takipçi vatandaşlarla doğrudan sohbet etme ya da herhangi bir konuda diyalog kurmayı sağlar,
3. Bloglarda olduğu gibi açık iletişime olanak sağlar,
4. Takipçi vatandaşlarla bilgi ve haber paylaşımını etkin kılar,
5. Konuma ve ilgi alanlarına göre reklam vb. tanıtım olanağını etkin kılar,
6. Yerel yönetimi temsilen statü güncellemeye olanak sağlar,
7. Mesajlaşma açısından takipçi vatandaşlarla gayri resmi iletişimi mümkün kılar,
8. Takipçi vatandaşların ihtiyaç duydukları noktalarda ilgili kişilere ve birimlere ulaşmasında kolaylık sağlar.

Yani yerel yönetimlerin kurumsal Twitter hesaplarının herhangi bir mesai saatinden bağımsız bir şekilde takipçilerden gelen istek ve yardım taleplerine 7/24 açık olması, iletişimin tek yönlü değil etkileşimli ve sürekli bir şekilde sürdürülmesi olanağının olması, bir duyuruyu ya da tanıtımı anında ve çok fazla sayıda kişiye duyurma imkanının olması gibi avantajlar vatandaşların yerel yönetimlerin ve yöneticilerinin Twitter hesaplarını kullanmaya teşvik etmektedir.

Ayrıca Türkiye’de de örneklerine sıkça karşılaştığımız insani bir kimliğe bürünerek takipçileriyle zaman zaman duygusal, eğlenceli ama çözüm odaklı yaklaşımla iletişim kuran yerel yönetimlere ait Twitter hesapları yer almaktadır. Bu hesaplarca kurulan gayri resmi iletişim sayesinde, vatandaşlarla hem sempatik bir ilişki kurmaktadır hem de talep edilen konuyla ilgili olabildiğince hızlı çözümler sunmaktadırlar. Yerel yönetim merkezine bizzat giderek yapmaya ya da öğrenmeye çalıştıkları konuları doğrudan Twitter aracılığıyla saatlerce muhatap olacak birilerini beklemeden gerçekleştirmektedirler.

İSTANBUL BÜYÜKŞEHİR BELEDİYESİ İLE KADIKÖY VE BEYOĞLU İLÇE BELEDİYELERİNİN TWITTER KULLANIMLARI ÜZERİNE BİR ARAŞTIRMA

ARAŞTIRMANIN AMACI

Günlük hayatımızın vazgeçilmez bir parçası haline gelen internet her geçen gün sunduğu olanaklar sayesinde daha fazla kullanıcıyla tanışmakta ve hayatımızın merkezinde kendine yer edinme açısından daha güçlü olanaklara karşımıza çıkmaktadır.

“Digital in 2017 Global Overview” raporuna göre, dünya nüfusunun yarısının internet kullanıcısı olduğu bir dönemde Ocak 2017 verilerine göre Türkiye nüfusunun da yaklaşık %60’ı yani ortalama 48 milyon kişi, sosyal medyayı kullanmaktadır. Türkiye’de sosyal medya kullanıcı sayısının son 1 yıldaki büyüme hızına baktığımızda Ocak 2016’dan bu yana %14’lük artışla 2017’de yaklaşık 6 milyon daha fazla kullanıcı sayısına erişmiştir. Ülkemizde en çok kullanılan sosyal medya kanallarını sırlayacak olursak ilk sırada Youtube gelmektedir ve onu küçük bir farkla Facebook ikinci sırada takip etmektedir. Görsel paylaşım ağı olan Instagram üçüncü, bir microblog uygulaması olan Twitter ise dördüncü sırada yer almaktadır. (<http://www.dijitalajanslar.com/internet-ve-sosyal-medya-kullanici-istatistikleri-2017/>) Sosyal medya, bahsi geçen kanalların sunduğu olanaklar doğrultusunda kullanıcı sayısını her geçen gün hızlı bir şekilde artırmakta ve dünyanın en güçlü kitle iletişim aracı olma yolunda ilerlemektedir. Türkiye’de son 1 yılda dahi göstermiş olduğu artış hızı, bize bu gücün çok daha ileri boyutlara varacağı sinyallerini şimdiden sunmaktadır.

Çalışmanın amacı; yerel yönetimlerin vatandaşlarına hızlı ve etkili çözümler üretmek, onları faaliyetlerinden haberdar etmek, onlarla etkileşimli bir ilişki kurmak amacıyla oluşturdukları resmi Twitter hesaplarını ne derece etkin kullandıklarını tespit ederek alan literatürüne katkı sağlamaktır.

Çalışmanın temel amacına ulaşırken elde edilen verilerle, yerel yönetimlerin resmi Twitter hesaplarını salt duyuru mecrası olarak mı yoksa vatandaşla karşılıklı iletişimin de gerçekleştirildiği etkileşimli bir mecra olarak mı kullanmaktadırlar sorusunun cevabını bulmaya çalışacağız. Ve Twitter hesaplarına ait takipçi sayılarının oranlarını etkileyen unsurların da neler olduğuna da yine elde edilen verilerle ulaşmaya çalışacağız.

ARAŞTIRMANIN YÖNTEMİ

Çalışmanın amacına ulaşması için toplanan verilerin incelenmesinde nicel araştırma yöntemlerinden biri olan içerik analizi kullanılmıştır. İçerik analizi, araştırma evrenini oluşturan metin yığınından seçilen ve bütünü temsil etme niteliğine sahip bir örneklemin incelenmesi ve içeriğin önceden belirlenen değişkenlerden oluşan bir kategori sistemine göre sınıflandırılması olarak ifade edilebilir (Wimmer & Dominick, 2007). Twitter hesaplarında paylaşılan metinsel veya görsel içeriklerin takipçilere hangi konularda bilgi sağladığı ya da bu içeriklerin insanların Twitter hesaplarını takip etmeleri, hesaplarla iletişime geçmeleri için teşvik edici unsurlara sahip olup olmadıklarını tespit edebilmemiz açısından çalışma içerik analizi yöntemiyle gerçekleştirilmiştir.

Çalışma 15 Mayıs 2017 - 15 Haziran 2017 tarihleri arasındaki 1 aylık dönemi kapsamaktadır. Türkiye’de 30 Büyükşehir Belediyesi yer almaktadır ve hepsine ait resmi Twitter hesapları vardır. Hesapların aktif kullanımlarına, takipçi sayılarına bakıldığında nüfus açısından en kalabalık şehrimiz olan İstanbul’un Büyükşehir Belediyesi Twitter takipçi sayısı Ankara Büyükşehir Belediyesi’nin Twitter takipçi sayısından düşük görünmektedir. (Bkz. Tablo 1) Ancak paylaşılan tweet ve retweet oranına bakıldığında İstanbul Büyükşehir Belediyesi’nin kullanım yoğunluğu tüm büyükşehir belediyelerinin önünde yer almaktadır.

	Türkiye'nin Büyükşehir Belediyeleri	Nüfus	Twitter Takipçi Sayısı		Türkiye'nin Büyükşehir Belediyeleri	Nüfus	Twitter Takipçi Sayısı

Tablo 1: Türkiye’deki Büyükşehir Belediyeleri Nüfusu ve Resmi Twitter Hesabı Takipçi Sayıları
Dolayısıyla çalışmada Türkiye’nin nüfus olarak en büyük şehri olan İstanbul’un Büyükşehir Belediyesi resmi

Twitter hesabı ile İstanbul'un Twitter'da en fazla takipçi sayısına sahip ilk iki ilçesi olan Kadıköy ve Beyoğlu Belediyelerinin resmi Twitter hesapları araştırmanın evrenini oluşturmaktadır. (Bkz. Tablo 2) Kadıköy ve Beyoğlu ilçe belediyelerinin İstanbul'un Anadolu ve Avrupa olarak iki ayrı yakasında yer almaları ve bu iki ilçe belediyelerinin farklı iki siyasi partinin çatısı altında olmaları araştırmanın evrenini oluşturduğumuzdaki diğer faktörler olarak belirtilebilir.

	İlçe Belediyeler	Nüfus	Twitter Takipçi Sayısı	Hesap Onayı		İlçe Belediyeler	Nüfus	Twitter Takipçi Sayısı	Hesap Onayı

Tablo 2: İstanbul'un İlçeleri ve Nüfusları ile Twitter Hesabı Takipçi Sayıları

Çalışma kapsamında 15 Mayıs-15 Haziran 2017 tarihleri arasında, araştırma evreninde yer alan 3 belediyeye ait resmi twitter hesaplarından paylaşılan toplam 763 tweet incelenmiş ve içerik analizine tabi tutulmuştur. Tweetlerin hangi konular altında paylaşıldıklarına, tweet başına alınan beğeni ve retweet oranlarına, tweetlerde belediye-vatandaş etkileşiminin ne oranda olduklarına bakılmıştır. Etkileşime sebep olan konular, şikayetler, talepler incelenerek verilen yanıtların olumlu mu, olumsuz mu ya da nötr mü sonuçlandıklarına bakılmıştır. Ayrıca 3 Twitter hesabı tarafından yapılan toplam 918 retweet de incelemeye alınarak konuları tespit edilmiştir.

BULGULAR

Çalışmaya konu olan 3 belediyenin resmi Twitter hesaplarına ait genel bilgilere baktığımızda Mart 2010'daki katılımıyla Twitter'da yer alan ilk belediye Kadıköy Belediyesi'dir. Ardından Ocak 2011'deki katılımıyla İstanbul Büyükşehir Belediyesi'nin Twitter hesabı ve sonrasında da Mart 2011'deki katılımıyla Beyoğlu Belediyesi'nin Twitter hesabı gelmektedir. Çalışmanın yapıldığı döneme ait elde edilen bilgiler doğrultusunda 1.858.076 takipçi sayısı ve 46.490 adet atılmış olduğu tweet sayısı ile Kadıköy Belediyesi etkin kullanım açısından çalışmamızda ele alınan diğer belediye hesaplarının önünde görünmektedir. 273.929 takipçi sayısı ve 26.535 tweet ile ikinci sırada İstanbul Büyükşehir Belediyesi, 102.076 takipçi sayısı ve 11.213 tweet ile üçüncü sırada da Beyoğlu Belediyesi yer almaktadır. Belediye hesaplarının takip ettikleri profil sayılarına baktığımızda 168 profil takip eden İstanbul Büyükşehir Belediyesi ilk sırada yer alıyor. Ardından 49 profil takibiyle Beyoğlu Belediyesi ve 4 profil takibiyle de son sırada Kadıköy Belediyesi yer almaktadır. Her 3 belediye de Twitter hesaplarından kurumsal internet sitelerinin linkini paylaşmaktadır. Birbirlerinden farklı olarak Beyoğlu Belediyesi Facebook, Kadıköy Belediyesi de Vine uzantılarına yer vermektedir. Kadıköy Belediyesi Twitter hesabında diğer hesaplardan farklı olarak çağrı merkezine ait telefon numarasına da hesap bilgilerinde yer vermiştir. (Bkz. Tablo 3)

Tablo 3: İstanbul Büyükşehir Belediyesi, Kadıköy Belediyesi, Beyoğlu Belediyesi Resmi Twitter Hesaplarına Ait Genel Bilgiler

İstanbul Büyükşehir Belediyesi Resmi Twitter Hesabı

Çalışmamızın evreninde yer alan 3 belediyeye ait resmi Twitter hesaplarının inceleme altına aldığımız döneme ait Twitter kullanımlarına tek tek baktığımızda İstanbul Büyükşehir Belediyesi'nin resmi Twitter hesabından toplam 165 tweet atılmış, 797 adet de retweet yapılmıştır. Atılan tweetler toplam 4.183 retweet, 5.529 beğeni almıştır. 165 tweet içerisinde 88 tweet ile belediye etkinliklerinin duyurusu niteliğindeki tweetler ilk sırada yer almaktadır. Etkinliklere ait tweetlerin çoğunlukta olmasının en önemli sebeplerinden biri olarak araştırmanın yapıldığı dönemin bir kısmının Ramazan ayına denk gelmesi ve belediyenin Ramazan ayına özel etkinliklere ağırlık vermiş olması olarak görülebilir. Tweetlerin görsel ve içerik açısından niteliklerine baktığımızda 153'ü fotoğraf içerikli, 8'i video içerikli, 3'ü metin içerikli, 1 tanesini de canlı yayın içeriklidir. Hesaptan araştırmamıza dahil edilen tüm konular hakkında retweet yapılmıştır. Tweetler ise Altyapı, Çevre Düzen ve Yeşil Alan, Etkinlikler, Belediye Başkanı, Ulaşım, Eğitim, Spor, Engelliler, Afet ve Acil Yardım ve Diğer konularında atılmıştır. (Bkz. Tablo 4)

Tablo 5: İstanbul Büyükşehir Belediyesi Resmi Twitter Hesabında Vatandaş Etkileşimi

İstanbul Büyükşehir Belediyesi'nin resmi Twitter hesabı üzerinde yapmış olduğumuz analizlerin bir diğer boyutu ise araştırmayı yaptığımız dönemde vatandaşla olan etkileşimin ölçümüdür. Hesaptan atılan 165 tweet içerisinde vatandaşla hiçbir şekilde iletişime geçilmediği görülmüştür. Tweetlerin tamamı tek yönlü olarak gerçekleştirilmiş, atılan tweetlere herhangi bir başka hesap üzerinden cevap atılmış olsa dahi karşılığı sunulmamıştır. (Bkz. Tablo 5) Bunun en önemli nedenlerinden biri İstanbul Büyükşehir Belediyesi vatandaşların şikayet ya da taleplerini Beyaz Masa olarak oluşturduğu destek ekibi ve bu ekibe ait olan Twitter hesabıyla gerçekleştirmesidir. Belediyenin resmi Twitter hesabına gelen şikayet ve taleplerin en azından Beyaz Masa oluşumuna yönlendirilmeyişi burada bir eksilik olarak görülebilir.

Kadıköy Belediyesi Resmi Twitter Hesabı

Kadıköy Belediyesine ait resmi Twitter hesabında ise araştırma tarihlerimiz içerisinde toplam 496 tweet, 119 retweet paylaşılmıştır. Paylaşılan tweetler toplam 1.199 retweet, 3.100 beğeni almıştır. Paylaşılan tweetlerin konularına baktığımızda 343 adet tweetle Çevre Düzeni ve Yeşil Alan konusunda en fazla paylaşım yapılmıştır. Paylaşılan tweetlerin görsel ve içerik açısından niteliklerine baktığımızda 496 tweetin 46'sı fotoğraf içerikli, 10'u video içerikli, 440'ı metin içerikli olarak paylaşılmıştır. Araştırmayı yaptığımız tarihlerde Alt Yapı, Çevre Düzeni ve Yeşil Alan, Barınak ve Veteriner, Etkinlikler, Belediye Başkanı, Ulaşım, Eğitim, Turizm ve Tanıtım, Spor, Kültür-Sanat, Engelliler ve Diğer konularda tweetler atılmıştır. Çevre Düzeni ve Yeşil Alan, Etkinlikler, Belediye Başkanı ve Kültür-Sanat konularında da toplam 119 retweet yapılmıştır. (Bkz. Tablo 6)

Tablo 6: Kadıköy Belediyesi Resmi Twitter Hesap Kullanımı

Çevre Düzeni ve Yeşil Alan konusunun en fazla paylaşımında rol oynamasının nedeni ise Kadıköy Belediye sınırları içerisinde "Kentsel Dönüşüm" programı nedeniyle bir çok bölgenin inşaat alanı haline gelmiş olması, yeşil alanlara karşı duyarlılık gösteren, çevre ve gürültü kirliliğini üst düzeyde yaşayan vatandaşların sık sık bu konularda talep veya şikayette bulunmaları gösterilebilir.

Kadıköy Belediyesi resmi Twitter hesabının vatandaşla olan etkileşimine baktığımızda kurulan diyaloglar, mentionlara verilen cevaplar açısından etkin bir kullanıma sahip olduklarını söyleyebiliriz. Kadıköy Belediyesi resmi Twitter hesabından atılan toplam 496 tweetin 430'u etkileşimli yani vatandaşla kurulan diyaloglar üzerinden gerçekleşmiştir. Bunlardan 303'ü şikayet içerikli, 127'si talep içerikli gerçekleşen tweetlerle kurulan diyaloglar olarak karşımıza çıkmıştır. Şikayet ve talep içerikli 430 tweetin 244'ü olumlu bir diyalog ve çözümle sonuçlandırılmış, 17'si olumsuz yani çözümsüz bir şekilde sonuçlandırılmış, 169'u da belediyenin görev alanı içinde olmayan şikayet ve talepleri içerdiği için nötr olarak sonuçlandırıldığı şeklinde değerlendirilmiştir. Ancak bu nötr sonuç olarak ifade ettiğimiz tweetler belediyenin Twitter hesabı aracılığıyla doğru muhatabın olduğu Twitter hesabına yönlendirilerek sonuçlandırılmıştır. Örneğin: Kadıköy Belediyesi'nin görev sınırları içerisinde olmayan bir elektrik problemini doğru muhatabı olan Elektrik İdaresinin hesabına yönlendirilerek vatandaşın destek olduğu tespit edilmiştir. Daha önce de bahsettiğimiz gibi belediye sınırları içerisinde yaşayan vatandaşların bölgedeki inşaat ve dönüşüm sürecinin etkisiyle, belediyenin Twitter hesabıyla en fazla Çevre

Düzeni ve Yeşil Alan konusunda diyaloga geçtiklerini görmekteyiz. Araştırma tarihlerimiz içerisinde vatandaşla etkileşime geçilmemiş olan konular Belediye Başkanı, Meteoroloji, Gıda-Beslenme, Sağlık ve Sosyal Hizmetler, Afet ve Acil Yardım olmuştur. (Bkz. Tablo 7)

Beyoğlu Belediyesi Resmi Twitter Hesabı

Beyoğlu Belediyesine ait resmi Twitter hesabında araştırma tarihlerimiz içerisinde toplam 102 tweet, 2 retweet paylaşılmıştır. Paylaşılan tweetler toplam 3.887 retweet, 7.311 beğeni almıştır. Paylaşılan tweetlerin konularına baktığımızda 43 adet tweetle Etkinlikler konusunda en fazla paylaşım yapılmıştır. Paylaşılan tweetlerin görsel ve içerik açısından niteliklerine baktığımızda 102 tweetin 81'i fotoğraf içerikli, 21'i video içerikli olarak paylaşılmıştır. (Bkz. Tablo 8)

Tablo 8: Beyoğlu Belediyesi Resmi Twitter Hesap Kullanımı

Etkinlikler konusunun en fazla paylaşılan tweet konusu olmasının nedeni ise İstanbul Büyükşehir Belediyesi örneğinde olduğu gibi araştırmamızın Ramazan ayının bir kısmına denk gelmiş olması ve Beyoğlu Belediyesi sınırları içerisinde gerçekleştirilen Ramazan ayı etkinlik duyurularının Twitter aracılığı yapılmış olmasıdır. Diğer tweet paylaşım konuları ise; Çevre Düzeni ve Yeşil Alan, Barınak-Veteriner, Belediye Başkanı, Eğitim, Gıda-Beslenme, Sağlık ve Sosyal Hizmetler, Turizm ve Tanıtım, Spor, Kültür-Sanat ve Diğer konular olarak gerçekleşmiştir.

Beyoğlu Belediyesi'nin resmi Twitter hesabı üzerinde yapmış olduğumuz bir diğer analiz ise araştırmayı yaptığımız dönemde vatandaşla olan etkileşimin ölçümüdür. Hesaptan atılan 102 tweet içerisinde vatandaşla 1 kez iletişime geçildiği görülmüştür. Çevre Düzeni ve Yeşil Alan konusunda sağlanan etkileşim, tanınmış bir iletişim profesörünün şikayet içerikli mentionlanmış tweeti üzerine olumlu çözümle dönüş sağlamaları şeklinde gerçekleşmiştir. 1 tweet dışında herhangi bir diyalogun gerçekleştiği etkileşime rastlanmamıştır. (Bkz. Tablo 9)

Tablo 9: Beyoğlu Belediyesi Resmi Twitter Hesabında Vatandaş Etkileşimi

SONUÇ

Araştırmamızda bir microblog uygulaması olarak hayatımıza giren ve dünyada milyonlarca kullanıcısı ile yaşanan ülkenin gündeminde oldukça etkili rol oynayan hatta kamuoyunda birçok değerli kişi ve kurum tarafından iletişim mecrası olarak birincil derecede kullanılan Twitter'in ülkemiz yerel yönetim birimlerince ne kadar etkili bir şekilde kullanıldığını görmeye çalıştık.

Araştırmamıza konu olan 3 belediyeye ait resmi Twitter hesaplarında ortaya çıkan en belirgin ortak özellik, Twitter hesaplarını tanıtım ve duyuru mecrası olarak kullanıyor olmalarıdır. Kadıköy Belediyesi resmi Twitter hesabının diğer 2 belediye hesabından bazı yönleriyle oldukça farklılıklar gösterdiğini tespit ettik. İstanbul'a ait bir ilçe belediyesi olmasına rağmen İstanbul da dahil olmak üzere bir çok Büyükşehir Belediyesi resmi Twitter hesaplarından çok daha fazla takipçisi olduğunu ve birçoğundan da daha aktif bir kullanıma sahip olduğunu söyleyebiliriz. (Bkz. Tablo 10) Diğer 2 belediye hesaplarından farklı olarak sürekli vatandaşla iletişim halinde olduklarını, vatandaşın gelen yoğun şikayet ve talepleri olabildiğince en kısa süre içerisinde olumlu, olumsuz ya da nötr bir şekilde sonuçlandırdıklarını görmekteyiz. Bu durum da Kadıköy Belediyesi Twitter hesabının bir çok vatandaş tarafından takip edilmesini teşvik eden bir unsur olarak karşımıza çıkmaktadır.

Diğer 2 belediyenin ise Twitter'da vatandaşla etkileşimli bir ortam sağlama çabaları olmadığını gördük. Bu durumu her iki belediyenin kendi iletişim stratejilerinin bir parçası olabileceği şeklinde de değerlendirebiliriz. Belediyeler Twitter hesapları üzerinden vatandaşların şikayet ve taleplerine cevap verdikleri sürece vatandaşın da herhangi bir konuda belediyeye Twitter üzerinden diyalog kurma çabası içerisinde olduklarını görmekteyiz. Yani cevapsız bırakılan vatandaş belediyeye Twitter yoluyla iletişime geçmekten vazgeçiyor. (Bkz. Tablo 11)

Kadıköy Belediyesi'nin bu kadar yüksek sayıda bir takipçisi olmasının ardında yatan en önemli nedenlerden birisi de Twitter hesabında belediyeyi ete kemiğe bürünmüş, duyguları olan bir insan formunda sempatik söylemlerle temsil etmesidir. Zaman zaman esprili, sıcak ve duygusal paylaşımlar yapılması ve bu paylaşımların vatandaşla etkileşimli bir şekilde sürdürülmesi Kadıköy Belediyesi resmi Twitter hesabının sadece Kadıköy'de yaşayanların değil tüm Türkiye'de yaşayan Twitter kullanıcılarının dikkatini çekmiş ve bu tutumu beğendikleri için de hesabı takibe almış olduklarını söyleyebiliriz.

Tablo 11: Belediyelerin Etkileşimli Twitter Kullanımlarına Ait Genel Görünüm

Belediyelerin hizmetlerine dair karar alma süreçlerine sosyal medya aracılığıyla vatandaşları dahil etme şansına sahip olduklarını daha önce belirtmiştik. Ancak incelediğimiz 3 belediyeye ait resmi Twitter hesabında böyle bir sürecin gerçekleştiği bir diyalog, anket vb. ortam tespit edilmemiştir.

İncelediğimiz belediyeleri ait resmi Twitter hesaplarına ait tweet paylaşımları en çok fotoğraf, afiş gibi görsellerle sunulmuştur. İkincil düzeyde video, GIF gibi hareketli görüntülerin yer aldığı paylaşımlarla ilgi yaratmaya çalıştıkları gözlenmiştir.

Twitter'i diğer sosyal medya kanallarıyla entegre bir şekilde kullanmadıkları zaman zaman günün anlam ve önemine uygun etiketli (hashtag) paylaşımlar yaptıkları gözlenmiştir.

İstanbul Büyükşehir ve Beyoğlu Belediyesi resmi Twitter hesaplarında takipçiye doğrudan seslenen bir dil kullanılmadığı, sadece belediye hizmet ve etkinliklerinin duygudan yoksun düz bir söylemle tanıtım, duyuru amacının gerçekleştirildiği ortam olarak kullanıldığını söyleyebiliriz. Kadıköy Belediyesi'nin resmi Twitter hesabında ise belediyeyi temsil eden ve her konuya hakim bir dille cevap veren zaman zaman üzüntü ve sevinç gibi duygularını takipçisiyle paylaşan bir söylem geliştirmiş olduklarını görmekteyiz.

Bir çok kişi ve kurumda olduğu gibi yerel yönetimlerimizin de daha aktif, sonuca dönük, takipçileriyle etkileşimli bir sosyal medya iletişimi kurlmaları artık günümüz dünyasının vazgeçilmezleri arasındadır diyebiliriz. Yerel yönetimlerimizin sosyal medyada eksikliklerini gidermeleri adına gerçekleştirilmesi gereken önerilerimizi de şu şekilde sıralayalım:

- Sosyal medya ortamlarına dönük iletişim stratejileri geliştirmeli ve projeler üreterek takipçilerinde memnuniyet hissi yaratmalıdırlar.
- Gerekteğinde krizleri sosyal medya kanalları aracılığıyla çözebilecek alt yapılarını kurlmalıdırlar.
- Vatandaşların dilek, şikayet ve önerilerini olabildiğince hızlı ve çözüm odaklı sonuçlandırabilmelidirler.
- Gayri resmi bir iletişim ortamı kurarak vatandaşlarla samimi ama ölçülü, duygusal ama çözüm odaklı ve kolay anlaşılır, sade bir iletişim dili kurulmalıdır.
- Vatandaşlara dönük mantıklı, ihtiyaçları karşılayan sosyal medya kampanyaları düzenlenmelidir.
- Hata yapılan durumlarda özür dileyen ve hatasını en kısa süre içerisinde telafi eden bir sosyal medya anlayışı yaratılmalıdır.
- Sosyal medya kanallarında temsil ettikleri yerel yönetim adına çıkan olumlu ya da olumsuz tüm paylaşımları takip altında tutmalı ve muhatap kişilerle olabildiğince hızlı iletişime geçebilmelidirler.
- Gelecekteki projeler vatandaşlarla paylaşılmalı ve o projeler hakkında onların fikirleri de alınarak hizmet ve faaliyetlere ortak edilmelidir.
- Tüm sosyal medya kanalları birbirleriyle entegre bir şekilde kullanılmalı; hızlı, mobil kullanım kolaylığı ve daha etkin iletişim ortamı açısından Twitter ayrı bir önemde ve özende kurgulanmalıdır.
- Vatandaşla iletişime geçmesi için görevlendirilen sosyal medya topluluk yöneticilerinin yerel yönetim ve yöneticilik hakkında ve yerel yönetimin işleyiş modeline özgü detaylı tüm bilgilere sahip olması sağlanmalıdır. Bu da vatandaşla iletişim halinde olan görevlilerin hızlı ve isabetli çözümler üretmesi açısından avantaj yaratacaktır.
- Sosyal medyanın güncel diline, doğasına ve kurallarına hakim bir şekilde hareket edilmelidir.
- Başkalarının haklarını ve kendi haklarını gözetken, hukukun üstünlüğü modeline uygun bir çalışma modeli gerçekleştirilmelidir.
- Sosyal medya kanalları herkesin her şeyi özgürce konuşabildiği bir ortam olduğu için hesap yöneticilerinin bu konuda hassas, bilinçli ve tahammüllü olması gerekmektedir.
- Diğer illerin ve ilçelerin yerel yönetimlerine ait resmi sosyal medya kanalları ile iletişimde olup eğlenceli, seviyeli içerikler üretilmelidir.

YOUTH MEDIA IN TWO WORLDS: A COMPARATIVE ANALYSIS OF CHILDREN TV SHOWS IN THE PHILIPPINES AND IN GERMANY

May Belle GUILLERGAN-
SCHOTT Division of Humanities
University of the Philippines
Visayas Miagao, Iloilo, Philippines
may.guillergan@gmail.com

ABSTRACT

This research analysed media products that have withstood time and are well-recognised by their target audience within the country they are produced. The observations generated systematic comparisons of the products' formats, contents, visual characteristics and combination of educational and entertaining elements, leading to a discovery of the inherent and specific influence media products (namely, *Goin' Bulilit* vs. *Die Sendung mit der Maus*, and *Batibot* vs. *Unser Sandmännchen*) have towards young audiences. It was inferred that: TV formats of the same genre are similar despite cultural divergence. The differences lie on the cultural philosophies, viewpoints, and values conveyed by the show. TV productions of different cultures present divergent social values. The presentation of these values is unique to each other's cultural context. The results pinpoint which areas a Filipino immigrant child can possibly experience difficulty when integrating into the German community because media focus on different values in different countries. It can be said that children who grew up in different media environments will have developed different media literacy skills.

Keywords: Children's TV content, genre, and format, cultural diversity, media literacy

INTRODUCTION

Television has become indispensable in most homes and has evolved into a daily pastime activity. Quite understandably out of sincere concern for their children, parents cannot seem to stop asking whether television has good or bad effects on the growth and development of a child. Youth media research has long tried to answer this question, but the argument on television being good or bad for kids has become passé since the effect can go both ways. There are undesirable consequences that may arise from a child's television viewing habit, but researches have likewise pointed to positive outcomes. Children's television viewing can open up their eyes to the world, making them better informed beyond what they learn from their immediate environment. Television can provide good educational influence, increase vocabulary, stimulate creative and intellectual activity, and suggest new ways of seeing and understanding life (Pitzer, 1989). Moreover, what both media research and media outfits all over the world agree with, is the fact that children are a special television audience. They are to be catered to differently. If media companies all over the world design media products differently, then children in different countries grow up with distinct content exposure from these media products.

Germany is an immigration magnet for Overseas Filipino Workers (OFWs), and its pull has heightened in 2012 as the German Embassy in Manila sent an open call for job opportunities for Filipino nurses. Subsequently, a unique community of Filipino immigrant children starts to increase in Germany. They are unique in the sense that most of them have entered the country at around grade school age to their early teen years (7 to 14 years old), an age wherein values and cultural identification are already formed yet not fully cemented (Tara na sa Germany: An Online guide to Filipinos migrating to Germany, Deutsche Botschaft Manila, 2015). The German Embassy in Manila stated online that there are 21,007 Filipino citizens in Germany as of 2015, herein excluding those who were naturalised and are undocumented. Most of them are OFWs settled in North Rhine Westphalia, Hanseatic Hamburg, Baden Wuerttemberg, Hessen and Bavaria. In the same year, 605 Filipinos became naturalised German citizens. At an average, around 700 Filipinos acquire German citizenship per year, and a majority of them came to Germany to work as household or hospital labourers, or as seamen on German/European-based ships. It is claimed that Filipinos are in general well integrated into the German society, but many of them have left their children in the country of origin (Federal Statistics Office; Philippine Embassy in Berlin, 2015). Most Filipino parents apply for a petition to reunite family members in order to bring their children into Germany. Legal processing for family reunion is intricate, which is why after their children have passed strict pre-integration requirements from German authorities, most of these

children come into the country at an age where they are caught between either maintaining or shedding off their acquired culture, foreshadowing a possible maladjustment. Young and adult migrants alike learn German language facility and way of life through watching TV shows, although it is possible that these shows have contents that do not coincide with the shows they were exposed to in their country of origin. As much as people around the world do learn from TV watching, this media form was originally invented for entertainment. There is inevitably an intertwining relationship between education and entertainment in TV shows, but then again, these two elements are treated in different ways in particular locations of production, and these particularities are interesting matters to discover.

Despite parental guidance, children will eventually choose the media of their preference, but they also will go through a process of differentiating what is fantasy and what is real. So it should not only be the media choice that must be guarded, but also the differentiation of reality and fantasy, the educational and the entertainment. Television is a reproduction of reality, but is not real; and this is what children themselves need to understand, while being under the process of inculcating media literacy through parental and institutional guidance. Children need to learn the skill of identifying how reality is represented in the segments presented in TV shows, and to differentiate what is applicable and not applicable in the real world. Young people's media competence can be expedient in creating social change and healthy interracial tolerance (Hilton, Bromley, 1996; Bonfadelli, Bucher, Hanetseder et.al., 2008; Tufte & Enghel, 2009).

THE STUDY

When areas that build or bridge media literacy gaps are pinpointed from children TV shows produced in two different global regions, a new design for television shows that also cater to the needs of migrant youth audience could be developed. There may not be a significant number of Filipino children who have immigrated into Germany, but they are a sample community of young media consumers who have been exposed to media products from two global regions that are distant from each other geographically, economically and culturally.

There are four children TV shows chosen for this project, two are produced in the Philippines and two from Germany; namely, *Goin' Bulilit*, *Batibot*, *Die Sendung mit der Maus* and *Unser Sandmännchen*. These shows were chosen according to their longevity of existence on air, target audience, genre and format similarities. Observation sheets were designed to guide the structured reading¹ of the shows. The analysis of a quarter-season production² of each show – that is five out of the minimum average of 20 episodes per season – dissects the differences and similarities in the shows' format, content and manner of presenting social values in visual form. There are obvious similarities that helped in the decision of juxtaposing *Goin' Bulilit* against *Die Sendung mit der Maus* (also referred to as *Die Maus*), and *Batibot* against *Unser Sandmännchen* (also referred to as *Sandmännchen*). The shows' target audience is their most apparent similarity. *Goin' Bulilit* and *Die Maus* target school age kids, but both also receive a noticeable amount of adult viewership. On the other hand, *Batibot* and *Sandmännchen* target early childhood kids.

The children shows chosen for this study have outlasted years of transition in their respective countries, and surviving inevitable changes in media structures and production practices. The longevity of their existence and the audience reach they have maintained from generation to generation are their common denominators, but there is a difficulty in establishing functional equivalence³ among them. The shows' social functions in their communities do not coincide with each other, so the inferences taken out of the observations have the tendency to become unfounded. *Die Maus* provides entertaining information and answers to curious questions, while *Goin' Bulilit* offers family entertainment at the end of the week. The *Sandmännchen* is a particular storytelling culture in itself, while *Batibot*

¹ When a television show is read, it means that it is observed and evaluated. The reading itself is an interpretation of what was seen in the shows. The documented observations and the notations are then prepared for tabulation, creating a structured reading.

² In the Philippines, similar to the US and Canada, typically 20-25 episodes are produced per season. A quarter-season is then 5-6 episodes. Normally there is one show for every week, unless it is a daily soap opera wherein the number of episodes per season may double the average amount. There are 52 weeks in a calendar year, hence there could be 26 episodes per season if its airtime does not fall on any holiday, which seldom happens. Holidays may set off reruns or special productions. It must be noted here that episodic productions packaged as one season is not a common practice in Germany, but the choice of having 5 episodes to be observed in this research to represent a whole set of production is based on the mentioned Filipino practice.

³ Gudykunst (2002) defines functional equivalence as "relationships between specific observations and the inferences that were made from the observations".

instigates story reading and listening, and renders lessons on basic learning skills. How then can equivalence be established among these children TV shows so that they can be structurally compared? To create equivalence among the four shows, we shall not look at their social function, but focus on the production mechanisms that allow them to be seen at equal status. The equivalence is then established through the following components seen in Figure 1.

Production Mechanisms	Goin' Bulilit	Die Sendung mit der Maus	Batibot	Das Sandmännchen
No. of episodes studied	5	5	5	5
Year of production	2014-2015	2014	2014-2015	2014
Format	Magazine Type: Sketch Comedy/ Parodies	Magazine Type: Fun and Factual Stories	Connected Intro- Extro with magazine type featured productions	Connected Intro- Extro with single featured production
Target Audience	Young audience & appealing to adults	Young audience with orientation for adults	3-5 yrs	3-7 yrs
Presence of Hero Figures	Dagul	Maus	Koko Kwik Kwak	Sandmännchen

Figure 1. Establishing equivalence among the four children TV shows

The paired shows are equal in their format. *Goin' Bulilit* and *Die Maus* are both of magazine type; one is a collection of spoofed segments, and the latter is a collection of fun and informative accounts. *Batibot* and *Sandmännchen* both have *intros* and *extros*⁴ that connect with each other, and between them are TV productions that are featured for the day's episode. All of the four shows have their own prominent characters, although *Batibot* and *Die Maus* have multiple heroes that act as storytellers, figures of authority and *segúe*⁵ guides. In this case, the characters that represent the show as a brand were then chosen as specimen. Aside from these equal components, more similarities are discovered in the process of observation. *Goin' Bulilit* and *Batibot* produce around 20 to 25 episodes per season. *Die Maus* and *Sandmännchen* produce at roughly 15 to 20 episodes in a year. The average amount of shows produced in a year at a quarter scale is then five episodes⁶. Five representative episodes were then chosen as specimen for each children TV show, spanning as much as possible two to three months in between. These specimens were produced and released towards the end of the year 2014, so to come up with five episodes each, some productions cross between the years 2014 to 2015. The shows were viewed via live streaming online; *Das Erste* for the German shows, and *Streema* for the Filipino shows, and with producers' agreement, downloaded/unencrypted so that the show can be repeatedly observed. The chosen specimens for each of the shows were coded as follows: *Batibot* (BAT16.03.14, BAT04.05.14, BAT17.08.14, BAT26.10.14, BAT14.12.14); *Sandmännchen* (USM18.05.14, USM03.08.14, USM12.10.14, USM07.12.14, USM03.02.15); *Goin' Bulilit* (GOBU16.02.14, GOBU10.05.14, GOBU06.09.14, GOBU25.10.14, GOBU13.12.14); and *Die Maus* (DSMDM10.13.14, DSMDM12.05.14, DSMDM15.09.14, DSMDM15.12.14, DSMDM09.02.15). The coding indicates the dates they were viewed or made available online.

In order to limit the coverage of this topic, Stuart Hall's Encoding-Decoding Model was utilised. Stuart Hall (1997) as a cultural theorist asserts that media as an apparatus has interest in production, circulation, consumption and reproduction much more than conveying a message. He further points out that the media is a tool of representation, or "production of the meaning for the concepts in the mind through language, enabling [one] to make references to either real or imaginary world." His theory suggests two important phases in the communication process: the production of the message (encoding) and the reading of the message (decoding). In conjunction to Hall's main assertion, this research takes communication as nothing natural, but a product shaped for consumption; therefore, it has the potential for variant interpretation and effects. Since the production process is the original source of reading, focusing on the production process can limit the variation of interpretation. This research therefore does not touch on the effects of consumption upon the viewers (decoding), but centres on the process of producing the

⁴ *Extro* (extroduction) refers the closure of the topic that completes what was presented in the *intro* (ntroduction) or opening of the show. ⁵ *Segúe* refers to the video clip that creates a smooth transition in between the segments of the show.

⁶ It is important to note that this research does not seek to give a general reading representative of all the shows' produced episodes, neither does it intend to establish the shows' total image or claim that the reading applies to all viewers' perception, nor does it mean to judge what is right or wrong with their values presentation or production practices. This research can only contribute possible interpretations and present structured evaluations of the areas observed in the shows. There are four aspects relevant to this research, and these are: (1) observations on the presentation and representation of values, (2) the patterns in the mixture of educational and entertaining elements, (3) the approaches to media literacy between two different cultures, and (4) the role of production practices and national laws/policies in the process of sending the message.

message (encoding). The research outlines what values, when presented in children shows, are divergent and similar to both cultures under scrutiny. Values, in this study, refer to deeply held beliefs on what is good, right and appropriate (Posner, 2009, p.4). Values are learned, but once imbibed they become deep seated and remain constant over time and become difficult to unravel. Posner (2010) asserts, that children commonly learn their values from parents, teachers and religious leaders, yet they are also influenced by what they see and hear in the media, or on the streets. There are different types of values, which specifically are: personal, corporate/business, organizational, psychological or social (p.29). Herein, the focus is on social values that are often shared by one national identity and by intent often protected by media policies.

THE GROUNDING METHOD

Descriptive content analysis was used to structurally observe 5 specimen episodes from each of the four children TV shows. This method entails a structured descriptive observation of the occurrence or non-occurrence of expected elements in the TV shows. What happens throughout the research is a constant comparison and verifying of inferences. In this case, general observations of each of the 20 episodes under scrutiny were done three times. First, was performing a preliminary observation that was meant to identify the units of analysis and test the observation sheets designed after existing research results. In the process, several observation sheets were discarded when found unsuitable for the material and purpose. Second, was executing the episode dissection using the final version of the observation sheets in documenting and tallying the amount of expected elements that are displayed in the show. Third, was to recheck the documented observations subsequent to the completion of the set of interviews in order to see if the preceding observations still stand after the side of the producers was heard. The main purpose of utilising descriptive content analysis is to identify the intention, focus and trends in the messages sent through children TV shows. A repetitive cycle of comparison was done until a pattern appeared. In this research, the content analysis concentrates on the following elements of the communication process:

ELEMENT	QUESTION	USE
The encoding process	Why?	*To provide evidences and evaluations as to why the messages are produced and shared in such manner (production practices, goals or purposes)
The channel	How?	*To record styles and techniques employed in the production
The message	What?	*To illustrate or describe patterns and trends in communication content *To relate and compare observed characteristics

Figure 2. Purpose guide for content analysis

Results of the observations directed the formulation of questions that were asked during interviews with the show's producers. The questions were arranged into a questionnaire that is modelled according to Paschal Preston's *Five Clusters of Influences in Newsmaking and Production*. Preston (2009) claims that journalism and media have become institutionalised, and for that reason one has to peel several layers of institutions affecting production in order to understand what shapes news and other media products. He enumerated five major layers of influences on media production that make up every single unit of news programmes or shows, and these layers are the following: cultural-ideological symbolic power, political-economic structures, organisational structures and policies, institutional practices and individual background. This model addresses individual, meso- and macro-level factors that are meant to help researchers create a holistic view of the media world.

Two observation sheets were designed after preliminary observations were accomplished. The first observation sheet allows for more descriptive observations, while the second is a tally sheet that allows for counting of occurrences. Based on the Winick, C., Williamson, L., Chuzmir, S. and Winick, M.P. (1973) content analysis research on children's television commercials, combined with Potter's (2008) concepts in teaching media literacy, *Observation Sheet 1* was designed to cover the area of conceptualisation practices in TV production, allowing descriptive documentation of the presence of social values, appearance of regular cast of characters, representation of authority figures or heroes, language nuances, segmentation listing, and penetration of media literacy skills in every episode.

CONCEPTUALIZATION PRACTICES IN TV PRODUCTIONS ⁷

7. Abstracting		

Figure 3. Sample exhibit of Observation Sheet 1

Potter (2008) outlines seven skills of media literacy that can be endorsed by media products, namely: analysis (identifying problems with solutions), evaluation (judging what is wrong or right, possible or impossible), grouping (finding similarities in problems and solutions), induction (recognizing general applications from a group of truths), deduction (discovering particular solutions based on a general law), synthesis (combining different solutions that can work together), abstraction (distinguishing and applying representations of the unreal with reality). These skills cannot be easily instilled in young audiences because they have to be practised and developed. The media materials produced for children must offer the means for these skills to be put to action. *Observation Sheet 1* is formulated to find out whether the children shows, by design, indeed try to encourage the development of media literacy skills.

Television was invented for home entertainment, and it is thereby inevitable that TV productions – no matter how educational a topic is – still include entertainment. *Observation Sheet 2* is designed to tally the occurrences of entertaining elements against the educational. Van Noort (1992, p.27) outlines education or information to likely come as exhibition of values, supplementation to lessons learned in school, and exposition of issues in the community. Entertainment on the other hand is characterised by the employment of games, talent showcasing, and the use of adventurous or humorous stories. Media producers can design entertainment by use of technologies that enhance the presentation of messages and help achieve specific educational objectives. Four areas of entertainment design can be extracted from children show productions, and these are: production method, immersive environments, theatrical agent and theatrical technology (p.33). These areas were scrutinized and compared between partner shows. Here is *Observation Sheet 2* in simplified form:

⁷ In order to fully understand the use of the *Observation Sheet 1*, it is necessary to define the crucial terminologies found in it: (a) **Language** herein does not refer to the use of Deutsch (Hochdeutsch) or Tagalog (Filipino), but the formality and non-formality of the use of these of these languages. The use of manifestations of formality such as *Sie* in Deutsch and *Po* in Tagalog is observed and the context wherein it happens is noted; (b) **Format** refers to the manner in which the segments of television shows are arranged in order to complete one episode. Formatting is meant to harmonise all the elements injected into the show; (c) **Segments** are distinct divisions of the show that composes one episode. They can be separated from each other because these are short but complete productions that can ideally stand by itself, yet can be creatively sewn together to complete the whole message of the episode; (d) **Spot** is the particular area where a segment is placed in relation to the totality of the show; (e) **Heroes** are the authority figures or characters that act as role models for children and randomly appear in TV show episodes. Winick, C. et al. (1973) published one of the earliest content analysis studies of children television commercials and had noted that children often search for authority or hero figures whom they can emulate in the TV shows they watch. These authority figures can be prominent personalities, sports figures, and even fantasy characters like a fairy or Santa Claus. Thus, heroes can eminently be found in productions for children.

SEGMENTAL COMBINATION OF EDUCATION AND ENTERTAINMENT

FUNDAMENTALS OF EDUCATION AND ENTERTAINMENT ⁸											
SEGMENTS (description)	EDUCATION/ INFORMATION			ENTERTAINMENT				ENTERTAINMENT DESIGN			
	Social values exhibit	School lesson support	Issues exposure (Political/ Environmental / Geographical/ Societal)	Games	Talent showcase (singing/ dancing, acting roles, playing instruments, etc)	Adventure/ Action	Humour, comic/ tall tales	Production method (live action/ animated/ mixed)	Immersive environment (on site/ studio/ abstract)	Theatrical agent (puppets/ mascots/ illustrations/ actors/ lay persons, moderator)	Theatrical technology (lights, music, SFX: sound effects, VO props, set)

Figure 4. Sample exhibit of Observation Sheet 2

Through *Observation Sheet 1*, the show is already dissected according to segments. This leads to a physical comparison of the shows' concepts, characters, target audience, and segmentation patterns. The comparison of the segmentation put together in *Observation Sheet 1* is then used as a guide for the systematic tallying of occurrences in *Observation Sheet 2*. The expected elements listed in *Observation Sheets 1* and *2* most often occur more than once in every segment of the episodes studied. The frequency counts were therefore tabulated according to the number of recorded occurrences in relation to its total occurrence, so that the comparative analysis can be based on a quantitative analysis. In this case, the tabulation is done in relation to the total number of occurrence for the whole episode, and not according to the number of segments per episode. The length of the spot where particular elements were found, are then also tabulated in relation to the total length of the episode, to show the amount of concentration such elements have against the total length of the show.

DESCRIPTIVE FINDINGS

Pair 1: The Clever Mouse and the Bulilit Gang

A feature unique to *Die Maus* is the segment where they try to answer curious questions of their young viewers. Most of these are how or why questions. The show has a production office that is meant to receive letters from its viewers, and those questions may likely find a spot in the show and have it answered through film shorts. These question-segments are considered the educational part of the show, although it is most often answered with humour. Some of the topics also feature difficult concepts to understand, for example, *Die Maus* had explained historical facts like World War II and even the Chernobyl Disaster in Ukraine. The explanations are often times reduced to its very basic information, and exemplified into everyday events that are likely to have already been experienced by a child, so that comprehension can be initiated.

Goin' Bulilit is relatively new having premiered in 2005, but in the Philippines where show existence dictated by viewership competition is part of the media system, having lived for 10 seasons from its birth to 2015 is already a record, and it also does not show signs of getting off air any time soon. The word "bulilit" in Filipino (Tagalog) stands for the description "tiny kids". The show features parodies and comedy sketches on how Filipinos deal with daily life situations. These sketches are all acted by child actors/actresses with ages that range from 7 to 13, after which the child is considered a graduate from the show's training. The show's title is in reference to a comedy sketch in the 1980s, *Goin' Bananas*, and the format is patterned from an earlier children's show *Ang TV* (Sketchpride, 2008), all of which are produced in the same TV channel. Its existence is without intermission, thus, the show is already depicted as long running. In its seven years of existence, it has received national acknowledgments and awards from media organisations recognising it as a quality family and comedy show.

⁸ In order to fully understand the use of the *Observation Sheet 2*, it is necessary to define particular inputs found in them: (a) **Social Values Exhibit** refers to the display of the application of societal principles; (b) **Lesson Support** refers to spots in the show that are used to accommodate and support academic learning; (c) **Issues Exposure** are show spots meant to discuss politics; environmental problems, geographical conflicts and societal difficulties; (d) **Games** is part of the show that involves a competitive activity meant for entertainment or amusement; (e) **Talent showcase** is part of the show that creates a platform for the children to display their talent such as singing, dancing, acting; (f) **Adventure** refers to the segments that contain stories/scenes that are exciting, unusual, risky or unknown; (g) **Humour** refers to the segments that contain stories/ scenes that provoke laughter, delight or pleasure; (h) **Production method** is the manner by which the segments were shot, which can either be live action, animation, or mixed use of live acts and animation; (i) **Immersive environments** indicate the location wherein the segment was shot, which can be in the studio, on site (actual location), or abstract (computer generated); (j) **Theatrical agent** signifies the character in the segment that puts the story together, who in the case of children shows can be actors (entertainer), moderators (show host), figures (objects animated by stop motion shots), puppets (characters manipulated by the entertainer's hands), mascots (an entertainer in full body costume), illustrations (animated drawings), or lay persons; (k) **Theatrical technology** speaks of the electronic materials used to enhance the show, like lights, music, sound effects (SFX), voice-over (VO), props (objects used to create reality in the scene), and set (studio designed to create a look of a location). Technologies are most often used unobtrusively, but those that are audibly and visually obvious are recorded during the course of observation.

The Target Audience

Die Maus obtains reception from viewers aged 4 – 8, but its reach ranges from young viewers to adults at an average of 39 years of age (Feil, 1994). *Goin' Bulilit* projects itself to reach kids of elementary school age, that is 7 – 12 years old, and family members of all ages. It is obvious that the segmentation of the shows is designed with predilection to what adult viewers can likewise enjoy. In several episodes of *Goin' Bulilit*, segments telling tall tales about “who’s the best among the rest” are often featured. One will say something that seems like no one could outscore him, but one tall tale is given after another. The tall-tale narrative style is common to both *Die Maus* and *Goin' Bulilit*. Such stories can be appreciated by kids and adults since they are so absurd, they cannot be anything else but funny. Targeting both young and adult audiences appears to be intentional, as Brigitta Mühlenbeck, head of family programming in WDR, reveals:

“The inherent secret of *Die Sendung mit der Maus* is the fact that it is equally appealing to children and adults. Grown-up people who were socialised with the MAUS as children are continuing to watch it even without having their own children. Others have become parents and watch episodes together with their children. Even young adults about the age of 20 years consider the MAUS cool—even though we’re mostly losing that target audience group in the meantime—they often return once they become parents.”⁹

In fact, it is the catering to both young and old that keeps both shows long running. It encourages the notion that these shows should be watched together with parents or adults. *Goin' Bulilit* starts the show with a tagline that says, “This show is for adults... ALSO.” Edgar Mortiz, director and producer of *Goin' Bulilit*, says that, “the segments of the shows are varied [...] from jokes for the [young], to more adult-themed sketches.” The American Academy of Pediatrics (APP) suggests that parents should watch television shows with their kids. This is to make sure that if there is occurrence of violence or ambiguous messages, the adults are there to discuss and contextualise the information (APP, 2001). In reality though, there are many occasions when parents could not sit down in front of the TV together with their kids because of household, personal, and professional obligations. Having the parent and child sit together for TV watching possible is when the show is at an airtime that allows all other responsibilities to be done or set aside, and when the show contains topics that can be appreciated despite viewers’ age gap.

Both shows are shown on Sundays, and plan to keep that day slot for airing. This is a preferred slot because there is more family viewership on weekends. As Mühlenbeck admits, *Die Maus* is challenged by the “decreasing number of children to stay in [their] scheduled place on Sunday morning on ARD, so that it still can be said that Sunday morning is MAUS time in Germany.” Both shows apparently target a slot that is known as a common time for family members to watch television shows together. This is Sunday noontime for Germany (*Die Maus* gets on air at 11:30h) and Sunday primetime evening for the Philippines (*Goin' Bulilit* is aired at 19:30h). The German children TV show exhibits interest in building a family activity that unites a country, or that which can be tagged as a German tradition. The Philippine children TV show commends the significance of talent, laughter and entertainment, as a common Filipino pastime. As Mortiz claims, “*Pinoy* [Filipinos, colloquial reference] kids are very talented and we love seeing kids who have those skills on TV... *Goin' Bulilit*, makes Sunday night a time for laughter and entertainment.”

Conceptualisation of Entertainment

Jonathan Gray (2008) describes entertainment as both an art and a practise. Entertainment itself is a lifeline of television, and this should blend in with all other elements a show wants to portray to make the flow of the show seamless. Aside from challenges in entertainment creativity, both shows, likewise, have to struggle with maintaining viewership and deal with competition. Producers claim that these challenges do not affect quality, but influence sustainability of the show’s resources. *Goin' Bulilit* struggles with finding young TV actors that have the comedic talent required for the show. The production team discharges actors that have reached a certain height and age, so there is a constant talent search for young actors who can replace those that leave the show. The show’s management is also

⁹ Interviews with show producers/directors were done in three languages; namely, English, German, Filipino (Tagalog), and sometimes with language code-switching. When they are quoted in this article, the lines have already been completely translated into English.

aware that a firm grip on viewership ensures investment from advertisers. In the recent years, it has to compete with a sitcom that is aired at exactly the same timeslot in a rival TV network. Whether this competition encourages creativity or lessens originality is still to be studied. What is herein clear, is that competition can be a driving force that makes shows adapt to what the viewers want. *Die Maus* also faces production challenges, and the audience also has a hand that can control the fate of the show. It was pointed out that;

“The challenge is enormous. Especially in Germany, there is big competition between TV channels of the different systems¹⁰. Survival of format is dictated by its appeal, its recognised importance, and when it instigates dialogues. The success is measured by the feedback of the audience— with [*Die Maus*] we’re receiving about 600 mails weekly, that should tell much (Mühlenbeck, Skype Interview, 2011).”

Philippine shows’ airtime survival is dependent on advertising magnetism; therefore, show formatting is often dictated by audience appeal, which may change from generation to generation. In Germany however, the media product should create public dialogues, and its importance is recognised if it brings about substance in conversations. If the show is talked about and leads public discussions, it is recognised as important. The show’s existence is founded in the intricacies of the German dual media system. Public broadcasting is composed of independent non-commercial media organisations that are funded mainly by licence fees. Commercial broadcasting subsists primarily on advertising. For *Die Maus* to survive both systems, it must protect its format style, and maintain it until it becomes an institution; that when one sees the format, it can only be *Die Maus*.

Segmentation of Episodes

The segmentation of *Die Maus* is simple and straightforward. There are generally nine to eleven segments in one episode, animated Mausspots herewith counted. Its segment and time allotment for segments is predictable, since the show billboard and introduction already reveals what is to be seen for the day’s episode. In the five *Die Maus* episodes studied, there are usually two featured film shorts that answer curious questions. Most of them were answered by Christoph, a man who loves wearing green and is curious enough to do experiments to have the questions answered. Between every segment is a Mausspot, a teaser where one could see the *Maus* with its sometimes silly, mostly absurd escapades with its constant companion, a blue baby elephant. Aside from the two film shorts, there are two animated stories that are obviously meant for young viewers, and perhaps an additional segment to feature a special occasion, like “Mother’s Day” in the set of episodes observed. This seems to be a tested formula, since the show’s producer claims there are minimal changes to the format of the show, as it has always maintained an alternate use of fiction and non-fictional stories. Mühlenbeck agrees to the simplicity of the segment arrangement of *Die Maus*, but in relation to other children shows in Germany, she considers the segments that answer curious questions as the most formidable stone in its structure, calling these non-fiction segments as the “building block of the format”.

The segment arrangement of *Goin’ Bulilit*, on the other hand, is less predictable in structure. It can contain 12 to 17 segments: opening billboard, and talent search announcements or in-show adverts herewith counted. The show contains random jokes that mirror common day-to-day experiences of Filipinos. There is no continuum of one segment to another, since soap opera sketches and gags are chosen according what is currently a hit. Jokes are grouped together according to the topic it wants to spoof. Other random entries to the show are put together as if it were inserts in a news programme. There is a topsy-turvy creativity to the handling of segment arrangement. One cannot expect what will come after the other. In terms of Filipino viewing habit, in fact, this can inhibit viewers from zapping TV channels with the remote control. Viewers need to wait for the next segment to start for them to see what it contains, and before they have decided they would like to skip and scan for other shows, they already got engrossed with what they see. If the structured segment treatment of *Die Maus* were placed within Filipino viewing context, it can happen that viewers choose ahead what segment they would like to see. They will begin scanning from show to show, then decide to go back to *Die Maus* just in time when that segment they have chosen to watch already appears.

¹⁰ WDR, the managing TV channel of *Die Sending mit der Maus*, is a public broadcasting network, but it is also aired in semi-commercial stations.

There is one production design in *Goin' Bulilit* that finds no equal to its German counterpart, *Die Maus*, and that is the karaoke-type music video segment. It is quite unimaginable to have it used in German children or family TV shows. These music videos come with lyrics on the lower part of the screen, just the way it is done in karaoke video materials. Child actors perform the song, and the viewers can sing along with it. Most often, the lyrics are distorted to trigger laughter. These music videos are often times rowdy and the dance numbers could be energetic or even boisterous, but these blown up sound and embellished movements are forms of Filipino humour, which possibly will not be interpreted the same way in German context.

Occurrence of Social Values

The use of language and social values presentation were observed between the two shows. In Germany, *Hochdeutsch* (High German) is the national media language. Although regional channels may prefer to use dialects to target regional viewers, productions meant for national viewing use *Hochdeutsch*. Philippine productions have to deal more with choosing what language to use. Although national media outfits use Filipino (Tagalog-based language) or English (official academic language), producers may choose 120 languages (10 of them are official regional languages, namely: Tagalog, Kapampangan, Bisaya, Cebuano, Hiligaynon, Bikolano, Ilokano, Waray, Tausug and Chabacano) and no fewer than 300 island-dialects (Gonzalez, 1998), which by national media law, can be used for TV productions. These languages have nuances that connote respect, authority, social status and relationships among characters. Therefore, Philippine productions show more cultural language cues than German productions. The use of “po” and “opo” when talking to parents, elders, older individuals and people in authority is a cultural Filipino tradition.

It was observed that *Goin' Bulilit* presents more visual cues on family values by featuring situational skits of everyday lives. Respect to elders was exhibited in a segment where the child allows an old lady to sit on her lap when riding a *jeepney*¹¹ so that they can save on travel fare. Duty and heroism are also evident in several segments of *Goin' Bulilit*, represented by incidents where a politician shares hotdog sandwiches to everyone until he himself cannot pay for all that he ordered, a bodyguard who sacrifices himself to protect his ward, policemen who keep order on the streets while dancing. On the other hand, *Die Maus* showed apparent presentations of factuality and inquisitiveness, and these social values which were not represented in its Philippine counterpart. *Die Maus* presents the real world and fantasy at equal footing, and both have equal importance to the show. Christoph experiments on his camera in order to know why wheels look like they're running backwards when seen in cowboy movies. Lehrer Linke's pupils answer his class question with more questions, which he also finds interesting enough to contemplate on. The Maulwurf comes out of its hole to discover different ways of using a lollipop. Shaun finds means to correct his mischief without having the farmer notice it. The “how” and “why” questions were answered with experimentations.

Representation Embodied by the Characters

The main characters of the shows also function differently for each culture. *Goin' Bulilit* features the eldest member of the show, Romeo “Dagul” Pastrana, who is genetically dwarfed. He is the smallest, yet often acts as the eldest. He does not feature talent, neither learning, but he seems to be the character that commands respect, an exemplification of *bulilit*; meaning, little people. He can be understood as a representation of childhood in every adult, and the adult mind in every child. Motiz however clarifies that Dagul's character does not serve as a mascot of the show, but that he represents a parent or an older brother. *Goin' Bulilit* offers a satirical treatment of the everyday lives of Filipino people. The events presented could have happened in reality, but its characters are obviously unreal and exaggerative in nature. Travails of poor families are sketched and treated with humour. An episode can lightly feature a social defect, like school bullying as a theme, offering a moral value at the end of the segment. Yet there is no regular character to which an audience can be attached, except for Dagul. *Die Maus* however, points to two types of characters in the show, the fictional and the non-fictional. The show tries to clearly assign what is real and fantasy. The bigger-than-life mouse of *Die Maus*, is not exactly someone who the kids could learn from, but is simply a character who makes experiences that deal with adversities, who sometimes has unconventional ideas and magical powers. The producers did not mean to present the mouse as a character to emulate, yet it is undeniably the central character of the show.

¹¹ A jeepney is a popular means of public transportation in the Philippines. It is a vehicle innovated and designed after the American army jeeps that were left on the islands after World War II.

	<p style="text-align: center;">DAGUL</p> <ul style="list-style-type: none"> * midget in size, shorter than fellow casts in the show * does not essentially impart knowledge but takes central attention * representing an older brother to the children 		<p style="text-align: center;">MAUS</p> <ul style="list-style-type: none"> * bigger than the size of a real mouse, larger than its human colleagues * does not essentially impart knowledge but takes central attention * show's segué indicator
---	---	--	--

Figure 5. Visual exhibit of the two dominant characters of children TV shows – Pair 1

There are many characters in *Die Maus*, but one character, Christoph, is distinct because he is in every episode as “the guy who always wears green jumpers or shirt”. He is a handyman next door who has a childlike curious mind, and tries to answer questions through experiments. There seems to be not an instance in his trivial activities that he could not find anything to ask. His simple analogies and explanations are easy to follow and understand. He leans towards representing curiosity and inquisitiveness. The Maulwurf, a mole, is a lovable inquisitive creature from the ground. Once it is out of its molehill, it goes about discovering new things that he most probably have not seen underground. One can also get to meet Käpt’n Blaubär, a blue puppet character who has three colourful and level-headed grandchildren. How he deals with his grandchildren and his accomplice Hein Blöd exemplifies family and collegial relationships. Another regular is Shaun, a mischievous sheep who often times leads the flock to naughty activities, yet ends up correcting the mistakes and saving everyone from disaster before the farm owner gets the chance to notice anything happened. He represents the mischievousness of children. Shaun’s mischievousness can be interpreted loosely in different directions, but Mühlenbeck clarifies, Shaun “stands for friendship, curiosity to try out things, team spirit, inventiveness and sense of responsibility despite all his mischief. *Die Maus* offers more variety in experience through its characters, but these are productions separate from the German studio itself. These are conglomerate efforts coming from different studios, which seldom is practiced in the Philippines.

The mentioned differences in character representation can already point to diversity in media literacy treatment between the two countries. The clear assignment of real and unreal characters, the value for inquisitiveness, allows *Die Maus* to demonstrate evaluative and analytic skills; discovering what makes information real and unreal. *Goin’ Bulilit* on the other hand aims for abstraction. The child is given descriptions of what can be learned from the segment to help them get the essence of the message, and they in turn discover how to apply it with their own experiences.

Penetration of Media Literacy Skills

Die Maus demonstrates opportunities for the analysis skills to be used. In fact, two of the five episodes observed revealed that six out of nine segments target analysis skills. Analysis as a TV literacy skill is present in all of the episodes studied. Most of these manifestation of analysis occur in the segments that answers the “how”, “why” and “what” questions. Exercising evaluation skill is also present in all the episodes, with around 2 – 3 occurrences out of 9 – 11 segments. The occurrences are apparent in animated segments, where the blue elephant and the mouse encounter situations where their friendship and teamwork are brought to light. Induction, deduction and grouping exercises randomly occur and are less obvious. A single occurrence of abstraction occurred in five episodes, and this happened only when a summary regarding a process is specified, or a portion of the film short is repeated in order to reinforce the answer given to the curious questions. *Die Maus* uses several languages for their introduction, first in German, and then in another language foreign to Germany. This is an effort to integrate young immigrant viewers of the show. The opening segment is therefore encouraging to evaluate the importance of foreign languages.

Goin’ Bulilit enforces the skill of abstracting meaning from a visual material to capture the whole sense of the story. The occurrences were found in all of the episodes observed. The segments that spoof news programmes are clear examples of targeting the viewers’ abstraction skill. In these segments the news anchor oftentimes states the

general idea of the reported event and poses a question to the audience, which then instigates viewers to give his or her own opinion. There were random occurrences of evaluation and analysis. Evaluation can be practiced in “who’s the best” segments. This segment features three kids trying to outwin each other in being the best. The first character comments on an event or an accomplishment that seems to be unbelievable, it can only be the best. Then the second tries to surpass that tale with something that is even more unbelievable. Then the third gives a simple account that topples all the other tall tales that were told. This type of comedy skit is often times a play of words, but through such segments, viewers are able to judge which one is more valued than the other. Often times, this segment could also give moral lessons, like humility or truthfulness.

Fundamentals of Education and Entertainment

In terms of the children TV shows’ use of elements of education and entertainment, both shows claim they do not aim to be educational shows. Their basic goal is to provide entertainment. Mühlenbeck tells that *Die Maus* blends education and entertainment in a way that “there’s no clear separation, and that there shouldn’t be any. The format is living out of its overall balance— not out of strict distinction of education/entertainment.” These fundamentals were found in both shows studied, but providing entertainment is still claimed as their main intention. Mortiz explains that *Goin’ Bulilit* is foremost entertaining because it is basically a comedy show. But he claims that the show educates both the actors and the viewers. The actors are educated in terms of learning the craft of comedy. The special feature of its format is that they are the only children show in the country that spoofs news and socio-political events in the country. “In that way they are creating social and public awareness to the kids, hence educational,” defends Mortiz.

Production Practices and Legal Policies

Mortiz affirmed that the production process of *Goin’ Bulilit* is mostly done in the studio and in the premises of the TV channel’s compound. There are on-site shootings that are separately done by a production unit. Aside from the director, a creative manager oversees the content of the show, a head writer supervises the writing of the script and distributes the script drafts to a pool of writers. The final approval for the complete product to be sent to the public is made by the director. The show’s financial resources come from advertising, intrusion of brands inside the episode and from the TV network’s production funds. The TV network does not have an influence on the content of the show, but its creative agencies may suggest ideas and comment on the produced episode for the improvement of the show’s format and audience reach. The production team does self-censorship, and thereby finds a way through the rigidity of the Movie and Television Review and Classification Board (MTRCB), a state agency under the National Commission for Culture and the Arts (NCCA) that censors biased programming and obscene acts on TV and in cinema. In this sense, MTRCB has the legal capacity to suspend news anchors, hosts, TV shows, or the whole media project itself, if found biased or obscene. Family shows do not have the immunity against censorship, but enjoy a loose grip.

Die Maus producer says legal issues do not restrict their production process. They find it a pity though, that the recent Rundfunkänderungsstaatsvertrag (RÄStV), an Amendment to the Interstate Broadcasting Agreement, killed the opportunity to experience the production via the Internet. *Die Maus* is not allowed to present episodes online longer than 7 days after the initial broadcast. In explanation to how the production internally works and how the show maintains on-air existence, Mühlenbeck elaborates,

“*Die Sendung mit der Maus*” is a signature brand of the *Westdeutscher Rundfunk*. It is part of our corporate culture that the editing team is developing its production in self-censorship, and only in the extremely rare case of clashes in public discussion the executive board may decide whether an episode can be broadcast. We are in competition with other children TV formats, but we stand well: in the target group of 6–9 year old kids it has a market share of up to 50%, in the broader group of the 3–13 year olds, up to 30%. Every week, 1.6 million people are watching the episode, and 99% of the Germans know it. One could say it’s beyond competition – nonetheless we’re still advertising ourselves every week.”

There are four production practices that are similar to both shows observed, and these are: the broadcasting network’s independence from the executive board in formulating the show’s content, self-censorship, self-advertising, and protection of its format. *Goin’ Bulilit* charms the audience by using kids to perform adult roles, an exceptionality that makes it stand out. While, the fascination for *Die Maus* comes from the appeal of its format. The preceding

descriptive findings can be summarized as follows:

Format	Both shows do not aim to be educational, but rather to provide Sunday entertainment for the whole family.
Entertainment & Education	Entertainment is expressed in different forms between the two countries. <i>Die Maus</i> has calm humour, in fact, the Maus as a character does not talk, but is just sharing an experience that helps one move smoothly to the next segment. <i>Goin' Bulilit</i> entertains by giving jokes, singing, dancing and displaying playtime. It can be described as "fun and boisterous."
Audience	Both shows target not only kids, but also members of the family of all ages as part of its survival scheme. The extent of viewership is important to the management of both shows, but <i>Die Maus</i> is not seriously threatened by drop of advertising since it is managed by a public broadcasting network. It aims to create public discussion to strengthen its importance to the German viewing public. <i>Goin' Bulilit</i> , on the other hand, is concerned with keeping the interest of the advertisers, since they are the lifeline of the show.
Language	Language use of both shows' segments is not peculiar. Both aim for national, not regional, viewership; therefore, official national language is preferred. <i>Die Maus</i> uses two languages in its introduction segment: High German, and a foreign language – a portion that can be interpreted as promulgation of integration of immigrants. The use of "Sie" as formal conversation with audience is not used in <i>Die Maus</i> , which is somehow in contrast to the German social reality where children are taught early to respectfully use the formal "Sie" in conversation with figures of authority. <i>Goin' Bulilit</i> ; however, consistently uses language cues of formality and respect, like "po" and "opo".
Values Representation	Values representation can be extracted from the characters of the show, but producers claim that all characters have their own places in the stories and within the segments. They are not there to represent qualities to be emulated.
Media Literacy Skills	Both children shows have segments that target particular media literacy skills. <i>Die Maus</i> has high occurrence for analysis, while <i>Goin' Bulilit</i> presents opportunities to practise abstraction.
Policies	Both shows declare to have independence in creating content, the ability to do responsible self-censorship, the right to do self-advertising, and the zeal to protect its format.

Figure 6. Summary of descriptive findings – Pair 1

Pair 2: The Little Sandman and the Batibot Troop

Unser Sandmännchen has been running in German television since 1959. Its main character, the *Sandmännchen* (also referred to as Sandmann), stop-motion animated character, was created for screen by the puppeteer Gerhard Behrendt. Earlier on, the little sandman had already been giving goodnight greetings on radio, and both sides of the then divided Germany had their own television versions of the little sandman. In 1991 the production in West Berlin ceased, but the former East Germany's version took over and outlived its counterpart (rbb, 2005). The *Sandmännchen* episodes contain good-night-stories, bringing children to sleep through fantasy adventures and fairy tales. The show always begins and ends with the little sandman.

Batibot is one of the children-oriented projects of Philippine Children's Television Foundation (PCTV), and is often described as the Filipino version of America's Sesame Street. The show tries to combine puppets, short story animation, short films and cultural references together. The episodes are often closed and opened by Koko Kwik Kwak, one of the show's main characters; and the theme stories start and end in the *Batibot* neighbourhood, a common meeting place often found in Filipino residential areas. *Batibot* was conferred by the Gawad Cultural Centre of the Philippines in 1996 as one of Ten Best Television Shows in the Philippines (Batibot Profile, CCP, 2007). The award speaks of the show's zeal in promoting Filipino culture. In a country where TV shows' lifespan is short, *Batibot* is considered the longest running children's show in the Philippines. The title is a Filipino word describes one who is undersized but robust. The word is in resonance to how Filipinos frequently describe themselves physically – "small but terrible".

The Target Audience

Batibot is designed to be watched by pre-school kids. The segments are short, aptly made for the short attention span of children at three to five years old. The executive producer claims that the show is designed for independent viewing, and that parents do not have to watch with their children, so the content must be well-discussed and planned for this set-up. The executive producer, Feny de los Angeles, explains that they are fully aware that parents are important part of children's lives. Parents can also make decision regarding the viewing choices of their children, so there are segments that allow parents to be engaged in viewing together with their kids. But the

production is meant to be understood and enjoyed by very young audiences apart from their parents' presence. *Batibot* is said to be at a good position that parents of the recent times have grown up with *Batibot* that they encourage their children to watch the show even without having to sit with them. The trust for the content of the show has been established among Filipino parents. De los Angeles is however more apprehensive about the changing taste and show preferences of children nowadays, as she confesses;

“I’ve always been concerned about the fact that children’s attention span is diminishing in length, shortened as time has gone by and there are many reasons for that. It’s a combination of lifestyles, and their daily activities: not having the kind of playtime that [allows] engagement of mind and skill. For example the traditional childhood games that involves planning. Even the simple *taguan*¹², it helps prolong attention span compared to playing video games.”

At the onset of its revival/repackaging in 2010, the show’s segment-pacing had to be adjusted to attune its tempo with the lifestyle of the new generation of audience, and likewise according to the timeslot allotted for them. They still maintain an amount of live-action film segments that depict the normal everyday lives of Filipino kids, most of which are shot in rural areas of the country, a feature that *Batibot* is known for.

The core target audience of *Sandmännchen* are also very young audiences, around three to seven years old. The extended target audiences are elder siblings, parents and grandparents, and even young adults who consider the Sandmann as a cult and alternative figure (rbb Briefing Material, n.d.). The target audience then stretches to family members of all ages. In comparison to *Batibot*, *Unser Sandmännchen* reveals signs that it is designed to be watched together with parents so that they could put the child to sleep after the episode. This provides parents a way to explain to the child why it is time for bed. In a sense the show could take the place of book reading as a send-off-to-bed ritual, yet also it can also be an ambience setter for book reading, since the child can ask for more stories in addition to the short story featured in the episode.

In the initial observations it is made obvious that *Batibot* seeks to inculcate Filipino culture. In the type of musical instruments heard, the songs sung, and in speech, all these aspects point to Filipino traits, customs and traditions. De los Angeles voiced out that the *Batibot* production team sees cultural preservation as their duty, specifically since “the show has always been committed to reflecting the realities of Filipino society – past, present and future. It meets children where they are [...] children from diverse socio-economic and cultural backgrounds, their issues, their interests and their concerns.” There are segments that also show the cultural diversity in the Philippine regions, but among the episodes observed there was no reference to cultures beyond the Philippines. The Sandmann likewise mirrors the German homes, what they do, where they live, the nature that surround them, and how they deal with nature. Among the episodes observed, there was one instance that demonstrates reference to diversity of races around the world. Sandmann was waving hands in greetings to children of different races. It was depicted that the kids around the world know the Sandmann, but there is minimal indication towards cultural diversity.

Conceptualisation of Entertainment

The technical capacities of *Batibot* look limited, but the creativity is apparent. The animation segments are rough; but in its roughness, the movements, colour change, costume and set design do not become overshadowed by animation. In the short story segment, for example, the animation sequence was done with slow lagging intervals and minimal movements. This makes the visuals that go with the story being told to come in consonance with the tempo of the storyteller. In this way, the child can focus on listening to the story, than get too involved with the movements that happen on screen. *Batibot* uses special tools that are meant to teach and to entertain. Each segment is related to each other by theme, but stand apart from each other by devise and function. Bodjie Pascua, a *Batibot* original cast and veteran performer, enumerates what they most often utilise in the episodes as he expresses that the people involved in production do sit down together to plan the “use of different forms of activities; like, singing children’s songs, dancing to children’ music, and acknowledging children’s fascination with puppets and animation.” Meanwhile,

¹² *Taguan* is the Filipino version of the game, “Hide and Seek”.

the animators of the Sandmann are already veterans of the stop-motion animation. It had started with the same stop-motion techniques from its premiere in 1959, and still utilises the same technique today. The show is not challenged technically, but the real challenges of the show lie in the motivation of the creators. Anne Knabe, executive producer and Head of Family Programming in rbb, believes that the production team of the *Sandmännchen* is keen in keeping their motivation for production towards the good of the children, and to focus on “developing new formats close to children’s soul, using new techniques without following the hype, modernizing without becoming fashion focused, and not let the Sandmann vanish from the children’s hearts.” Both shows claim that the focus of their production is not on technical competence and capabilities, but in creating quality content and well-thought arrangement of episodes.

Segmentation of Episodes

The segment division design is done independent of each other, making sure that one segment is a complete message by itself and can stand alone. Some of the segments are only 30 seconds long, similar to a commercial – short, direct and easy to understand. This is meant to encourage independent watching among children. Every episode opens and closes with Koko and the *Batibot* community. The problem presented at the beginning of the show is solved at the end. Every *Batibot* episode is composed of 13 to 16 segments; opening billboard and extro are hereby included. An episode can be composed of live action clips, animated *segués*, learn-a-song segments, and storytelling. Pascua reveals that storytelling is an integral part of the show. He discloses that “particular to *Batibot* is its storytelling segment. Many children materials were developed from *Batibot*, not only on TV but also in published books. *Batibot* restored storytelling into our society, and now many have become interested in storytelling.”

Unser Sandmännchen’s segmentation is simple, composed of only introduction and extroduction, both executed by the Sandmann, and an insert feature in between. There are only three segments divisions in every episode. Episodes often start with a calm scene, and the Sandmann is always warmly welcomed wherever he goes. He waves at the kids he visits, and then waves at the audience. He takes time to gather the kids into a cosy area. Then the kids, or toys, or animals in some cases, sit down with him, indicating it is time to watch TV to hear and see a story. At the beginning of the show, the song insinuates that the children are at this time allowed to watch TV for the Sandmann’s goodnight greeting. Then towards the end of the show, the continuation of the theme song is sung, which tells the children it is time to go to bed. They must rest, just as the sandman needs to rest too. The Sandmann leaves and waves goodbye, and blows the magic sand onto the kids and towards the viewers. It is then time to sleep.

Occurrence of Social Values

Common to both shows is the presentation of activities that family members do together. Particular to *Batibot* is the employment of segments that discusses problem solving in the social context, and suggests ways on how a Filipino can deal with it. It is obvious that *Batibot’s* use of language is special. The language cues of respect and authority, the “*po*” and “*opo*” are apparent. Conversations are scripted in avoidance of the use of colloquial terms that are substantially English-based. This stance came when political discussion on the increasing penetration of the use of American English in media and into the daily lives of young Filipinos. It is claimed that it destroys the local language proficiency of the children, making them not fluent in Filipino, neither in English. *Batibot* took on the zeal to counteract this allegation. Pascua himself admitted that it had at times felt unrealistic, since they were not allowed to swear even in intense scenes, and not allowed to use any English words or even the use of the trivial expression “okay” since it is not native to the Filipino language. The result is felt in the years after though, because people who have watched *Batibot* long before have increased local language proficiency, Pascua asserts.

The observation results show that *Batibot* presents high occurrence of respect for elders, as visually represented with video clips of kids placing the hand of an elder onto their forehead, the a tradition of *pagmamano*. Other highly repetitive social values presented are friendship, cooperation and creativity. The problems in the *Batibot* community are often solved together with friends or through the guidance of an older person. Episodes are also filled with songs and art activities like hand painting and drawing and decorating. It is also obvious that entertainment, like singing and dancing, is injected in almost every segment. The theme song of *Batibot* also conveys social values. The tune and lyrics of the song is known to the Filipino viewing public. It has been repeatedly heard in its almost 20 years of existence. The repetitive exposure of the kids to the tune and the lyrics has made the song a home item to Filipinos.

The lyrics tell that the day starts with a sunny smile, so everyone should follow the smiling sun to get to *Batibot*, where the children are active and cheerful. The song speaks of family fun and amusement.

Unser Sandmännchen presents high occurrences of courtesy. The Sandman is always courteously welcomed into homes without question to his character, as presumed that he is known to members of every German home. There was also obvious presentation of friendship, generosity, curiosity and learning. *Sandmännchen's* theme song has also become a home item in Germany, and likewise, an important part of the show. Most, if not all Germans, are familiar with the tune and lyrics of the song. The song has two parts, one is sung at the beginning of the show, and the other at the end. Both parts send out messages on timeliness. The first part of the song, which is sung at the beginning of the show, depicts children telling the Sandmann that it is not yet time for bed, but they ask him to make time for them as they want to listen to his goodnight story. The lines can be translated as: *Sandman, dear Sandman, it's not yet time! First we'll watch the evening's greeting before every child must go to bed. Surely, you have time for that.* The second part of the song, which is sung at the end of the show, pictures the Sandmann telling the children that it is indeed the time to go to bed. He has enjoyed his time with the children, but now they should go and lay in bed to rest. Further translated, it goes: *Children, dear children, that was fun. Now, quick, to bed and sleep tight. Then I will also go and rest. I wish you a good night.* The children learn when exactly they are allowed to watch television, and when to stop, and when to get to bed. At an early age, the Sandman has exposed the children to practise a sense of time and has subjected them to the importance of timeliness.

Representation Embodied by the Characters

The two dominant characters of the shows, Koko and Sandmann, are peculiar figures that do not exist in the real world. Fantasy is an important element of education and entertainment for both *Batibot* and *Sandmännchen*. These characters are also evidence of the location where they were conceptualised. Koko is supposed to be a yellowhead eagle that is endemic to the Philippines, while Sandmann is a magical character particularly known to Europe. The illustration gives you a closer look:

	<p>KOKO KWIK KWAK</p> <ul style="list-style-type: none"> * a young bird, supposedly a young Philippine eagle, who loves singing and dancing * welcomes the spectators of the show * acts as the big brother of the kids and shows love for nature * wears colourful Filipino ethnic inspired costume 		<p>SANDMANN</p> <ul style="list-style-type: none"> * a special magical character in itself, whom one cannot classify as an elf, nor a fairy * welcomes the spectators of the show * he loves calm moments with children & nature * he wears red coat, light red stockings, pointed cap and shoes, warm clothing typical of Nordic countries.
---	---	--	---

Figure 7. Visual exhibit of the two dominant characters of children TV shows – Pair 2

The *Sandmännchen* is a unique character in its own. From a Filipino point of view, he could be equal to a *duwende*¹³ with his long white beard, but he looks too young to be an equivalent to that character. His face and attire can remind one of elves, but he lacks the wings. He could also be one of the helpers of Santa Claus. But the *Sandmännchen* is none of these. Volker Petzold, journalist and the author of a book that extensively describes the Sandmann's history, explains;

“His character, Ole Lukøje, is partly Nordic and Greek mythology, the Dream God, as well as partly from old German legends of a character who blows sand into the eyes of the kids for better sleeping and dreaming. These legends also exist in the Scandinavian countries. Yes, you really can say that this character is a European type.”

¹³ A *duwende* is a Filipino mythical character, who is bearded and dwarf-like in size, and often sits on top of an anthill. He can be kind to children when they are good and respectful, but he can harm them if they misbehave.

Koko's ideals are present throughout the *Batibot* show. He comes as either illustrated animation figure or as a mascot, a full body puppet. He randomly pops in between segments. What he says at the beginning and at the end wraps all the concepts learned in the episode. His characteristics mirror that of a four-year old child. He is always curious and enjoys discovering things, places and people, and of course he always invites the kids in his quests. Together with Koko's youthful character, the show has two adults, Ate Maya and Kuya Fidel¹⁴ who are regularly there to accompany the kids like an older brother and sister. In comparison to the omnipresence of Koko in *Batibot*, the Sandman however simply appears at the beginning and end of the show, and is never featured in between. For Knabe, the hero quality of the Sandman does not change regardless of how often he appears in the show. She explicates that, "the Sandman is the real hero. It does not matter how often heroes appear. The major issue is they appear at the right time." He is the children's main reference character. They may like the story characters, but they adore the Sandman, because he is the one responsible for bringing the nice stories.

There are other important characters that were observed from the episodes of *Batibot*. Manang Bola, a resident soothsayer whose predictions never come true, is observed to encourage the acquisition of individual problem solving skills. Kapitan Basa is responsible for assisting children in their academic and cognitive struggles. The siblings, Ningning and Gingging, are found endearing because they picture normal sibling relationships. In the set of Sandmännchen episodes observed, additional characters were seen, and these were Molly Monster, Piggeldy & Frederick, Lola Langohr, and Lena & Paul. Each of them were observed and readings of their characters were done. Molly is seen to display tenderness. Despite of her being a monster she treats her family, neighbours and friends with kindness. Piggeldy is observed to find answers to childlike questions with humour instead of explaining things the scientific way. His older brother Frederick is his constant victim. When Frederick answers Piggeldy's questions, yet he would finally find his own answers to his questions. Lola is a detective rabbit. She holds office on a small island together with her animal friends. Other animals come to her office to ask for her help in finding what they have lost, or solve a mystery. Lola is a deductive thinker, who answers questions by putting together what was observed to find solutions. The relationship between Lena and Paul on the other hand seems to be leaning towards fantasy. There is a simplistic treatment to problems in the segment with Lena and Paul, her teddy bear. Indeed there is a sense of curiosity to be found in Lena, but the arrangement of things in her world seems to be in perfect place. Lena and Paul are targeting an audience not undertaking pedagogic risks. In it, mother, father and child are in well-defined positions, and Lena as a child finds ways to fit well in such a constellation.

Penetration of Media Literacy Skills

The production team of *Batibot* is convinced that fantasy is an important part of childhood. Pascua explains that, "when a storytelling segments contain legends, we do define what legends are. Perhaps not all the time, but there were several instances where we tell what a legend is, letting them know that at times science is not the only way to know things." Pascua continued to make an interesting analogy of children's need for fantasy to his own awe towards the unrealistic stories.

"We intentionally use legends and figures of fantasy. Speaking for myself, as a child, I was aware that the events are not true, I know they are not scientific, but it opens up in me a sense of wonder. That is the same with all kids. Look, even if they know that Superman is not true, even when they know it does not happen in real life, and even when parents tell them this is not real, they will still go and watch them, because it brings out their sense of awe. That is the pay-off of fantasy, the *oh-that-was-a-beautiful-story* feeling, than the *oh-so-that-was-the-actual-process* kind of reaction."

Therefore, in *Batibot*, the inductive skill is most often targeted. Kids are given a general concept and are then given examples of the concept in the successive segments. In fact there is one episode wherein 12 out of its 16 segments contain inductive processing of ideas. There is also high occurrence of grouping, wherein children are asked what belongs together, and what does not belong among the objects on screen. This has occurred around 2–4 times

¹⁴ In Filipino, *Ate* is a respectful indicator to an older sister. *Kuya* is for an older brother. *Ate* and *Kuya* is used not only for biological siblings, but also to friends or acquaintances who are older in reference to one's self.

out of 14–16 segments. Abstraction is also common to the show. The adults of the show often times explain what should be learned in the segments. Then there are random occurrences of evaluation, analysis and evaluation.

The *Sandmännchen* production team insists, the Sandmann does not need to talk. This is a deliberate and obvious storytelling style. Through this, the children can focus on the calmness of the Sandmann's character. It is not technically neither conceptually needed. It can be done, the Sandmann can begin to sing and dance, the show could change its structure, increase its tempo, perk up speed, make the stories less trivial. But the producers do not see this as a necessity for the type of age group they are targeting. Anne Knabe, she says;

“It is my impression that with development of technical capabilities and elements in stories, structures, volume, rhythms and tempos, we refuse to be aware of the emotional and perceptive abilities of very young children. In simple words, I think a calm anchor is needed in the life of TV beginners, making them able to relax and listen and feel, and not be bomarded by harsh sounds and movements.”

The shows repetitive nature allows the children to practice their skills to evaluate, analyse and abstract. *Unser Sandmännchen* shows high occurrence of evaluation. All the episodes target how children judge the value of things. Lena likes making new friends, but also values her longtime friendship with Paul. There are also noticeable occurrences for analysis, especially the segments with Lola Langohr's detective jobs. Practising the skill of deduction is also common. An interesting treatment of deduction and analysis together was seen in the segment with Herr Fuchs and Frau Elster discovered how dangerous icicles could be. Added to these, there are random occurrences for abstracting, deduction and induction.

Fundamentals of Education and Entertainment

Batibot sees itself as an educational show. Its producers believe that the driving force of their production is to educate children. Pascua believes even when the show is designed to be entertaining, its soul speaks of teaching. “*Batibot* teaches that a Filipino is respectful, caring towards others, loves the country, loves nature; and that we have our own culture, we have our own history, we have our own heroes, our own language, own beauty, own value.” Even then, Batibot utilises numerous elements of entertainment. Its theatrical agents and technologies, like the puppets, the animations, props, costumes and use of music all point towards entertainment. De los Angeles admits this to be true, when she expressed that “[Education and entertainment] must both be there, and there should be no conflict between them. What is important is age appropriate content, interesting storylines and engaging treatments, good quality visuals, music and humour.”

The producer of *Sandmännchen* agrees to the creative mix between education and entertainment. They should not be put in conflict against each other. Knabe explains how she sees education and entertainment being blended together in *Unser Sandmännchen*. “The Sandmann is focused on a snug end to the day, after a fun adventure. With the help of these [moods mentioned], it's easy [...] to communicate values than through the use of academic instructions, dogmatism and subtle threats.” The Sandmann does not tell what to do, or what not to do, rather it creates a mood wherein children become willing to learn something by themselves.

Production Practices and Legal Policies

Feny de los Angeles, herein, gave a detailed description of how the production of Batibot goes. Batibot is apparently a product of teamwork: The first stage is the curriculum development process and research that guides the writing and production of the show. New ideas emerge from individuals as well as from team work, and team members may need to multitask as scriptwriter, crew, and production designer. Brainstorming goes on at every stage, until a decision is reached regarding what can go together in one episode. Concrete themes are then built from ideas of the scriptwriting pool. The education/research team and the writers and the production team collaborate all throughout the stages from brainstorming a program episode, to scriptwriting, to the production of the various segment formats. The executive producer then has the final say as to whether the product will go on air or not. The production team, and especially the producer, is responsible for the content of product, and is qualified to internally censor. It is not the content censorship that threatens the quality production of children shows in the Philippines. The challenge is how to finance an educational TV program in a competitive commercial TV industry. Batibot has to

compete with viewership against other local and international children shows aired at the same timeslot in other channels. The Philippine media landscape is filled with competition between shows of the same genre. De los Angeles clearly painted how the media landscape for children TV production looks like in the Philippines.

“The situation in the Philippines is that, everything is based not necessarily on just the rating scheme but on a marketing system where advertisers go to networks that have the greatest outreach and where they feel they would get value for money in terms of returns. And it’s also, as we learned early in the years of Batibot, it’s a, we used to call it old-voiced network. So it’s a question where they also want to put their products. So it’s a money game, and even when you do have resources, or even when you deliver good quality – that does not always translate into advertising revenue. And since it’s a money game, a network will not necessarily invest in you.”

Anne Knabe also detailed how the production process for children’s television in Germany goes. She explains that the procedure in general can be a mixture of hunting for producers, content planning, time and financial planning, creative production – storyboards animation and pilots. For the substantive part, the description is more an intricate web of people working only for specialised areas. There is less room for multitasking: First, the producer is responsible for the smooth contact between the editorial and production company and is usually also the creative director. Through him/her the artwork and animation is being developed. Under him/her generally works a supervisor for the artwork. The authors are also very involved in the production, because they write the stories or scripts. For large productions and companies there are often several authors, which in turn are under a supervisor. The director is in charge of developing concept, script, storyboard and animation. After that, he/she supervises the animation and visual design, the editing plan, the creation of the sound mix and everything else in close collaboration with the editors. The editor is instrumental in the development of the concept, for content and the design of point-of-view. He/she participates in the development of the scripts and is also involved in the animation, and works as an independent critic outside the studio production. It is good to have proper distance from the studio production, so that the production progress can still be considered relatively objective. Music is at the same time composed for general ambience. There is a very close collaboration between directing and editing.

There is no immediate competition for the Sandman, because there is no other bedtime story format in the German market. But Knabe admits that the production management deliberately observes the TV market for first-time viewers. This includes program analysis of other stations as well as quota statistics with comparable programs of other providers. Being under a public broadcasting network, *Unser Sandmännchen* is protected from quota requirements and the production team receive funds from licence fees. *Sandmännchen* is an institution, a cultural figure. Its chance for surviving media competition is positive. Even then, Knabe shared internal anxieties and their eagerness to make sure that the show will not fall into institutional or financial disaster. “Contrary to popular belief – children TV shows can become under quota pressure. TV shows, public or private owned, not watched by significant number of audience shall cease to exist on air.” Observing the quota gives producers enlightenment regarding which days of the week audience actively watch the show, and where the fluctuation lies. It was also revealed that despite funds, the institutional process in using funds is regulated and structured. There is no complacency in the use of fund, Knabe disclosed;

“Governed by public broadcasting laws means: no sponsoring, no subscription plans, and no advertisement. Even more as we (the children’s TV) are subject to especially strict supervision. Also product placement is completely disallowed for us. The Sandmann is a co-production of three broadcasting stations in the ARD compound: rbb, NDR, mdr. Each of these stations is maintaining a slightly growing budget position for the Sandmann since 20 years now. Those budgets go to a pool from which the resources are given out for the productions according to prior common decision making. The rbb station as the leading entity is also taking the biggest part, production and budget wise. It also pays the expenses for confectioning, archiving and dispatching materials. It is likewise responsible for the design and maintenance of the web site, and for the acquisition and handling of merchandising materials. Around 27% of the cash backflow from merchandising go to the production pool.”

Parallel to Pair 1, *Batibot* and *Sandmännchen* also show four production practices that are common to each other's media environment, and these are: independence from the executive board of the broadcasting network in formulating the show's content, self-censorship, self-advertising, and regular format re-evaluation. The concepts that can be extracted from the descriptive observations are the following:

Format	Format is simplified and can be adjusted according to the changing needs of young viewers. What is important is that the format is able to convey culture and
Entertainment & Education	Entertainment is expressed in different forms between the two countries. <i>Unser Sandmännchen</i> designs entertainment to be calm and non-aggravating. <i>Batibot</i> is designed to be full of fun activities and colourful amusing stories. Both shows consider the fantasy world as a necessary element to children shows. The shows likewise commonly seek to preserve its country's culture, but has minimal reference to cultural diversities beyond its territories.
Audience	The shows are designed for public viewing in the absence of a parent or adult. The extent of viewership is important to the management of both shows, but <i>Unser Sandmännchen</i> is not gravely threatened by advertising and competition since it is managed by a public broadcasting network. <i>Batibot</i> is more concerned with keeping the interest of the managing TV network and that of the advertisers, since these are the lifeline of the show.
Language	Audible language is not inherent to the central character of the show <i>Unser Sandmännchen</i> . The Sandmann does not do dialogues but rather sends messages through gestures and facial reactions. The use of "Sie" as formal conversation with audience is not often used in the insert films, since the dialogue setting is informal and conversational. <i>Batibot's</i> use of language is particular because English is to be avoided, unless the context of the story asks for it. The show also utilises language cues of formality and respect, like "po" and "opo". Use of music, like singing songs and playing musical segues, is a common language used in both shows.
Values Representation	Family values are inherently found in both shows, but they may take different focus. <i>Batibot</i> showed family values that tackle care for elders, care for parents, sibling ties, among others. <i>Unser Sandmännchen</i> showed bedtime ritual for the whole family, and individual responsibility of family members.
Media Literacy Skills	Both children shows have segments that target particular media literacy skills. <i>Batibot</i> has high occurrence for inductive skills exercises. Grouping and abstracting skills were also practised. <i>Unser Sandmännchen</i> on the other hand showed more opportunities for evaluation and analysis.
Policies	Production practices in <i>Unser Sandmännchen</i> are more rigid and structured, and decisions are often a collaboration of the expertise among the members of the team. The decision for final product is shared by the editor and the director. The set-up of the production team of <i>Batibot</i> is prone to multitasking, but the final decision is done by the executive producer. In <i>Batibot</i> , separate units are sent out to shoot outdoors and in the studio, while the shooting of <i>Unser Sandmännchen</i> is done inside the studio. This difference lies upon the difference of animation and entertainment technologies they wish to employ.

Figure 8. Summary of descriptive findings – Pair 2

TABULATED FINDINGS

Values Presentation

Combining the documented observations, and examining the totality of the specimen videos of each of the four children TV shows, it can be observed that there are seven social values prominent in four shows altogether. These social values are found to occur in every single episode observed, meaning "five out of five" episodes of each show; and these social values are: coordination/integration, courtesy, entertainment, factuality, family values, orderliness and timeliness.

In *Goin' Bulilit*, these social values occurred in every five episodes: entertainment, family values. These values occurred in "two out of five" episodes: respect for elders, sacrifice. In *Die Maus*, these social values occurred in every five episodes: coordination/ integration (especially characterised by the use of two languages in the introduction), entertainment, factuality and orderliness. Occurring "four out of five" is: learning/inquisitiveness. Occurring "three

out of five” are: systematisation and timeliness. Occurring “two out of five” are: collaboration e.g. sheep working together with dogs or pigs), responsibility, romance, and teamwork.

In *Batibot*, these social values are visually interpreted in every five episodes: coordination and integration (characterised by dialogues that give cues on belongingness despite economic status, social background or regional differences), family values. Occurring “four out of five” is: friendship. Occurring “three out of five” is helpfulness. Occurring “two out of five” are: community feeling, continuous improvement, forgiveness, respect for elders and thankfulness. In *Unser Sandmännchen*, these social values are found in each of the five episodes: courtesy, entertainment, family values and timeliness. Occurring “two out of five” is learning/ inquisitives. As a whole there are 65 social values present in four shows. The next table compares the percentage of the amount of social values present in each show in relation to the amount of social values generally found in four shows:

Classification	Country	TV Show	Total Values Present in 4 shows (N)	Total Frequencies in 5 episodes (n)	Percentage
PAIR 1	Philippines	Goin' Bulilit	65	36	55.58%
	Germany	Die Sendung mit der Maus	65	49	75.38%
PAIR 2	Philippines	Batibot	65	54	83.08%
	Germany	Das Sandmännchen	65	41	63.08%

Table 1. Comparison of the frequency of social values presentation found among four children TV shows

The table reveals that both countries have the tendency and the capability to present social values through children shows. *Die Maus* is at 75%, while *Goin' Bulilit* is at 55%, a difference of around 20% between the two as transporters of social values. This does not show much difference in their capability to illustrate social values within the show. *Die Maus* shows a greater percentage of social values compared to *Goin' Bulilit*, although both of the shows equally agree on entertainment as a social value. The higher percentage of social values presentation carried by *Die Maus* most probably comes from the fact that the shows production uses more of on-site segments, which can carry more visual cues on how people act within society. The segments that answer curious questions are mostly shot outside of the studio and use laypersons interacting with each other. There is more social interaction in on-site shots. It is not meant to say that studio shots cannot portray social values, but that studio set-up shows less interaction with the society as a whole.

Batibot, on the other hand, shows a higher percentage of social values presentation compared to that of *Sandmännchen*. *Batibot* is at 83%, while *Sandmännchen* is at 63%, again a difference of 20% between the two children shows. That is not a big distance in their capability to convey social values. With almost the same principle as that of *Die Maus*, the viewers are exposed to live shots of actual people on the streets, in the community and from different islands with *Batibot*. Messages in live shot can somehow be read in many different ways, and are prone to misinterpretations. Conversely, *Sandmännchen* is fully shot in the studio, and the social values it can share are limited to those which are in the script. However, *Sandmännchen* is repetitive by nature, and since its messages are visually repeated, there is less possibility for messages to be misread.

Among the four shows, *Batibot* shows the highest percentage of social values transported through its segments. This mirrors its goal, as admitted by its producer. The show seeks to inculcate Filipino culture and its values. *Goin' Bulilit* shows the lowest percentage in social values conveyed. This is because the show does not aim to do so. Its focus is on providing entertainment. *Die Maus*, although it purposes itself to provide entertainment, still demonstrates a strong capacity to carry social values. This can be based on the format of the show, surprisingly so – I must admit. We should think though that a large part of the segmentation is allotted to answer the questions of viewers and children, and those that the producers find interesting to discuss. In this way, the questions already mirror what is important for the community. It demonstrates what the public wants to discuss.

All four shows, being considered to be under the banner of family programming, exhibit family values. *Sandmännchen*, *Batibot* and *Goin' Bulilit* revealed a frequency count of “five out of five” episodes. But how the family values are represented appears differently among them. The concentration on a type of family value is also divergent

among the four shows. Family values were counted as one social value, but they are represented in many ways within one segment. The specific representation of family values are as follows: care for elders, care for parents, discreteness in dealing with other family members, appreciation of domestic work, having a common evening ritual, doing each members responsibility individually, nurturing children or the younger members of the family, maintaining sibling ties, and keeping the family together. The next table illustrates the presence of specific family values that occur in every single episode.

Family Values Present in the 4 Shows Studied		1. Care for elders	2. Care for parents	3. Discreteness in dealings	4. Domestic work	5. Evening/bedtime ritual	6. Individual responsibility	7. Nurture children	8. Obedience to parents	9. Sibling ties	10. Togetherness/Member ties

Table 2. Comparison of the presence of specific family values in every five episodes – Pair 1

The table reveals that *Goin' Bulilit* contains messages that recommend family togetherness as an important social value. It shows a 100% occurrence in all of the five episodes, meaning it occurred “five out of five”. The show also encouraged obedience to parents and discreteness in dealing with other members of the family at 40%. The three specific representations are not found in *Die Maus*, but they both agree on representing family values in a way that ‘care for parents’ and ‘appreciation of domestic work’ is encouraged. The same tabular observation was done between *Batibot* and *Sandmännchen*, and it likewise exhibited interesting results.

Family Values Presented in the Shows		1. Care for elders	2. Care for parents	3. Discreteness in dealings	4. Domestic work	5. Evening/bedtime ritual	6. Individual responsibility	7. Nurture children	8. Obedience to parents	9. Sibling ties	10. Togetherness/Member ties

Table 3. Comparison of the presence of specific family values in every five episodes – Pair 2

As expected, *Batibot* does carry several specific representations of family values, but none of them are actually repetitive, as we see that there is no 100% occurrence of one specific family values in every five episode. The

representations are many but they randomly appear in the episode. In *Sandmännchen*, it has its specific place, and is shown at the beginning and is repeated at the end. *Sandmännchen* encourages a common evening activity among family members before bedtime, occurring at 100%. At the same percentage level, 20%, both *Batibot* and *Sandmännchen* encourage individual responsibility. The *Batibot* episode illustrated siblings doing household chores before their parents arrived, while the *Sandmännchen* episode demonstrated children doing their own role: father cutting wood, brother and sister playing outside and stacking wood for the chimney, mother feeding the baby, until the *Sandmann* came to gather them into the living room to sit down and relax at the end of the day.

In *Batibot* there is 80% occurrence rate of nurturing the young members of the family, followed by a 60% occurrence rate for family togetherness. The table further exhibits 40% occurrence of care for parents and maintaining sibling ties, followed by 20% occurrence of care for the elders, doing home chores, individual responsibility (as aforementioned), and obedience to parents. These results tell us of the type of family values to which children in the Philippines are exposed.

These findings lead to a reflection that kids from different worlds are exposed to different values through media. The way they match visuals with meaning are then different, so they are equipped with different media literacy skills. This study cannot prove that the level of media literacy is different, but that the possible types of media literacy of kids from Germany and Philippines are most likely different from each other. We shall then further look into what media literacy children shows of two different cultural backgrounds try to target.

Media Literacy Treatment

Jayasankar and Montiero (2001) asserts that the act of interpreting visual messages into significance is culture bound, and culture is an assembly of knowledge and belief systems, relationships, technological and societal practices. Media, being a technological bearer of culture, is part of the values formation of a child. It can be presumed then, that media literacy can be culture bound. With the successive tables, we would like to see what media literacy each of the shows strongly focuses on.

Table 4. Comparison of the frequency of media literacy skills targeted in general scope within five episodes – Pair 1

The preceding table exhibits that *Goin' Bulilit* often targets the skills of abstraction, seen at a rate of 15. This is the ability to make accurate description of the message. In *Goin' Bulilit* abstraction can often be applied and observed in parody segments of news programmes. On the other hand, *Die Maus* obviously encourages the skill of analysis at a rate of 24, which is a lot higher compared to the 6 occurrences observed from *Goin' Bulilit*. Of almost the same importance, *Goin' Bulilit* and *Die Maus* encourage the skill of evaluation, although the topics were different. *Goin' Bulilit* deals with daily experiences, *Die Maus* deals with finding answers. There is a stark difference between the shows' promotion of the skill of induction. *Goin' Bulilit* exhibits no instance for induction to be practiced, also a big difference to *Die Maus* that reveals an occurrence rate of 7. *Die Maus* also allows more rounded experience of media literacy skill, since it regularly contains all the seven media literacy skills suggested by Potter (2008). *Goin' Bulilit* however only tackles three out of the seven media literacy skills. The same comparison is done between *Batibot* and *Sandmännchen*, and the results reveal that the media literacy skills targeted by the shows are divergent.

In the subsequent table, it is revealed that *Batibot* shows the highest occurrence of media literacy skill being promoted within the show, and this is the skill of evaluation at the rate of 21. *Sandmännchen* however, encourages the evaluative cognitive processes of children, observed to be occurring at the rate of 15. Both illustrate no occurrence of synthesis since their target audience are very young kids, or pre-school age, and may not yet have the motor skills to build sturdy objects and do experiments without adult assistance. *Sandmännchen* did not give segments that exercise the ability of a child to do grouping exercises, but its segments are more analytic and evaluative. *Batibot* however, exhibits frequent occurrence of segments that encourage abstraction, seen at the rate of 12, followed by analysis at 10, and evaluation at 9. Both shows have equal number of media literacy skills suggested by Potter (2008), but they aim at different types of skills. Following these observations are the investigations on the type of technologies for education and entertainments utilised by the children shows in question.

Table 5. Comparison of the frequency media literacy skills targeted in general scope within five episodes – Pair 2

Conduct of Education and Entertainment

The succeeding tables reveal the type of educational and entertaining materials each show prefers to utilise. We will observe the differences, or similarities, in the types of technologies children from the two different countries experience. The elements in the observation sheet were based on Van Noort's (1992) study that enumerated the type of educational and entertaining elements in the show, to which kindergarten students in London were exposed. As we look into the results of the comparison tables, we shall try to see if indeed there is a difference in the children's experience on education and entertainment via television. University of the Philippines Diliman, College of Mass Communication – UPD CMC (2011) *Plaridel Academic Journal* released a statement, which contends that "digitisation and technological improvement across the value chain, may it be personal, business or social, have provided the required impetus for improving the quality of content of media and its ability to reach the masses." Observation results tend to agree that technologies are needed to get messages across. The blending of information and entertainment in children shows become even more seamless with the use of multimedia technologies. The next table details the distribution count of infotainment content, followed by a table that details the distribution of entertainment technologies:

Paired Classification	Country	Name of TV Show	No. of Episodes	No. of Segments N	EDUCATION / INFORMATION						ENTERTAINMENT							
					Social Values Exhibit		School Lesson Support		Issues Exposure		Games		Talent Shows		Adventure/ Action		Humour/ Comic Tall Tales	
					n	%	n	%	n	%	n	%	n	%	n	%	n	%

Table 6. Summary frequency count of the occurrences of the fundamentals of education and entertainment – Pair 1 & 2

The numeric results on Table 6 describe the use of the fundamentals of education and entertainment present in the four shows observed. Education and entertainment are delineated from each other by enumerating elements that will fall either under education, or under entertainment. Under education are: the exhibit of social values, the support to school lessons, and the exposure to social issues. Under entertainment are: games, talent shows, adventure, and humorous tales. The frequency of the occurrences of these elements was counted and tabulated together to create a general scope. The number of occurrence is then correlated to the number of segments the show has, in order to see if the segmentation design is concentrated on education or entertainment. The tables are also meant to exhibit if the show leans towards the elements of entertainment or education.

It is revealed that all four shows exhibit social values, and in this case, when counted according to the number of segments in one show, in relation to the amount of occurrence of display of social values, *Sandmännchen* actually has the highest rate of concentration towards exhibiting social values, seen at 100%, followed by *Batibot* with a concentration of 79%, then *Die Maus* at 53%, and the least is *Goin' Bulilit* at 40%. Lesson support is not a concentration of any of the shows, except for *Batibot* that displayed around 8%, confirming that even if it is not their focus to give school lesson support, they have the tendency to design their segments toward helping kids with their school lessons. Both German shows, *Die Maus* and *Sandmännchen* reveal a trend of exposing their audience to political, sociological or environmental issues, at 53% and 24% respectively.

Germany shows a higher trend for issues exposure. It is followed by *Goin' Bulilit* at 20% and not far behind is *Batibot* at 15%, which also shows that there are instances of issue discussion on politics and the environment, but those are not a main stay in the design of the segments. *Goin' Bulilit*, *Die Maus* and *Sandmännchen* reveal heavier leaning towards entertainment, except for *Batibot* that reveals high concentration on education, but also not so low occurrences in entertainment. This confirms that *Batibot* is an educational show that utilises entertainment to get its message across.

In terms of entertaining elements, *Sandmännchen* shows the highest concentration of a certain element of entertainment, and that is 'adventure', which occurs at a 100% rate in relation to the number of segments in an episode. The next highest concentration on entertainment is the use of humorous tales, 90%, and adventure, 82%, both of which are carried by *Die Maus*. *Goin' Bulilit* follows at the rate of 76% for humorous tales, and 71% for talent shows and 25% for adventure and action. *Batibot* shows less amounts of entertainment, which is at 29% outdoor games, 18% talent showcase, 14% humorous tales, and 11% for adventure.

The high incidence of social values exhibited by both shows from the two countries, with only slight frequency of occurrence supports Table 1, which reveals that all shows transmit and communicate social values to their audience. The table in the next page is a full summary of the occurrence and use of entertainment design. There are four types of entertainment design often found in children shows, and these are: methods of production (live action, animated or a mixture of both), immersive environment (studio, on site, abstract/computer generated), theatrical agent (puppets, mascots, figures, illustrations, actors, lay persons, moderator), and theatrical technology (lights, music, SFX, VO, props, and set). These were based on Van Noort's study in 1992, but slight additions were placed into each of the categories, according to what often appears in the episodes of the shows.

EPISODE REFERENCE	Production Method			Total occurrence per episode (n)	Immersive environment			Total occurrence per episode (n)	Theatrical Agent							Total occurrence per episode (n)	Theatrical Technology					Total occurrence per episode (n)				
	Live action (n)	Animated (n)	Mixed (n)		Studio (n)	On site (n)	Abstract (n)		Puppets (n)	Mascots (n)	Figures (n)	Illustrations (n)	Actors (n)	Lay persons (n)	Moderator (n)		Lights (n)	Music (n)	SFX (n)	VO (n)	Props (n)		Set (n)

Table 7. Comparison of the frequency of occurrence and use of entertainment technological design

In terms of production method, animation is revealed to be the most preferred method of the majority of the children shows studied. *Die Maus* has 55% of occurrence in terms of the total number of its occurrence per episode in relation to the number of its occurrence in 5 episodes altogether. *Batibot* uses animation at 42%, and *Sandmännchen* utilises it with the highest occurrence of 93%, with the exception of *Goin' Bullit*, which concentrates on studio shots, thereby focusing on live action at 66%. This is in consonance to a study that claims that animation is the most common form of production used in children shows. Paus-Haase (1998) and Götz & Lemish, et al. (2002) revealed in their media literacy researches that heroes and fantasy are normal needs of children. Children's reaction and explanation about their understanding of the fantasy world exhibits how unreal figures help them perceive their physical and emotional environment better. It is evidently found in many children media materials. Animation is effective with children, because its use of basic shapes and forms conveys a visual sense of repetition, and its reliance on motion makes it possible for even the very young to observe the movement. Its simplified forms facilitate the focusing of attention, and its semi-abstractness makes it easy for children to take in a complete scene (Winnick, et al., 1973, p. 36).

The immersive environments preferred by most of the children shows is the studio, occurring at 44% for *Sandmännchen*, 42% for *Batibot*, and 40% for *Goin' Bullit*. *Die Maus* however, leans toward the use of abstract environments occurring at 57%, and on site shooting which occurred at 39%. Yet *Batibot* elevates itself over *Die Maus* in the amount of use of on-site shots, which is at 43%. There was not much difference with the preference of indoor and outdoor environments between the two countries' production style. The observation only showed that the outdoor environments manifested more occurrences of visual display of social values, than those shot in studios and indoors. Only the studio shots that simulated outdoor environments and household-setting scenes made it possible for indoor environments to display social values.

Observations on the use of theatrical agents revealed that the Philippine children shows opt for the use of actors rather than illustration and figures, which are preferred by the German children shows. This is perhaps due to heavier financial constraints Philippine shows experience in comparison to the children shows in Germany. *Goin' Bullit* and *Batibot* uses actors at 69% and 23% respectively. *Sandmännchen* uses figures at 67%, and *Die Maus* utilises illustrations at 45%. These results reveal that Philippine children show productions are more dependent on live action shots than animation, because the country's filmmakers and TV producers consider live acting to be a faster, cheaper, and more efficient method of media production.

The most preferred theatrical technology among the four shows is the use of music, which is found to be used at 62% for *Batibot*, 50% for *Die Maus*, 49% for *Goin' Bullilit* and 36% for *Sandmännchen*. The type of music is not differentiated here, as the observation sheet does not give importance to it. But in the course of doing the observation, it was obvious that the particular type or style of preferred music for children shows between two countries is observable. Voice-over is not extensively used in the Philippines, it is not used for *Goin' Bullilit*, and occurs only at 3% for *Batibot*; in comparison to 15% in *Die Maus* and 23% in *Sandmännchen*. Filipino characters and hero figures are more talkative. They tend to explain everything to other characters in the show, or directly toward the audience. German characters and hero figures are more contemplative, often thinking to themselves instead dialoguing with other characters or to the audience.

The observations successfully exhibited the frequency of occurrences of social values, the particularities in family values, the preferred media literacy target and the education-entertainment design of the show. Based on the categories discussed, the following patterns can be formulated:

Format	The use of animation and music is common to all shows, but the type of animation and music can differ. Philippine children shows employ more actors than animation. German children shows employ more animation than actors. Format protection is found to be more important in Germany, than in the Philippines. Philippine show formats tend to change easily to cater to change in preferences and lifestyle of the audience.
Entertainment & Education	Education and entertainment are blended into all children shows studied, but the animation design is different. <i>Batibot</i> showed the highest occurrence of pedagogical treatments.
Social Values Presentation	All shows promote social values, but the particular kind of values is different. There are 7 social values dominantly found in the four shows and these are: coordination/integration, courtesy, entertainment, factuality, family values, orderliness and timeliness. When looking closer into the 7 social values, the trends are: common to all are entertainment and family values; common to both German shows are orderliness and timeliness; common to both Filipino shows are entertainment and family togetherness; common to <i>Die Maus</i> and <i>Batibot</i> is coordination/integration; dominant to <i>Die Maus</i> alone is factuality; dominant to <i>Sandmännchen</i> alone is courtesy.
Family Values Representation	Family values are common to all of the four shows, but the quantification and representation reveals significant differences, and the Filipino shows are more elaborate on defining a particular family value. The specific family values that can be considered particular to Filipino children shows are: family togetherness, nurturing young members of the family, care for parents, obedience to parents, discreteness in dealing with other family members, and appreciation of domestic work. The family values that can be considered particular to German children shows are: Family togetherness, evening bedtime ritual, care for parents, and individual responsibility.
Media Literacy Skills	All shows target media literacy, but the particular skill targeted is different. Specific media literacy skills highly targeted by German children shows are: analysis and evaluation, and fewer but relevant instances of induction, deduction, synthesis and abstraction. Based on the amount of media literacy targeted, German children shows exhibit a trend of creating a holistic way to exercise media literacy. Specific media literacy skills highly targeted by Filipino children shows are: abstraction, induction, and fewer but relevant instances of evaluation and analysis.

Figure 9. General summary of tabulated findings

CONCLUSION

The research was successful in finding areas of similarities and differences between children shows in the Philippines and in Germany. The generalisations that were formed from the observation results point to possible areas that cause the complications in integration and the possible areas where children from the Philippines and Germany could meet in terms of their media exposure. Philippine and German children shows reveal common grassroots in inculcating family values, but different focus on a specific type of family values. The children shows also displayed their ability to be useful in inculcating media literacy, but the focus on what particular literacy skill is varied. Further research on how to mix these varying particularities together, can aptly supplement the results of this research.

The research exhibited more areas in youth media research to be explored. The decoding of the messages among children themselves can be another extension from this study. Adding the questions like 'What are the exact types of humour, music and animation being employed'; and, the *why* question can also be interesting starting point for further research. For example, 'Why do Filipino children shows employ more actors than animation compared to German TV shows?' or 'Why do German children shows display more values of timeliness and orderliness, while Filipino children shows display more values of entertainment and family togetherness?'

It can then be said that children who grew up in different media environments will have developed different media literacy skills. The descriptive findings answered the research questions on differences and similarities in the show's format and content, the values that characters send out, the interpretation of social values in visual form, the manner of transposing education and entertainment within the show, and the differences in media literacy treatment between the two countries. Children TV producers also voiced out their goals in mind when constructing the contents of their shows. They also shared a picture of the process of production before the message is sent out on television. It was declared that the members of the production team are the ones responsible for content construction, and institutional authorities have nothing to do with content formulation. Yet the national policies that may subtly control content remains as one possible research focus.

It cannot be concluded in this study though, that the differences discovered are the causes of integration problems. What the results simply say is that media content and the concentration on the types of values presented in children TV shows are varied, and is culture dependent. This research has not exhausted all the possible areas that need to be cross-referenced and re-examined. The interviews were also not enough in finding out what media policies and national laws affect the production processes and content of children show production. All producers claim that neither the network, nor the institutional policies have an effect on the production of the content and the format decisions for the show. If indeed these institutions do not have an effect on the content, there may be some areas in the production where they have an impact.

The results of the observation point to actual differences in media literacy skill targets. Media literacy is not a 'given' in a child. It is a skill, it is learned, and television is its teaching tool. Chu & Schramm (2004) noticed that there is much negative perception about television as a teacher, but they argued that television can be a way more effective teaching equipment than the classroom. Howe (1983) likewise points to television as a library of learning materials. One simply has to choose wisely. Lemish (2007) is then precise in her assertion that media literacy can be instilled early, preferably to toddlers, but even also at a younger stage.

I find the lines of Philip Mosher, a missionary kid to Africa quite amusing, when he said, "No wonder I see things differently. I saw different stuffs and creatures on TV back home." This innocent comment directs us to what O'Guinn and Schrum (1997) describe as the ability of television to create reality and world perception among viewers. They claim television can appear real (like news and TV dramas) and alter one's social reality. The observation results do not necessarily agree to this claim, but point to areas in children television where the messages and the interpretation thereof can differ, and thereby create a different social environment for the child. These results do not point to an alteration of reality, but a possible effect on how viewers react to what is seen on screen when they have seen different messages in the country where they grew up. A child with well-developed media literacy skills will be less prone to the negative effects of television.

Animation, music and humour were found in the observation results to be important ingredients in children TV productions. Chu and Schramm (2004); however, declare that "there is no consistent evidence that either humour

or animation significantly contributes to the learning from instructional television (p. 28).” Animation and music, in this research, are discovered to be mood enhancers and are indicators to differentiate reality and fantasy settings. Through animation, children can pick up differentiation cues easily. Animation was used to relax the viewers, bring them to a magical world, or make the scenes less agitating as they would have been in the real world. Animation music and humour may not add to the learning, but they enhance the children’s imagination and practice their media literacy skills.

Several inferences can be formulated from this study; and among them are: (a) TV formats of the same genre are similar around the world. The differences lie on the cultural philosophies or viewpoints, and values conveyed by the show. (b) TV productions of different cultures present divergent values. Some are common to both, some are different. The presentation of these values is unique to each other’s cultural context. It shows that immigrant children, particularly Filipino children in this study, can experience difficulty when integrating into the German community because media focuses on different values in different countries. (c) Producers claim that the shows’ contents are not affected by media regulations, production practices. (d) The children show producers practice self-censorship in content. It is the producer or the production team who takes responsibility for the content; and what they keep in mind are the media literacy principles governing the composition of children TV shows particular to their respective countries.

What remains now is the question on whether there are areas that could bridge the gap between the differences of what German young viewers see, in contrast to those that Filipino children are exposed. This is where media education and media literacy comes in. In order for children of different cultural backgrounds to come together and learn of each other’s perception of the world, there should be an international movement toward media literacy. There should be guidelines as to how media literacy development can be made holistic at an early age. There should be a campaign that shows cultural diversities and attach this with media literacy programmes in school, and even in the homes. As Liebert, Neale and Davidson (1973) clarify, a “media-educated person understands the following: all media messages are constructed; media messages shape our understanding of the world; individuals interpret media messages uniquely; and mass media has powerful economic implications (pp. 98-102).” A media-educated person will be able to limit use of media; make positive media choices; select creative alternatives to media consumption; develop critical thinking and viewing skills; and understand the political, social, economic, and emotional implications of all forms of media. This is what children shows around the globe shall try to achieve.

**SELF-CONCEPT OF COORDINATORS OF DRUG ADDICTION PREVENTION
AND OTHER SOCIAL AND PATHOLOGICAL PROBLEMS IN SLOVAKIA FROM
THE PERSPECTIVE OF UNIVERSITY EDUCATION**

PhDr. Roman Božík, Ph.D.

Faculty of Education
Charles University in Prague
e-mail: jiri.prokop@pedf.cuni.cz

Abstract: In this study, the author presents the partial results of research carried out in Slovakia among coordinators for drug addiction prevention and other social and pathological problems. The research was focused on determining the self-concept of the position of prevention coordinator. As a result of the research sample, the research mainly shows the adaptation of a new research instrument which could be applied in the conditions of the Czech Republic to determine the self-concept of the position of methodologist for school prevention. The research is still ongoing.

Key words: prevention coordinator, self-concept

1. THEORETICAL BACKGROUND OF THE STUDY

A coordinator for the prevention of drug addictions and other social and pathological problems in Slovakia, pursuant to Act no. 317/2009 Coll. on teaching staff and vocational training employees, is a teaching employee/specialist who coordinates in cooperation with the whole teaching staff and school employees preventive activities in a school which prevent social and pathological problems or eliminate them. Prevention coordinators in primary schools are teachers who attended a course during their university studies, or those who continued their education during the exercise of their profession. The position of prevention coordinator is mentored in Slovakia by two ministries (diagram 1)

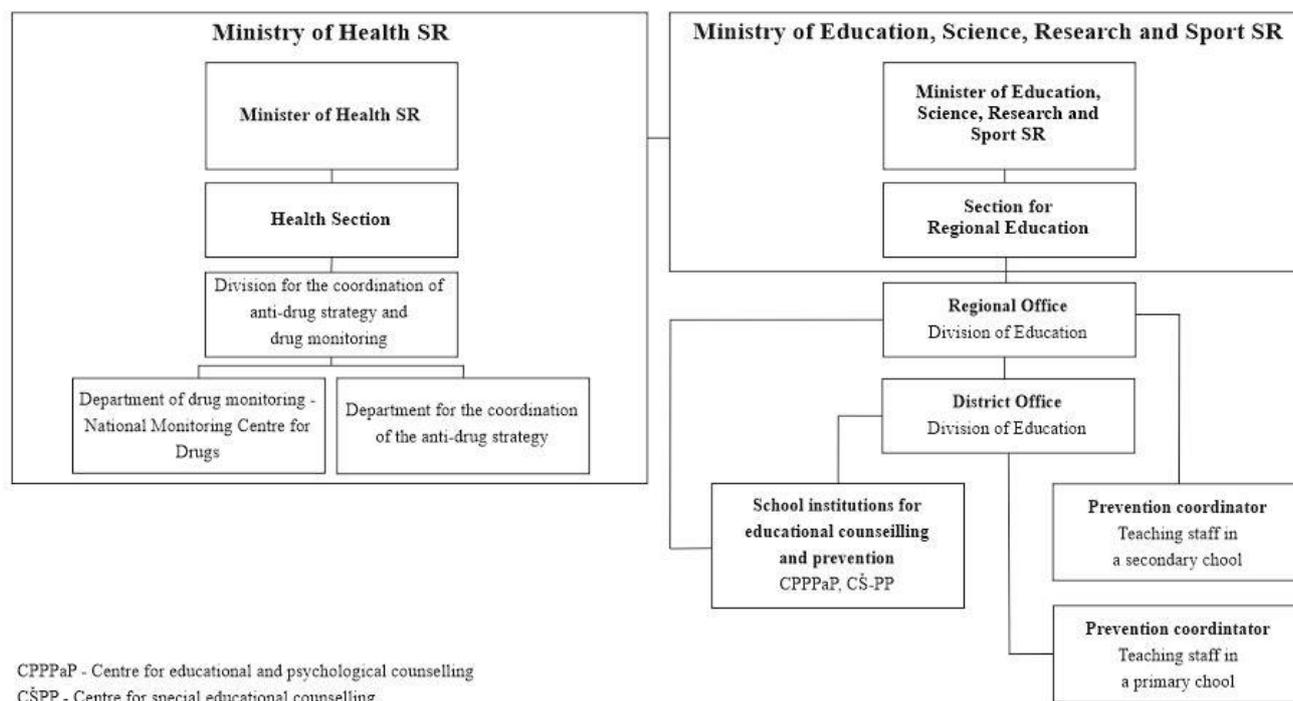

Diagram: *Graphical depiction of the scheme for the prevention system in the Slovak Republic*

The coordinator for the prevention of drug addictions and other social and pathological problems is appointed by the school director. One of the basic tasks of a prevention coordinator is to prepare an annual plan of individual prevention activities which will take place in the specific school (so-called prevention plan) in harmony with the school profile and the National Programme for the Fight against Drugs.

Teachers who see this position as a “necessary evil” to give them a full timetable in school (see Božík, 2017) also become prevention coordinators. Of course there are also some who carry out the job out of personal conviction. In practice, no-one expresses interest in prevention coordinators nor does any follow their professional growth. This is one of the reasons why we were interested in what makes primary school teachers become prevention coordinators, why they work in this position and what has an impact on their work in this job. These questions led us to monitor the personal self-concept of prevention coordinators.

We understand self-concept as a mental interpretation of the “I” which is stored in one’s memory as a knowledge structure formed in the process of a person’s interaction with his/her social environment. Self-concept is really a sum of opinions which a person has in relation to himself/herself; in this context, it is a sum of feelings which make us feel satisfied or dissatisfied with oneself. Self-concept also includes the realisation of one’s own personal characteristics, often distorted or stylised (see further Atkinson, 2003, Andrews, J.A. & Duncan, S.C., 1997, Wiegerová, 2012, Gavora, P. & Wiegerova, A., 2017). These aim to create a certain impression of oneself on other people. And this self-concept of prevention coordinators, its investigation and analysis was the subject of our research, whose partial results we are presenting here.

2 RESEARCH METHODOLOGY

The aim of the research was to find out what is the self-concept, personal conviction and self-evaluation of the position of coordinator for the prevention of drug addictions and other social and pathological problems in primary schools in Slovakia. We wanted to know what is their perception of their status as seen through the prism of the status of coordinator, cooperation with school staff and motivation to carry out their job.

Considering the potential relevancy of variables, we defined only one empirical hypothesis:

HYP: there exists a statistically significant difference between men and women in the majority of the elements of the questionnaire on the self-concept of coordinators.

2.1 Research instrument and its adaptation

As our research instrument, we used a scale questionnaire. Compared to a questionnaire composed of questions and multiple choice answers, this kind of questionnaire offers better statistical options.

In the first step, we defined the elements of the questionnaire:

1. Perception of the status of prevention coordinator/ school methodologist: how does a prevention coordinator/ school methodologist think that his position is perceived by his/her surroundings (parents, colleagues, pupils etc.)
2. Cooperation with school staff: how does the prevention coordinator/ school methodologist evaluate cooperation with other staff within the school in which he/she works.
3. Motivation for the position of prevention coordinator/ school methodologist: evaluation of his/her own motivation for carrying out this position and his/her opportunities for career growth.
4. Positive evaluation of his/her own work: own self-evaluation of carrying out the function of prevention coordinator/ school methodologist.
5. Limits of the impact of one’s own work – self-evaluation of his/her own work in this position, with consideration for certain factors.

For our scale, we used a Likert scale consisting of a statement and a numerical scale with 5 levels. On this scale, the prevention coordinator expresses the level of his/her agreement/disagreement with the statement:

Statement	1 Strongly disagree	2 Disagree	3 Neither agree nor disagree	4 Agree	5 Strongly agree
-----------	------------------------	---------------	---------------------------------	------------	---------------------

We prepared a questionnaire with 50 statements.

The Excel data was coded so that all the results matched a scale of 1 to 5, with 1 being the less favourable evaluation and 5 the most favourable evaluation. Since certain items had a negative expression (e.g. item 47, 3, 19, 16 etc.), the poles needed to be changed. After re-coding, value 1 became value 5, value 2 became value 4 etc. This is a normal procedure for changing the polarisation of scales.

2.2 Reliability of the questionnaire

The reliability of each constituent of the questionnaire was ascertained using Cronbach Alfa. The items within each element were correlated in relation to the other items of the element (item-total correlation). The items which had a low or even negative correlation were excluded from the element. This achieved the sufficiently homogenous composition of the questionnaire constituents, meaning that the constituent has a suitable reliability. However, this reduced the number of items in the questionnaire from the original 50 to 26. The final questionnaire therefore has 26 scales.

The composition of the questionnaire is as follows:

Name of constituent	Number of items	Alfa reliability
Perception of the status of coordinator	7	0,897
Cooperation with school staff	4	0,834
Motivation for position of coordinator	7	0,917
Positive evaluation of own work	4	0,602
Limits of the impact of own work	4	0,624

The first three questionnaire constituents have the reliability required of professional research instruments. The next two constituents have a lower reliability, mainly due to the small number of items. In methodology, it is known that the number of items in a constituent plays a significant role in its reliability. Even with a reliability of around 0.60 %, we consider the reliability of the last two questionnaire constituents sufficient for the purposes of our research which does not strive to be representative.

The final version of the questionnaire after being shortened:

Scale used: 1 strongly disagree; 5 strongly agree

PERCEPTION OF THE STATUS OF COORDINATOR

1. I consider the position of coordinator in school to be very useful.
2. Colleagues do not at all appreciate the position of coordinator.
3. Colleagues consider the position of coordinator as a way of earning extra money.
4. I consider the position of coordinator in school to be underestimated.
5. For parents, a coordinator is a pointlessly paid person.
6. Parents consider the position of coordinator as a difficult and responsible one.

COOPERATION WITH SCHOOL STAFF

1. School management participates in the preparation of the prevention plan.
2. Cooperation with other school staff in the field of prevention is very formal and impersonal.
3. Colleagues often have a tendency to lecture me on their methods of prevention.
4. Cooperation between the coordinator and other school staff fails based on different attitudes to the use of drugs.

MOTIVATION FOR THE POSITION OF COORDINATOR

1. The position of coordinator is given to the teacher for whom there is nothing better left.
2. I think just as highly of the position of coordinator as of teaching my teaching subjects.
3. I see it as an opportunity for career growth.
4. For me, it is an opportunity for personal growth and self-realisation.
5. The position of coordinator is purely a formal affair.
6. For me, the position of coordinator is an opportunity to gain new contacts with specialists in the field of social pathology.
7. The position of coordinator enables me to take part in training courses and practice.

POSITIVE EVALUATION OF OWN WORK

1. I am able to awaken sufficient interest in my pupils on the issue of addiction.
2. When solving problems, I am objective and fair.
3. I am able to be of support to pupils when dealing with problems in the field of social pathology.
4. I am satisfied with the realisation of programmes and activities under my leadership.

LIMITS OF THE IMPACT OF MY OWN WORK

1. I do not have the opportunity to influence the pathological behaviour of pupils' parents.
2. I really cannot deal with difficult cases of social pathology.
3. I have a minor influence on pupils compared to the influence of their contemporaries.
4. I have a minor influence on pupils compared to the influence of their parents.

(questionnaire authors Gavora, Božik, 2016)

2.3 Validity of the questionnaire

We carried out the face validity based on our own judgement of the suitability of items in terms of the composition of the questionnaire. We tested the relationship between the questionnaire constituents using a correlation coefficient.

Table 1: *Intercorrelations between questionnaire constituents*

		Perception of status	Cooperation	Motivation	Positive evaluation	Limits
Perception of status	Pearson Correlation	1	,017	,973**	,770**	-,218*
	Sig. (2-tailed)		,873	,000	,000	,037
	N	92	92	92	92	92
Cooperation	Pearson Correlation	,017	1	-,036	,441**	-,918**
	Sig. (2-tailed)	,873		,736	,000	,000
	N	92	92	92	92	92
Motivation	Pearson Correlation	,973**	-,036	1	,747**	-,147
	Sig. (2-tailed)	,000	,736		,000	,163
	N	92	92	92	92	92
Positive evaluation	Pearson Correlation	,770**	,441**	,747**	1	-,562**
	Sig. (2-tailed)	,000	,000	,000		,000
	N	92	92	92	92	92
Limits	Pearson Correlation	-,218*	-,918**	-,147	-,562**	1
	Sig. (2-tailed)	,037	,000	,163	,000	
	N	92	92	92	92	92

** . Correlation is significant at the 0.01 level (2-tailed).

* . Correlation is significant at the 0.05 level (2-tailed).

Individual correlations between questionnaire constituents express logical connections, which supports the justification of the thematic focus of the five constituents.

3. VERIFYING QUESTIONNAIRE ON A SELECTED RESEARCH SAMPLE

3.1 Characteristics of the research sample

Within Slovakia, we distributed 230 questionnaires, 98 of which were returned to us, giving us a return rate of 42.61%. Six questionnaires (6.12%) were excluded during the processing, because the respondents left out certain items, or filled them in incorrectly.

In the final count, 81 women (88%) and 11 men (12%) took part in the verification of the questionnaire. We can therefore notice that women dominate in the position of prevention coordinator, just as in the whole of the school system. Originally we assumed that men would be more interested in the position of prevention coordinator, but that was not the case. However, finding out the self-concept of men and women is a logical presumption of difference. In our case, due to the low number of male respondents, monitoring the self-concept based on gender differences is irrelevant. However, it appeared that the length of teachers' teaching experience is an interesting opportunity to follow differences in self-concept.

We divided the length of the teaching experience of prevention coordinators into five groups, with a range of 5 years for each interval. The most frequently represented group was the group of prevention coordinators with a length of teaching experience ranging from 6 to 10 years, with 36 (39.1%) respondents. The second most numerous group were coordinators for the prevention of drug addiction and other social and pathological problems with a length of teaching experience under 5 years, with 26 (28.3%) respondents. This is followed by a group of respondents with a length of teaching experience ranging from 16 to 20 years (16 respondents, i.e. 17.4%) and from 11 to 15 years (12 respondents, i.e. 13%). The least represented group is that of coordinators for the prevention of drug addiction and other social and pathological problems with a length of teaching experience over 21 years (2 respondents, i.e. 2.2%).

Table 2: *Composition of research sample by length of teaching experience*

Teaching experience	Frequency	%
0 – 5	26	28,3
6 – 10	36	39,1
11 – 15	12	13,0
16 – 20	16	17,4
21 and more	2	2,2
Total:	92	100,0

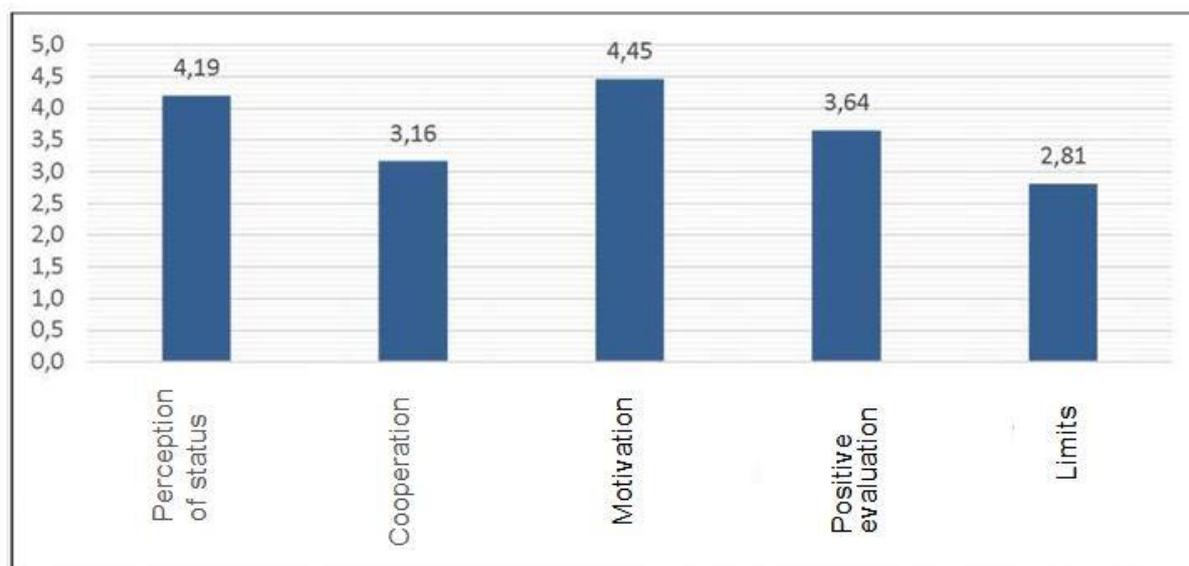

We divided the length of experience in the position of coordinator for the prevention of drug addiction and other social and pathological problems into three groups, each with a range of 3 years. The most represented is the group of respondents with experience in the position of coordinator from 4 to 6 years, namely 60 (65.2%) respondents. The second most numerous group is composed of 22 (23.9%) respondents with a length of experience as prevention coordinator from 0 to 3 years. The smallest group is that of respondents with experience of 7 to 9 years in the position of coordinator.

Table 3: *Composition of the research sample by length of experience in the position of coordinator for the prevention of drug addiction and other social and pathological problems*

Experience as prevention coordinator	Frequency	%
0 – 3	22	23,9
4 – 6	60	65,2
7 – 9	10	10,9
Total:	92	100,0

3.2 Interpretation of facts ascertained in the research in relation to the hypothesis

The main results of the questionnaire are shown in graph no. 1. The higher the score, the better and more valuable the given result. As can be seen, in all constituents (except for the constituent “Limits”) the data is above the middle value of the scale (which is 3 points), which points to a good level of prevention coordinators in each examined constituent. The highest scores are shown by the dimension of “Motivation” which is gratifying: the prevention coordinators clearly sufficiently understand the importance of their status. Coordinators achieved a result just a little lower in the constituent “Perception of status”. The other constituents follow with slight differences.

Graph 1: *Questionnaire results by constituents*

In the next part of the research, we were interested in finding out whether, despite the limited number of respondents, there exist differences between men and women in the average score of questionnaire constituents. The results are shown in Table 4.

Table 4: *Results in individual constituents of the questionnaire by gender*

GENDR		Perception of status	Cooperation	Motivation	Positive evaluation	Limits
Men	AP	4,18	3,23	4,50	3,68	2,77
	N	11	11	11	11	11
	S. D.	0,76689	0,65626	0,6463	0,31802	,39457
Women	AP	4,19	3,15	4,44	3,63	2,81
	N	81	81	81	81	81
	S. D.	0,67667	0,64309	0,63044	0,35795	0,39037
Statistical difference M - W		0,673-	0,357-	0,352-	0,732-	0,487-

The level of self-concept of coordinators essentially copies the whole sample in each questionnaire constituents. Even though there were certain differences between genders, it was shown that these were not statistically significant. As the last row in table 4 shows, statistical differences in the average score between men and women were not ascertained in any of the questionnaire constituents (Mann-Whitney nonparametric test).

a) Perception of status of coordinator

The prevention coordinators themselves, whether they are men or women, consider the work carried out in their position as very useful, while also feeling that this position is not sufficiently appreciated in the school. In their opinion, even their colleagues do not sufficiently appreciate this position, do not know the activities involved in the position of coordinator and see this position only as a way of earning extra money. According to the coordinators, even parents, one of the school's key partners in prevention, consider this position to be difficult and responsible while also being a pointlessly paid position.

b) Cooperation with school staff

Coordinators were unable to give an unequivocal statement on cooperation with school management on the preparation of the annual prevention plan. Perhaps this position is really considered as a formality, and this is how the school management and other school staff approach the issue, because coordinators expressed themselves ambiguously on this question. Not all school staff have the same opinion on the use of psychoactive substances and a healthy lifestyle, and coordinators were not able to express themselves unequivocally on this topic, whether their cooperation with other members of the school staff fails based on differing attitudes to the use of drugs. The ambiguity of answers in this category can point to the fact that the prevention coordinator can only rely on himself/herself or is, in our opinion, an overall prevention activity carried out only on a formal level.

c) Motivation for the position of coordinator

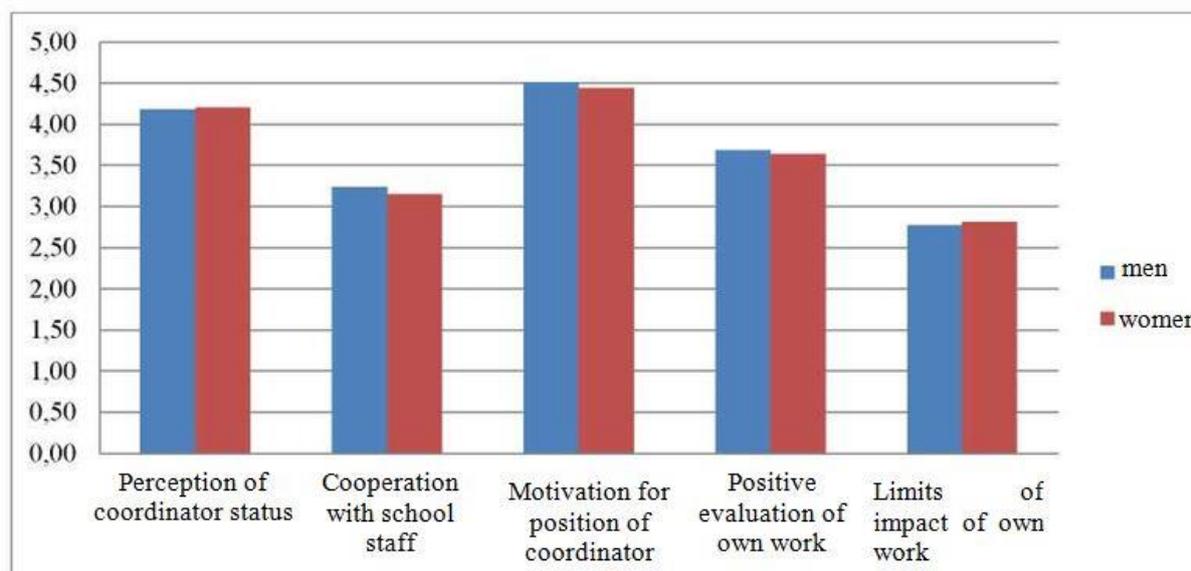

Coordinators declare that the position of coordinator is given to teachers for whom there is nothing better, but they also value this position as much as the teaching of their own subjects. They perceive this position as an opportunity for their own career growth, it's an opportunity for personal growth, self-realisation, and obtaining new contacts with experts, it's an opportunity to take part in training courses and practice, but they also see the position of coordinator as a purely formal affair (since this category is filled with a high score, we can point out the confirmation of our supposition from the previous category of the formality of the position of coordinator).

d) Evaluation of own work - abilities

This category presents the self-evaluation of the coordinator to carry out this work, with the coordinators declaring "uncertain agreement" with the fact that they are able to awaken interest among pupils in the issue of drug dependencies, as well as being objective and fair when solving problems. We can assume that the coordinators are not entirely convinced that they are able to be a support for pupils when solving problems from the area of social pathology, and they do not unequivocally express agreement with the satisfaction and realisation of programmes and activities under their own leadership.

e) Limits of the impact of their own work

The prevention coordinators expressed that they have the opportunity to influence to a certain extent even the pathological behaviour of pupils' parents (the oft-declared cooperation between school and family) and to a certain extent are able to deal with serious cases of social pathology. Their influence on pupils compared to the influence of their contemporaries or parents is not negligible, in their opinion.

Graph 2: Results of individual questionnaire categories by gender

3.3 Classification by age group – findings

a) Perception of the status of coordinator

If we compared relations between individual age groups, the answers of the 26-30 age group differ significantly from the other age groups, while uncertainty and ambiguity can be felt in all the answers in this category. The other age groups answered in approximately the same way with slight deviations in score. In our opinion, this swing can be caused by the enthusiasm of new teachers and a certain subsequent attenuation or scepticism, followed by stabilisation and balance once this period is overcome.

b) Cooperation with school staff

This category is dominated by the difference in answers from the 41-50 age group, which declares that the school management participates in the preparation of the prevention plan, but also agrees that cooperation with other school staff is informal and fails based on various attitudes to drug use. They express agreement that colleagues have a tendency to lecture them on methods of prevention. This age category is composed of mature teachers with a certain perspective and self-reflexion and so we can assume that their answers were not influenced by anything and that they replied just as they felt, even though the result is not particularly flattering. The other age categories replied ambiguously.

c) Motivation for the position of coordinator

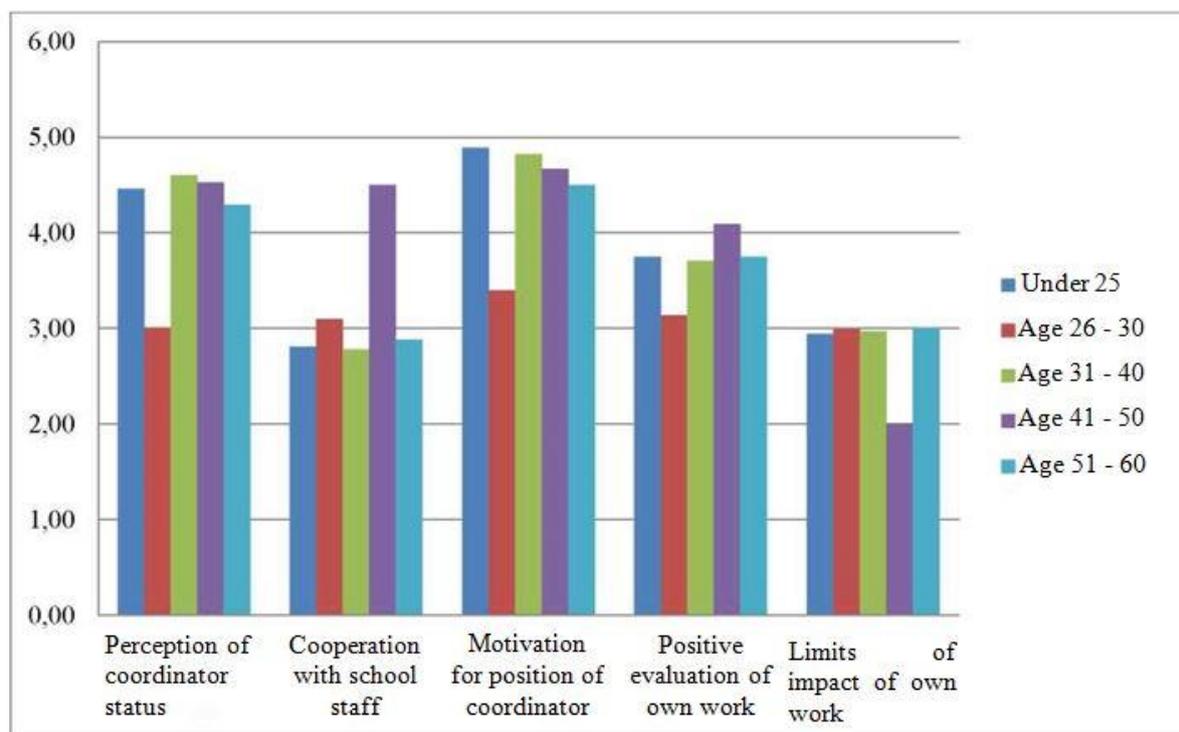

Even in this category, the 26-30 age group differs significantly, oscillating on the border between ambiguity and indecisiveness. As expected, the under 25 age category sees the position of coordinator in effect as an opportunity for career growth, self-realisation and obtaining new contacts, but also sees this position as a formality for those for whom there is nothing better left. In other age categories, the score almost equally falls.

d) Evaluation of own work - abilities

In this category, coordinators from the 41-50 age group have the most confidence in themselves and express satisfaction, and based on previous results, as expected, coordinators aged from 26 to 30 express themselves ambiguously. The other age categories are at the same level with small deviations.

e) Limits of the impact of their own work

Almost all age categories oscillate around the border of ambiguity, however, the 41-50 age category shows sufficient self-awareness according to the results in terms of the impact of their own work, even compared to the contemporaries or parents of the pupils.

Graph 3: Results of individual categories by age group

3.4 Classification by length of teaching experience – findings

a) Perception of the status of coordinator

Uncertainty and ambiguity is clear from the answers of coordinators with an experience of under 5 years, which contrasts with their eagerness and enthusiasm as newcomers in the previous results.

The other groups have slight deviations (in our case of no significance) at almost the same level.

b) Cooperation with school staff

Coordinators with teaching experience of 16-20 years unequivocally answered differently to other groups, which might be related to the length of experience, as well as match previous results when coordinators with such experience are already mature teachers and mature personalities with perspective and self-reflection, and so we assume that their answers were not influenced by internal or external motivations.

c) Motivation for the position of coordinator

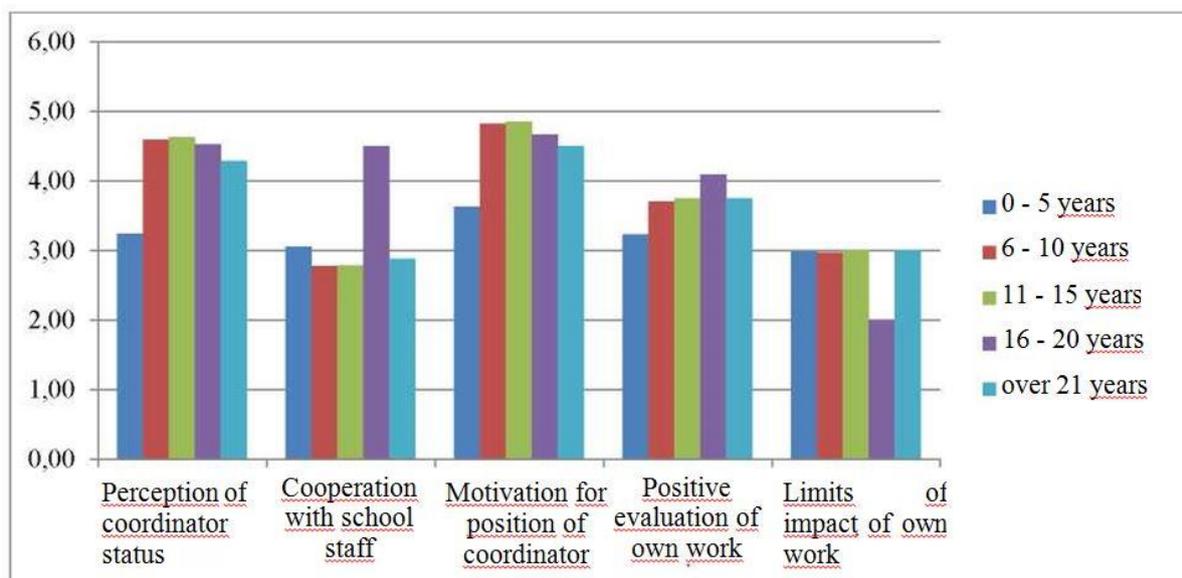

Coordinators with experience of under 5 years formulated their answers more clearly but still did not meet the level of other groups, whereas coordinators with experience of 11-15 years and 6-10 years expressed themselves the most unequivocally, which points to a certain stability and consistency.

d) Evaluation of their own work - abilities

In this category, coordinators with an experience of 16-20 years have the most confidence and express satisfaction, which is natural from our point of view, since they are experienced teachers who should be able to evaluate realistically their work and results.

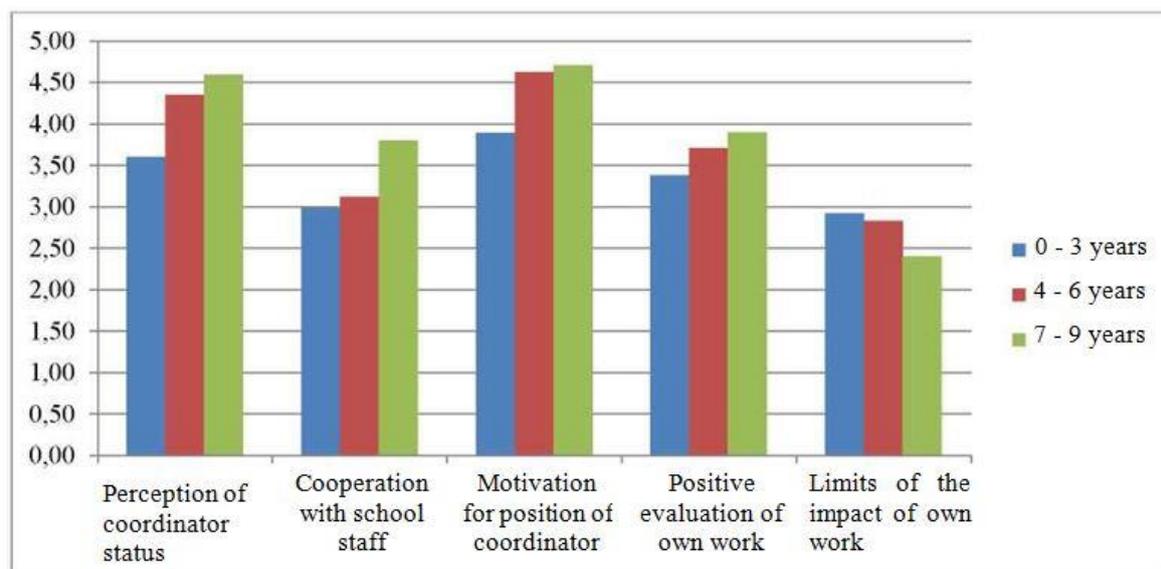

e) Limits of the impact of their own work

The very group with an experience of 16-20 years sees its limits in a positive light and does not agree with a single statement in this category. In effect, we can note an overlap within the classification by age, which might confirm the connection of the numerous matches in answers.

Graph 4: Results of individual categories by length of teaching experience

The results clearly show the impact of the length of experience on the position of coordinator in relation to the unequivocalness of answers in all categories, as well as their own self-evaluation and a certain dose of certainty when evaluating the limits of the impact of their own work for those with experience of 7-9 years. It is clear to see the maturing and progress across each category in the sense that the longer the experience, the greater certainty and conviction. The above points to the fact that experience and professional maturity also have an impact on the position of prevention coordinator. At present, we are finishing similar research on the position of school methodologist for prevention.

Graph 5: Results of individual categories by length of experience in the position of coordinator

4. SUMMARY

The findings which this phase of the presented research brought point to the fact that it might be a good idea to devote further attention to prevention coordinators, also in relation to their personal self-concept. The results presented by us are not complex, since at present data collection is also underway in the Czech Republic. “The Czech school system has its specific features in relation to the preparation of teaching staff” (Prokop, 2012). For relevant results, the number of respondents included in the research must naturally be increased. But we expect that the research instrument adapted by us may also be of use in further research projects.

Teachers/prevention coordinators, as well as certain personality traits essential for carrying out this position, which we tried to map out by finding out the self-concept of prevention coordinators in Slovakia, should also indispensably meet the requirements of professional qualification.

In relation to this, it is appropriate to reflect on the preparation of future teachers at universities. Universities should unconditionally prepare students within each study programme for work on the prevention of social and pathological problems and pay attention, or create sufficient space for carrying out work experience in institutions which deal with the issue of social pathology and thus enable them to obtain the widest portfolio of knowledge.

Our unequivocal recommendation is that the preparation of prevention coordinators should be cyclical and systematic and that it should also contain personality-developing elements.

CREATING A COLLECTIVE ALZHEIMER AWARENESS IN BASIC DESIGN EDUCATION THROUGH COSTUMES DESIGNED WITH THE THEME ‘MISSING YEARS’

Aysen CELEN OZTURK

Eskisehir Osmangazi University

Architectural Department

TURKEY

acozturk@ogu.edu.tr

ABSTRACT

In the present study, the concept of “memory loss due to Alzheimer” was scrutinized as a design problem in architecture department basic design course, for young individuals to recognize the increasing prevalence of the Alzheimer's disease worldwide and in Turkey and to raise social awareness in the society. Initially, the students discussed how memory loss can be presented as a design. Later, using two and three-dimensional presentation techniques, they turned their designs into material products. In basic design education in architecture, “learning by doing” method was used. The problems presented in Basic Design course are supported not only by the discipline of architecture but by different disciplines as well. In creating the problem presented here, fashion design discipline, which is similar to architectural construction techniques, was utilized. Both disciplines are based on human scale. Furthermore, “Fashion design” was chosen since it is an interesting and intriguing, easily accessible design discipline that people from all walks of life could relate to. The building and production approaches of both disciplines that determine the main construct of design using a concept, are also similar. Construction and production techniques are determined by materialdetail solutions. Thus, the students of architecture were asked to design an “Alzheimer’s Awareness Costume with the theme of Missing Years” and to present the costume in a fashion show to arouse interest. The “Awareness Fashion Show/Exhibition,” organized in collaboration with Eskişehir Alzheimer's Association was presented to all at a predetermined venue in Eskişehir urban center.

Keywords: Basic design education, Fashion and Architecture, Alzheimer’s Awareness, Spatial/Temporal Disengagement, Items of Forgotten Memory.

INTRODUCTION

Today, universities focus on their students’ emotional and intellectual development as well as their vocational education. University education no longer tackles with only acquisition of material knowledge, but also focuses on current social problems. Thus, the most prevalent disease of the future, “Alzheimer’s disease” was addressed as a social problem in the present study. The world population is gradually getting older and the average life expectancy is getting longer. The World Health Organization calculated the rate of population over 65 years to the total population as 10% today and predicted the same rate as 16% in 2050 (Arslantaş et al., 2009). According to Turkish Statistical Institute figures, while the rate of the population over 65 to total population was 7.5% in 2012, it was expected that this rate will be 10.2% by 2023, 20.8% by 2050 and 27.7% by 2075 (Ozturk, 2017). Based on this data, universities and all educational institutions are responsible to devise pertinent projects to attract social attention to Alzheimer’s disease and increase collective awareness on the issue.

In design disciplines such as architecture, interior design, industrial design, fashion design, etc., when design is considered as an act of problem solving, the “Basic Design” course provides abstract and conceptual thinking which is the most basic tool of the act of design. Basic design course makes it possible to analyze a given problem, to conceptually deconstruct the same, to reach an abstract plane from the tangible, to produce ideas, and then to return to tangible (Erdogdu, 2016). Especially during the “Basic Design” training in the freshmen year of architecture education, the cognitive formation of the abstract, the development of creativity, critical thinking and perceptual awareness, three-dimensional thinking, are among the most important development of skills. The basic design course studio possesses the most significant contextual weight in time and effect at the beginning of architectural education. The design logic commences to form in this course. In the design studio, it is important to discuss the predesigned products rather than the instruction of design. L. Bruce Archer defined design as systematic research, the knowledge of manmade objects and systems or the determination of the view, composition, structure,

objectives, values and the meaning of the abovementioned objects (Archer, cited by Bayazit, 2004). The designers work with an imagined future reality; the designer describes and creates the non-existent (Jones, cited by Yürekli, 2004). The most important characteristic of the act of design is the need to think about the future and to identify future problems. The designer should learn to strengthen and utilize intuitions and common sense, and thus could 'speculate about the future' (Yürekli, 2004). Recently, the schools of architecture were criticized that they instructed the "basic design courses" in stereotypes, reducing the course into instruction of the form, without improving creative skills. In today's rapidly changing environment, it was argued that there is a need for a curriculum, which constructs a mental structure that can produce flexible, dynamic, and novel probable situations and an inquisition process (Yurtseven, 2011).

In the present study, which continues the abovementioned debate, the utilization of interdisciplinary work in the basic design course was studied. The transformation of the knowledge in different disciplines and theoretical heuristic approaches also affect the final products. Students who discover relational approach to architecture through various disciplines would present their unique designs with their unique presentation methods and would transfer rich cognitive images to the final product in the design process (Avcı, 2011).

In the present study, the discipline of fashion design was selected as an instrument in transferring the memory loss caused by Alzheimer's disease to the design. The main objective of the study was to draw attention to Alzheimer's disease, which is the greatest health and social problem of today and the future, and to contribute to future studies by creating a social awareness on the issue. The fashion design discipline was selected since it has become an important discipline that people from all walks of life could relate to and it is an interesting, intriguing, and an easily accessible design discipline.

The main topic of the present study was the "memory loss caused by Alzheimer's", and the content was examined theoretically and the problem of "Alzheimer's Awareness Costume Design with the theme of Missing Years" was developed empirically. It was expected that the uncertainty of the problem and the necessity of defining it in detail by the designer, rather than providing a final definition of the design problem, would promote abstract concepts such as intuition, common sense, emotional intelligence, flexibility and creativity. The resulting product, "Alzheimer's Awareness Costume Design with the theme of Missing Years", was presented in a fashion show, arousing interest.

THE STUDY

Eskişehir Osmangazi University (ESOGÜ) Architecture Department renamed the freshmen "Basic Design" course as "Introduction to Design I and II" studio with a change in the curriculum in 2012. Within the scope of the studio, several basic design problems are discussed throughout the academic year. These design problems are often introduced in a vague structure without sharp limits to improve mental creativity and abstraction skills. The design approach is learned by practicing and experimenting in the studio. Students are asked to produce three-dimensional models using hands-on "learning by doing" method and explain their designs. The overall aim was to develop the "critical thinking and producing approach" of the freshmen architecture students based on their designs. Instead of theoretical instruction, the construction of nurturing concepts in architecture using different disciplines (art, sociology, philosophy, medicine, natural sciences, etc.) and developing a discussion-ideas through these concepts was the basic approach in the Design Studio.

In architecture education, the words studio and workshop are occasionally used synonymously. Hence, it is essential to make a distinction between these two terms, since there are fundamental differences in terms of their implementations. In workshop spaces, student work is revised by instructors and the final products are shaped according to the direction provided by the coordinator. In a hierarchical, canonical structure, a study for a product with a predetermined outcome is the subject matter. Nevertheless, the studio environment is different from such structure with respect to its focus on development rather than the correction of the final product. Accordingly, the work in the studio is criticized and most of the studies are carried out in groups. The student work is expected to be developed according to the criticisms and interpretations of the studio instructors who teach the course together. The hierarchy between students and teaching staff is perceived less and the design process is more important than

the final product (Lang, 1998). Therefore, Introduction to Design course in Eskişehir Osmangazi University (ESOGÜ) Architecture Department is taken into consideration from the viewpoint of a studio.

Once the relevant literature is reviewed, it is possible to observe that two major paradigms play an important role in the development of architectural design education. One of these paradigms is Ecole des Beaux-Arts, which first applied the studio system. In Dewey's early period study at the beginning of the 19th century at Ecole des Beaux-Arts regarding the basic design system in architectural education, it was observed that students discussed the problem in a collaborative manner with their instructors, shared an intensive process and simultaneously experienced the means to design (Tschimmel, 2010). This paradigm was criticized for its formal and stylistic approach to design, which repeats the precedents in the history, for its two-dimensional and symmetric composition approach, and elitist and aristocratic attitude (Uluoglu, 1990). The second paradigm of architectural design education is the Bauhaus school. It is possible to assert that the ultimate difference of the Bauhaus from the Beaux Arts model is to free the student from any kind of conditioning and bring his creativity, imagination, individual expression possibilities to the forefront.

In addition, Itten, the founder of the Basic Design education in Bauhaus, aimed that the student could question the previously acquired patterns of thought, could consider the problems before deciding and could experience these within a personal integrity (Arıdağ & Leo, 2012, citing Lerner).

Similar to the education method defined in Dewey's book, "Freedom and Culture", the design studio should have a structure that does not solely provide information to students, but makes them accustomed to finding the paths to problem solving and provides students the habit of thinking for this purpose (Dewey, 1987). Concurrently, Dewey points out learning by doing as an important way to establish causal relationships between objects, concepts, in his books "Experience and Education" (Dewey, 2007). According to Dewey, it is important to grasp relationships in the design studio and construct similar relationship in other circumstances and other time periods, to interpret or decipher other situations (Özkar, 2009). In this sense, Dewey's method, which allows the student to freely discover oneself and allows him/her to learn by doing, was adopted as the instructional methodology in the Introduction to Design course in Eskişehir Osmangazi University (ESOGÜ) Architecture Department.

Architecture and fashion design, which are both design activities regarding humankind, exhibit similarities in terms of tectonic and structural strategies. Architecture and fashion have common concepts regarding design theories. Design is referred as a problem-solving process by individuals. Gully asserts that, even in fashion design, problems regarding clothing is related to the resolute aesthetics proposed by the designer. Such solution should have a connection with the human body in terms of design style, color, fabrication, proportion and pattern (Chinwendu, 2014). Both architects and fashion designers tend to use similar techniques such as the use of geometry to create form where they both begin the process with a skeletal structure then add other elements to support it, occasionally these elements could be draped or even suspended. Even though there are connections between architecture and fashion as pointed out above, there are some modifications in scale, materials, sizes, shapes and proportions as well.

One of the main methods of improving educational process in the Architectural Schools is systematic and gradual development of skills to create tectonically embodied space. In Eskişehir Osmangazi University, Architecture Department the complex three-phase model for acquisition of the tectonic skills is employed. At every phase, the tectonic skills are improved progressively. In the first phase (initial year), the reveal of tectonic characteristics in nonarchitectural objects is treated as an experimental stage that sums up the analysis of the nature of materials. In the second phase (intermediate year), the cognition of tectonic systems in architecture and their types are approached as the analytical stage for studying the evolution of tectonics. In the third phase (third and fourth years), tectonic systems are interpreted as the final stage which develop skills in tectonic treatment of a form in terms of architectural composition and architectural design. At this phase, the design aims to secure coherent educational system and interdisciplinary connection via the tectonic subject. The aim is to encourage students to avoid mannerism and incapacity related to the form and instead to accentuate simple visual characteristics of architecture and to comprehend truthful possibilities in creating tectonically embodied space.

In the first-year Introduction to Design course, the concept of tectonics was analyzed in the light of etymology via its comparison with terms such as *techne*, *technique*, and *technology*. The main idea of the studio's methodology commences with Aristotle's concept of *techne*. According to Aristotle, everything in the world is a matter that gained form, and the essence of any matter is its potential to become and do something. The matter performs its essence as a form. Aristotle, and thenceforward Heidegger, mention the four causes in the formation of *techne*. These causes are, *hyle* (the material cause), *eidos* (the formal cause), *telos* (the ultimate cause) and *logos* (the effective cause). According to this idea, *techne* is "knowing by doing, doing by knowing" (Ergül, 2015). During the studio work, this conceptual substructure was utilized as the "knowing by doing, doing by knowing" technique. It was previously suggested that technology is a mode of revealing the essence of the materials. As presented in Diagram 1, organized knowledge for production technics could be formulated in order to transform raw material into useful instruments, which reveal the means they were made in contrast to natural objects.

In this study, the students were primarily requested to choose and develop a past memory item to explain the memory deficits caused by Alzheimer's as design decisions. As seen in Table 1, the designs were taken into consideration as matters that belong to the past, namely, Daily objects, culture and art objects, famous artists, forgotten technological images, and forgotten items of romantic sentiments. Starting with such conception, the nature of the materials was analyzed, assembly techniques were developed and a holistic body structure was created in order to design costumes with three-dimensional multipartite materials. In the creation of the whole, materials' tectonic function independent of the body was discussed during the course. According to Gottfried Semper, assembly is a contemporary fragmentation experience and it allows a discourse that eliminates the metaphysical content of the duality between construction and representation. Assembly presents its tectonic form in its disconnectedness (*dis-joint*) (Özkan & Akçakoca, 1997). The experience of assembly constitutes an important mental process in the formation of the tectonic construct by the students. According to Louis Kahn design should as well transform the nature of the present matter via technical means ("by technique") and enlarge its environment (Güvenç, 1997). The three-dimensional and piecemeal techniques of materials enable the act of making that allows the creation of tectonic construct. Therefore, various joint and assembly techniques (knitting, sewing, stapling, etc.) were developed and the surface properties of materials were altered via the employment of these techniques.

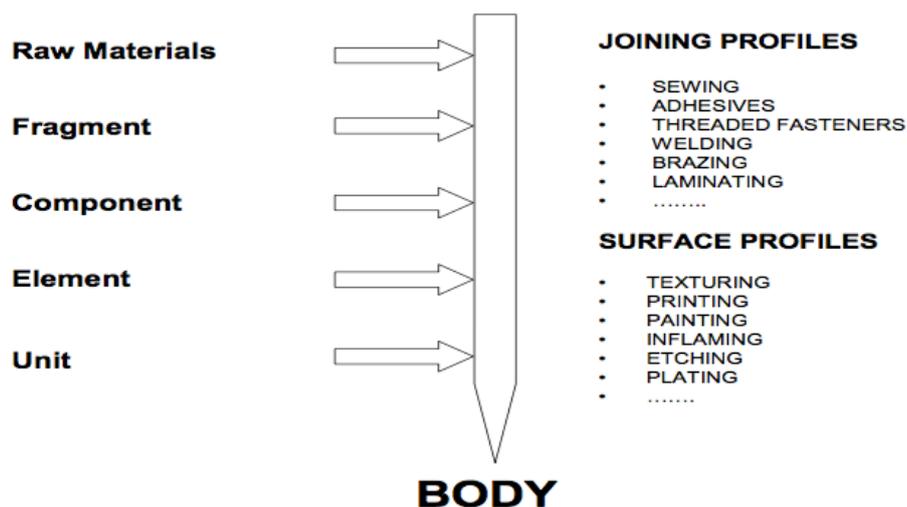

Diagram 1: Methodologies of creating tectonics and making Technologies

FINDINGS

Within the scope of basic design studies in Eskişehir Osmangazi University Architecture Department, this study intended not only to inform students on Alzheimer's, but also to explore significant consequences of the disease, such as "spatial/temporal loss," through transforming the items of forgotten memories (audio tapes, black and

white photos etc.) into costumes and a costume exhibition. In this framework, the designs were analyzed and were presented in 5 distinct groups in Table 1. These distinct groups constitute of items deleted from past memories (newspaper headlines, typewriters, pay phones and twig brooms), collectors of cultural and everyday life (audio tapes, 33 rpm records, black and white film strips etc.), childhood games in the past (abacus, pog game chips, Tetris, the Friendly Ghost etc.), past images (good-bad memories, memory boxes, spinning toy etc.) and romantic memory items (love letters, photo albums, archives, seals, etc.).

As presented in Diagram 1, raw materials (such as paper, cardboard, linear elements as wires, etc.) were transformed into three-dimensional objects from their two-dimensionality via geometric organizations and various making methods (knitting, stitching, etc.). Costume designs with structures that acquire stability via establishing a relationship with the body through partial contact were created. The designs that were outcomes of group work were presented initially to the jury members by one individual from the group, and then were developed and finalized, and finally presented to the inhabitants of the city to improve awareness of Alzheimer's. Emotional moments were experienced at the fashion show, to which Alzheimer's patients and their relatives joined, and the costumes were observed with enthusiasm. This study is considered as an important experience for students to experience design practice through a different discipline, in addition, it is as well a significant experience in terms of researching on an important social problem and developing a design thinking through examining its complications, and presenting the design interactively to receive its implications.

Table 1: Abstract representation of the items/images of the forgotten memories through costume design.

DESIGNS	ITEMS/IMAGES OF FORGOTTEN MEMORY	MAKING METHODS
	1. Newspaper headlines	Knitting 2-dimensional newspaper papers after transforming them into 3-dimensional strips
	2. Classic typewriter	Combining circular section cardboard typewriter keys with metal structure
	3. Pay phone	Creating surface texture with electric cable knitting method and metal pulley
	4. Twig broom	Creating surface texture via knitting of bushes and attaching them by metal clamps
	5. Audio tapes	Creating texture via knitting audio tapes
	6. 33 rpm records	Combining the circular elements produced as 33 rpm records within different geometric organizations
	7. Audio tapes and veils	Providing an irregular fabric through the tight pattern of audio tapes that pass through the scattered gaps of the veil membrane
	8. Black and white film strips	Obtaining a volumetric textile material in flexible geometric forms by passing thin wires through the top and bottom holes of the film strips
	9. Abacus	Creating a wearable costume with the curvature construction of metal bars and wooden beads, referring to abacus, the counting element of our childhood
	10. Casper the Friendly Ghost	Fixing the image of the cartoon character Casper (the Friendly Ghost) into the transparent triangular prisms and clothing the body via a metal construction
	11. Pog game chips	Creating a surface of geometric organizations through the 2-dimensional pop game chips image pieces
	12. Tetris	Fixing colored Tetris blocks to a metal construction with different geometric organizations
	13. Spinning toy	Creating a spinning toy by knitting a linen thread around the body that constitutes a formwork for the spinneret through the use of kraft paper and the combination of three-dimensional geometric patterns
	14. Photo albums	Creating geometric patterns that originate from the habit to keep all our photos in albums and frames in the past
	15. Erasable photo storages	Making old printed photos portable via mobile storage
	16. Good and bad memories	Geometric abstraction of good and bad memories as black and white memory elements
	17. Archive and seal	Creating a three-dimensional surface texture from the two-dimensional kraft paper to represent the old archival images
	18. Türkan Şoray, old Turkish movie actress	Türkan Şoray's image, one of the strong images of Turkish cinema, is transformed into a three-dimensional textile element through the combination with two dimensional kraft paper and geometric forms
	19. Autograph love letters	Transforming the old autographed love letters on paper into three-dimensional representation to constitute a surface texture
	20. Empty photo frame	An object of photographic images in the past, the photo frame, is constructed as a structure

Figure 1 and 2. Exhibit of Alzheimer Awareness Costumes at the fashion show.

Figure 1 and 2 presents the dramatic representations of the costumes selected from the musical archives of the past. One of the most important advantages of the conducted study was the evidence that university students are interested in community problems and that they could show determination in addressing these problems. The comments received from the students indicated that they heard of the “Alzheimer’s disease” until then, yet they did not have substantial information on the subject, and would be willing to work on social projects in the forthcoming processes.

CONCLUSIONS

One of the most important constituents of architectural education is ‘knowing by doing/doing by knowing’. Design problems, which are as well enriched by interdisciplinary studies as much as the autonomous realm of architecture, are particularly transformed into end products by means of discussion. It can be asserted that two well-known branches of design, fashion and architecture, are substantially integrated with each other. Both disciplines employ the ‘concept’ approach to regulate design, while their manufacturing approaches also run in parallel. Their fabrication techniques are established on the search of the relationship between material and detail. Thus, each material in design a process has the potential of adding new layers or changing the meaning of the design product. This study addresses the student Works as the final product of the Introduction to Design course and emphasizes the significance of these outcomes to demonstrate the effectiveness of the employed course methodology. Consequently, this study aims to create a collective awareness regarding Alzheimer’s through costume designs of architecture students on the theme ‘Missing Years’. A fashion parade and exhibition was performed in collaboration with Eskişehir Alzheimer Union, under the name “Awareness Parade/Exhibition” in the city center for Eskişehir’s inhabitants.

ABSTRACT

The link between problem-solving and programming skills is well known. Students with higher problem-solving abilities find programming easy and they can master programming with no or little difficulties regardless of the programming environment. On the contrary, students with lower problem-solving abilities find programming difficult to understand and are often unable to master it. The before mentioned groups of students usually make up two thirds of the entire class, the top and lowest thirds, respectively. What about the "middle third" students? This is probably the most represented group; those are students who can master programming but with some difficulties. Visual programming language environments are tools designed to engage all students but maybe the "middle third" students would gain the most benefit from that approach. In this paper, we explore the educational and motivational effect of using Scratch for game-based programming on 5th-grade elementary school students based on their problem-solving abilities. Results presented here confirm the positive effect of using Scratch as the introductory programming language for game-based programming on "middle third" students, compared to Python as the text-based programming language.

Keywords: programming, Scratch, problem-solving, elementary school, "middle third" students

INTRODUCTION

Programming is difficult, and most children won't become programmers, so why should they learn to program? Programming, as a part of Computer Science, is also a part of everyday life, so learning programming as soon as possible should be the educational right of the 21st Century (Maloney, Peppler, B. Kafai, Resnick, & Rusk, 2008). It is well-known that programming requires higher problem-solving abilities and that by programming problem-solving abilities can be practised. Students with higher problem-solving abilities can master programming with no or little difficulties, so motivation is crucial to this group of students. On the other hand, students with low problem-solving abilities are facing a lot of difficulties during learning programming, and are often unable to master it. We could facilitate their efforts by choosing an appropriate pedagogical approach. Maybe the most interesting group are "middle-third" students who can master programming with some difficulties (Armoni, Meerbaum-Salant, & Ben-Ari, 2015). Motivation and appropriate pedagogical approach can be crucial for these students. Choosing the proper programming environment for target age may be the key factor.

Textual programming language approach rely on "real" programming approach with languages like BASIC, Python, etc. Those languages require high problem-solving skills and precision in syntax, so many children perceive programming as difficult. Programming is most commonly taught through solving various math problems. The question is: do children find programming based on this approach repulsive?

Visual programming languages are syntax error free and more attractive to children. Scratch is visual, block-based, programming language appropriate for elementary school children (Resnick et al., 2009). Using programming languages like Scratch has the advantage of eliminating syntax problems which allows students to focus on the language semantics. Besides that, elementary school students have yet to reach the appropriate level of abstract thinking required to program, which makes learning programming more difficult. Learning programming by using a visual programming language can provide concrete to abstract experience (Dann & Cooper, 2009), and can thus be used as a medium for mediated transfer (Dann, Cosgrove, Slater, & Culyba, 2012) towards “real” programming. By teaching programming in Scratch, we can also shift the context of programming from solving math problems, which is the most commonly used approach in text-based programming, to programming games, storytelling, etc. The question is: do students learn programming concepts or is it just fun?

Our previous research (Mladenović, Krpan, & Mladenović, 2016) showed that 5th-grade students with higher problem-solving abilities achieved better results in Python as “real”, text-based programming language. When it comes to Scratch that is not the case. Students with intermediate problem-solving abilities achieved better results in Scratch than in Python. This led us to new questions, can we affect the “middle third” students to achieve better results in programming? Can we motivate the “higher third” students to take programming class? Can we measure the motivational factor of these languages? In this paper, we give answers to these questions. This research was conducted in classroom settings. We analysed 5th-grade elementary school students’ test results during their enrollment in elective course Informatics in two schools by both approaches using Python as textual language and programming games in Scratch. Students didn't have any programming experience, and their problem-solving abilities were tested prior to the experiment. Based on the problem-solving test results, students were assigned to one of three groups. Students were learning different programming concepts in two programming languages and were tested for both approaches. Test results were analyzed and compared for each problem-solving group. The results of our research are presented in this paper.

BACKGROUND

Novice programmers find it very difficult to master programming. In order to solve a programming problem, we first need to break the problem into smaller, more manageable steps. This is the process of developing an algorithm. Students who need to focus more on syntax commonly ignore this phase. Flow charts and trace tables are often used to take the students through the steps of structured problem solving which leads to identifying sequence, selection, and repetition (Whitfield, Blakeway, Herterich, & Beaumont, 2007). Afterwards, novices need to program these steps using some programming language. A programming language is perceived as a major obstacle for novices (McCracken et al., 2001), especially when it comes to elementary school children because novice often focus on programming language syntax rather than developing an algorithm. Visual programming languages may help with this issue since they have simpler syntax, which allows novices to focus on developing an algorithm (Grover & Pea, 2013).

It has been reported that students with lower mathematical skills can learn problem-solving and programming if provided with appropriate materials and the use of less complex visual tools (e.g. Java Trainer) before moving to IDEs which are considered more complex (Whitfield et al., 2007). It is also reported that children weren't aware that they were programming, they argued that they were making games, stories, interactive presentations in Scratch (Maloney et al., 2008). This phenomenon Randy Pausch called “head fake” (Dann & Cooper, 2009) (Pausch & Zaslow, 2008).

In one of our previous research, we compared students’ success in LOGO, which is a text-based, and Scratch, which is a block-based programming language. Results showed that students’ success in Scratch was better, especially with regard to the concept of a nested loop. There were only a few students who were able to fully understand basic programming concepts while using Logo, but after a switch to Scratch that number increased. When it comes to motivation, Scratch is far more positively accepted than Logo (Mladenović, Rosić, & Mladenović, 2016).

Therefore, we can conclude that the “middle third” students can benefit from using a visual programming language. Similar conclusions were made in other studies. It was demonstrated that the use of the Jeliot program animation

system primarily benefited “middle third” students (Ben-Bassat Levy, Ben-Ari, & Uronen, 2003). The same conclusion was reported in a study where Scratch was used as an introduction to C# (Armoni et al., 2015). Besides, students can master basic programming concepts more quickly by using a visual programming language (Armoni et al., 2015) (Price & Barnes, 2015).

However, there are studies that indicate some possible bad habits of programming in Scratch. It's reported that during programming in Scratch middle-school students developed *bottom-up programming* and *extremely fine-grained programming bad* habits, although researchers were satisfied by motivation and developed technical skills of students by programming in Scratch (Meerbaum-Salant, Armoni, & Ben-Ari, 2011). These habits may have been developed as part of “natural learning” based on “scenario based learning” which fits with the idea of Scratch programming approach. These habits shouldn't be concerning (Gordon, Marron, & Meerbaum-Salant, 2012), especially when Scratch is used as part of formal learning in a classroom setting in which teachers can guide students.

Researchers analysed a total of 100 projects, and two other bad habits were discovered. The first one refers to character naming, where most students didn't change default names like *Sprite1*, *Sprite2*. Conversely, it was also reported that user variables are named correctly, i.e., semantically meaningful. A possible explanation is that when creating a new character, the name is given automatically which is not the case when adding new variables. The second bad habit is duplicating code in the same project which indicates that abstraction and modularization were not taught (Moreno & Robles, 2014). Teachers who use visual programming languages in their classroom need to be aware of bad habits to minimize their occurrence.

METHODOLOGY

In this study, qualitative and quantitative methods were used.

Research design

This research was conducted with the purpose to compare the basic programming concepts understanding, concerning two programming languages: Python and Scratch. The target group were elementary school students with no previous programming experience. In the Republic of Croatia Informatics is an elective course (Ministry of Science Education and Sports of the Republic of Croatia, 2005) from 5th to 8th grade, and programming is only one of several main topics in each grade. Therefore, 5th-grade students were appropriate for this research. Since programming is related to problem-solving skills and there is a positive correlation between math and programming (White & Sivitanides, 2003), the administered pre-test was designed to test student problem-solving skills. Students were first exposed to Python programming for four weeks with two hours per week which makes a total of eight hours. The lectures included selected programming concepts: variables, input, print, sequencing and conditionals. Student skills in Python programming were tested afterwards. Three weeks later (after winter school break), we introduced students to programming in Scratch. We have selected a game-based approach and students were required to program simple games. They were introduced to basic programming concepts like sequencing, conditional and iteration. The lectures were held for two hours per week for three weeks, and afterwards students' understanding of concepts in Scratch was tested. Additionally, they were given a questionnaire about their attitude towards programming after learning both Scratch and Python.

The participants of the experiment were students from two elementary schools in Split, in both of which the first author of this paper was the teacher. Prior to the experiment, the teacher had five years experience of teaching computer science in elementary schools and four years of experience in teaching computer science at the undergraduate level.

The research design is shown in Table 1.

Table 1: Research design

Experiment				
week		Topic	New terms and instructions	New concepts
Pre- test				

1	Python	Algorithms: sequencing, conditional and iteration	Algorithm, sequencing, conditional and iteration	Introducing algorithm term, basic algorithms: sequencing, conditional and iteration with examples from real life. Introducing to Python programming language.
2		Variable, input and output	Variable, input, print, int	Basic Python instructions, variable term and integers with examples in Python.
3		input processing, output process phases of the computer program	Arithmetic operations (+, -, *, /)	Solving simple problems in Python program using input, processing including basic arithmetic operations and output.
4		Conditional	If else	Solving simple problems including branching algorithm in Python using if else.
Python test, questionnaire about programming and python				
Three-week Christmas holidays				
1	Scratch	Aquarium simulation program	forward, left, right, repeat	sprites, concurrency, loops
2		Chasing ghosts game	If, variables	conditionals
3		Simple ricochet game	communication by messaging, conditional loops, Coordination and Synchronisation	loops with conditionals
Scratch test, questionnaire about programming and programming languages				

The primary goal of this research is to find the differences in students' results between pre-tests and tests following the Python and Scratch lectures. The second goal is to examine the differences in attitudes towards programming and the programming language used. Based on that, we defined the next hypotheses:

- H1 – Students with higher problem-solving abilities will be more successful in Python programming than students with lower problem-solving abilities.
- H2 - Students with higher problem-solving abilities will be more successful in Scratch programming than students with lower problem-solving abilities.
- H3 – attitude towards programming will be more positive after Scratch than after Python.

Participants

The research sample consisted of 54 5th grade students from two schools during the school year 2014/2015. Since programming was taught for seven weeks, some students didn't attend all of the lectures or tests. Hence, the final number of participants is 50, which includes 34 boys and 16 girls. Students had no previous programming experience, which means that this is their first contact with programming. Non-probability, purposive sampling (Cohen, Manion, & Morrison, 2013) was used, because our goal was to target pupils with no previous programming experience in elementary school.

Assessment instruments

The data was collected in three phases. In the first phase, students were tested for problem-solving abilities before the programming lectures began. In the second phase, they were introduced to basic programming concepts in Python like variables, input, print, sequencing and conditionals. Students' knowledge (acquired concepts) was tested using Python assignments. They also filled a short questionnaire about the attitude toward programming. During the last, third phase, students were learning basic programming concepts like sequencing, conditionals and iteration while programming games in Scratch. Again, after the third phase, their acquired programming concepts were tested using Scratch assignments. They also filled a short questionnaire about the attitude toward programming and programming languages.

Data analysis

Results were analysed by qualitative and quantitative techniques that are used for triangulation purpose (Cohen et al., 2013) to increase the validity of the findings. Kolmogorov-Smirnov test is used to determine the normality of

data. Parametric independent t-test and non-parametric Mann-Whitney U test are used to compare results between groups. Parametric test paired t-test and non-parametric Wilcoxon Signed Ranks Test are used to compare student results in different tests. Non-parametric tests are used for data which doesn't meet the requirements for using parametric tests.

RESULTS AND DISCUSSION

Results are presented in this section.

Problem-solving test

The first test was a problem-solving test that was administered before any programming lectures were held. The maximum test score was 14 points. Based on the achieved score, students were placed in one of three groups: stronger, intermediate and weaker students. The test can be seen in our previous paper (Mladenović, Krpan, et al., 2016). Table 2 shows distribution of participants by strength groups.

Table 2: Distribution of participants by strength groups

Group	N	points	Mean	SD
Stronger	15	≥ 11	11,93	1,223
Intermediate	16	Between 7 and 11	9,69	0,704
Weaker	19	< 8	4,05	2,97

Post-tests

Two post-tests were conducted in order to assess students' achievement. The first post-test was administered following the conclusion of Python lectures, and the second one following conclusion of Scratch lectures. Since the number of points in each test was different, we decided to use the percentage as a measure of success. Kolmogorov-Smirnov test showed that there is a normal distribution of data in both Python ($p=0,197$) and Scratch ($p=0,069$) tests, but not in all groups combined. Table 3 shows descriptive statistics results.

Table 3: Descriptive statistic

	Python test			Scratch test		
	Mean	SD	Shapiro-Wilk p	Mean	SD	Shapiro-Wilk p
Stronger	81,667	20,5116	0,006	76,953	19,7003	0,095
Intermediate	61,831	22,5395	0,278	71,575	19,0275	0,253
Weaker	38,910	21,9488	0,504	54,537	17,1179	0,505

Because the results of the Python test didn't satisfy the assumption of normal distribution, the Kruskal-Wallis test was conducted. The test showed statistically significant difference between strength groups ($\chi^2(2)=19,342$, $p=0,000$). As it can be seen in Table 3, stronger students achieved, statistically significant, better results compared to intermediate and weaker.

ANOVA test was conducted to compare group results in Scratch test. There was a statistically significant difference between groups as determined by one-way ANOVA ($F(2,47) = 6,943$, $p = .002$). As ANOVA showed statistically significant difference, we made further analysis by Man-Whitney U and independent t-test differences between groups whose results are presented in the following sections.

Comparing success based on problem-solving abilities

In order to compare student success based on programming language used, we used the Mann-Whitney U test. In the analysis, we considered only two-thirds of the participants, those with intermediate and higher problem-solving skills. Students with lower problem-solving skills were left out of the analysis. When the Mann-Whitney statistic was calculated to determine whether there was any statistically significant difference in the Python test scores ($U = 62,5$, $z = -2,288$, $p = 0,022$), a statistically significant difference was found between students with higher problem-solving skills and those with intermediate problem-solving skills. From these results, we conclude that the former group of students achieved better results than the latter. In the case of Scratch test scores, no statistically significant difference between groups was found ($U = 99,5$, $z = -0,828$, $p = 0,408$).

These results indicate that with programming language like Scratch we can boost “middle-third students” for programming. This finding is consistent with other studies which showed that “middle third” students have the most benefit from the use of animations (Ben-Bassat Levy et al., 2003) and visual programming languages like Scratch (Armoni et al., 2015).

Afterwards, we compared intermediate and weaker students by independent t-test for both test results. Results of the t-test showed that students from intermediate group achieved statistically significant better results on the Python ($t(33)=3,040$, $p=0,005$), and Scratch test ($t(33)=2.788$, $p=0.009$). These results indicate that weaker students are “struggling” with programming regardless of the programming language used.

Based on the result we accept H1 because problem-solving abilities are directly related to success in Python programming language. But, when it comes to Scratch success this is not the case, at least for intermediate students so we can reject H2 because “middle third” students are equally successful in Scratch as stronger students. Based on these results we can conclude that students with higher problem-solving skills can master programming regardless of the programming language or method used. An important finding is that by programming games in visual programming languages like Scratch we can stimulate the motivation of intermediate students. If we add a motivational factor, it’s worth to give a chance to new programming languages and approaches to reduce quitting from programming.

Attitude towards programming

In H3 we assumed that a positive attitude towards programming would be higher after using Scratch compared to Python. After the lessons about programming in Python, students answered a Likert scale question of 5 items about their attitude towards programming. This question was repeated in the small questionnaire students answered after the Scratch lessons. The questionnaire was composed of four Likert scale questions regarding their attitude towards the programming languages used.

Table 4 shows the questions.

Table 4: Survey questions

	Questions	
After Python	Q1	How much do you like programming?
After Scratch	Q2	How much do you like programming?
	Q3	How much do you like Python?
	Q4	How much do you like Scratch?
	Q5	Which programming language do you prefer?

Figure 1 shows frequencies.

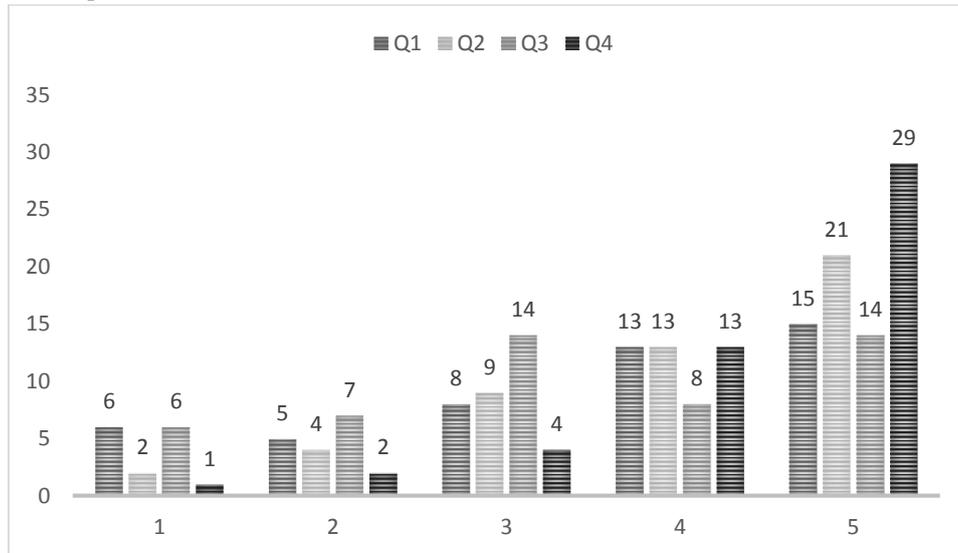

Figure 1: frequencies of the answers

From Figure 1 it is obvious that students liked Scratch more and that attitude towards programming is more positive after using Scratch. Figure 2 shows results for Q5.

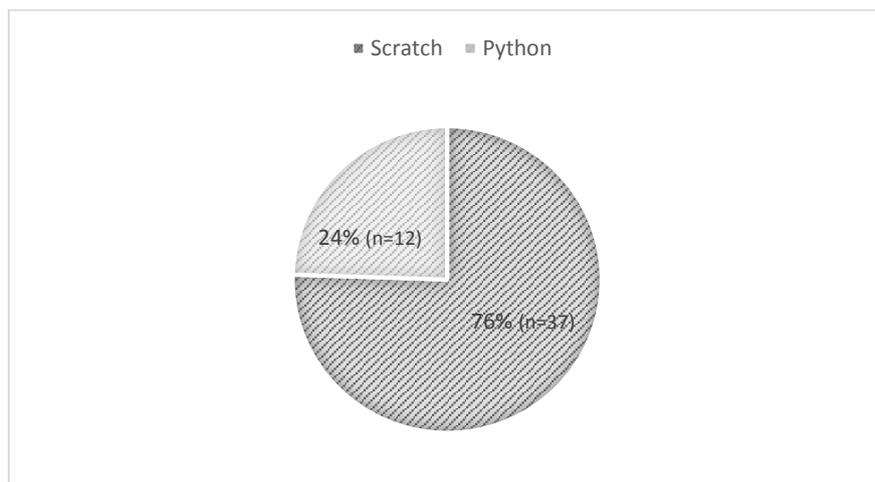

Figure 2: Q5 results

We wanted to compare student attitude towards programming after Python (Q1) and after Scratch (Q2). The Wilcoxon signed test rank showed statistically significant difference between Q1 and Q2 groups ($Z=-2,012$, $p=0,044$). Students had a greater affiliation for programming after Scratch compared to Python. This confirms that Scratch had a positive effect on student attitude towards programming. Thus we can accept H3 and conclude that attitude towards programming is more positive after Scratch than after Python.

However, it came as a surprise that even after being introduced to Scratch, a handful of students still preferred Python. We assumed that these are the students that belong to the top third of the class with regard to their problem-solving abilities.

In the questionnaire, students had space to write their thoughts about programming. They wrote 32 comments, only 4 of them were negative. For example:

- “this is boring”, “it’s too hard for me”, ‘it’s too complicated’.

Some of the comments were neutral:

- “*sometimes is boring and sometimes fun*” ...

Most of the comments (22) about programming were positive:

- “*Programming is awesome.*”, “*Programming is cool.*”, “*Programming is great and interesting.*”, “*I like programming, and I would like to learn it again next school year.*”, “*I like programming because I learned something new*”,

Some comments referring to Scratch:

- “*I like Scratch more than Python*”; “*Scratch is extremely fun, it’s nice to see a game that I made.*”; “*I don’t like programming too much but I had fun while programming in Scratch*”; “*I like both Python and Scratch but I’ve chosen Python as favorite programming language because I was on Python programming competition*”; “*I like both programming languages, Python and Scratch*”; “*Scratch is awesome.*”...

Since the first author was the teacher in all classes, we can also confirm the observations (Armoni et al., 2015) which refer to early recognition of though concepts in a second programming language. Furthermore, we also observed a shortened teaching process which enables the teacher to assist students with weaker programming abilities, while those with higher programming abilities could explore new features in Scratch.

CONCLUSION

Programming novices, especially those at the elementary school level need a very gentle introduction to programming. Students should be able to focus on problem-solving and writing algorithms instead of thinking about syntax. Visual programming languages, like Scratch, offer the experience of syntax free programming which is suitable for novices. Furthermore, visual programming languages allow the teacher to shift the teaching context from solving math problems to programming games. Finally, it improves positive attitude towards programming. Considering statements above we need to be careful not to forget that the main reason for using visual programming languages is to focus on teaching programming concepts. Scratch should be a media or a tool used for transfer of those programming concepts into “real” text-based programming languages like Python.

Students with high problem-solving abilities can master programming easily, regardless of the programming language. On the other hand, students with lower problem-solving abilities encounter significant difficulties while learning programming, and might be unable to truly master it. These two groups usually constitute two-thirds of students in a class. The “middle third” students are the ones that we can influence the most. This is a group that is able to master programming with some difficulties. Based on some previous studies we assumed that the use of Scratch might boost their motivation, attitudes and achievement. With the teacher’s help, Scratch can be used as a tool for mediated transfer of programming concepts from block-based to text-based programming languages and can improve the motivation for all students.

There is a lack of empirical research which compares the use of text-based and block-based visual programming languages in school settings at the K-12 level. We conducted research among 50 5th-graders in two elementary schools. Students were learning programming in Python, and later in Scratch. Results showed that students with higher problem-solving abilities were more successful in Python programming than students with lower problem-solving abilities. This is not the case when it comes to Scratch. In the case of Scratch, there were no differences in the success between better and “middle third” students which proves the usefulness of using Scratch to learn programming. Most students had more positive attitude towards programming after Scratch than after Python. It is important to note that students learned Python first, which is more difficult than Scratch. This order of introducing different programming languages might seem inversed, but we believe that it had a positive influence on the student’s motivation. We believe that their motivation would be smaller if the languages were introduced vice versa.

Abstract

This research was conducted with the qualitative research pattern and in the screening model in order to identify the leadership styles of education administrators and the organisational commitment and mobbing exposed by the teachers. From the qualitative research techniques, the semi-structured interview and document analysis were used for the data collection.

The generated data indicated that the leadership styles of school administrators have major impact on the organisational commitment and mobbing experience levels of teachers. The results of the research have major significance since they are considered to have important impact on the identification of negative factors on the organisational commitments of teachers and enhancement of the organisational commitments.

In consideration with the research results, the shortcomings in the knowledge about the leadership and leadership styles in addition to the low organisational commitment should be taken into great consideration. The recommendations developed following the results are considered to be beneficial for the prevention of future negative behaviours between the school administrators and teachers and the associated negative circumstances.

Keywords : Education administrators, Leadership Features , Mobbing, Organisational Commitment

INTRODUCTION

According to the studies, people, who work in a positive organisation environment, have higher job satisfaction and are more efficient (Mulki, Jaramillo and Locander, 2009; Vardi, 2001), have higher motivation, efficiency, organisational behaviours and organisational commitments (Cullen, Parboteeah and Victor, 2003; Schwepker, 2001), have more ethical behaviours (Bartels, Deshpande, Fritzsche, 2000; George and Joseph, 2000; Harrick, Martell and Strickland, 1998), have less negative behaviours within the organisation (Peterson, 2002), create more quality organisation output (Weeks and Nantel, 2004), show less role conflicts and disturbance and higher trust towards the administrator (Mulki, Jaramillo and Locander, 2008). Additionally, teachers show more

commitment to the school in a positive and healthy school environment (Turan, 2002). Pursuant to the studies on the education organisations, teachers are exposed to heavy work burdens causing particularly stress and tension, experience excessive stress and exhaustion (Boyle, Borg, Falzon and Baglioni, 1995; Capel, 1991; Cemaloğlu, 2007b) and are faced with more mobbing behaviours when compared with the other professions (Cemaloglu, 2007b; Ertürk, 2005; Hoel, Faragher and Cooper, 2004; Hubert and Veldhoven, 2001).

The individuals experiencing mobbing in the organisations have less job satisfaction and self-confidence, feel shame and guilt as well as helplessness and despair, have lower self-respect, are isolated in the organisation, experience deep hopelessness, are criticized in an unfair way for their efforts, lose their motivation due to unfairness and distance from the realisation of organisational objectives due to their concern and depression (Blase and Blase, 2002; Hoosen and Callaghan, 2004; Lewis, 2004; Leymann, 1990; Matthiesen, 2006; Tinaz, 2006). O'Driscoll and Beehr (1994) indicated that the reason for the work and work environment related problems of employees are related with the behaviours of administrators. Einarsen (1999) and Vartia (1996) noted that the reason of negative behaviours at the work place is the weak administration and lack of leadership skills in the administrators. Bulutlar and Öz (2009) and Peterson (2002) emphasized that an ethical organisational environment diminish the frequency of mobbing behaviours that have an impact on the functioning of organisation.

Although the researchers indicate that the leadership behaviours of school administrators and organisational trust have an impact on mobbing; the number of studies conducted in this domain is limited. Einarsen (1999) underlined that more studies must be performed to understand the reasons and nature of mobbing. Therefore, this research aims to study the opinions regarding the impact of leadership features of teachers on the mobbing and organisational commitment.

Considering the literature, the leadership styles of school administrators and mobbing and organisational commitment have been evaluated as variables that affect and be affected from each other abroad; however, many questions regarding this issue have been left unanswered. This study assessed the relationship between the leadership styles of school administrators and mobbing levels of teachers, and the impact of decrease or increase in mobbing level on the organisational commitment (Yağcı, Uluöz, 2017).

METHOD

This section includes the model of research, working group, data collection and explanations on the data analysis.

THE MODEL OF THE RESEARCH

In the qualitative research phase, this study was conducted in the qualitative research pattern and screening model to deliver the impact of leadership features of education administrators on the effect of mobbing and organisational commitment among teachers in addition to using qualitative research techniques suitable to data collection and semi-structured interview and document analysis. The content analysis was performed for the analysis and interpretation of qualitative data generated from the participants.

The interview technique can be classified as structured, semi-structured and non-structured interviews (Tanrıöğen, 2011). The questions for the semi-structured interview were prepared before and the related questions were used in the research accordingly as how it is in the nature of semi-structured interview. However, during the data collection phase, the researcher may add new questions at the time of interview (Karasar, 2010). This method is not as rigid as the structured interviews and not as flexible as the non-structured interviews. As such flexibility is provided to the researcher, the semi-structured interview technique was used for this study.

WORKING GROUP

This study is limited with the secondary schools (total number of 13) under the Ministry of National Education within the boundaries of Nicosia, the central district of the Turkish Republic of Northern Cyprus for the academic year of 2014-2015. The private and vocational schools under the general secondary education were not included in this study.

Among the secondary school within the working group, the total 8 schools were selected as the most crowded and central schools. This study was planned to be conducted with all secondary education school principals in the beginning but in the end 8 school principals were taken under the study and the study was conducted accordingly as some school principals did not accept the interview.

DATA COLLECTION TOOL

As the data collection tool for the qualitative research, the questions in the semi-structured interview form prepared with the school administrators were asked and the personal information form was used. In order to show the opinions regarding the impact of leadership features of education administrators on the mobbing and organisational commitments among the teachers, the semi-structured interview technique was used for the data collection tool and a number of 6 open-ended questions were asked to identify the opinions of school administrators

In the qualitative research approach, the in-depth interview (face-to face), direct observation and document analysis techniques are generally used (Legard, Keegan and Ward, 2003). The data of research were generated through “face-to-face technique”, which is frequently preferred in the qualitative research approach enabling to understand the perspectives of participants about the subject that can not be observed with other data collection tools. The in-depth or face-to-face interviews have some advantages as they have high answer rate, they provide flexibility in the order of questions and opportunity to control on the environment as well as in-depth information related with the subject matter (Yıldırım and Şimşek, 2011). This method is a foundation for the reveal of various dimensions like reasons, feelings, ideas and beliefs, which are the basis for the answers (Legard, Keegan and Ward, 2003).

Patton (Quot: Marshall and Rossman, 1999) defined three types of interviews as conversation style interview, standard open-ended interview and interview form approach. Semi-structured interview method, which is defined as the interview form approach, was used in this research. This method was preferred as it gives the flexibility to the researcher in the preparation and order of questions as well as provides the facilitation to intervene when necessary. In such interview, the researcher has a kind of questionnaire comprised of questions or topics in relation with the research subject. Hence, the researcher can ask such questions to the participants at any times and may create alternative questions that are not in the questionnaire depending on the answers given and may use explanatory questions that would help the participant to express the opinions in a more elaborated way.

DATA COLLECTION PROCESS

During the data collection phase, the school principals of secondary education in Nicosia, TRNC were interviewed. The participants were informed in advanced about the aim of study and interview method, which was chosen as the data collection method. Appointments were arranged with the voluntary participants and the data were collected during the fall semester of 2014-2015 academic year. Upon taking the required permits from the Ministry of Education, the data collection phase was launched.

During the face-to-face interviews with the administrators, the complete interview was recorded with a voice recorder in order not to lose any data in accordance with the voluntarism principle; the confidentiality had high significance. Each interview was an average of 20 min. long. In addition to using voice recorders during the interviews, written notes were also taken in order to eliminate any confusion during the interview as well as maintain the interview in a systematic way. At the end of each interview, a certain time was allocated to thank the participants for their contributions.

DATA ANALYSIS

Open-ended questions are asked during the semi-structured interviews. The interviewees are expected to give elaborated answers. Each answer is categorised and inserted into the tables. Following the first categorisation, the researcher reviews the data and main themes as well as categories are determined. The field related with such themes and categories are taken into consideration and the categories with similar patterns were matched and the categories with variances were put different categories and coded. The administrators were indicated next to the related answer. The sentences form the categories were written in the statement part as an example. The individual interviews were performed when the administrators were available. The interviews were conducted in a place suitable for face-to-face discussion. The administrators were observed to give answers without any

problem. Some answers of administrators were short. The researcher asked the same questions again and aimed to lead the administrators into thinking more on the questions.

The data generated for the content analysis were entered into computer. Then the raw data texts were grouped on the basis of questions in the interview form. The content analyses were conducted on such grouped texts. At the reporting phase of research, the codes such as GR1, GR2, GR3; GÖ1, GÖ2, G3... were used for the participants and direct quotations were used to improve the reliability.

At the end of data coding phase, the main themes, main categories and sub-categories were determined as they are the findings of this study. Additionally, the variation, one of the most used strategies of qualitative research methods, was performed to test the validity and reliability of data analysis.

FINDINGS

In this section, the data collected through data collection tools are analysed and the results are interpreted accordingly. Each table is interpreted individually.

I. Dimension: *Opinions of administrators regarding whether their leadership nature have an impact on the organisational commitments of teachers.*

All of the school administrators that participated to the research had indicated that the leadership natures of administrators have an impact on the organisational commitments of teachers. "...We as leaders have a common aim in accordance with the common objectives; to raise our students towards the needs of community, in other words our aim in raising them is common. I believe that using the school resources in the most compatible way, making democratic decisions, ensuring that the perception of good decisions were made are all affecting the organisational structure. You have to be democratic and influence the majority. As I indicated above, the principals or administrators change depending on the place and time. Sad to say, it is difficult to be an administrator at state departments and schools." (G:R(1)). According to another administrator; "...The approach-attitude- of leaders, who is the school principal in the problem resolution phase have either negative or positive impact on the organisational commitment. If the leader included the teachers into the decision-making process then it is difficult to interrupt the works as mutual consultation was performed at the time of decision-making. The educational activities might be interrupted if teachers do not participate to the decision-making process and are constantly instructed about what to be done since they are not consulted; hence no contribution is made. A leader must be democratic, transformational and fair as well as objective in the activity assessment" (G:R(5)). According to another administrator; "...The commitment of principals for their school is one of the factors affecting the leadership. Of course, I personally think that the school principals have to have two qualifications, one of which is to be a good administrator in order to comply with all the laws and regulations. Moreover a principal should be a good leader too. A leader sets a vision, shows a target and motivates. The exact Turkish word might be 'to trigger' or 'the intuitive'. You might motivate with external factors with nice words or some financial contributions but the most important thing is to make that person act with instinctive behaviours. I think that this is what is needed, not only at schools but the leaders always show targets and determine the vision. All of such become reality with leadership and administrators with leadership features"(G:R(8)). Other administrator indicated that "...First of all a school principal, which we call leader, is a component that strengthens a school in terms of moral and physical factors. School principle is the backbone. If a principal has knowledge and show love and respect then regardless the vicious nature of teachers, they are influenced with that person and then the school would provide a successful education"(G:R(7)).

II. Dimension: *Opinions of administrators regarding their methods towards the change in the mobbing exposure of teachers.*

The administrators noted that in their methods used for the variation of mobbing exposure among teachers, they do not behave in a way that would affect the mobbing among teachers and they create a democratic environment in general. "...A leader must motivate the teacher, must set a vision and mission for himself; he must be sharing and must identify an effective strategy together with the stakeholders in a team-work" (G:R(3)) and (G:R(2)) "...First of all, he should set a vision and become a leader, who questions whether everything is that so within that vision. He should not only work with the ones, who are close to him but also he should try to find ways to

bring the distanced ones together. Schools are a slight reflection of school. If there is a pioneering leader at a school, the individuals, even in an environment where everything is going wrong, would not be problem oriented but would look for solutions. In a problematic environment, a lot of skill and ability is required to lead people for solutions. "...Mobbing is not something that I approve; it is not even my style. As you know, being a leader and administrator are two different things. In my perspective, a good leader can lead communities without any pressure. Otherwise, forcing people for a work through using a position as well as mobbing is a very offending act. It is not natural" (G:R(6)). Another administrator indicated, "...In general, the structure of society is changing. There is violence and arguments, which all are reflected on the education. And then you are faced with mobbing. For a school leader, it is very difficult to activate the administration discipline regulation. Everything must be transparent and open"(G:R(7)). The other administrator stated, "...Whether private or public, the national education regulation and legislations and their amendments discourage us every year and we do not hear good things from our teachers when we give them the news about the wages. In private sector, the teachers consider mobbing in terms of their wages. Then they are discouraged and leave work. It is not easy to keep a quality teacher in private sector or finding another good teacher for the one leaving the job. The acceptance of a new teacher and adaptation are not also easy too"(G:R(1)).

III. Dimension: *"Opinions of administrators regarding their methodology for the improvement of organisational commitments among teachers"*

Administrators indicated a number of opinions for the improvement of organisational commitments among teachers. "...I try to be democratic, fair and objective. I think that I have good relations with the teachers. I aim not to do mobbing"(G:R(5)). Another administrator stated; "...Trust and commitment, the commitment towards our organisation, ownership. Team work and majority concept, not working as an individual but being awarded like a team (G:R(1)). "...I assess every teacher with the complete year performance and most importantly, we build our communication, I celebrate them in the meetings and encourage them. We are in good relations with out parents association"(G:R(3)). "...One of the main characteristics of education is to improve the organisational commitment. Therefore, we always undertake the projects together with the teachers whenever we do group work in our educational activities. The more teachers participate to the program development and improvement, the stronger our team spirit and communication become"(G:R(6)). According to another school administrator; "...we have to be very careful and work together in the implementation of programs and methods. Teachers must be included in all social and academic activities. Otherwise, the teacher would be discouraged and the education quality gets worse.

RESULTS AND RECOMMENDATIONS

This chapter discusses the findings and results based on the interpretation and the recommendations in relation with the results accordingly.

The common view of all administrators under the scope of this study is that the leadership nature of administrators has an impact on the organisational commitments of teachers. Particularly, the participation of teachers ensured by a democratic leader would increase the organisational commitment. As the organisational commitment has various areas that it has an impact, it also influences the organisational commitment. As a result of studies conducted on this matter, Luthans (1992) noted that the personal factors (investment, years of experience), work factors (position, nature of position, limits, controversies and inconsistencies) and factors within and outside the organisation have an impact on the organisational commitment; and he also stated the existence of leadership model in the inter-organisation elements and professional options in the elements that are not in the organisation in addition to the nature of person (positive – negative sentimentality; a point of supervision where a person can supervise oneself).

While the administrator is a person that implements the existing structures and appropriate methods to reach the organisational objectives; the leader is the person that can influence people rather than using the traditional methods used by an administrator such as ordering. Hence, the leadership is effective between the relations among people and influence them while ensuring the use of ways required to reach the identified objectives (Celep, 2004). Elkins (1980) had also made a similar definition, as the leader is an influencing person on the environment in reaching the organisational objectives. They use their existing authorities and affect their

surroundings. The relevant authority is related with influencing the acts of others and refers to the authority acquired when reached to the resources that are not available in people or groups yet required. Some of the definitions of organisational commitment are; the perception of an individual together with the organisation or workplace (Leong, Furnham and Cooper, 1996); the sense of organisation and unity given by the organisation to an individual, partners or employees (Lambert et.al., 2010).

The administrators mainly indicated that the behaviours that might have a negative impact on the mobbing levels of teachers do not generally happen in the school with democratic environment and in compliance with the legislation; the mobbing is not generally observed in the state schools and the mobbing behaviours, which can be rarely observed in the private schools, are mainly caused due to the negative impacts of wage policies. The concept of mobbing exists since the beginning of work life but yet there is no consensus regarding its definition. Additionally, the people that are exposed to mobbing at their workplaces consider such acts as routine conflicts or daily problems. Such perceptions mislead the researches and make it difficult diagnose (Ertürk, 2005). Moreover, Tınaz (2006) discusses that the lack of knowledge about mobbing in Turkey is related with the fact that people do not know what they encounter and the most important element in fighting with mobbing is based on the consideration of the problems by the victim as well as the employer, colleagues and whole community.

The studies on the mobbing indicate that out of the total mobbing acts, the rate of USA is 81% (Vandekerckhove and Commers 2003), and the rates in Germany, Austria and England are between 70% and 80%; and the people, who experience mobbing from their seniors affect more than others (Einarsen, 1999). Pursuant to the various studies conducted in Turkey (Ertürk, 2005; Cemaloğlu, 2007a, Cemaloğlu, 2007b; Cemaloğlu and Ertürk 2007; Cemaloğlu and Ertürk, 2008; Kılınç, 2010; Gündüz and Yılmaz, 2008; Sağlam Çiçek, 2008; Dick and Wagner, 2001), teachers are exposed to a high level of mobbing and more than half of mobbing acts are towards the teachers working under the school administrators. The study conducted by Hubert and Veldhoven (2001) noted that mobbing acts are widely experienced in the education institutions and 37,3% of such acts is among the employees. Upon the interviews with the people exposed to mobbing, some researchers noted that such people are exceptional as they have high emotional intelligence; they assess their own behaviours and they correct themselves when they see that they are wrong. They are generally rational people with principles, who can question and are not be led by others but they lead themselves (Davenport et.al., 2003). The studies stated that the mobbing at the workplace have a prominent impact on the organisational environment (Araújo et.al., 2010). Researchers like Agervold and Mikkelsen (2004) underline that the adopted leadership style is one of the reasons of mobbing. Similarly Cemaloğlu (2007b) noted that mobbing might be experienced in every organisation, that there are various factors in the performance of mobbing where the leadership styles of organisation administrator are one of the significant variables.

The researched underlined that mobbing is observed in the big and bureaucratic organisations and the mobbing performers are more widely seen. Moreover, the strict and weak authority style and laissez-faire style leadership are related with the mobbing (Salin, 2003).

In order to improve the organisational commitments of teachers, the administrators mainly use team work, participation, awarding, reconciliation methods, working with joint decisions in the parents association activities, democratic management style, meeting the technological needs of school in accordance with the demands of teachers, using feudal/informal relations in relations in addition to formal relations and collective decision-making and application in social and academic activities as the effective methods. The scope and characteristics are the factors that are organisational based and have an impact on the organisation. The quality and significance of activity for the society influence the commitment level. If the quality and significance are high then the organisational commitment will increase. The administrative style is also one of the factors that affect the establishment of commitment towards the objectives and values or organisation. When the senior level management gives importance to the organisational culture and values, the productivity and progressiveness increase (Meyer and Allen, 1991). The negative attitudes that would be performed by the management towards the employees such as the authoritarian statements, dominance would cause negative outcomes as decrease in productivity and not to be creative and would affect the commitment of individual accordingly. The available information regarding the general functioning of organisation is one of the most significant indicators for the

functioning of organisation (Goffee and Gareth, 2000). The indicator, which is also called as the organisational culture, has an impact on the activities of employees and the general organisational functioning (Chow et.al., 2006).

The accomplishment in reaching the objectives and maintaining the activities in an efficient way for the education system and school can be realized when the school administrator and teachers believe and accept the objectives and values determined by the school and education system (Celep, 2000).

In order to reach the general conclusion of research, the aim was to identify the opinions of education administrators concerning the leadership characteristics on the impact of mobbing and organisational commitment. Therefore, the leadership characteristics and organisational structure are among the most important factors affecting the commitment. Within this framework, the size and structure of organisation, terms on the working hours and working hours, opportunities for the specialisation in the profession, leadership attitude, organisation status, image of organisation, total quality management activities, promotion opportunities within the organisation, wage rates, wage arrangements, rights granted other than the wage, rewarding arrangements, performance system and participation to management process are all organisation based factors (Byington and Johnston, 1991; Sağlam; Koç and Yavuz, 2007).

RECOMMENDATIONS

The recommendations towards the researchers and implementing parties are as follows:

1. School administrators and school staff (teacher, secretary and other staff) should be informed about the leadership and management process. For such purpose, the in-service trainings should be organised, practice based activities should be performed and if possible, the participation to such courses should be mandatory.
2. The active participation of teacher to all kinds of activities at school should be ensured. An improvement in the organisational commitment might be realized as a result of such participation. Hence, in any situation requiring “decision-making” process, the teachers as well as the administrators should actively be in this process.
3. The supervision mechanism should be developed at school. Letters and questionnaires can be used in regular intervals to obtain information about the existing situation and the teachers should be included to the management process to develop participatory management approach.
4. When the school is considered as an organisation, the administrators, teachers and other school staff should be ensured to understand that it is not about creating an interest for the school. Therefore, the sub-dimensions of organisational commitment “adaptation, identification and internalisation” would be developed in a balanced and equal way in the school.
5. The time spent by the teachers at school should be increased, which would improve the organisational commitment. For this purpose, the laws might be implemented actively.
6. The social sharing might be improved in the school through the positive communication between the school administrators and teachers, which can prevent mobbing.
7. The organisational commitment can be improved through the positive atmosphere at the school, which can prevent the formation of negative behaviour.
8. The individuals, who think that they were exposed to mobbing, should explicitly express this. Hence, the performers of such act can be assessed accordingly.

9. Legal regulations concerning mobbing should be in place. The school staff (administrators – teacher – other personnel) should be informed about mobbing. Any teacher or staff that has knowledge about mobbing should define such act in case of any exposure.

10. The inspectors of the Ministry of National Education might be consulted in the studies of this matter and their views might contribute to the study accordingly.

11. The performance of mobbing level on the administrators as applied in this study might contribute to this research.

12. This research was conducted with the administrators of public schools. The performance of a similar study at private schools might be recommended. The public and private schools can then be compared.

ABSTRACT

This paper intends to introduce structures of preferred values among adolescents. Value structure demonstrates motivation tendencies of a personality and is therefore useful for researchers. It is specifically important to map values in so called transition period – in a period of adolescence. The research sample composed of Slovak adolescents (N=231), of girls (N=162) and boys (N=69). The average age was of 16.7 years. Our interest was focused on gender differences. The value structure was searched using PVQ questionnaire (Portrait Value Questionnaire, Schwartz, 2003). The identified results have shown changes in the preferred value structures (statistically significant difference) between girls and boys. Our findings show that girls have higher scores in the values of conformity, power, and conservation. On the other hand, the boys in comparison to girls have higher level in the values of universalism, achievement and self-transcendence. The present study is a part of the project VEGA 1/0623/15 Value Messages Perceived by Pupils in Formal Education.

Key words: values; adolescents; gender; motivation

INTRODUCTION

Classroom Values are a significant source of motivation, giving direction to our actions. Value is often understood as subjective appreciation or level of importance that an individual assigns to certain things, phenomena and symbols or to other people (Průcha, 2008). That is why researchers pay such significant attention to value structure of a personality (Štárhoň, Juříková et al., 2015, Šramová, Džupina, Jurášková, 2013, Sigelman, Rider, 2015). It is known that a value orientation is being formed since one's birth: Therefore, the key role in every process is played by child's parents (Vernarcová, 2015), who by their attitudes, opinions, interests, aspirations and behaviour participate on formation of the chart of values of their own child. Further important institution taking part in human value formation are media (Šramová, 2014). In current informative society, media are highly significant communication tool that is being used by the recipient to create a picture about the world and enables him to confront his values with those that are being presented to him by media (Mazzarella, 2007, Pavelka, 2014). Special attention is being paid to school as an institution that participates on formation of value structure of students, doing so intentionally as well as involuntarily (Brunclíková, 2011, Ferková, 2016, Cabanová, 2013, 2015, Vernarcová, 2013). Group of same age students proved to be one of institutions influencing needs, interests, attitudes as well as values of an individual (Šramová, Džupina, Jurášková, 2013). This influence is very significant in adolescent age - in a period of identity formation (Berzonsky, 2011, Šramová, 2007), bringing changes in physical development (physical development completes, changes get slighter) as well as mental development changes: quality of thought operations changes, development of critical thinking abilities peaks (Šramová, 2007, Vancu, 2014, Šramová, Hamranová, 2015a, 2015b, Andreánska, Brunclíková, 2015). Kraus et al. (2006) sceptically describes current young people who often live from one day to another, not having any long-term goals, not maintaining greater spiritual values, not spending their time valuably. According to the author, it is a consequence of quick life pace that does not create sufficient space for continual incorporation into society. The adolescent is now more than ever confronted with great concentration of often contradictory information that are hard to handle even for an adult. This is one of the factors making

identity formation process harder, one may therefore witness higher emotional immaturity of adolescents, in comparison to their higher cognitive maturity if compared with previous generations in adolescence period. However we also can witness their interest, will, engagement and excitement for world and environmental issues that they are engaging in (Soukalová, Gottlichová, 2015).

Using digital technologies and mainly by means of social networks they not only can name the problem, but can also mobilize other people to support and help the case (e.g. in case of poverty, necessity to help someone in difficult life situation, in case of loss of close person, health issues, home losses etc.) This is the development period in which the adolescent confronts values, goals, attitudes that are being presented to him by parents, school, peers, media or other social groups (Hamranová, 2015a). All the aforementioned institutions significantly participate on socialization process. On one hand, the adolescent strives to be stand-alone, independent, on the other hand he wants to be a part of social peer groups. We therefore witness strong individualism as well as collectivism. At this point we face further often discussed problem – negative influence of communication technologies being preferred by adolescents in comparison to communication face to face. High level of digital literacy that is so typical for current generation of adolescents is being used by themselves to create social relationships in virtual reality (Šramová, Hamranová, 2015). This negatively reflects in increased social isolation, decreased ability to solve problems, decreased communication ability (as much verbal, as non-verbal), ability to create and maintain friendships (not the virtual ones), adaptation complications etc. In other words, social communication in virtual environment may have its negative as well as positive side (e.g. helping to develop social relationships) (Mazzarella, 2007; Valkenburg, Peter, 2009). In order to be able to intentionally form values of young generation, it is necessary to know them first. It is known that except the aforementioned factors, the value chart is being influenced also by culture that forms an individual as such (Schwartz, 2003). Values are also bound to gender in an adolescence period (Šramová, Džupina, Jurášková, 2013).

Schwartz (2003) identified ten basic values: *Power* (authority, wealth, social status and prestige, control or dominance over people and resources), *Achievement* (personal success and ambition), *Hedonism* (pleasure), *Stimulation* (excitement and novelty, challenge in life), *Self-direction* (independent thought, creating), *Universalism* (tolerance and protection for the welfare of all people and for nature), *Benevolence* (helpfulness for people with whom one is in frequent personal contact), *Tradition* (respect and acceptance of the ideas traditional culture or religion), *Conformity* (obedience), and *Security* (safety, harmony, and stability of society, and of self). According to Schwartz (1992, 1994) these individual values are grouped into four higher-order value types that create the value structure of an individual. These are the mentioned groups: *Self-enhancement values* (power, achievement) emphasize self-interest, social status, and prestige; *Self transcendence values* (universalism, benevolence) emphasize the welfare and interests of others; *Openness to change values* (self-direction, stimulation, hedonism) emphasize independent thought, and readiness for new experience and pleasure; and *Conservatism values* (security, conformity, tradition) emphasize self-order, and resistance to change.

The aim of our research was to find out about value preferences and value orientation of adolescents considering their gender.

We have formulated following research questions: What kind of value system do adolescents maintain? Is there a difference between value characters of adolescent girls and boys?

METHODS, PARTICIPANTS AND MEASURES

The participants of the research were adolescents attending high schools (N=231), composing of 162 girls and 69 boys. The average age of participants was of 16, 65 years.

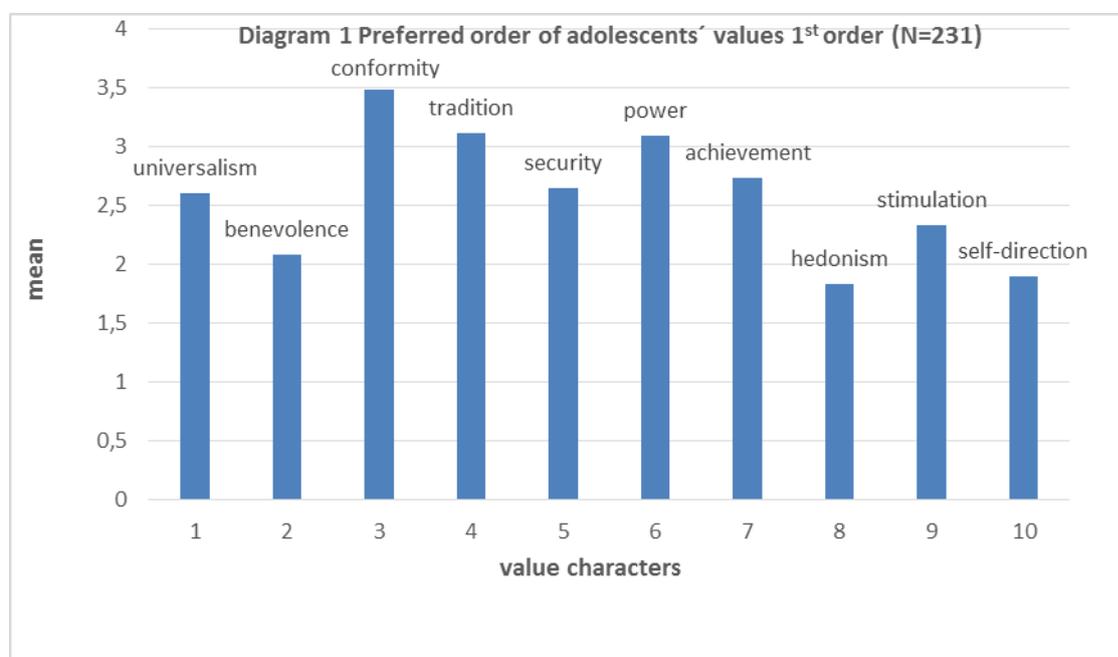

In order to measure values and to find out about the value structure of adolescent girls and boys we have used 21 item **Portrait Values Questionnaire** (PVQ, Schwartz et al. 2001) (Cronbach's $\alpha = 0.621$). Participants are asked to respond to each question “How much like you is this person?” on a scale of 1 (very much like me) to 5 (not like me at all). The questionnaire composes of ten values of 1st order: Power, Achievement, Hedonism, Stimulation, Self-Direction, Universalism, Benevolence, Tradition, Conformity, and Security. Each value type was measured by two items, except for universalism (three items). The instrument contains short verbal portraits that describe a hypothetical person’s goals, aspirations, or wishes that are thought to reflect the importance of a certain value type. Ten values were possible to combine into four levels higher, i.e. 2nd order – value structure: Self-Enhancement, Self-Transcendence, Openness to change, and Conservation.

Table 1: Reliability coefficients for the 1st and 2nd order values of Portrait Values Questionnaire (PVQ)

Values- 1 st order	Amount of items	Values- 2 nd order	Cronbach's α
Power	2	Self-Enhancement	0.57
Achievement	2		
Universalism	3	Self-Transcendence	0.55
Benevolence	2		
Hedonism	2		
Stimulation	2	Openness to change	0.52
Self-Direction	2		
Tradition	2		
Conformity	2	Conservation	0.52
Security	2		

RESULTS

According to performed measurements, the adolescents prefer following values the most: *conformity* (control over own acts, tendencies and impulses – not to break social expectations or social norms, courteous and polite behaviour, honouring parents and seniors), *tradition* (respect, acceptance of customs and ideas anchored in traditional culture or religion, avoidance of extreme situations in life or behaviour, acceptance of circumstances of life), *power* (social status and prestige, feeling of strength, tendency to order and control others, demonstration of own domination), *achievement* (ambitions, achievement of own goals, demonstration of own competences and abilities, receiving recognition from others), *security* (own family and own nation, adherence to social order), *universalism* (defined by understanding, appreciation, tolerance, inner harmony, society and nature protection), *stimulation* (characterized by excitement, life challenges, life changes, courage, turbulent and exciting life), *benevolence* (readiness to help, loyalty towards own friends), *self-direction* (necessity to stay independent, to make up new things constantly) and the least preferable value was *hedonism* (being characterized by joy and enjoyment of life). (Diagram 1).

Considering preferred value structure it is obvious that the adolescents incline to *conservation* (composing of values: safety, conformity and tradition). The other value structures were *self-enhancement* (determined by success and power), *self-transcendence* (defined by values: universalism and benevolence) and *openness to change* (infused with hedonism, stimulation and self-direction). (Diagram 2).

Data describing gender differences between the groups of boys and girls in particular values and value structures are stated in Table 2. Significant higher differences of girls were measured in *conformity* ($t=2.56$; $p=0.012$), *power* ($t=3.15$; $p=0.002$) (values 1st order) and *conservation* ($t=2.15$; $p=0.032$) (values 2nd order). Significant higher differences of boys were measured in *universalism* ($t=-3.03$; $p=0.003$), *achievement* ($t=-2.89$; $p=0.004$) (values 1st order) and *self-transcendence* ($t=-2.85$; $p=0.005$) (values 2nd order).

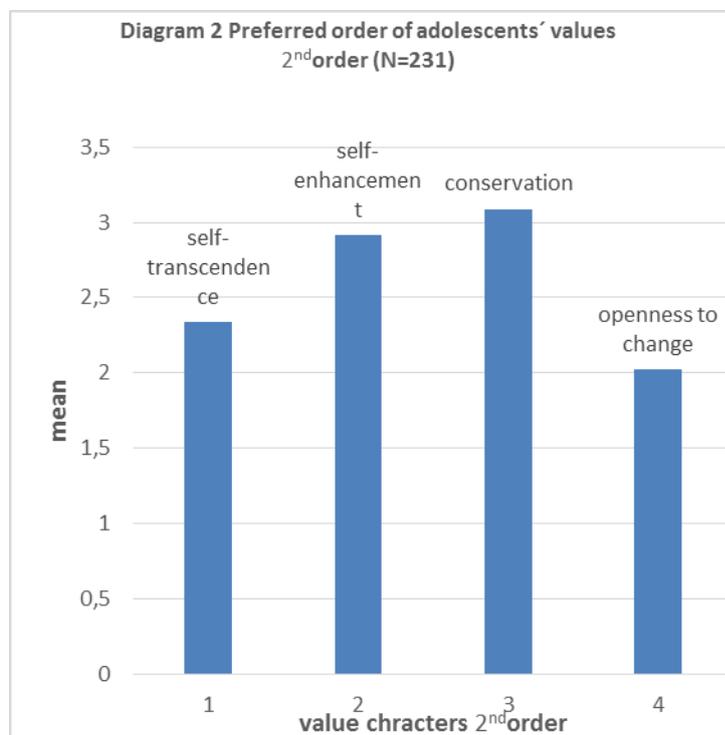

Table 2: Differences in value characters (t-test) of adolescent girls (N=162) and boys (N=69)

Values	AM girls	AM boys	t	p
1st order				
Universalism	2.48	2.88	-3.03	0.003
Benevolence	2.03	2.24	-1.64	0.102
Conformity	3.65	3.20	2.56	0.012
Tradition	3.17	3.03	1.09	0.277
Security	2.65	2.53	0.80	0.425
Power	3.26	2.70	3.15	0.002
Achievement	2.56	3.07	-2.89	0.004
Hedonism	1.82	1.82	0.02	0.987
Stimulation	2.36	2.23	0.99	0.322
Self-Direction	1.91	1.85	0.51	0.611
2nd order				
Self-Transcendence	2.26	2.56	-2.85	0.005
Self-Enhancement	2.91	2.88	0.16	0.872
Conservation	3.16	2.92	2.15	0.032
Openness to change	2.03	1.96	0.71	0.479

CONCLUSIONS

In the society, the value system of a person is constantly confronted with alternatives, outer pressures and societal changes that have great influence on young people as well as educational system.

The analysed adolescents proved the highest occurrence of following values *conformity* that includes certain level of self-discipline, courtesy and respect towards communication partners, *tradition* characterized by respect towards traditions and society culture and *power* that includes striving for dominance, control, prestige as well as for social status. The above values are natural necessity for the adolescent development period. It corresponds with the most preferred values of a higher order *conservation* (composing of tradition, conformity and security) a *self-enhancement* (composing of achievement and power). The least preferred values were *hedonism* typical for life joy, *self-direction* including striving for independence and *benevolence* characterized by readiness to help and loyalty towards friends. The least preferred value structures were in compliance with the aforementioned *openness to change* (composing of *hedonism*, *stimulation* and *self-direction*).

Our findings show that value preferences are gender determined. Girls prove significantly higher level in *conformity* that includes certain level of self-discipline, courtesy and respect towards communication partners and also in value of *power* that can be characterized as striving for dominance, control, prestige as well as for social status. The two mentioned values may be related to frequent conflicts and inner inconsistencies that are typical for psyche of adolescent girls when forming their identity. It also may be a culturally conditioned aspect, when girls are being led to have higher respect towards habitual and socially given standards, when it comes to gender. Girls, in comparison to boys, are more significant in value structure of *conservation* (composing of *tradition*, *conformity* and *security*).

Boys scored more significantly in value of *universalism* characterized by understanding, comprehension, tolerance and social justice. Further value is *achievement* typical by effort to achieve personal success and ambitions, which is typical for boys in this age. In value structure, they are stronger in *self-transcendence* (composing of *universalism* and *benevolence*), in comparison to girls.

In adolescence, the formation of identity composing of, among all, value and value orientation creation, is the most significant. It is one of the most important life milestones in identity formation process (Šramová, 2007).

According to Poliaková (2013) and Hamranová (2003), education should be a process of personality cultivation. Formation of values and value orientation of girls and boys is, without doubt, its important part. It is being proved that by understanding of the most prevailing value structure we may perform targeted influence in cultivation process respecting gender differentiation.

ABSTRACT

Introduction: Communication disorders can be often linked to psychiatric diagnosis in children. The aim of this article is the need to point out the specifics of speech and language intervention in children with psychiatric diagnosis. Methodology: The qualitative analysis of psychiatric disorders and communication disorders was carried out in Psychiatry Hospital in, Czech Republic. Results: The most frequent sequence of psychiatric diagnosis combinations and communication disorders were specific language impairment, specific learning disabilities and communication disorders in intellectual disabilities with ADHD. Conclusion: The need for speech and language therapy and special education intervention in children in the psychiatric hospital setting is indispensable. Partial results of the investigation are related to the issue of specific learning disorders related to the project IGA "Research on selected disorders and differences of communication ability with focus on the specifics of speech and language therapy and special education for hearing impaired assessment and intervention" conducted at the Institute of Special Education Studies Faculty of Education in Palacký University Olomouc, Czech Republic, IGA_PdF_2015_024.

Key words: communication disorders, special education, psychiatry, children, hospital, specific language impairment, specific learning disabilities, ADHD

INTRODUCTION

A stimulating and supporting family background is crucial for general development of the child, especially for speech and language development. Children's adequate language skills are often an important prerequisite for the child to engage in successful social interaction (Damberg et al., 2014). One of the main distractors of successful development of speech and language is a dysfunctional family. Specific language disorders carry a significant risk of comorbid psychiatric disorders that occur in early childhood and can persist into adulthood (Sundheim and Voeller, 2004). These psychiatric disorders are attention deficit and hyperactivity disorder (ADHD), anxiety disorders, depression and antisocial personality disorder (ibid.). Margari and Buttiglione (2013) state a comorbidity of specific learning disorders with these neuropsychopathologies: Hyperkinetic disorders (ADHD), Anxiety Disorder, Developmental Coordination Disorder, Language disorder and Mood Disorder (diagnosis categorized with respect to WHO ICD-10 classification). Horowitz et al. (2003) in Sundheim and Voeller reported, that children with language problems tended to come from homes characterized by low education, low expressiveness, poverty, high levels of parenting stress and parents who reported worrying about their children's language problems.

Children with language impairment (e. g. Specific language impairment - SLI) more often have demonstrated for example: aggressive behavior, distractive attention, heightened levels of anxiety, somatic complaints, social withdrawal and excessive shyness in comparison with children without language impairment. (Damberg, 2014). That behaviour causes problems in social areas e.g. functioning in the class that may lead to behaviour disorders.

Specific learning disorder is comorbid with ADHD (Gilmore, 2000 in Scharff, 2012). According to Scharff (2012) the specific learning disorder/ ADHD symptom shows inattention, impulsivity, hyperactivity and frustration at being held back in concentration, expression, perception, processing and retention leading to difficulties in relationships with peers, teachers, siblings and parents. Speech and language delay especially in preschool children with normal hearing may be a pointer toward ADHD (Venkatesh et al., 2012). Students with ADHD and specific learning disorders had poorer reading skills, inferior social skills, and more behaviour problems when compared with their peers with LD alone, and those differences persisted over time (Xin, 2014). El Sady et al. (2013) found out some reasons why the speech and language differ in children with ADHD in comparison with intact children.

ADHD represents a group of disorders that affects processes essential in the development of language: attention, thinking, learning process and social interaction of the child. Children with ADHD show lower working memory –it takes longer for children with ADHD to process syntactically complex information. Children with ADHD have considerably lower accuracy in comprehension. Speech and language differ in children with ADHD because of its neurological origin - frontal lobe and basal ganglia involvement were claimed to affect both ADHD and language disorders (ibid.). Pokorná (2010) mentions 4 types of reactions to failure among children with specific learning disabilities: the first is a defensive and avoidant mechanisms: the child refuses to cooperate, does not write homework, the child is in opposition to school; the second type is a compensatory mechanism: the child tries to push through misbehaving; the third is aggression and hostility: children resort to aggression, children bully others; And the last one is anxiety : children feel weak, they are closed, sensitive, restless, depressed. Psychosomatic symptoms occur with the last mechanism: vomiting, loss of appetite, sleep disturbances, decreased immunity (ibid.). Based on this mechanism psychiatric disorders could occur. The presence of ADHD has a long-term deleterious effect on academic, social and behavioural outcomes for students with learning disabilities and emotional disturbances (Xin, 2014). Both specific learning disorders and ADHD frequently persist into adulthood, and long-term consequences of their remaining undetected include an increased risk for developing substance abuse addiction and psychiatric disorders such as anxiety disorder, depression and oppositional defiant disorder (Karande et al., 2007)

Within the categorization on impaired speech and language therapy (SLT) we can speak, in case of children with psychiatric and communication disorders, about so called symptomatic speech disorder. According to Vitásková (2013), or Lechta (2002), they are represented by a wide range of manifestations in verbal and non-verbal communication. The aetiological conditions may be variably related to a primary disability, therefore this area of SLT is very closely connected to special education, especially if we consider the contemporary inclusive educational trends. All communication levels (phonetic-phonologic, morphologic-syntactic and lexical-semantic level and the pragmatic level), may be impaired. The causes of the specific symptoms of symptomatic speech disorders may be completely independent of the comorbid health impairment having other impacts on the sphere of verbal or non-verbal manifestations. From the pragmatic perspective, the impaired co-verbal behaviour of the client during expressive oral-verbal production may be even more distractive and intruding than the impaired articulation itself.

THE METHODOLOGICAL DESIGN OF THE STUDY

The goals of this research survey are:

- to analyse the environment, communication disorders in children and psychiatric disorders in children
- to analyse specific logopedic and special education intervention in children with psychiatric disorders
- to verify the association communication disorders and psychiatric disorders.

The research was mainly based on analysis of communication disorders, psychiatric disorders and the anamnestic data of children. The research was conducted on children patients currently hospitalised in Children's Department in Psychiatric Hospital, Czech Republic. The research sample includes all patients from Section B (here are boys in primary school) and patients from Section A only who attends speech and language therapy. In the Section A there are hospitalised preschool children and girls. The research sample contains 21 children in total, 3 girls and 18 boys. The age of children varies from 3 to 17 years of age.

RESEARCH FINDINGS

Analysis of environment

The children's department in Psychiatric hospital, Czech Republic was established in 1958. There are 3 sections: A for pre-schoolers and girls (17 beds), B for boys of elementary school age (18 beds) and C for adolescents; boys, girls (20 beds). The reasons for hospitalization are behavioural disorders, auto mutilation, adaptation disorders, affective disorders, anxiety disorders, eating disorders, incipient and developed psychosis. Hospitalization within diagnostic stay could be in case of differential diagnostics of autism spectrum disorders (ASD) and developmental diagnostics of children. The team of professionals is interdisciplinary: medical doctors (senior consultant and medical doctors - psychiatrists), nurses, psychologists, a speech language therapist (SLT), occupational therapist, art therapist and social worker. During the week the child obtain the care of: medical doctor every day, senior consultant medical doctor once a week, nurses full day, teachers in the morning, educator to fulfil the assignment. In the afternoons there are therapies with SLT, psychologist, occupational therapist and art therapist. Late afternoon continues with sports activities and hippo therapy. During free time children play games, have some competitions, trips or other group activities.

The admission is based on the request of doctors (paediatrician, outpatient psychiatrist) When the child comes to Hospital, he or she is assessed by all members of the team, after the medication is adjusting. The child is observed,

the therapy is provided. The cooperation with family or children's home in leadership and education is routine. When the health condition is stabilised, child could start to go to therapeutic leaves home or Children's home. After that a dismissal comes. In case of need the health condition is monitored by an outpatient psychiatrist, outpatient psychologist.

Analysis of specifics logopedic and special education intervention and communication disorders in children with psychiatric disorders

The special education and SLT care in the observed institution can be described this way: the assessment is realized in cooperation with an interdisciplinary team. The therapy is provided according to type and severity of communication disorder. Group and individual therapy with preschool children runs in the morning. Individual therapy with school children in severe disorders also takes place in the morning. Individual therapy with school children proceeds in the afternoon. There are some specifics in special education and SLT care. SLT has to cooperate with other members from the interdisciplinary team. The care depends on the character of patients - children come from dysfunctional families, children's homes and sometimes with syndrome CAN. The SLT needs to know an anamnesis of children and work sensitively with children. Sometimes children should be tired and sleepy according to adjusting medication. The cooperation with the family is limited in the case of dysfunctional families. Often diagnosis in children with psychiatric disorders are: dyslalia, delayed language development (DLD), specific language impairment (SLI), specific learning disabilities (SpLD), communication disorder in intellectual disability (CD in ID), stuttering, cluttering, communication disorder in autism spectrum disorder (CD in ASD).

Association between communication disorders and psychiatric disorders

Table 1: The communication disorders and psychiatric disorders with a brief family anamnesis in children in special education and SLT care, the Section A (diagnosis categorized with respect to WHO ICD-10 classification)

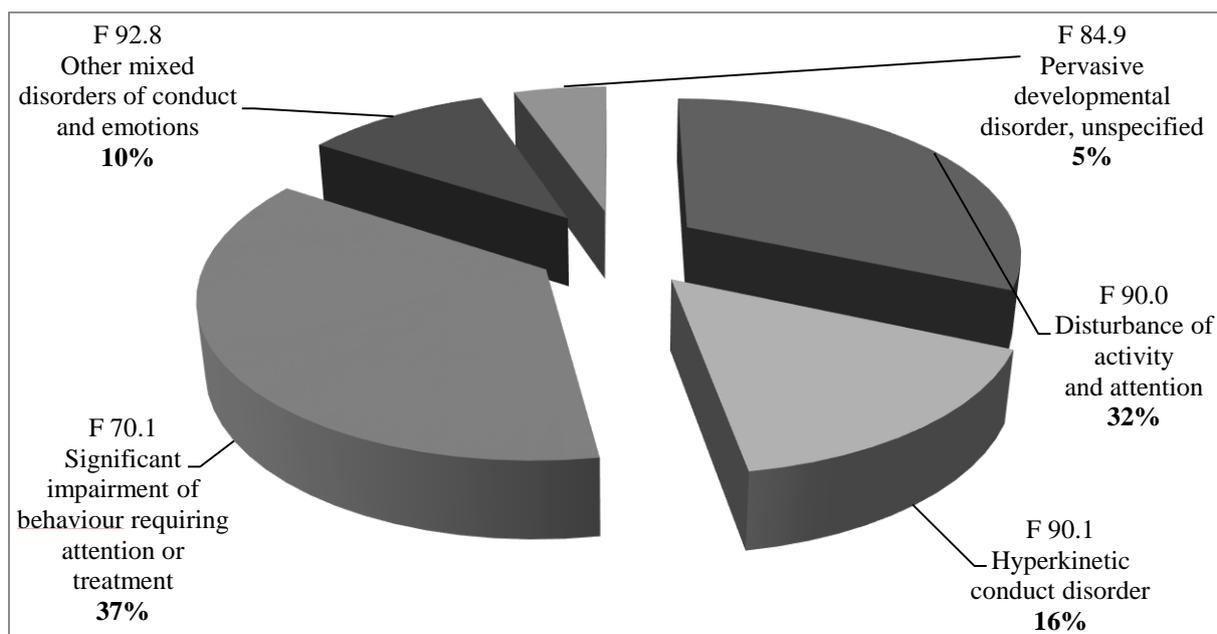

Child	Diagnosis	CD	Family background
E. I.	F 70.1	CD in ID	From 6 months in the Institute of Infant care because of neglect of mother (prostitution), father is imprisoned, now in children home
M. J.	F 90.0	DLD	mother comes from a children's home, the father abused the child, the father is a drug user, now imprisoned, mother raises a child alone
M. T.	F 84.9	CD in ASD	mother with psychiatric burdens, mild intellectually disabled and alcoholic, father has primary education
N. P.	F 70.1	CD in ID	Inconsistent upbringing, divorced family
P. K.	F 70.1	CD in ID	Dissociated family - mother is a prostitute, she mistreated her child, the child now in the care of his father

As seen from Table 1, the communication disorder in intellectual disability is associated logically with the children with intellectual disability. The communication disorder in ASD and delayed language development occurs once in the table 1. The tested children come from dysfunctional families (Table 1).

Table 2: The communication disorder and psychiatric disorders with a brief family anamnesis for the section B – boys in younger school age

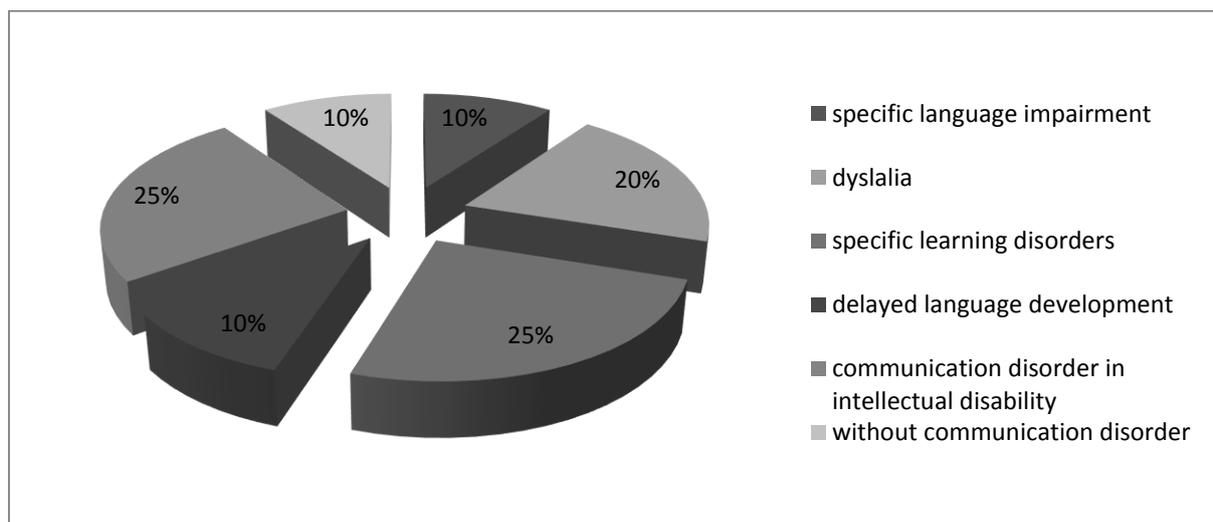

Child	Diagnosis	CD	Family background
M. B.	F 90.1	DLD, SLI	socially deprived child, grew up in uninspiring family, now in children home
T. B.	F 70.1	CD in ID	dissociated family - alcoholism
T. H.	F 91.2	Without CD	child witnessed physical abuse of mother by father, currently in children home
A. H.	F 92.8	dyslalia	Intact family
T. H.	F90.0	SpLD	Dissociated family
D. K.	F 70.1	CD in ID	divorce family, inconsistent upbringing
P. K.	F 90.0	DLD, dyslalia	Inconsistent upbringing
P. K.	F 90.1	dyslalia	Dissociated family, child witness of aggressivity of father (alcoholism), disagreement between parents
L. K.	F 92.8	SpLD	Psychiatric anamnesis in mother, child doesn't know his father, brought up by grandparents from 3 years of age
M. M.	F 70.1	CD in ID	Mother has only Elementary school, child raised without father
J. P.	F 90.1	SpLD	removed from the family for neglect, now lives in children's home
R. R.	F 90.1	Without CD	He raised only by father and grandmother because of mothers disinterest
P. S.	F 90.0	dyslalia	Mother has only elementary school education, from 6 years of age brought up by grandparents because of mother's disinterest
L. S.	F 70.1	CD in ID	Mother only elementary school education, uninspiring, neglectful background, now in care of grandfather
R. Š.	F 90.0	CD in ID	emotionally cool environment, parents are divorced, now in children's home
L. Z.	F 90.0	SpLD	father in prison, foster family, bullied at school

Table 2 summarizes children with communication disorders and psychiatric disorders with brief family anamnesis too. The children have these communication disorders: delayed language development, specific language impairment, dyslalia, communication disorder in intellectual disability and specific learning disorders. Only two children are without any communication disorders.

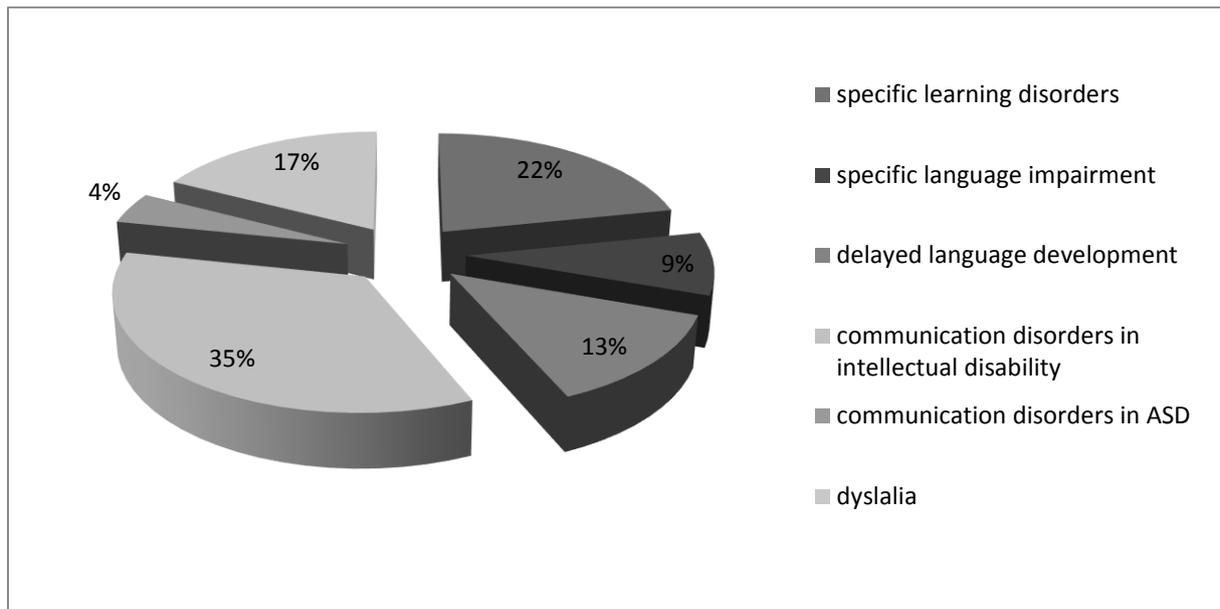

Graph1: Participation of psychiatric disorders in children with communication disorders in sections A and B.

The most frequent diagnosis is Significant impairment of behaviour requiring attention or treatment (37%), next Disturbance of activity and attention (32%) and Hyperkinetic conduct disorder (16%). 10% of children suffer from other mixed disorders of conduct and emotions and 5% of children have been diagnosed with Pervasive developmental disorder, unspecified. (Graph 1)

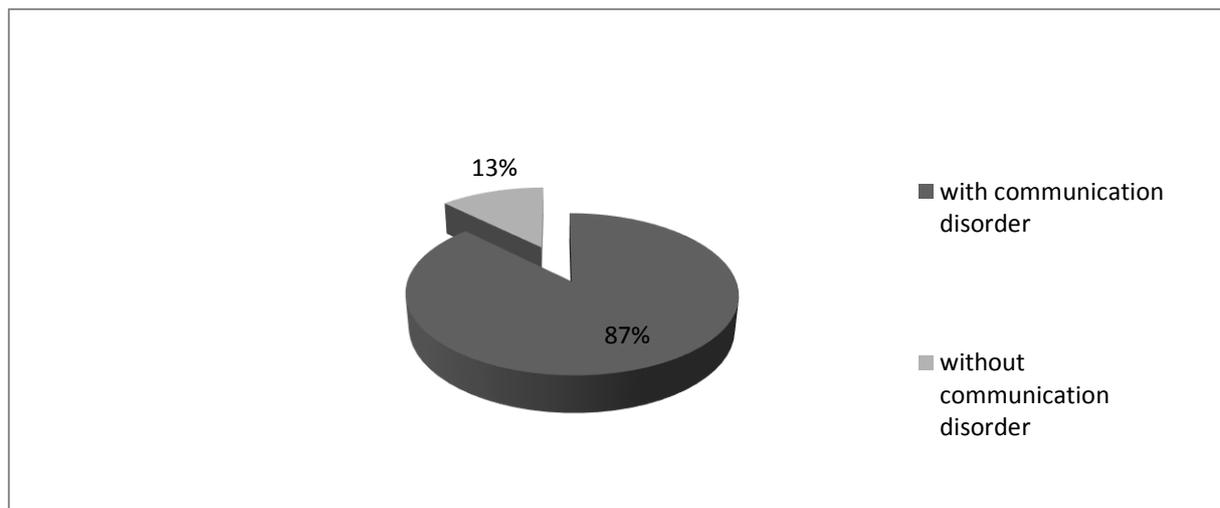

Graph 2: Participation of communication disorders in patients hospitalised in the section B.

The most frequent communication disorder in children hospitalised in Section B is specific learning disorders and communication disorder in intellectual disability – both 25%, then dyslalia with 20%, next specific language impairment and delayed language development with 10%. Only 10% of patients in Section B have not been diagnosed with any communication disorders.

Graph 3: Total participation of communication disorders in Section A and B

Communication disorder in intellectual disability records the highest participation (35%), after that are specific learning disorders (22%), dyslalia (17%), delayed language development (13%), specific language impairment (9%). The lowest percentage was recorded with communication disorder in autism spectrum disorder (4%).

Graph 4: Participation of communication disorders in all patient hospitalised in Section B

Communication disorders have been recorded with 87 % of the children in the Section B; only 13% of children are without any communication disorders.

CONCLUSIONS

The analysis of environment, communication disorders, psychiatric disorders, the association communication disorders and psychiatric disorders and specific logopedic and special education intervention in children with psychiatric diagnosis was carried out. To conclude, the professional background of Psychiatric Hospital is interdisciplinary. Child patients come from dysfunctional families. The association between communication disorders and psychiatric disorders is obvious: 87% of primary school children in the Psychiatric Hospital have some communication disorder, the most frequent psychiatric diagnosis was F 70.1- Significant impairment of behaviour requiring attention or treatment, the most frequent communication disorder was communication disorders in intellectual disabilities with the syndrome ADHD. The presence of SLT at workplaces of child psychiatry is indispensable.

ABSTRACT

The aim of the study is to investigate the opinions of preservice teachers in social studies department related to the social project called "our guest students" whose target group is Syrian students. In accordance with this purpose, the study was designed with case study method, which is one of the qualitative research methods. The sample of the study consisted of 8 preservice teachers studying their third year at Social Studies Education Department in the Faculty of Education of a state university during the academic year 2016-2017. Sampling of the study was performed according to criterion sampling, a type of purposeful sampling. The data of the study was gathered through semi-structured interview, weekly reports with photographs and a magazine article which is an end-of-study product. The data was analysed with descriptive analysis method. At the end of the study, it was found out that the main activities performed were playing games and watching films, the primary problem in the project was communication problems, the project made a lot of contributions to many skills particularly empathy skills and values specifically hospitality and preservice teachers associated the project they carried out with community service practices course.

Key Words: Social Project, Community Service Practices, Learning by Servicing, Syrian Students, Preservice teachers in Social Studies Department

1. INTRODUCTION

Awareness towards global problems is much lower than the desired level. In order to raise awareness to these global issues, probably the most effective way is to raise conscious people, and so universities, nongovernmental organizations and political corporations should carry out projects that are realistic and applicable (Aydın, 2016, preface). On the university basis, these projects are conducted through scientific studies, or based on voluntariness, or within the framework of courses. Considering the university courses, we come across community service practices, a course compulsory in all departments of education faculties.

According to Sönmez (2009) education affects the whole society and the most essential factor in this system is teachers. In this sense, community service practices course is of critical importance in order for preservice teachers not to be grown isolated from the society. In the light of this, considering that one of the most basic social problems in Turkey today is the issue of Syrian refugees, conducting activities aimed at Syrian refugees within the frame of community service practices course is regarded as crucial. Preservice teachers would absolutely give priority to Syrian students with this regard.

When it comes to the conditions of Syrian students, it can be seen that more than the half of the Syrian refugee population registered is under the age of 18, that is, this population is comprised of individuals that are in their teenage periods. These children having the trauma of both war and immigration are having educational problems as well as difficulties regarding their basic needs such as health, accommodation etc. As for their educational problems, it is also observed that Syrian children can get education in temporary education centers according to Turkish Ministry of Education Circular No:2014/21 on "Education Services for Foreign Nationals" and in schools within the corporation of Ministry of Education, they are given a good education with good facilities in the camps yet most of the Syrian refugees, therefore Syrian children, try to maintain their lives outside the camp and have to get education outside the camp and schooling rate of those outside the camp is low (The State of Syrian Refugee Children in Turkish State Schools: Policies and Implementation Suggestions, September 2015)

The reason why the study included preservice teachers in the department of social studies is that many topics and learning outcomes of community service practices course and a lot of notions regarding the issue of refugee, which

is one of the problems of today's world, such as citizenship, human rights, immigration, exile, refugee, asylee, multiculturalism, awareness, empathy, respect, tolerance etc. are closely related to social studies program. In addition, when it is considered that the emergence of social studies courses is because immigrant children will become socialised (İnan, 2014), it can be clearly seen that this issue is highly associated with social studies and preservice teachers in this fields. Then, this being the case, what kind of activities will our preservice teachers in the social studies field do, what kind of problems will they experience in these activities, what kind of solutions will they find for these problems and most importantly what will be the contributions of these activities to these preservice teachers?

1.1. The Aim of the Study

The aim of the study is to investigate the opinions of preservice teachers in social studies department related to their social project aimed at Syrian students.

1.2. The Importance of the Study

It is believed that the result of the study is of critical importance as it enlightens issues such as the activities, the problems experienced and the solutions related to these problems for preservice teachers who will carry out a project aimed at our Syrian students in community service practices course . In the literature, no scientific study has been encountered concerning community service practices towards Syrian students. Also, in some studies it was emphasized that trainings related to the adaptation of the students with immigrant status should be provided and projects should be developed to involve these students in education (Çakırer Özservet, 2015)

1.3. Sub-goals

- What are the reasons of the preservice teachers in social studies department to choose the project called "our guest students"?
- What kind of activities did the preservice teachers in social studies do within the frame of the "our guest students" project?
- What kind of problems did the preservice teachers in social studies experience and how did they solve these problems?
- What are the contributions of the "our guest students" project to the preservice teachers in social studies?
- What are the suggestions of the preservice teachers in social studies for those who will carry out similar projects to "our guest students"?
- What are the attitudes of the stakeholders towards the "our guest students" projects according to the preservice teachers in social studies?
- Is there a relationship between our guest students project and community service practices course according to the opinions of preservice teachers in social studies?

2. METHOD

2.1. Design of the Study

The study was designed with case study method, which is one of the qualitative research methods. According to Merriam (2013), case study is the method in which a limited system is described and analysed in a detailed way. The thing that is to be studied should be a limited system such as only one person, program, group, organization etc. This study focused on a school, a group of 8 preservice teachers voluntarily servicing there and their experiences related to this school. As Creswell stated (2016) in case study method, detailed information is gathered with multiple information sources and the case analysis is conducted. In this study, thanks to experiences of the preservice teachers related to the activities that they conducted with Syrian students, the data was gathered through multiple information sources- semi structured interview, documents and reports- and then analysed.

2.2. Sample of the Study

The sample of the study consisted of preservice teachers studying their third year at Social Studies Education Department in the Faculty of Education of a state university in Republic of Turkey during the academic year 2016-2017. Some activities were performed during 10 weeks by the preservice teachers in a state-funded secondary school in the city center where the university is located. In the study, the opinions of totally 8 preservice teachers were received on these activities. Sampling of the study was performed according to criterion sampling, a type of purposeful sampling. Yıldırım and Şimşek (2013) suggested that purposeful sampling enables in dept analysis of the cases that are considered to have rich information. In the criterion sampling, a type of purposeful sampling, the criterion used was "participating in the project voluntarily". The group went to the school regularly every Friday

and conducted activities for about 3 hours daily during 10 weeks. Since the size of the sample is just a case considering the focus group of the study, working with a group of 8 was considered to be satisfactory. Moreover, when weekly reports and studies were analysed, it was seen that notions and processes started to repeat and data saturation was observed with one group.

2.3. Roles of Researchers

The researchers in this study don't have the role of participant, they watched the process, conducted the focus group discussion and analysed the related documents and reports. The first researcher has been giving social project and community service practices courses at undergraduate and post graduate levels for 10 years. The second researcher has been following social project and community service practices courses closely for about 4 years. Both of the researchers have certificates of appreciation within the context of community service practices and carry out studies on social projects.

2.4. Data Collection Tools

The data of the study was gathered through document analysis (reports, photographs, magazine article) and semi-structured interview.

Semi-structured interviews were performed in social studies seminar room. The room had a u-shaped table as well as adjustable and comfortable chairs. For the interview, 7 questions that are suitable for a conversational atmosphere and daily language use were prepared. Depth interview was tried to be performed with 8 probes emerged during the interview. In the preparation process of the questions, the literature was reviewed and right after forming first draft of the items, opinion of an expert in the field was referred to. The piloting of the questions was conducted with some preservice teachers formerly accomplishing projects in the community service practices course. The interview was fulfilled by the researchers. It took one hour and thirty four minutes.

Weekly reports with photographs: The group was required to prove that they had worked at "guest students project" and so the preservice teachers were asked to present weekly reports in order to be able to give their reflections immediately before the activity lost its effect on them. The reports were written with no more than 500 hundred words. Students were asked to include the impressive events, the emotions felt, the problems faced and suggestions for solutions in their reports.

Magazine article: The preservice teachers were asked to write a magazine, limited to two pages. The reason for this was to reach the emotions and experiences of the preservice teachers from different ways. The instructions for writing were provided for students and they were informed to include content related to the target group, impressive events, the problems encountered and suggestions for solutions.

2.5. Analysis of Data

The data obtained from interview was analysed with descriptive analysis method. In this method, the data gathered is summarised and interpreted according to the pre-determined themes. The data can be arranged considering the themes on which the research questions center (Yıldırım and Şimşek, 2013). In this study, the data was also designed according to the themes on which interview questions focused. The analysis of the data was conducted in the following process:

- For descriptive analysis, the frame was designed according to interview questions. The themes that were dealt with were the reasons to choose the project, the contribution of the project, problems encountered in the project, recommendations for the project, the project and course relationship and the opinions of other stakeholders.
- Right after determining the thematic frame, the next step was processing the data. The interview was transferred to computer medium without making any changes and 16 pages of data was gathered. The data was shown to the participants and they were informed that they would remain anonymous and the data would be used for scientific reasons. The coding was conducted first and then themes were put into the final form. The main themes were determined with agreement-disagreement method.
- In the following step, the findings were started to be described. Under each theme, direct quotations were presented.

- Finally, the findings were interpreted so as to reveal cause effect relationships.

2.6. Credibility, Transferability and Consistency

In the study, regarding the credibility, long term interaction was maintained, depth oriented data was tried to be collected, expert opinion was referred to, participant confirmation was achieved. In this sense, the project called *our guest students* lasted 10 weeks and thanks to the reports presented each week, long term interaction with data was maintained. During ten weeks, participants that were in contact with the researchers were provided with a comfortable atmosphere where they could rely on the researchers to contribute to the study with the interviews. In order to collect depth oriented data, ten probes were included during the interviews. While preparing the questions for focus group discussion, expert opinions were obtained from field experts and Turkish education experts. After the whole study was finished, it was examined by the experts in the field. After the interviews, the participants were provided with the last version of the study and asked if there were any parts to be corrected or clarified to maintain member checking. Member checking was carried out through a specific meeting for this purpose. Member checking meeting was photographed with the consent of the participants. This evidence will be kept in archives for a while.

Within the scope of transferability in the study detailed description was performed and purposeful sampling was used. After the data obtained from interview was described comprehensively, direct quotations were often given place to. For purposeful sampling, criterion sampling was used.

In order to maintain consistency in the research, during the coding process of the data gathered from the interviews, consistency in conceptualisation was taken into consideration.

As for the confirmability in the study, the coding and results of the study were examined by the expert in the field.

2.7. Ethical Issues

The participants of the study participated in our guest students projects voluntarily. Their consent was taken to conduct interviews. After the study was finished, the results that they had been waiting for excitedly were checked and then confirmed by them again. Symbolic codes were used in the quotations. Data gathered from interviews will be kept in archives for a while.

3. FINDINGS AND DISCUSSION

3.1. Findings Related to The First Sub-problem

The reasons of the preservice teachers to choose the projects are as follows:

- The city that they have been living for a long time is a cosmopolitan city and as problems have been observed about this issue
- They are our guests and it is our duty to help them
- It is a part of being human to help others
- It is necessary to find solutions to the students' adaptation problems
- Empathising with them is essential
- It is important to help them financially and morally

Some expressions of the preservice teachers supporting these reasons are as follows:

S8: *"I live in Gaziantep. Since there are a lot of people from different nationalities in my city, I believed that I can be helpful for this project. It is my duty as a human to help these people that are visitors in our country in order to meet their financial and emotional needs. That's why, I took part in this project. "*

3.2. Findings Related to The Second Sub-problem

The activities that the preservice teachers performed within the frame of the project are as follows:

- The First Week: Greeting activity
- The Second Week: Playing Game (football and volleyball)
- The Third Week: Watching Film (Like Stars on Earth)
- The Fourth Week: Playing Game (word play and dodge ball)
- The Fifth Week: Watching Videos (on alphabet, proverbs and nursery rhymes)
- The Sixth Week: Watching Animation (Ice Age 4) and Having conversation
- The Seventh Week: Playing Game (football) and Singing Turkish Songs

- The Eight Week: Playing Game and Having conversation
- The ninth Week: Watching Film (Shaun the Sheep) and Documentary (Arabic Day)
- Tenth Week: Watching Film (Shaun the Sheep cont.) and Farewell conversation

It was emphasized that these activities were conducted to establish a communication and get more closely acquainted with them, to win their trust, to improve their Turkish, to have fun time and to make intercultural comparisons.

3.3. Findings Related to The Third Sub-problem

The contribution of the project to the preservice teachers is as follows:

- Developing empathy skills
- Realising the importance of communication
- Gaining school experience
- Getting experience in learning the problems related to Syria from the first hand source and Witnessing the effects of these on the children
- Meeting new people, language and culture
- Getting the satisfaction and the excitement of having a nice, enjoyable time
- Observing the positive and negative result of multiculturalism
- Developing problem solving and communication skills

Some expressions of the preservice teachers supporting these ideas are as follows: S1: *" I can say that the first contribution of this project for me is to develop empathy skills,. I often put myself into their shoes and tried to understand the problems they have been experiencing. I realized how important the communication is. "*

3.4. Findings Related to The Fourth Sub-problem

According to the preservice teachers, the problems faced in the projects and solutions for these problems are as follows:

- Communication problems because of language level (peer translating, using body language, activities intended to improve their languages)
- Introvertness stemming from the effects of war and immigration and communication problem resulting from this (activities to win their trust, trying to understand each other)
- The project being limited to activities only in school body because of bureaucracy and restraints depending on this issue (improving the quality of the activities and making them more enjoyable)
- The aggressive attitudes towards other friends
- Cultural differences (trying to understand each other's cultures)
- Time constraint due to midterm week (performing the activities even at the least)
- Unwillingness towards learning the language and adaptation as they think they are staying temporarily
- Problems related to place because of the overlaps of the activities (performing the activities with having breaks)

Some expressions of the preservice teachers supporting these ideas are as follows: S4: *"As I mentioned earlier, the most important problem that we experienced was communication problem based on their language level. After overcoming this problem, of course we had some other minor problems as well. Even if the students had a problem, they didn't want to talk about them. "*

3.5. Findings Related to The Fifth Sub-problem

According to the pre-service teachers, recommendations for the projects are as follows:

- People that can show empathy should choose the project
- Their trust should be gained first
- It is a must to be voluntary
- The project should be preferred taking the language problem into account
- Extra scholastic activities especially trips should be arranged
- First, their speech should be given importance

- Putting away prejudices and marginalising, financial and moral support should be provided
- They should be provided with psychological support
- Offending attitudes and behaviours should be avoided
- It should be known that the project is difficult and endurance is required.

Some expressions of the preservice teachers supporting these ideas are as follows S3: *"A peaceful environment should be created for them with games and conversations through all manner of conversation. They should be given chances to talk."*

3.6. Findings Related to The Sixth Sub-problem

According to the preservice teachers the opinions of stakeholders are as follows:

Syrian Students: Their opinion was not taken about coming to Turkey. Some of them are happy to be here while some others don't want to adapt to the environment as they think they are staying temporarily. They have been longing for their hometowns, families and friends. While some of them have good economic conditions, some of them have unemployed parents.

Teachers and The principal: They supported the project. The teacher opinions related to the project is positive. They stated that they wanted to see preservice teachers at school in different projects as well

Other students: they have tendency towards violence, look from a different perspective, have negative attitudes and marginalise the guest students.

Some expressions of the preservice teachers supporting these ideas are as follows: S7: *"I observed that the other students insulted the refugee students and sometimes isolated them, especially those who are not competent enough to speak the language. They should be talked to on this issue to overcome these problems.."*

3.7. Findings Related to The Seventh Sub-problem

According to the preservice teachers, the relationship between project and community service practises course is as follows:

- Community Service Practices is regarded as finding solutions to people's problems and so it is seen related with the project
- Children/students are seen *an/the most* important part of society
- It is regarded as already a precaution for the future's society in order not to have problems
- The project is seen as reintegrating an individual into the society
- Students at childhood period cant become self sufficient and so they should be supported

Some expressions of the preservice teachers supporting these ideas are as follows: S6: *"All in all, students are also a part of our society, and even one of the most important part. If we don't win these students, in the future there may be undesired results for them and the society. In this sense, I can say that this project is related to this course."*

4. CONCLUSION, DISCUSSION AND IMPLICATIONS

4.1. Conclusion and Discussion

It is seen that our guest students project was chosen because it is a duty to solve a social problem. Considering that the basic problem about social welfare is not being able to reach the people who are actually in need (Yıldırım, 2010), it is seen that the participants took this basic problem into consideration.

In the project owing to bureaucracy problem, intramural activities specifically playing games and watching were performed. It was also observed that some other studies also included therapeutic games aimed at Syrian students (Gökşen, 2015).

Our guest students project had significant contributions to preservice teachers in social studies department. According to their statements, it is seen that they asserted that their attitudes towards Syrian students has become more positive. Accordingly, regarding the partially negative attitudes of social studies preservice teachers towards Syrian refugees (Topkaya and Akdağ, 2016), it can be inferred that these kinds of projects can develop positive attitudes.

It was observed that the most frequent problem faced was the problem of communication/language. This finding coincides with the results of other studies (The State of Syrian Refugee Children in Turkish State Schools: Policies and Implementation Suggestions, September 2015)

Preservice teachers has made some suggestions for individuals that will carry out projects similar to our guest students project. One of these suggestions is that they should get psychological support. This finding coincides with the results of other studies (The State of Syrian Refugee Children in Turkish State Schools: Policies and Implementation Suggestions, September 2015).

It was understood from the study that Syrian students, as a stakeholder of the project, has positive and negative attitudes, teachers and the principal has positive attitudes towards the project, the other students has negative attitudes towards Syrian students. The finding that the other students have negative attitudes towards Syrian students coincides with the results of other studies (The State of Syrian Refugee Children in Turkish State Schools: Policies and Implementation Suggestions, September 2015)

The preservice teachers emphasized that our guest students project is related to community services practices course. Likewise, in the studies conducted on this issue (Şeker, 2009), it can be seen that immigrants, asylees and refugees are within the framework of community service practices.

4.2. Implications

- It is suggested that activities that will be performed at the projects aimed at Syrian students should be determined first considering the problems, suggestions for solutions and sample activities in this study.
- It is recommended that the project should be expanded through getting language and psychological support.
- It is seen that the project has some certain contributions. It is suggested that preservice teachers should take part in similar projects at least for once.
- While expressing their opinions, the preservice teachers stated that the project contributed a lot to their understanding of the values such as empathy, problem solution and communication skills as well as sophistication, equality, tolerance, respect to difference, cooperation, hospitality and independence. It is suggested that studies on the contributions of this project to these skills and values should be carried out.
- It was observed that other students have negative attitudes towards the guest students. Similar projects should be conducted with the aim of changing these negative attitudes.
- This study was conducted with the preservice teachers at the level of bachelor degree. Similar studies can be performed with different education levels as well.

İrfan ŞİMŞEK

irfan@istanbul.edu.tr

ABSTRACT

Literature for education calls for a differentiated curriculum to cater for the wide range of student differences in any classroom. There are significant experimental studies which indicate that differentiation is able to meet with different needs of the students with wide range. However, attitudes and beliefs of teachers are as important as experimental studies to understand the advantages of curriculum differentiation, because differentiation is achieved by means of practitioners. Questions included topics such as the need for differentiation, educational practice and organization of differentiation, teachers' attitudes on differentiation, the relation between differentiation and inclusion. Participants' ideas were documented in a focus group that includes elementary school teachers, math teachers, experts and academicians in gifted and elementary school education, and a pre-service teacher. They reported the importance of differentiating both the curriculum and the learning environment. They pointed out that differentiation brought the infusion which helps to meet the different needs of different students. They also reported that technology was a useful tool for differentiation. They pointed out that successful organization substantially increased the likelihood of succeeding differentiation as well.

Keywords: curriculum differentiation, learning needs, differentiation, inclusion

SCHOOLS AS INSTITUTES OF ACCULTURATION: A QUESTION OF BELONGING

Maura SELLARS

ABSTRACT

This paper considers the position of students with refugee experiences in Neo Liberal classrooms. It explicitly raises questions about the notion of belonging, school culture and invariable tensions these constructs create in the context of age - related standardized testing, the epistemological foundations of the curriculum and the inevitable context of competition that is characteristic of economy based schooling. It questions the capacities of Neo Liberal educational systems to educate these students in ways which acknowledge their relative strengths, their cultural richness and their need for holistic, supportive teaching and learning interactions. It also examines the cultural tensions that are created by educational spaces which exclusively privilege the majority culture, as is currently the case in many of the 'host' countries in which these students find themselves. The widespread focus on individualism at the expense of community and on personal achievement and gain as a replacement for collaborative, joint effort may be tolerated as a necessary evil in many western cultures, but may prove to be the ultimate devastating challenge to students with refugee experiences as their communities struggle to come to terms with the horrors of displacement and the subsequent battle to retain their sense of identity.

INTRODUCTION

The world is currently experiencing the most widespread displacement of people that has ever been known. Over sixty five million men, women and children have been forced to flee their homelands in an effort to escape, war, violence, religious and civil conflicts and widespread destruction of the lives they had previously known in their countries of origin (United Nations Refugee Agency, 2017). Over half of this number are young people and children under eighteen years of age. Those who survive face great difficulty and hardship in their quests for new homelands and many spend months and years in camps and temporary accommodations under conditions which cause further stress and trauma. Amongst those who make up this global diaspora are millions of school aged children and young people. They, together with their existing families and communities, exist in hope of finding a new homeland on which to settle, to be accepted and to belong. Currently, however, many of the countries who have agreed to accept these newcomers as citizens have political and educational agenda and policies which marginalize the disadvantaged in their own communities and which do not have the structures and services to productively accommodate the degree of religious, cultural, and social diversity that is characteristic of the displaced communities. Consequently, many individuals with refugee experiences find themselves in new homeland societies which are very different from those they were forced to flee, and into which they are expected to be acculturated and assimilated.

ACCULTURATION

There are two distinct approaches to understanding the what occurs as the result of the coming together of two dissimilar cultures. One approach is the psychological approach which seeks to understand the changes and processes of that individual experience as the result of these interactions (Berry, 2009; Berry, Horenczyk, & Kwak, 2006). In this model, acculturation is generally understood to be the 'general process and outcomes (both cultural and psychological) of intercultural interaction' (Berry, 1997, p 8). The second, original model is primarily an anthropological model which seeks to explain how people as groups begin to live their lives in the context of other, different cultures (Ogbu, 1995a, 1995b). Both of these perspectives are valuable when discussing acculturation in the context of individuals with refugee experiences as these populations usually arrive in a context which is to be their homeland with others who have similar characteristics and backgrounds. In discussions of acculturation generally, there are several factors which impact on the process of acculturation. These are identified as the size of the groups who are undergoing the changes, the reasons for the migration, how long these groups have been in contact with the majority culture to which they are attempting to integrate and the degree of difference between the two cultural groups. One factor which both perspectives of acculturation agree as a critical factor is the in the predictor of acculturation outcomes is the degree to which the cultural interaction is forced or voluntary (Berry, 2009; Berry, Horenczyk, et al., 2006; Berry, Phinney, Sam, & Vedder, 2006; Ogbu, 1995a, 1995b). This is a particularly important aspect to consider in case of students with refugee experiences as the contact is generally involuntary and there are limited prospects of returning to the homes from which they have fled or been forcibly displaced. This lack of choice makes these individuals more vulnerable to developing an 'oppositional cultural

frame of reference' (Ogbu, 1995a, 1995b) in which they engage in behaviour in their cultural groups which are not acceptable ways of behaving in the majority culture; or of developing negative acculturation attitudes towards intercultural contact as a result of negative interactions such as marginalization (Berry, 1997; Berry, Horenczyk, et al., 2006). This may be a particularly pertinent factor for consideration in educational settings where students with refugee experiences are regarded as 'deficit' and are perceived by themselves and others to be at a disadvantage in relation to the other students from the majority culture. Education systems which are developed in the context of the neoliberal economic politics have particular characteristics and processes which serve to privilege specific groups of students and lack the creativity and flexibility to honor diversity and difference REF. It is in these educational contexts that many students with refugee students find themselves placed in their newly settled contexts and in which they may, in many instances be at considerable risk of not developing positive acculturation attitudes and processes unless considerable accommodations are made to ensure their acceptance and inclusion (Atasay, 2015; Vickers & McCarthy, 2010).

SCHOOLS AS SYSTEMIC INSTITUTIONS

Schools are acknowledged to be the major centre of acculturation for young people (Hamilton & Moore, 2004; Stewart, 2011). They are expected to convey the culture, social expectations and behaviors of the societies in which they are placed. They frequently act as the 'gatekeepers' to other learning opportunities and prospective occupations by the implementation of the evaluative practices that are deemed appropriate for the societies in which they are placed. They are generally part of a system, the policies, characteristics and policies of which are implemented as mandatory curricula, processes and procedures. In many cases, these requirements are institutionally implemented with little or no provision for diversity or difference. A student's age, for example, determines the stage of schooling in which they are placed, what they are expected to learn and the ways in which these expectations can be achieved (Hamilton & Moore, 2004). This alone can be a source of disorientation and distress for many students with refugee experiences. Irrespective of variations in the educational backgrounds of these students, a defining characteristic is that, for some, their schooling has been at least interrupted, for others, formal schooling is a new experience as they have had little or no formal education in their previous context REF. The notion that learning is age related may also be challenging for some students and their communities as coming together to learn what needs to be learned, irrespective of age, is a more familiar concept to many students with refugee experiences, especially those from African countries REF. Despite these factors that place the learning needs of the students as a secondary consideration to the administrative practices and procedures of formal education in most countries where schooling is mandatory from a defined age, the school environment and context are recognized as critical to the potential for students with refugee experiences to develop positive attitudes and intercultural interactions towards acculturation (Stewart, 2011). Historically, students with refugee experiences were generally treated like any other students in a well-meaning effort to minimize difference and demonstrate acceptance into the school community and emphasize the need for assimilation into the mainstream culture (Berry, 1997). However, a body of evidence provides evidence that contradicts this notion as a successful strategy (Stewart, 2011), with the result that schools have mainly served to marginalize these students with potentially significant consequences for both the communities with refugee experiences and the communities to which they seek to belong.

The consequences of prioritizing institutional procedures and policies and assuming assimilation will take place has particular impact in school systems which are heavily influenced by neoliberal economic principles. Identified by their focus on individual competition, one size fits, all high stakes testing and inflexible curricula, schools in these systems have the capacity to marginalize not only students with refugee experiences, but any students with a background of disadvantage who do not identify with the complex values, beliefs and principles that are inherent in these schools and systems. Students with refugee experiences are particularly disadvantaged. The issues of language and literacy skills are always problematic as are the difficulties that many students with refugee experiences encounter when subsumed in a world of printed material. This reliance on print impacts not only on students with backgrounds of oracy, but also those students whose educational backgrounds were previously limited to the knowledge of specific religious or cultural texts. The additional stress that is created for these students is accelerated by the ways in which assessment procedures are implemented, most especially in situations where national testing regimes are implemented. Not only may the epistemologies of the curricula, and therefore the contents of the tests, be unfamiliar to them and conflict with their own cultural beliefs and ways of knowing, the language proficiencies required to engage productively with these evaluations of learning only serve to further marginalize and disadvantage these already vulnerable groups of learners. A further disadvantage for many students with refugee experiences may be their physical appearance. These may include facial features, skin colour and general physique that sets them apart from the students of the mainstream culture, resulting in cultural interactions that demonstrate attitudes of prejudice and discrimination by those belonging to the mainstream culture. Once again, this can be particularly dominant in schools and systems that are governed by policies and procedures which are exclusive and inflexible, such as those dominated by 'one size fits all' pedagogies and

curricula, deficit remedial programs which exaggerate perceived shortcomings and lack of linguistic and other social capital (Bourdieu, 1986, 1990) and which limit the choices of acculturation strategies for students with refugee experiences.

BELONGING AT SCHOOL

There are different types of acculturation and often, the strategies for some types of acculturation are either too challenging or are not possible in the contexts in which some students with refugee students find themselves (Hamilton & Moore, 2004; Stewart, 2011). Assimilation, which is an expectation in many of the countries who regularly permit an annual quota of migrants, including populations with refugee experiences, into their nations, actually means that these people are expected to forfeit their original cultures and to totally embrace the language, customs and values of the countries in which they are resettled. The opposite of this total immersion in the culture of the 'host' country is separation. This is where the individuals wish to retain their culture of origin and avoid contact with those of other cultures. As a result, these individuals do not readily acquire the language, values and customs of the country in which they are resettled and so find it difficult to sustain productive, positive interaction with others who do not belong to their cultural group. Most at risk of separation are females who do not attend school but remain at home with their communities. Integration is likely when these populations are able to retain the aspects of their culture of origin, but also be able to interact in their new cultural contexts by acquiring language, values and ways of doing that are associated with participating positively and productively in their new cultural contexts. Strategies to integrate have been found to be the successful option for those individuals wishing to adapt to life in another cultural context. There is one more option for acculturation which is especially pertinent when considering the expectations of students with refugee experiences in schools in countries with neoliberal politics and economies. This is marginalization. Marginalization is frequently the result of negative interactions with other cultural groups. Individuals reject their culture of origin because of negative perceptions and interactions with the dominant cultural group and, although they may strive towards achieving the language, norms and values of the dominant group, they are unable to do this effectively or efficiently and, consequently, they also develop negative attitudes towards the dominant cultural group. This can be a particularly problematic outcome in schools, especially those where difference and diversity are met with low degrees of tolerance and limited understanding and support systems. In many schooling contexts, students with refugee experiences simply cannot compete academically with their peers in formal school systems which prioritizes high stakes testing and one size fits all pedagogies and so cannot fully access the cultural capital of education which may lead to a gradual process of marginalization.

Conclusion

Acculturation is gradual process which develops over time and changes individuals, communities and the 'host' culture as interactions create new norms and perspectives. It is essential for students with refugee experiences to have significant support systems made available to them in a variety of contexts, including school contexts. It is also vital for the development of positive acculturation strategies and attitudes that students with refugee experiences experience interaction with their peers from the dominant culture, not least for the saturation of language experiences that native language speakers can provide for their classmates (Schumann, 1986). Schools have particular responsibilities as the major avenue by which students with refugee experiences can be acculturated to provide environments which are inclusive, tolerant and accepting of difference. School climate has been well established as an important indicator of student belonging and inclusion REF and consider not only the policies and practices of schools but also the ethos and 'hidden curriculum' REF. for students with refugee experiences, school climate becomes paramount to their future success, not only in academic terms but terms of their social and emotional wellbeing. The question, however, that appears not to have been asked, much less answered, by policy makers, school systems and support agencies is simply this 'How can an educational system that prioritizes individual competition and academic success accommodate students with refugee experiences?' If they cannot successfully compete, the only way they can belong in such education systems is to become the failures that are required to validate winners. Society's risk then is that the only type of acculturation that many students with refugee experiences may be able to develop is that which is least beneficial at all three levels of consideration (Berry, 1997): the individual, the institutional and the national.
